The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I attended one of your listening sessions. From that I understand that public utility companies are exempt from monitoring for PFAS. I hope I am wrong about that. I tried to find out from my public utility what the PFAS levels are. They responded like I was speaking in a foreign language. They could not answer my question. Hence, I have no idea what level of PFAS I am consuming. Consumers should not be responsible for monitoring this! My immune system is compromised with an auto-immune disorder. Please, take the strongest actions possible to protect the public's health. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Regarding the commenter's question around "public utility companies" and monitoring, the EPA clarifies that public water systems that meet the definition of a public water system under the SDWA must comply with and are not exempt from monitoring for PFAS as provided in this NPDWR. Under the final PFAS NPDWR, the EPA is adopting a three-tiered monitoring framework that public water systems must follow. Sampling tier and frequency is based on previous data, system type, and system size (population served). The EPA is finalizing the requirement that initial monitoring, or demonstration of previously collected data to satisfy requirements, must be completed within the first three years following promulgation of the rule. Based on this initial monitoring data, annual monitoring will occur at a specific tier. For further details on the monitoring required under this NPDWR, please see Section VIII.F of the FRN. Monitoring for PFAS outside of this NPDWR is outside the scope of this rulemaking. However, to learn more about ongoing monitoring for 29 PFAS contaminants and 1 metal (lithium) in PWSs under UCMR5, please visit the EPA website (https://www.epa.gov/dwucmr/fifth-unregulated-contaminant-monitoring-rule). Along with monitoring, this PFAS NPDWR requires public water systems to communicate information about distributed water to consumers. For more information on these required communications, such as the CCR and the PN requirements, please see Section IX of the FRN and section 9 of the EPA response in this *Response to Comments* document.

Keith Kisselle (Doc. #2670, SBC-047149)

Dear Administrator Regan:

I teach environmental studies and can say that students are often puzzled and concerned when we discuss what is and what is not regulated for our drinking water. many of them believe that EPA does it's best to protect citizens from environmental hazards. As a former post-doc research with EPA, I know that this goal is at the heart of the agency, but it can be better.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathy Goings (Doc. #2671, SBC-047150)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I have lived where we have had contaminated drinking water, as well as bathing water.clean water should be an expectation in the US and SHOULD ALWAYS BE AVAILABLE. No company should be allowed to contaminate water!

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

William Coder (Doc. #2672, SBC-047151)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

My own residence's water supply relies on a PFAS/PFOA contaminated aquifer due to corporate malfeasance enabled by lax state environmental regulation and enforcement. We don't want this to happen to anyone else, and EPA 's science based approach is the best defense.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Reimers (Doc. #2673, SBC-047152)

Dear Administrator Regan:

My cousin has been directly impacted by PFAS in the drinking water in Wilmington, NC. My cousin and many of her friends (only in their 40s) have similar large lumps on their necks that they had to have surgically removed. As you know, PFAS affect your thyroid, and this is what happened to my cousin. I am worried that her daughter will be next.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Dyson-Cobb (Doc. #2674, SBC-047153)

Dear Administrator Regan:

I am grateful for the EPA's proposed national drinking water regulations for six PFAS chemicals. This is such a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. It's time to move forward speedily to protect those alive (and inadvertently consuming PFAS chemicals), the coming generations, and our whole continuing environment. When our drinking water no longer has PFAS in it, we will be sending far less PFAS into our rivers, oceans, and water tables!

Thank you for following through on this essential first step!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Luana Rubin (Doc. #2675, SBC-047154)

Dear Administrator Regan:

3 generations of my family have been sickened by toxic chemicals/VOCs from the oil and gas industry. My friend who is a doctor says he's stopped testing for toxins in the blood because every single person he tests has such high levels of countless carcinogens in their blood samples. The administrators at the hospital tell the doctors not to tell the patients, because the polluters are donating to the hospitals. It is absolutely shameful that this continues, to enrich the few, and poison our communities.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Demaris Kenwood (Doc. #2676, SBC-046249)

Please act to regulate PFAS in the drinking water. PFAS have been proven to be dangerous and present a significant public health concern. As a mother and former teacher, I want drinking water to be safe for our children, families and all people.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Reilly Ruechel (Doc. #2677, SBC-046224)

Please stand up against industry pressure to weaken health standards for 6 of the most widely detected PFAS chemicals in our drinking water. We need safe drinking water!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Mahony (Doc. #2678, SBC-046468)

Dear Assistant Administrator Fox,

There is mounting evidence that PFAS and other chemicals are causing many of our health issues. As someone with Parkinson's Disease I strongly support the EPA's proposed PFAS national primary drinking water regulations. I urge the EPA to finalize the standards as quickly as possible while simultaneously working to reduce PFAS pollution at the source.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peter Ayres (Doc. #2679, SBC-047415)

I am glad to hear the EPA is addressing the PFAS in drinking water and adjusting the rules for drinking water to deal with this serious issue.

I support any new rules that will help rid the many types of PFAS that might get into our drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bailee Jones (Doc. #2680, SBC-046448)

I am a young and active person who lives next to one of our Great Lakes, Lake Michigan. My community is seeing the devestating affects of PFAs in our fish and are worried about the long

lasting affects of PFAs in our drinking water. You must protect Americans by regulating this dangerous and damaging forever chemical.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ariel Dahan (Doc. #2681, SBC-047276)

· I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

· I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

· Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

· The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

· These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

· There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

· EPA should immediately halt the approval of all new PFAS.

· While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chad Thomack (Doc. #2682, SBC-046294)

It is a no-brainer that we are polluting our waters with chemicals that last well forever. They can not be taken out of the system and cause irreversible damage to human health. Water is something that all creatures need to survive and there for all have the right to clean water. We need to take action now that we are aware, the public is aware of the harmful effects of PFSAs. I urge you to take action now for the health of society. There has to be another way to keep people safe that benefit from PSFAs, it just might take some time and money, but in my mind it is worth it.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Payne (Doc. #2683, SBC-046829)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. Please, please, finalize them as quickly as possible.

As a large, long-lasting, and highly dangerous class of forever chemicals which persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment, they cannot be allowed to continue to be inflicted on us.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. I am aware of nothing more essential to human health and well being than clean, safe drinking water, with the possible exception of clean air which is not overburdened with CO2. Both are absolutely vital.

Again, please quickly finalize these standards and implement an essential health-protective rule that is not weakened by industry special interests.

Sincerely,

David Payne

Winter Park, FL 32792

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Keith Puntenney (Doc. #2685, SBC-046895)

Dear Michael Regan,

Thank you for taking the step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards could provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released in the environment. PFAS have contaminated drinking water supplies for approximately 200 million people; the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, currently there are no federal or state limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities, from coast to coast. Establishing strong limits on six widely detected PFAS, this proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year, saving our health care systems millions in costs. The EPA acknowledges and has yet to address the cumulative impacts on communities who are exposed to multiple PFAS. By now issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap. This will begin regulating, and hopefully start a process to remove PFAS in US drinking water. I urge you to quickly finalize these standards, and implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Keith Puntenney

Boone, IA 50036

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Mckay (Doc. #2686, SBC-046525)

Dear Michael Regan,

Please get all PFAs out of our drinking water! Thank you for taking the first step to regulate PFAS.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to

multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Susan Mckay

Columbus, OH 43212

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kelly Casey (Doc. #2687, SBC-046830)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

As a citizen of Minnesota, I have been working on our HF2310 to ban PFAs. I am sure you are aware of the work we are doing here. My friend Amara Strande died from cancer related to toxins in the water in her neighborhood. Please help to pass laws to ban the production and use

of PFAs. As a chaplain and a former teacher, I don't want to visit another child or family who is dying from the effects of poisoning environmental pollution.

Gratefully yours,

Kelly Casey

Sincerely,

Kelly Casey

Savage, MN 55378

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

George Goffe (Doc. #2688, SBC-046831)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. John Savlove (Doc. #2694, SBC-046836)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

There are innovations to be tapped (pun intended). Clean water is a relative term. We want to ban PFAS through various methods in concert - including working with industry to better understand the promise of nature as nature intended - a self-cleaning operation that humans have the biology to do at our level.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

There is nothing helpful to populations or industry about waiting to strengthen and maintain regulations. The health care system is overworked. The economy is obviously imperiled, which means that the value of health is even more precious and will be ever more so. Money alone cannot buy a healthy populace. It is not too late to combine values, ethics, science, and common sense into one corrective mandate.

Thank you for taking these issues seriously and using your powers of office and diplomacy to strengthen our country's relationship with water.

Sincerely,

John Savlove

North Bennington, VT 05257

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carol Newman (Doc. #2695, SBC-046451)

Dear Michael Regan,

Thank you for taking the first long overdue step to regulate PFAS in drinking water.

I join in supporting your proposed standards and opposing industry's efforts to weaken these necessary protections.

I urge EPA to finalize these standards as quickly as possible.

Sincerely,

Carol Newman

Astoria, OR 97103

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Christine Cotton (Doc. #2696, SBC-046837)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA

acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

When is our government going to stop poisoning and killing us? Why do we even need these chemicals in the majority of things that they're put in? And Roundup needs to be banned and taken off the shelves. People are killing their lawns which in turn is killing pollinators. Without pollinators we don't have food. It's as simple as that. Do your jobs and get this crap off of the shelves and out of our products!

Thank you,

Christine Cotton

Sincerely,

Christine Cotton

Ellsworth, ME 04605

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Scott Chase (Doc. #2697, SBC-046424)

Dear Michael Regan,

Thank you for moving to regulate PFAS in drinking water. These forever chemicals pose risks to us all.

We urge you to enact needed restrictions as soon sa possible.

Sincerely,

Scott Chase

Pine Plains, NY 12567

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ruth Fink-Winter (Doc. #2698, SBC-046567)

I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination. I'm concerned that I probably already have these chemicals in my blood and fat tissue. I want to make sure I don't get any more in my drinking water.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods from canned goods to frying pans, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless Americans.

Please support these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mayra Rivera (Doc. #2699, SBC-047155)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

We want to leave a better future for our loved ones. There are "forever chemicals" because they can survive for years without really breaking down. This means that they can continue to build up in your blood as you drink them. And if you happen to drink water because you are human. According to Richard J. Vogl Book, A Primer of Ecological Principle (pg,140,#12) It is easier to prevent degradation, Contamination, invasion, or dysfunction that it is to stop, remove, restore, or repair abnormal conditions and damaged ecosystem.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you

Sincerely,

Mayra Rivera

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Todd Snyder (Doc. #2700, SBC-046677)

As a stakeholder, I demand that the EPA finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cindy Moeckel (Doc. #2701, SBC-046838)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Sincerely,

Cindy Moeckel

Ashford, CT 06278

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Mabry (Doc. #2702, SBC-046839)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. Please remove them from our water! Thank you!

Joan Mabry, person who frequently drinks water.

Sincerely,

Joan Mabry

Manchester Township, NJ 08759

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Sexton (Doc. #2703, SBC-046461)

Dear Michael Regan,

As your constituent, I strongly support the proposed standards, to get rid of six toxic chemicals in our drinking water and ask that the EPA swiftly finalize the standards.

I am so unhappy that clean drinking water is not the top priority rather than bending to industry wishes. It's about time!!!!

Sincerely,

Elizabeth Sexton

Sedona, AZ 86336

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tamera Luth (Doc. #2704, SBC-046840)

Dear Michael Regan,

It's appalling to me to see what has happened to our environment in my short lifetime. I'm 65. Now, drinking water isn't safe, our food isn't safe. Everything is touched by chemicals. EVERYTHING! Businesses and people have become accustomed to think with their wallets and base decisions upon profits first, health and long term affects are a distant second if they're considered at all. Act quickly, with your common sense and conscience. Please.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Sincerely,

Tamera Luth

Amarillo, TX 79119

Marybelle Suczek (Doc. #2705, SBC-046841)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. But this action is long overdue. People are being sickened and dying from these chemicals. You know how dangerous and widespread they are, so act asap to save us from this profit driven catastrophe.

I'm already ninety, so I speak not for myself, but for others. Do your job to protect people.

Sincerely,

Marybelle Suczek

South Padre Island, TX 78597

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Taina Litwak (Doc. #2708, SBC-046842)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. These "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I urge you to QUICKLY finalize these standards, and implement a rule that is the most health-protective. PLEASE resist industry's massive lobbying efforts to weaken them.

Sincerely,

Taina Litwak

Gaithersburg, MD 20878

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pamela A. Lowry (Doc. #2709, SBC-046902)

Dear Michael Regan,

We need stronger protections from PFAS in our drinking water. And EPA's proposed drinking water standards could provide that, which is why I strongly support the proposed standards and urge EPA to finalize them as quickly as possible.

For decades, PFAS have contaminated drinking water supplies for millions of us across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. Yet despite the serious health risks associated with them, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Pamela A. Lowry

Grand Junction, CO 81503

Allen Wheeland (Doc. #2710, SBC-046843)

Dear Michael Regan,

I am very happy to thank you for taking the first step to regulate PFAS in drinking water. I must confess that I, personally, have been very concerned about these dangerous chemicals since I have become aware of how ubiquitous they were in my own life and the lives of my family and friends. PFAS have contaminated drinking water supplies for millions of people across the country for many years, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would begin to provide important and long overdue protections against six of these toxic chemicals. Many aware Americans have come to strongly support the proposed standards, and now we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. As so-called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. This is a curse on not just humans, but all life forms in the environment. PFAS have contaminated drinking water supplies

for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vivian Cerny (Doc. #2725, SBC-047163)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ann Riddel (Doc. #2726, SBC-046455)

Dear Administrator Regan:

Thank you for EPA's proposal to regulation six PFAS chemicals in our national drinking water.

PFAS are harmful to the human body and need to be regulated.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

N. Almazol (Doc. #2727, SBC-047164)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

NOTHING is needed in our drinking water except, perhaps, 4% Food Grade Hydrogen Peroxide, to deal with mold or mildew & micro-organisms. Everything else is superfluous, & dangerous, INCLUDING FLOURIDE, an Aluminum derivative, which is a central nervous system disrupting toxin!.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. There is NO sane reason to have them in the water system.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The medical industry would STILL make PLENTY of money off food-borne illnesses without these poisons in the drinking water.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cheri Bumgardner (Doc. #2728, SBC-047165)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

The most important part of finalizing the regulations is following through and making sure that these regulations are upheld. If you think self-regulation will work, I believe you are sadly mistaken. This issue can't be swept under the rug.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Frey (Doc. #2729, SBC-047166)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. There is no amount of PFAS that is safe for human consumption, not to mention fish and other aquatic life. As you are well aware, toxic substances become concentrated higher in the food chain, so it is not just our water that is affected but the entire food chain.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jim Merkle (Doc. #2730, SBC-047167)

Dear Administrator Regan:

It's unknown what long time exposure to these chemicals will do to humans and I am very concerned that there will be some very negative repercussions. Please make the strongest protections that you can to get PFAS out of our drinking water.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carmen Nichols (Doc. #2731, SBC-047168)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

The Environmental Protection Agency has proposed groundbreaking new regulations on six highly toxic PFAS chemicals found in drinking water. And while we need the EPA to do more to protect against PFAS, this is a crucial first step toward tackling this massive public health crisis. Push back against opposing industries' efforts to weaken these necessary protections.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lisa Johnson (Doc. #2732, SBC-047169)

Dear Administrator Regan:

Let's make clean and healthy air, water, plants and animals a top priority - RIGHT AWAY and keep our priorities that way forever and a day!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sheila Rekdal (Doc. #2733, SBC-047170)

Dear Administrator Regan:

With Business Majors running Corporate interests it is not surprising that ALL these Chemicals have been allowed to be released into OUR Environment, as they are only interested in Bottomline...Sadly the real bottom line is the number of humans that are living very unhealthy lives dealing with cancer & other dastardly diseases caused by this plethra of chemicals that have been released in OUR environment!!!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Eric Knight (Doc. #2734, SBC-047171)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

We don't need widespread pollution linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. We need to ban PFAS compounds to prevent any further pollution.

Finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Noelle Congdon (Doc. #2735, SBC-046225)

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Powers (Doc. #2736, SBC-047172)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Our entire community has been exposed to these toxic chemicals through our damaged city wide water system. This very likely will lead to health challenges for many citizens. It is time, to regulate these known cancer causing chemicals. It is your duty - no one is exempt.

Thank you

M.Powers

Wausau, WI

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Clara Brasseur (Doc. #2737, SBC-046305)

I am writing in support of the new EPA PFAS Drinking Water Regulation. The research is clear that PFAS compounds are harmful, and because of their longevity and compounding effects it is critical to lower their level in drinking water as quickly as possible. Because of the additive effect of small small levels building up over time, the decrease in overall PFAS pollution levels

will have a large positive effect on public health. I recognize the importance of setting achievable and enforceable maximum levels for these compounds, however given that there is no PFAS amount, however small, that is not harmful, once the targets laid out in this regulation have been reached it will be important to enact further measures to keep lowering PFAS levels in the water system.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sam Inabinet (Doc. #2738, SBC-046671)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

Your actions and inactions regarding this and all related concerns have been, are being and will be remembered by all of us who will live in the world that you are shaping with your decisions right now, in addition to being a matter of public record. We are all on it together. Environmental emergencies are affecting everybody's health and livelihood, and will do so for generations to come. All issues need to be considered as facets of the critical state of the biosphere.

Given the consistency with which each current and foreseeable crisis has been weaponized against the vulnerable majority of the population of the United States of America and the world, and the exceptional leniency shown toward – not to mention the overwhelming subsidization of – those industries that create and perpetuate these crises, any failure on your part to directly address and act upon these issues can only be seen as complicity in extinction and a clearly genocidal agenda.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Allison Nemenyi Shiozaki (Doc. #2739, SBC-047634)

The basic function of governance needs to address the needs of the people and also non-human life forms that our actions impact. The health of our society rests on this really basic understanding that the limited amount of drinking water that exists needs to be protected. Wastefulness and disrespect to this life force are not virtuous behaviors, and theres a reason. Water is life. No amount of these kinds of chemicals should ever go into the water. None, never. Yet, it keeps happening. Whats it going to take to stop this madness Please due your due diligence by protecting life here in Hawaii Nei and abroad. Repercussions to those who poison and pollute our water. Clean up, then cease and desist.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jim Worth (Doc. #2740, SBC-047173)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

You know that you cannot protect the environment from climate change when the congress refuses to acknowledge the problem but wants to push back on the President's beginning attempt to deal with it. You must use your budget and authority to educate (in fact shame) the congress into facing the truth and acting responsibly.

How else can you protect the environment?

If not now, WHEN?

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Breast Cancer Prevention Partners (Doc. #2743, SBC-047289)

PFAS is one of the most toxic compounds known and there is no known safe level of PFAS in food, air, and water. PFAS are persistent, bioaccumulative and negatively effects all organ systems of the body. Particularly concerning is the significant association between PFAS exposure and breast cancer, the incidence of which has risen in recent years. We urge you to consider cumulative and aggregate risks when it comes to drinking water contaminants and adopt the most stringent requirement possible to regulate and eliminate PFAS in the drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA acknowledges that there is some evidence that PFOA exposure may be associated with an increased breast cancer risk. For specific discussion on dose additivity and aggregate health effects, please see section IV of the FRN.

Matthew Granados (Doc. #2744, SBC-046545)

Water is the medium of life, and access to clean and safe drinking water is essential for the health and well-being of all living beings. Therefore, the EPA's proposed national drinking water regulations for six PFAS chemicals are a crucial step towards protecting our families and communities from the harmful effects of PFAS pollution.

As stated by Dr. R. Vogl in the Primer of Ecological Principles, "water is the medium of life," and any mismanagement or contamination of this precious resource can have devastating consequences. PFAS chemicals are persistent and widespread pollutants that have been linked to serious health effects. The EPA's proposed rule would provide millions of people in contaminated communities with safer drinking water, preventing tens of thousands of PFAS-related illnesses each year and saving thousands of lives.

I urge you to finalize these regulations swiftly and to continue addressing all other types of PFAS to ensure that all Americans have access to clean and safe drinking water. Thank you for your efforts to protect public health and the environment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Debbie Ruiz (Doc. #2745, SBC-047174)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

It is really shocking that the greatest nation on earth can't assure that everyone has clean drinking water. Access to clean drinking water is a basic human right.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karen Embertson (Doc. #2748, SBC-047175)

Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. It would save thousands of lives and prevent tens of thousands of PFAS-related illnesses each year.

Please finalize the regulations of these six chemicals, implement a rule that is health protective, then tackle all other types of PFAS until we all have pure, clean water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jennifer Valentine (Doc. #2749, SBC-046599)

the proposed rule is important because:

Exposure to PFAS chemicals has been linked to severe health issues. The protection of public health is the primary concern at stake here. Ingesting or being exposed to PFAS chemicals has been linked to serious health concerns, including cancer, organ damage, and immune system suppression. In children, these chemicals have been shown to have negative impacts on development.

No level of PFAS chemicals are safe to drink. Even with very low levels of exposure, PFAS has still been shown to have toxic effects on the human body. While the industry argues that PFAS is used in many ways in our daily lives, this is no excuse for inaction. Given the known health risks, setting enforceable limits for PFAS as close to zero as possible is necessary to protect and preserve public and environmental health.

PFAS are "forever chemicals." PFAS essentially last forever in the environment, and can also bioaccumulate in fish, other animals, and humans. This poses a massive concern for exposure, since the chemical can remain and build up in the environment over years, and remain there for centuries. Moreover, the effects of PFAS are not always short-term, but after drinking contaminated water for months or years, the health impacts can be serious if not deadly.

Regulations encourage safer industry practices. Setting these regulations will encourage manufacturers and PFAS-producing industries at large to be more responsible in their use of PFAS. Ideally, industries would invest in safer alternatives for PFAS chemicals if they receive pressure from those in the regulatory and water supply sectors.

Regulations set legal standards for enforcement. Importantly, these standards create legal limits of PFAS chemicals in the water supply, meaning that legal action can be taken if the contaminants exceed these limits and are not addressed. The establishment of legal limits also provides clarification on the expectations for the use of PFAS chemicals and on the standards for providing safe, healthy drinking water for the public.

please protect ourselves and future generations from toxic forever chemicals!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Jones (Doc. #2751, SBC-046555)

I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and

keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lara Villalobos (Doc. #2752, SBC-047176)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS which is important since as Dr. R. Vogl, Primer of Ecological Principles. 2014 stated: "water is the medium of life" and therefore should be protected and ensure to be save for consumption. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kelly Kulak (Doc. #2753, SBC-047177)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Salazar (Doc. #2754, SBC-047178)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

As Richard Vogl, a professor from the California State University, Los Angeles says, "Water is the medium of life". We cannot allow toxic pollutants and forever chemicals to contaminate our water due to their health effects and potentially many more ecological effects.

Thank you,

Paul Salazar

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marianne Nurmi (Doc. #2755, SBC-047441)

To whom it may concern,

The implementation of a PFAS regulation is a crucial step toward ensuring the safety of drinking water in the United States.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michele Nihipali (Doc. #2756, SBC-046598)

Exposure to PFAS chemicals has been linked to severe health issues. The protection of public health is the primary concern at stake here. Ingesting or being exposed to PFAS chemicals has been linked to serious health concerns, including cancer, organ damage, and immune system suppression. In children, these chemicals have been shown to have negative impacts on development.

No level of PFAS chemicals are safe to drink. Even with very low levels of exposure, PFAS has still been shown to have toxic effects on the human body. While the industry argues that PFAS is used in many ways in our daily lives, this is no excuse for inaction. Given the known health risks, setting enforceable limits for PFAS as close to zero as possible is necessary to protect and preserve public and environmental health.

PFAS are "forever chemicals." PFAS essentially last forever in the environment, and can also bioaccumulate in fish, other animals, and humans. This poses a massive concern for exposure, since the chemical can remain and build up in the environment over years, and remain there for centuries. Moreover, the effects of PFAS are not always short-term, but after drinking contaminated water for months or years, the health impacts can be serious if not deadly.

Regulations encourage safer industry practices. Setting these regulations will encourage manufacturers and PFAS-producing industries at large to be more responsible in their use of PFAS. Ideally, industries would invest in safer alternatives for PFAS chemicals if they receive pressure from those in the regulatory and water supply sectors.

Regulations set legal standards for enforcement. Importantly, these standards create legal limits of PFAS chemicals in the water supply, meaning that legal action can be taken if the contaminants exceed these limits and are not addressed. The establishment of legal limits also provides clarification on the expectations for the use of PFAS chemicals and on the standards for providing safe, healthy drinking water for the public.

PFAS are not safe at any level and many lives will be saved when these are no longer in our water.

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see section V of the FRN and section 5 of the EPA response in this *Response to Comments* document for further discussion regarding the enforceable limits for PFAS.

Justine Dao (Doc. #2757, SBC-047179)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals are a welcome first step to protecting our families and communities from the scourge of PFAS.

As Dr. Vogl once stated, "Water is the medium of life" (Dr. R. Vogl, Primer of Ecological Principles. 2014). This principle is important to keep in mind because, for us, water is quite literally life. It's essentially what sustains us and we rely on its importance as a natural resource, while also assisting other forms of life and the planet in numerous ways. For these chemicals that are being found drinking water means an imminent danger is threatening our lives.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent thousands of serious PFAS-related illnesses each year.

I urge you to finalize the regulations of these six PFAS chemicals quickly, implement a health-protective rule, and then begin addressing all other types of PFAS.

Thank you,

Justine Dao

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Nguyen (Doc. #2758, SBC-046265)

I support the proposed limits to PFAS and PFOAs. We cannot control the amounts of these that enter our bodies through the food chain and products, but we can expect our municipalities to treat our drinking water to remove them, this reducing our exposure and the exposure of pregnant women and their babies to these know toxic substances.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Aidan Pacillas (Doc. #2759, SBC-047180)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. "Water is the medium of life." This means that water is the most important attribute to all of life and should be treated as the most important thing and should be cherished.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marlon Harrington (Doc. #2760, SBC-047181)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

Not often considered is a concept mentioned by Richard Vogl in his book "A Primer Of Ecological Principals" where he says "As a result of the accumulative effects of certain actions or materials, the addition of relatively small amounts can trigger major chemical or ecological reactions"

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jessica McGeary (Doc. #2761, SBC-047182)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I live in Boston, Massachusetts, which is infamous for the former filth of our water. I went to school in Cleveland, Ohio, where the river caught on fire. Both of these situations were cleared up by enforcement of the Clean Water Act, and I am eternally grateful. But that was not enough of a law on its own to deal with the chemicals we have only really come to understand now.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ruth Katz (Doc. #2762, SBC-047183)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Addressing the PFAS inner water is probably one of the greatest contribution we can make to the health of humans and all life on this earth.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Kennedy (Doc. #2763, SBC-047184)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The very least we can expect is clean air and water. We rely on your agency to deliver on certain basic rights. This is one of them.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Deborah Izumi (Doc. #2764, SBC-046595)

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking Docket ID: EPA-HQ-OW-2022-0114

Dear Administrator Regan,

Thank you for taking this historic step to keep our drinking water safe from PFAS contamination. For decades, PFAS chemicals have contaminated both public and private

drinking water supplies across the country. PFAS contamination exposes communities to serious health risks, including cancers, impacts to the immune and reproductive systems, and other harms. The EPA's proposed drinking water standards would provide long overdue federal protections against six types of highly toxic PFAS.

I strongly support this proposed rule and urge EPA to move swiftly to finalize health-protective standards to reduce PFAS in our drinking water.

The PFAS crisis is widespread, contaminating the blood of humans, fish, and wildlife worldwide. Communities of color and low-income communities are particularly impacted by PFAS exposure, where health impacts are often compounded because these communities tend to face cumulative effects from multiple environmental injustices and public health hazards.

EPA's proposal would significantly reduce exposure to PFAS in our drinking water for millions of people by setting strong, science-based drinking water standards for six types of PFAS. While this proposal is an important first step towards addressing PFAS exposure, it is critical that EPA also expedite efforts to prevent these chemicals from entering our waters and environment in the first place, before it even reaches our taps.

These proposed regulations are long overdue and I fully support this first step of regulating six dangerous PFAS in drinking water. In addition, I encourage the EPA to take a comprehensive approach to regulating the entire class of chemicals in order to reduce overall PFAS exposure, and improve drinking water safety in thousands of communities across the country.

Thank you for your consideration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Suzanne Hungerford (Doc. #2765, SBC-046216)

It is imperative for the health of the nation (and world) that these chemicals be better regulated by industry and government. Time is running out.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Putnam Wendy Whetsel (Doc. #2766, SBC-047185)

Dear Administrator Regan:

Less than 2% of the water on this planet is potable. It supports ALL life on this planet including, human life, animal life, and plant life, all living creatures. We MUST PROTECT IT.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vanessa Lemieux (Doc. #2767, SBC-046846)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. . . How will our civilization survive if we keep over polluting the water and land?

Train derailments, lab viruses, unearthly amounts of trash, sewage, PFAS, Fertilizer.

The cooperation's priorities are NOT in favor of people, I am all for profit, but at what cost?

Can responsibility be taken before it's too late for us all?

Sincerely,

Vanessa Lemieux

North Fort Myers, FL 33917

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Lewis (Doc. #2768, SBC-047186)

Dear Administrator Regan:

I live in an area that has been affected by these chemicals. At my address, we were never informed of the contamination and were not notified to stop drinking the tap water. After talking to neighbors all around my residence and learning they had all received these notices, I did

research. I found out that not only are there dry cleaning chemicals in our drinking water, it was discovered 12 years ago. Franklin Street Groundwater Contamination Superfund site. They haven't even begun to fix it. Luckily for me, I grew up on my own well in the country. But the last three years I have been in town on city water, I have seen the effects. I have developed dandruff, my hair is brittle and dry. We stopped drinking the tap water and our stomach issues we have been battling with for years were essentially cured. If you all don't have to live like this, why should we. My story is not even close to as bad as others across this country, who have been without clean drinking water for years. This is not the time to pass new regulations as a cop out. You need to fix and address these issues or you will have nobody left to make your money.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Betty Sabo (Doc. #2769, SBC-047187)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

Qquickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Eldredge (Doc. #2770, SBC-047456)

USD is grateful for the resources provided to deliver safe drinking water and address emerging contaminants like per- and polyfluoroalkyl substances (PFAS), particularly through the

Infrastructure Investment and Jobs Act. At the same time, we would like to stress the scale of the proposed undertaking and the need for relief for many communities, especially those that are small, disadvantaged, and lacking in professional capacity. Otherwise, the costs risk falling disproportionately on vulnerable populations.

This is the first new contaminant to be regulated in drinking water in three decades and the first since Congress significantly amended the Safe Drinking Water Act (SDWA) in 1996. This is a new experience for many and will entail an additional learning curve especially given this is the first time EPA has chosen to use a Hazard Index for a federal drinking water maximum contaminant level (MCL).

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. For concerns around communicating this NPDWR, including the Hazard Index, please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion regarding funding, particularly for small and disadvantaged communities, please see section 2.4 of the EPA response in this *Response to Comments* document. Sections 13 and 14.10 of the *Response to Comments* document address the evaluation of costs and benefits of the NPDWR, including its impacts on disadvantaged communities.

Robert Frang (Doc. #2771, SBC-046187)

Please PFAS out of our water.

EPA Response: The EPA acknowledges and appreciates this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gaila Dury (Doc. #2773, SBC-047188)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Aurora E Gonzalez (Doc. #2774, SBC-047189)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Dr. R Vogl states in his book, Primer of Ecological Principles. 2014, "Water is the medium of life. Water is indeed the medium of life, and it is our collective responsibility to protect this vital resource for present and future generations. By prioritizing the implementation of health-protective regulations and subsequently addressing other types of PFAS, we can ensure the well-being of our communities and build a sustainable future.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

F. T. (Doc. #2775, SBC-047190)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joel McCormack (Doc. #2777, SBC-046508)

Dear Administrator Regan:

The Roman Empire suffered ill effects from lead in their water, coming from linings in their aqueducts to reduce leakage. At least they could plead ignorance.

We are, in some ways, dumber than people living 2000 years ago. We know the problems that many chemicals cause, but don't do anything to prevent their use. The family of PFAS are particularly nasty, given their longevity. And do we restrict them only to the most critical uses, where they cannot contaminate humans? No, we put them on fast food wrappers to prevent sticking!

I fully support the EPA's proposed regulations for six PFAS chemicals. Please implement this as soon as possible, and restrict the entire family of PFAS as soon as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Leslie O'Neil (Doc. #2778, SBC-047191)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I fully support the proposed rule -- I very much want safer drinking water for the millions of people across the nation. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carolyn Petrakis (Doc. #2779, SBC-046847)

Dear Michael Regan,

I am a mother and a retired clinical social worker who worked for decades in healthcare. I love nature and our only home, the earth. I fear our children and all living beings will be deprived of a healthy and safe future because of toxic pollution of our land, air and water. I am deeply concerned and angered about the toxic pollution of our waters with PFAS. Our family invests in expensive water filters for our home to protect us from PFAS. I know people from lower

incomes are unable to buy these filters ti protect themselves from the PFAS-saturated water. Action must be taken to insure that all Americans have clean, PFAS-free tap water.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Carolyn Petrakis

Chicago, IL 60645

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rebecca Smyth (Doc. #2780, SBC-046220)

PFAS should be regulated as a whole class but until they are any step we take to reducing the exposure and harm of individual PFAS is a positive and necessary one.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lisa Sweet (Doc. #2781, SBC-046557)

Docket ID: EPA-HQ-OW-2022-0114

I am heartened that the EPA announced the proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS). I understand that the EPA anticipates finalizing the regulation by the end of 2023 and that the EPA expects that if fully implemented, the rule will prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses.

I am an individual advocating for the health of my family and my neighbors. We live in an identified cancer cluster on the Seacoast of New Hampshire. Is it really too much to ask that the safety of chemicals be proven before releasing them into the environment? I do not want these chemicals in my food, water, clothing, dental floss, cosmetics - or anywhere. We should not have to bear additional risk because that is more convenient or easier for industry. If there is no level of exposure to PFAS that has been proven safe, then the limit should be zero.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joanna Meyer (Doc. #2782, SBC-047192)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation, saving thousands of lives and preventing PFAS illnesses.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Quinn Montana (Doc. #2783, SBC-046466)

The PFAS family of chemicals should be regulated stringently, with a goal of ending the production of ANY chemical in that family. They are known carcinogens. Every possible effort should be directed towards removing all extant PFAS from the environment. Your children's children will curse you for their illnesses from this abomination in their world.

Dr. Quinn Montana

Environmental Science, PhD

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. The production of PFAS and PFAS in mediums other than drinking water are outside the scope of this rulemaking. Please see section 15 of the EPA response in this *Response to Comments* document for out-of-scope topics.

Mike Roche (Doc. #2785, SBC-046515)

This is literally and totally insane. I do not believe (at all) the USEPA and their toxicologists. After the Covid-19 debacle, the supposed "scientists" at the US government have exactly zero credibility.

The regulations are way ahead of the tox-science on this one. You are telling me that it is "ok" to drink water with 4.99 PPB of TCE, but it is "not ok" to drink water with 4.01 PPT of PFOA/PFOS??? I have absolutely no faith in the supposed "scientist-toxicologists" who "conducted" research on the "health" effects of PFAS. How in the hell have they determined that there are detrimental health effects at the single digit PPT exposure level that ARE NOT actually attributable to some other contaminant or exposure?

These proposed MCLs for PFAS should not be established

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees with this comment, including the commenter's statements about the current state of the science supporting the EPA's decision to regulate PFAS in drinking water through a NPDWR in accordance the SDWA, as well as the questions around the health effects of PFAS. As required by the SDWA, the EPA used the best available, peer-reviewed science to finalize the PFAS NDPWR. The assigned MCLs for each of the individual PFAS were determined via a multi-step process consistent with the SDWA, including establishing MCLGs followed by setting an MCL as close to the public health goals as feasible while considering costs. For information regarding the health effects of PFAS compounds and the analyses that went into determining the MCLGs, please see the Toxicity Assessments support documents (USEPA, 2024c; USEPA, 2024d), as well as the summaries provided in the FRN section IV and V for setting MCLGs and MCLs, respectively.

Paula Schild (Doc. #2786, SBC-047193)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

One of my neighbor's developed testicular cancer because of PFAS

The EPA's proposed rule would provide safer drinking water in my community.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Matz (Doc. #2787, SBC-047616)

The new PFAS Standard must be finzalized as soon as possible at the RECOMMMENDED LEVEL! The health of our population is at stake due to the high toxicity and potential harm of these chemicals. Adopting the 6 mg PFAS in drinking water will positively impact the health of the US population as well as impact costs associated with the cancers and other significant negative impacts of higher exposure to these chemicals that are ubiquitous in our environment. EPA must adopt the scientifically determined thresholds and not bow to special interests.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA is unclear as to what the commenter is referring to regarding "adopting the 6 g PFAS in drinking water." For further information the MCLs that are set by this NPDWR, please see section V of the FRN and section 5 of the *Response to Comments* document.

Anonymous (Doc. #2790, SBC-046189)

I want this danger to the citizens of Michigan removed.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

E. Cuenca (Doc. #2791, SBC-046672)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Truly clean (uncontaminated) drinking water is the single most important factor for insuring our health, ahead of diet, exercise, sleep etc. Consuming contaminated water will inevitably lead to poor health consequences, even death.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Campbell Hart (Doc. #2792, SBC-046673)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. That this problem has been known for years and nothing has been done to hold the responsible parties accountable what are we to think and what are we to do? What we take away is that we don't matter, the children don't matter, the animals on the planet don't matter. What

does matter? Money. Really? Can you drink it? Can your babies drink it? Can your dogs drink it without getting sick? Not for long.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gerald Gladstone (Doc. #2794, SBC-047194)

Dear Administrator Regan:

I feel like we've all been poisoned for years without knowing it! NRDC's letter b elow is fine but need emphasis. The EPA must get these awful substances out of our drinking water!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judith Clinard (Doc. #2795, SBC-046322)

I live on the central coast of California near our county airport. In the past year the neighbors in my area were notified that PFAS were found in over 50 of the 60 domestic wells they tested. The contamination occured over a period of many years from the use of Fire fighting foam at the airport. The State water board of Calif issued a clean up draft to the airport and Cal Fire for a plan to clean up the ground water and to provide treatment to the homeowners wells. Sadly the county and Cal Fire both decided that they are not legally responsible for the clean up because they were only doing what Federal law imposed upon them . Now we homeowners are in limbo wondering when our water will be safe to use again. Litigation can take a long time for results and decisions to be made! Most of us have some sort of filtration for drinking water but we all live on rural parcels that we use for growing our own produce, raising livestock and poultry. No

one seems to be able to tell us if it is safe to continue consuming our home grown goods, and our animals ingest the grasses and water on our lands. We deserve to have our water safe for all uses not just what we drink. Some of the homeowners have PFAS levels in over 100- 4000 parts per trillion. The county has known about this for years and has spent 2 million dollars on investigations and in attorney fees but have yet to use the monies to install treatment systems at the well heads of the homeowners or to reimburse the homeowners for the thousands of dollars they have spent out of pocket trying to make their own water safe. While reverse osmosis may treat the water at the faucet it is still putting it right back into our septic systems and back into the ground and then recontaminating our ground water. In the meantime we are all wondering if our health has been or will be impacted from the many years of drinking this contaminated water. I am in total support of the EPA enforcing stricter standards for MCL in our water. If you know of anyone that could give us some guidance I would appreciate it! Thank you

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Skyler Principe (Doc. #2796, SBC-046681)

Dear Administrator Regan,

Thank you for proposing limits on PFAS chemicals in drinking water to protect our health that reflect the latest scientific information on their effects on our health.

EPA should finalize these Safe Drinking Water Act regulations as soon as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of the EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and reduce or stop uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Candice Hambrick (Doc. #2798, SBC-046205)

If we have evidence that these chemicals are harmful to health it seems common sense we would limit levels.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2799, SBC-047436)

I am also deeply concerned about communication with vulnerable affected communities. A recent episode in Yuma, Arizona, illustrates the difficult problem of educating affected populations. Yuma County, Arizona, is a majority Hispanic population. Communication in the Spanish language is a necessary, but not sufficient, form of outreach. Online communications and mass media are not sufficient either. Door-to-door outreach to homes affected by PFAS contaminated drinking water is absolutely necessary as a component of effective public engagement.

Another difficult issue is the role of polluters who produced the PFAS in the first place. It is clear that this regulation cannot be left to polluters to enforce. Thus, despite the well-intended outreach of Marine Corps Air Station-Yuma to affected homeowners, that organization cannot be the lead agency in implementing these proposed rules.

Finally, education and training of staff of affected agencies will likewise be critical to successful implementation of this proposed regulation.

Thank you for this opportunity to comment.

EPA Response: The EPA acknowledges this comment. For concerns around communication to vulnerable and affected communities, as well as communication to staff of agencies via education and training materials, please see the discussion in section 1.2 of the *Response to Comments* document. Please see section 1.3 of the EPA response in this *Response to Comments* document regarding the issue of polluters.

Lana Fishkin (Doc. #2800, SBC-046184)

Need clean drinking water!

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathy Garvey (Doc. #2801, SBC-046454)

Dear people,

It doesn't take a genius or even a scientist to realize that fresh clean drinking water is ESSENTIAL to life. So, I will keep this message short and to the point -- do everything humanly possible to maintain clean water for everyone! Your families and their families to come will be forever in your debt. Thank you,

Kathy

EPA Response: The EPA acknowledges and this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kevin Rolfes (Doc. #2802, SBC-047314)

I strongly support the proposed National Primary Drinking Water Regulation (NPDWR) to reduce polyfluoroalkyl substances (PFAS) and their mixtures: Perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as "GenX" chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS). The adverse health effects of per- and polyfluoroalkyl substances (PFAS), ranging from birth defects to cancer, have been clearly established in numerous studies. Unfortunately, these "forever" chemicals do not break down and are widely found in our environment, including in our drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Anne Hisler Skabla (Doc. #2805, SBC-046201)

We should have clean drinking water and clean soil. These chemicals kill by causing cancer.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Guthrie (Doc. #2806, SBC-046586)

Every American has a right to safe drinking water.

For the health of Latinos and all Americans, I support EPA's plans to regulate and limit harmful PFAS in drinking water and the environment.

Considering the potentially devastating health impacts of PFAS exposure, it is unacceptable for these chemicals to be released into and remain in the environment at unsafe levels (https://salud.to/PFASbm).

While researchers have made strides in destroying PFAS in water, we must address PFAS contamination at the source with enforced regulations, as even undetectable levels of PFAS can pose human health risks including damage to fetal growth and increased cancer risk (https://salud.to/pfasdes).

PFAS affect everyone but may impact some populations more than others. For instance, Latino families are more likely to live in neighborhoods where there is a lack of clean and safe drinking

water (https://salud.to/nitrate) and where utility companies have less funding to meet community needs.

Therefore, environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure, such as Latinos. I applaud EPA's proposed plans to regulate and limit PFAS chemicals in drinking water and the environment, which could help ensure a healthier future with less exposure to potentially harmful chemicals.

Are you not supposed ro be protecting us from these dangerous chemicals? Isn't the word "pretcetion" part of the name of your agency? Why then is it like pulling teeth to get you to do your jobs? Why are you allowing these dangerous chemicals into our water, air, land, and food?

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see section 13.4-13.9 of the EPA response in this *Response to Comments* document that outlines the quantifiable and nonquantifiable benefits of this NPDWR that may address the commenter's concern of low levels of PFAS that can pose human health risks. In response to the comment that states that "environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure", as part of its environmental justice analysis for this regulatory action, the EPA evaluated the distribution of baseline PFAS exposure in drinking water across demographic groups. For additional discussion on this topic, please see the EPA's EJ analysis in section 8 of the EA (USEPA, 2024a) and section 14.10 of the EPA response in the *Response to Comments* document.

Brenda Bell (Doc. #2807, SBC-046848)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of

lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

———

Shalom,

I am a servant of Lord Yahweh(God) Almighty and the Most High Yahweh in heaven, Lord Jesus Christ who is Lord Yahweh's son and the Messiah or the Anointed One and the Holy Spirit. I have been given the authority to speak on their behalf. Lord Yahweh has been aware of these chemicals none as PFAS. Your acknowledgement will only go so far. Keep the public aware of your intentions. Lord Yahweh is aware that it will take some but you are working on it. Thank you for taking the time to read my comments.

Truly

Sincerely,

Brenda Bell

Opelika, AL 36804

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Therese Argoud (Doc. #2808, SBC-047590)

Just as we have strong regulations and monitoring of chemicals for pesticide

Applications to plants, we should have at least equal if not greater regulations for regulating chemicals in water. Drinking water limits proposed by EPA is more than reasonable. It is necessary and vital to peopless health and the health and safety of animals, plants and our environment as a whole. Thank you for your attention to this critical matter and please expedite implementation.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Matthew Lilly (Doc. #2809, SBC-046517)

The adverse health effects of per- and polyfluoroalkyl substances (PFAS) have been clearly established in numerous studies, ranging from from birth defects to cancer, and unfortunately, these chemicals are widely found in our environment, including in drinking water.To maintain the public health benefits of the proposed rule as scientific knowledge and technical feasibility improves, EPA should regularly update the rule by modifying drinking water standards and adding more chemicals to the regulations.

The proposed regulation is a vital step in protecting public health from PFAS contamination. However, EPA must also separately and expeditiously facilitate solutions which address PFAS waste produced during treatment to avoid re-introduction of the contaminants into groundwater, soil, or air.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion around generated waste following treatment, please see section 10.4 of the EPA response in this *Response to Comments* document.

Robert Johnson (Doc. #2810, SBC-046259)

By restricting these other pf's, how much is this going to cost the consumer? These arbitrary restrictions and implementation costs will be passed to the end customers! More scientific data, research, and public opinions need to be considered prior to allowing the EPA from advancing any more legislation!

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. For some information on available federal funding through the BIL, please see section II of the FRN, as well as additional discussion in section 2.4 in the *Response to Comments* document. Additionally, please see section 13.3 of the EPA response in this *Response to Comments* document for discussion of costs, including system costs, associated with the implementation of this NPDWR.

Desiree Rammon (Doc. #2811, SBC-046280)

I support the proposed U.S. Environmental Protection Agency National Primary Drinking Water Regulation (NPDWR) that would limit the levels of PFAS compounds and their mixtures in drinking water. PFAS compounds are in my drinking water, here in the suburbs of Philadelphia. These compounds are in much of the drinking water sources across the United States. It is the purpose of the USEPA to provide these regulations, and I support this regulation to limit PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Therese MacKenzie (Doc. #2812, SBC-046480)

I am horrified to think anyone, anywhere – but certainly in the United States – would drink less that 100% pure water. Please do everything possible to provide laws and policies and funding to make all drinking water completely safe.

I do not add supporting evidence as you must have plenty of it by now. What's needed is motivation to protect real people, especially children. Please make all water the quality you would want for yourself and your family.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peter Wolanin (Doc. #2813, SBC-046571)

I thank the U.S. Environmental Protection Agency (EPA) for its sound research and effort that generated the proposed NPDWR. The adverse health effects of per- and polyfluoroalkyl substances (PFAS), ranging from birth defects to cancer, have been clearly established in numerous studies. Worse yet, these are persistent chemicals that do not break down and are widely found in our environment, including in our drinking water.

Because of this, I strongly support the proposed National Primary Drinking Water Regulation (NPDWR) to reduce polyfluoroalkyl substances (PFAS) and their mixtures: Perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as "GenX" chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS). The proposed drinking water limits are adequate to protect health, reasonable, and achievable.

To maintain the efficacy of the proposed rule, I ask that EPA continue reviewing data regarding the health effects of these compounds, adjusting the MCLs and HBWC values and adding more chemicals to the regulations as new data becomes available.

I firmly support the proposed NPDWR and look forward to seeing it implemented as a vital part of an overall strategy to protect public health from PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tracy Feldman (Doc. #2814, SBC-046297)

Please make water quality rules as strong as possible, so that we the people have clean drinking water, and so the water we swim in is clean. This is one of the basic things we entrust to our government--clean water is one of the most fundamental needs of humans and all life on earth. Thus, I was very concerned when I heard about plans to weaken water quality rules, or changes to make it harder to safeguard our water. Please stand strong, and make sure the rules are in place to hold industry accountable for not polluting water. Make sure the standards are strict, as human health is not something to cut corners with.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lana Kelley (Doc. #2816, SBC-046543)

I support the proposed National Primary Drinking Water Regulation (NPDWR) to reduce polyfluoroalkyl substances (PFAS) and their mixtures. The adverse health effects of per- and polyfluoroalkyl substances (PFAS), ranging from birth defects to cancer, have been clearly established in numerous studies. Unfortunately, these "forever" chemicals do not break down and are widely found in our environment, including in our drinking water.

I ask that EPA continue reviewing data regarding the health effects of these compounds, adjusting the MCLs and HBWC values and adding more chemicals to the regulations as new data becomes available.

While the proposed NPDWR is a crucial step to protecting human health and the environment from the significant harms caused by PFAS, to be ultimately effective, EPA must expeditiously address the next step: facilitating effective and safe disposal methods of the waste material from PFAS removal.

I support the proposed NPDWR as a first step, and look forward to seeing it implemented as part of an overall strategy to protect public health from PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion around generated waste following treatment, please see section 10.4 of the EPA response in this *Response to Comments* document.

Riley Talbot (Doc. #2817, SBC-047266)

My name is Riley Talbot, and I am the Policy Associate for the Catholic Climate Covenant and a concerned citizen who is advocating for the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. Even more, I am a resident of New Orleans, with some of the most contaminated water in all of our country. I am concerned about my health and the health of my family and community members. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jessica Berta (Doc. #2818, SBC-046233)

Please stand up against industry pressure to weaken these rules. I urge you to quickly finalize these drinking water standards to protect public health, our drinking water, and our communities.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diane Tomkinson (Doc. #2819, SBC-047264)

My name is Sr Diane Tomkinson, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a Franciscan faith community, I take seriously our responsibility to care for creation and bring about greater justice for the most vulnerable in our society. The faith and scientific communities agree on the urgency of addressing forever chemicals. These regulations

would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anne Kelley (Doc. #2821, SBC-047195)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

And remember, producers of PFAS chemicals have known about the downside of these substances cause for decades but put profits above health of people and the planet again and again, suppressing and denying they were harmful pollutants. And they MUST be held responsible for the cost of clean up.

Please do the right thing!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. Regarding the commenter's statements about producers of PFAS, the EPA notes that only PWSs are regulated by this PFAS NPDWR and other entities, like PFAS producers, are outside the scope of this rulemaking.

Mary Smith (Doc. #2824, SBC-047262)

I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Frazer (Doc. #2825, SBC-046230)

Please stand up against industry pressure to weaken these rules, and quickly finalize these drinking water standards to protect public health, our drinking water, and our communities.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Therese Patton (Doc. #2826, SBC-047196)

Dear Administrator Regan:

I doubt the Supreme Court gives a damn about clean drinking water as long as their select few don't have to worry about where their water comes from. I'm sure they all drink from single use plastic bottles all day long anyway.

But please fight to give the rest of us access to this #1 basic need to survive.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joann Edmonds-Rodgers (Doc. #2827, SBC-047197)

Dear Administrator Regan:

I support the the EPA's proposed national drinking water regulations to keep six PFAS chemicals out of our water. It's a welcome first step to protecting communities from the scourge of PFAS.

As you know, PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

This proposed rule would provide safer drinking water for millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please quickly finalize the regulations on these six PFAS chemicals, implement a health protective rule, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michelle Parr (Doc. #2828, SBC-046212)

As a citizen, I believe this regulation is a step in the right direction for our health and safety. I fully support the revised regulations.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Pawlikowski (Doc. #2829, SBC-047263)

My name is Rev.Dr. John Pawlikowski, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation

which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. Hence I support this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

SheilaMarie Tobbe (Doc. #2831, SBC-047265)

My name is Sheila Marie Tobbe, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination. Clean water is essential for our health and the health of our children.

As a member of a faith community, I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Perry (Doc. #2833, SBC-046473)

PFAS National Primary Drinking Water Regulation Rulemaking

Please enact and enforce regulations to eliminate toxic PFAS in allprimary drinking water systems in the USA and its territories. The negative effect of PFAS in the nation's environment leads to a down hill landslide into unhealthy outcomes for all living beings. Save lives and expense by moving quickly to eliminate PFAS from our water and our environment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that not "all primary drinking water systems" are subject to this PFAS NPDWR, but only certain PWSs that meet the definition under SDWA are regulated by this rule. Please see section 1.4 of the EPA response in this *Response to Comments* document for the EPA's response of the scope of PWSs that are covered by this final rule.

Marilyn Green (Doc. #2835, SBC-046512)

I am a retired educator from Malibu, California. I am writing to thank you in advance for eliminating six extremely toxic PFAS chemicals from our drinking water through these regulations. I strongly support these new regulations for human health. Please put our health above corporate profits and give us these essential safeguards.

PFAS "forever" chemicals do not easily break down in the environment and can accumulate in the human body over time. Exposure to PFAS has been linked to a plethora of human health issues, such as cancer, immune suppression, reduced fertility, and developmental abnormalities. We do NOT want them in our water.

I have children and grandchildren who the EPA can protect by keeping forever chemicals out of our water.

Thanks.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Fitzpatrick (Doc. #2838, SBC-047260)

My name is Mary Fitzpatrick, and I am part of the Catholic Climate Covenant which supports the proposed EPA National Primary Drinking Water Regulation setting enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. The EPA must do something to protect Americans from this lasting contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation.

Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Johanna Stoneking (Doc. #2839, SBC-047268)

My name is Johanna Stoneking, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

The Pope has reached out to the world to show compassion for others. He's asking support for clean water, food, air & shelter. I'm disappointed the SCOTUS Catholics aren't showing empathy for their fellow man. They changed laws about abortion but they won't provide clean water for the children. Shame on them.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit

nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Gribble (Doc. #2841, SBC-047261)

My name is Kathleen Gribble, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lorraine marden (Doc. #2842, SBC-047270)

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

· I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

· Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kirven Blount (Doc. #2843, SBC-047275)

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

PLEASE immediately halt the approval of all new PFAS.

While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue NW

Washington, DC 20460

Subject: Act quickly to finalize the EPA's proposed national drinking water regulations for six PFAS chemicals -- Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (Document ID: EPA-HQ-OW-2022-0114-0027)

Dear EPA Administrator Regan and PFAS NPDWR Team Lead Alexis Lan:

Thank you for proposing health-protective limits for perfluoroalkyls (PFAS) chemicals in drinking water that reflect the latest scientific information on their health effects. The Environmental Protection Agency's proposed national drinking water regulations for six PFAS chemicals is a welcome—albeit long-overdue—first step to protecting our families and communities from the scourge of PFAS. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. The Environmental Protection Agency's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards and strongly urge the Environmental Protection Agency to finalize them as quickly as possible.

We need national standards for PFAS. PFAS are a large, long-lasting, and highly dangerous class of chemicals which are used to manufacture a range of goods. Because they break down very slowly over long periods of time, they are often called "forever chemicals." Thousands of PFAS chemicals are in use and PFAS can be found everywhere, including clothes, food packaging, and even Norwegian Arctic ice. PFAS persist in the environment, build up in plants and in the blood and organs of people, wildlife, aquatic life, and continue to cause harm decades after they are released into the environment. This contamination poses a direct threat to our health and our ecosystems.

These toxic substances have for too long been allowed to get into our drinking water, threatening the health of millions of Americans. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. The Centers for Disease Control and Prevention (CDC) has found these chemicals in the bodies of nearly every American it has

tested. PFAS have been linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

The Environmental Protection Agency's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, as well as the combination of different PFAS, the proposal will protect our drinking water from this toxic contamination and would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The Environmental Protection Agency acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, the Environmental Protection Agency is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. This rule will especially benefit Black and brown communities who are disproportionately impacted by PFAS contamination.

The ubiquity of PFAS is why we need to act fast and decisively. All parts of Environmental Protection Agency and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Finalizing these regulations would protect drinking water for countless communities. I strongly urge you to quickly finalize these badly needed and long-overdue standards to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination. Please implement a rule that is the most health-protective and resist industry's efforts to weaken the rule.

"The ultimate test of a moral society is the kind of world that it leaves to its children."

-- Dietrich Bonhoeffer

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,

Christopher Lish

San Rafael, CA

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcy Denker (Doc. #2845, SBC-047272)

I am writing as a resident of the VIllage of Nyack and the Chair of the Nyack Climate Smart Committee in full support of the EPA draft regulations proposed for six PFAS chemicals. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

The water in the Village of Nyack and most of Rockland County, is contaminated with toxic PFAS chemicals, and since we learned this several years ago we have also learned that many wells and reservoirs here in Rockland are contaminated with PFAS at levels below the current New York State drinking water standards. Many are also are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts

The draft EPA standards will require filtration of the majority of Rockland's contaminated wells and are written for combined standards, which would require many more of these chemicals to be cleaned up.

If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS. Moving forward, EPA should extend these regulations as quickly as possible to cover the over 12,000 PFAS chemicals as a class.

These rules will send a strong signal to the chemical industry to invest in safe alternatives now. I urge you to finalize these regulations as quickly as possible.

Marcy Denker

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For a response regarding the scope of the PFAS NPDWR for PWSs that meet the definition under SDWA, see section 1.4 of the EPA response in this *Response to Comments* document.

Lynn Davis (Doc. #2847, SBC-046849)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Please resist efforts to weaken the standards. Our family, like many, has suffered from cancer and other health challenges due to pollution, and the EPA is in the best position to protect our health and that of millions of others.

Sincerely,

Lynn Davis

Santa Ana, CA 92705

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Donna Yannazzone (Doc. #2848, SBC-046200)

These toxins need to be decreased and addressed properly for safe human water consumption.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rhoda Schlamm (Doc. #2849, SBC-046897)

Dear Michael Regan,

We need your help in protecting our drinking water from PFAS. If you don't use every means at your disposal to circumvent court decisions and legislation that would continue to allow pollution of our water supply, you are invalidating your mission to protect our environment and all who depend on it.

You have taken the first step to regulate PFAS in drinking water and we need you to continue to accelerate the pace to protect our water supply.. For decades, PFAS have contaminated drinking water for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to

multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Liz Szabo (Doc. #2850, SBC-047506)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judith Schafer (Doc. #2851, SBC-046245)

The dangers of PFAS are fact. We have got to protect our rivers, lakes and oceans. Our survival and that of the earth depend on clean waters. Please pass strong to keep our waters clean and to punish those who ignore them.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Victoria Oltarsh (Doc. #2852, SBC-046333)

I live in Nyack, NY 10960 and I spend quite a bit of money on water purifier so my drinking water shower purifier, so my bathing water and then extra drinking vessels that contain ways to clean water. This is ridiculous. How could the water not be a top priority in the county like Rockland county? It's so so sad how many chemicals and toxic Materials are in drinking water, something we need to sustain ourselves and our health. When you can smell the water and taste how horrible it is that it's really bad and I've never had such bad water as living in Nyack. And it's getting progressively worse I've lived here for 20 years and in the last few years when I turn on the faucet in the morning, I am overwhelmed by the smell of what smells like chlorine, bleach, or mold, coming out of the top, does hasta be adjust ASAP! Above all else! What concerns me the most is that corporations and bureaucracy is allowed to rule over individual safety and needs of human beings and animals that depend on water. Just a thought that they made them forever chemicals back into the Hudson. It's so ridiculous that we even have to be discussing it as is keeping toxic horrible Pollutants in our drinking water

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Frederick Warwick (Doc. #2853, SBC-046850)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Alexandria Zielinski (Doc. #2856, SBC-046296)

As a nurse and teacher, I think it's extremely important to regulate our drinking water. We are studying and learning of the dangers in our water, particularly PFAS. Unfortunately, expecting everyone to be able to buy a reverse osmosis system for their home is impossible as so many cannot afford basic things like food and transportation. It is our duty to protect our environment and to protect each other, and it is not fair that our environment and our people have to deal with the mistakes and irresponsible nature of companies. Please pass this rule to keep our people and planet more healthy!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sherry Kessel (Doc. #2857, SBC-046852)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against toxic chemicals. I strongly support the proposed standards, and I urge EPA to implement them.

PFAS in the environment affect our bodies, and harm years after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people. They are in everyone's blood--even in the blood of newborn babies who are exposed in utero. When are federal limits on PFAS going to be imposed for our drinking water? Doing so would save thousands of lives and avoid serious illnesses.

We need to begin regulating PFAS in drinking water. I urge you to immediately implement standards--no matter what the resisting industries say.

Sincerely,

Sherry Kessel

Bruce Hlodnicki (Doc. #2860, SBC-046594)

Dear Michael Regan,

Thank you for taking a first step to regulate PFAS in drinking water.

For decades, PFAS have contaminated millions of people's drinking water all across the country. That by itself has increased rates of cancer, developmental and reproductive abnormalities, and other serious diseases. The Environmental Protection Agency has finally proposed drinking water standards to protect against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large class of compounds. They tend to be long-lasting, and biologically hazardous with high dosages or repetitive or prolonged exposures. Often called "forever chemicals," PFAS persist in the environment for very long periods. They accumulate in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million Americans and the blood of

nearly every individual in the United States, including newborn babies who are exposed in utero. Despite the serious health threats associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges the cumulative effects on communities exposed to multiple PFAS. With this, EPA is one step closer to keeping its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I want you to quickly finalize these standards, and to implement the most stringent rule by resisting industry's efforts to weaken them!

Sincerely,

Bruce Hlodnicki

Indianapolis, IN 46226

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Erin D'Alessandro (Doc. #2861, SBC-046854)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. Darcy Johnson (Doc. #2868, SBC-046858)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections

against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

#WaterisLife and we have the right to have clean drinking water.

Seattle's 1854 Oration -ver.1.

WHEN THE LAST REDMAN

HAS VANISHED FROM THE EARTH,

AND THE MEMORY IS ONLY THE SHADOW

OF A CLOUD PASSING OVER THE PRAIRIE,

THESE SHORES AND FOREST WILL

STILL HOLD THE SPIRITS OF MY PEOPLE,

FOR THEY LOVE THIS EARTH AS

THE NEWBORN LOVES ITS MOTHER'S HEARTBEAT.....

CONTINUE TO CONTAMINATE YOUR BED,

AND YOU WILL ONE NIGHT SUFFOCATE

IN YOUR OWN WASTE,

WHEN THE BUFFALO ARE ALL SLAUGHTERED,

THE WILD HORSES ALL TAMED,

THE SECRET CORNERS OF THE FOREST

HEAVY WITH THE SCENT OF MEN,

AND THE VIEW OF THE RIPE HILLS

BLOTTED BY TALKING WIRES,

WHERE IS THE THICKET? GONE.

WHERE IS THE EAGLE? GONE.

AND WHAT IS IT TO SAY GOODBYE

TO THE SWIFT AND THE HUNT?

THE END OF LIVING

AND THE BEGINNING OF SURVIVAL...

"CHIEF SEATTLE 1855"

Sincerely,

Darcy Johnson

Kittitas, WA 98934

Cat Ransom (Doc. #2870, SBC-046860)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, and we don't even understand all the health damage they cause yet. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies in Prescott, Arizona, near my home and there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Cat Ransom

Cottonwood, AZ 86326

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julianne Kever (Doc. #2871, SBC-046861)

Dear Michael Regan,

I have a friend whose husband is a firefighter and got cancer, most likely from the PFAS in their mandatory clothing. I have nine grandchildren and two great-grands, all of whom I wish the best health throughout their lives, but I'm very concerned about PFAS in turf fields where they play sports, clothing they may wear and even the floss they use to keep their teeth and gums healthy. The use of these 'forever chemicals' NEEDS to be banned NOW!

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. Sandra Przybylski (Doc. #2876, SBC-046865)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible. Again, these limits on 6 PFAS in our drinking water are long overdue.

Thank you for your time.

Sincerely,

Sandra Przybylski

Kirksville, MO 63501

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ken Kurtz (Doc. #2877, SBC-046597)

Dear Michael Regan,

I want to express my gratitude for your initiative in addressing the regulation of PFAS in drinking water. The contamination of drinking water supplies with PFAS has been an ongoing issue for many years, affecting countless individuals nationwide. It is alarming to see the increased rates of cancer, developmental and reproductive harm, and other serious diseases linked to these toxic chemicals.

The proposed drinking water standards by the EPA are crucial and long overdue. They offer much-needed protections against six of the most harmful PFAS compounds. I wholeheartedly support these standards and strongly urge the EPA to finalize them as swiftly as possible.

PFAS, often referred to as "forever chemicals," pose significant and long-lasting dangers. They persist in the environment, accumulate in our bodies, and continue to cause harm even decades after their release. It is distressing to note that approximately 200 million people have been affected by PFAS-contaminated drinking water, and nearly every individual in the United States carries these chemicals in their blood, including unborn babies exposed in utero.

Despite the clear health risks associated with PFAS, there are currently no federal limits on their levels in drinking water. This situation needs to change.

The EPA's proposed rule has the potential to provide safer drinking water for communities across the nation. By setting strong limits on the six most commonly found PFAS compounds, this proposal could save thousands of lives and prevent tens of thousands of PFAS-related illnesses each year. Moreover, the EPA acknowledges the cumulative impacts on communities exposed to multiple PFAS, showing a commitment to addressing this issue comprehensively.

I implore you to swiftly finalize these standards, ensuring they are the most health-protective measures possible. Let us not allow industry interests to weaken these critical rules. Together, we can make a significant difference in safeguarding the well-being of communities and future generations.

Sincerely,

Ken Kurtz

Carl B. and Pamela Lechner (Doc. #2881, SBC-046893)

Dear Michael Regan,

We appreciate your early efforts to date to regulate PFAS in drinking water. We know that for decades, PFAS have contaminated drinking water across the country. This abuse has resulted in increased rates of cancer, developmental and reproductive harm and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. These "forever chemicals," (PFAS) persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We ask you to finalize these standards as soon as possible and to implement a rule that is the most health-protective possible that will resist industry's efforts to weaken them.

Sincerely,

Carl B. and Pamela Lechner

Brian Levo (Doc. #2883, SBC-046868)

Dear Michael Regan,

Greetings. Thank you for taking the first step to regulate PFAS in drinking water. I is my understanding that EPA's proposed drinking water standards would provide important and long overdue protections against toxic chemicals, or PFAS, which for decades, have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

Based on my research, PFAS are a large, long-lasting, and highly dangerous class of chemicals , often called "forever chemicals." PFAS, which persist in the environment, build up in our blood

and organs, and continue to cause harm decades after they are released into the environment. Unfortunately, despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

I believe EPA's proposed rule would provide safer drinking water for communities by establishing strong limits on six widely detected PFAS. In addition, the proposal would save lives and prevent serious PFAS-related illnesses each year. It has been reported that the EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap. I please urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Thank you for your consideration in this matter.

Sincerely,

Brian Levo

Falls Church, VA 22044

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Tepe (Doc. #2884, SBC-046494)

Dear Michael Regan,

Thank you for doing something to regulate PFAs in our drinking water. These are terrible chemicals that get into our bodies through water and can persist forever. We need to limit these in our drinking water so that our children and families are safer. We need to establish limits at the federal level so that all states take this seriously and implement these changes consistently nationwide. Please get these finalized as soon as possible, as they are so important to families everywhere.

Thank you,

Sharon Tepe

Sincerely,

Sharon Tepe

Union, KY 41091

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

M. Lou Christ (Doc. #2885, SBC-046523)

Dear Michael Regan,

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. This is unacceptable.

So thank you for finally acknowledging & addressing the cumulative impacts on communities exposed to multiple PFAS, and for issuing this proposal, this first step to regulate six widely-detected PFAS in drinking water.

I urge you to quickly finalize these standards and to implement a rule that is the most health-protective as well as strong enforcement coverage-- regardless of industry's efforts to weaken or ignore them.

Sincerely,

m lou christ

Seattle, WA 98103

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carolynn Kohout (Doc. #2887, SBC-046869)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

For decades,

PFAS have contaminated drinking water supplies

- for millions of people across the country, resulting in

- increased rates of cancer,

- developmental and reproductive harm, and

- other serious diseases.

EPA's proposed drinking water standards

- would provide important and long overdue protections

- against six of these toxic chemicals.

We strongly support the proposed standards.

We urge EPA to finalize them

- as quickly as possible!

PFAS are

1. a large, long-lasting, and highly dangerous class of chemicals

- "forever chemicals".

2. build up in our blood and organs and

-** continue to cause harm decades AFTER they are released into the environment**.

3. have contaminated

- drinking water supplies

- for approximately 200 million people and

4. contaminated the blood of nearly every individual

- in the United States,

- including newborn babies EXPOSED in-utero.

Despite the serious health risks associated with PFAS,

there are currently no federal limits

- on PFAS levels in drinking water.

EPA's proposed rule

- would provide safer drinking water

- for communities from coast to coast.

Strong limits on six widely detected PFAS,

would

- save thousands of lives and

- prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA acknowledges and addresses the cumulative impacts

- on communities

- who are exposed to multiple PFAS.

By issuing this proposal,

EPA is one step closer to fulfilling its commitment

- under the 2021 PFAS Strategic Roadmap

- to begin regulating PFAS in drinking water.

Quickly finalize these standards and implement a rule

- the most health-protective,

- resisting industry's efforts to weaken them.

Sincerely,

Carolynn Kohout

Hillsboro, OR 97124

earthwindspirit9@gmail.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Lynch (Doc. #2888, SBC-046675)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

What can be more important than drinking water which every child learns early in life is necessary for all life. Water as it was meant to be before pollution!

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Katherine Scott (Doc. #2889, SBC-047271)

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

I live in Rockland County, New York, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells – unless the draft EPA regulations are passed.

Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jeff Golliher (Doc. #2890, SBC-046331)

Rockland County and the State of New York should take strong and decisive action to protect people and ecosystems from PFAS contamination in water. Regulations must be effective and strongly enforced. This must be done immediately.

EPA Response: The EPA acknowledges this comment in general support of a final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Louis Pisha (Doc. #2891, SBC-047618)

I live in Rockland County, NY, which has been finding levels of PFAS in our drinking water wells, some at hundreds or thousands of times higher than EPA proposed limits. My neighbor died of kidney cancer, and we now find that kidney and testicular cancers are among the impacts of these forever chemicals.

Therefore, I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michael Parietti (Doc. #2892, SBC-047630)

Lets not wait to find out decades down the road that PFAS have been poisoning people in many more ways than one. It is common sense that these industrial chemicals are detrimental to our water sources and potentially toxic and carcinogenic to human health. Don't allow private entities to take priority over the public interests in the name of easy and excessive profits. Enact these essential protections now so we have confidence in the purity of our water supply and the ability of our democratic system of government to strike the prudent and proper balance between the demand of industry and the common good.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Hayes-Tripp (Doc. #2893, SBC-047509)

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Susan Hayes-Tripp

Placerville, CA 95667

iloathecomputers@comcast.net

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dwight Johnson (Doc. #2894, SBC-046870)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

I urge you to quickly finalize these regulatory standards, and to implement rules that are most health-protective and to resist industry's efforts to weaken them.

Sincerely,

Dwight Johnson

Orinda, CA 94563

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Golden (Doc. #2895, SBC-046416)

Why should we-who pay whopping water rates to poison our children and grandchildren??

Have the EPA clean this horrible situation up. If the AR 25s don't get our kids the poisonous water will.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Tkacz (Doc. #2896, SBC-046442)

Dear Michael Regan,

We must regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important protections against six of these toxic chemicals and provide safer drinking water.

Please finalize these standards.

Sincerely,

sharon tkacz

Novelty, OH 44072

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James Ward (Doc. #2897, SBC-046607)

I am writing to you as a citizen concerned about the health effects of the group of chemicals known as PFAS. Their presence in our environment is pervasive and the negative health impacts are well documented. The general population is relatively unaware of this problem and continue to purchase products containing these chemicals often without knowing their hazards. There is also little to no recycling of PFAS and they don't breakdown in nature, therefore they remain in the environment virtually forever.

The first products containing PFAS were developed about eighty years ago. Now they are ubiquitous in the environment with little to no regulation. Companies have convinced consumers to purchase sports bras containing stain resistant PFAS despite their connection to birth related problems. Fire retardant foams containing PFAS are used at airports and seep into ground water. Fish and game in those areas are considered too toxic for human consumption. Food wraps and coatings containing PFAS are linked to high levels of cancer and other diseases. These are just a few examples of how the lack of regulation of PFAS is affecting our environment and human life.

I applaud the EPA for reaching out for comments on clean water standards. You are the only hope we have of protecting us from ourselves. In a perfect world those standards for PFAS in our drinking water would be zero. The larger issue is why we are still allowing the sale of products containing PFAS? Despite what the chemical industry claims, alternative safer solutions could be used in most cases and those that are truly essential should be tightly controlled. It could be part of a nationwide recycling program which our country badly needs. We need to control these chemicals at the frontend of their lifecycle and not just attempt to clean up their mess at the backend.

The second issue is who should pay for the clean up? If you developed the product or sold products containing PFAS without provision for containment, safety and efficacy, then you should bear the brunt of cost of cleanup. Local water departments or the taxpayers should not have to bear all those costs.

Other issues include education of the public. Many people don't read or don't watch news that covers issues such as PFAS contamination. A public campaign to educate people about PFAS and product labeling requirements that identify the presence and danger of PFAS in products is necessary. Water companies should publish PFAS content levels in their water. Funding should also be made available for new technologies to remove PFAS from our water.

The challenges you face are enormous. Those who should be held accountable have made a lot of money selling PFAS products and they can buy a lot of politicians to fight their battles. We spend a trillion dollars on finding cures for cancer and yet we know there is a link between PFAS and cancer and we won't regulate it! It would be insane to just set a weak standard for clean water quality as proposed and do nothing to prevent future contamination.

To summarize, (1) regulate all products containing PFAS family chemicals, (2) make polluters pay, (3) educate, disclose and label PFAS in products and (4) set clean water standards at zero with flexibility as practicable. In the real world reaching zero is improbable, but if you don't try for it you'll never come close.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the concern for educating the public on PFAS, please see section 1.2 of the EPA response in this *Response to Comments* document for additional discussion. For specific concerns on treatment, please see section 10 of the EPA response in this *Response to Comments* document. For the commenter's requests to "regulate all products containing PFAS family chemicals; make polluters pay; and educate, disclose and label PFAS in products", please see section 15 of the EPA response in this *Response to Comments* document for topics out of scope of this rulemaking.

Anya Contreras (Doc. #2898, SBC-046530)

Dear Michael Regan,

As you know, PFAS are a large, long-lasting, and highly dangerous class of "forever chemicals" that bioaccumulate in the tissues of living beings and cause harm decades after they are released into the environment.

PFAS have contaminated drinking water for over 200 million people resulting in increased rates of cancer, developmental and reproductive harm, and other life-threatening diseases. Despite the serious health risks associated with PFAS, there are currently no federal limits on levels of PFAS in drinking water.

The EPA's proposed limits on six widely detected PFAS would save thousands of lives and prevent tens of thousands of illnesses each year. We urge you to quickly finalize these standards, and implement aggressive health-protective policies, resisting industry's efforts to weaken human and environmental protections.

Sincerely,

Anya Contreras

Miami, FL 33176

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Virginia Cole (Doc. #2899, SBC-046247)

As a social worker in the health care system, I urge the EPA to adopt the Docket ID: EPA-HQ-OW-2022-0114 reducing these harmful carcinogens from our water supply. This will save many lives and and be a boon to our economy and public health.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sally Small (Doc. #2901, SBC-046871)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Sally Small

Indianapolis, IN 46219

sallyasmall@att.net

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Keith Lewison (Doc. #2902, SBC-047654)

I live on Cape Cod, MA where before 2016 the Hyannis public drinking water system had the highest PFAS levels of any in the state of MA. This was due to legacy toxic contamination from a county fire fighter training center and airport. A second major hot spot for PFAS in my region is located "downstream" from Joint Base Cape Cod. MA DEP instituted a drinking water mcl for 6 PFAS chemicals in 2020. Since then more and more towns are finding PFAS in regional drinking water supplies. Much tax payer / rate payer funds have been put into adding filtration systems. However, source areas have not been adequately cleaned up / addressed. This means that toxic PFAS are continuing to migrate through ground and surface waters affecting fish, shellfish, private drinking water wells, etc. The EPA's proposed drinking water limits on PFAS make Americans safer and healthier.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-

saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Commerford (Doc. #2903, SBC-046528)

Dear Michael Regan,

No conceivable cost-benefit analysis could result in the PFAS pollution plaguing the world. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. Consequently, I strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water by establishing strong limits on six widely detected PFAS. The proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. Please finalize the rule as expeditiously as possible.

Sincerely,

John Commerford

Phoenix, AZ 85004

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joanne Szamreta (Doc. #2904, SBC-047198)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

All Americans need to be drinking safe water, the foundation for all our lives. Children are particularly at high risk. for toxic substances and this makes elimination of PFAS i drinking water especially important!

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Janet Alderton (Doc. #2905, SBC-047199)

Dear Administrator Regan:

A friend of mine who lives on San Juan Island has recently learned that her community well is contaminated with PFAS at a 10x higher level than the worst previously known contaminated water supplies in Washington State.

Immediate action is needed to avoid continuing to contaminate our environment with PFAS chemicals. All variants of PFAS must be immediately banned from production and removed from supply chains.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rosemarie SantiEsteban (Doc. #2906, SBC-046429)

Round up and other PFAS have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. And every day, millions of people across the country drink water contaminated with PFAS. Please ban their use.

Thank you.

EPA Response: The commenter requests EPA ban the use of PFAS. The EPA notes that request is outside the scope of this PFAS NPDWR. For topics outside the scope of this rule, please see section X of the *Response to Comments* document. Also, please see section 1.3 of the EPA response in this *Response to Comments* document.

Cheryl Citron (Doc. #2907, SBC-046547)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a first step to protecting our families and communities from harmful PFAS, known as "forever chemicals". .

PFAS are persistent (forever) and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.It is a start for our country to have safer water. We want it for my husband and I, but also for our daughter and our young grandson Jack. We want it for everyone else's mother, father, grandparents, children and grandchildren. Thank you,

Cheryl and Andy Citron

Raleigh, NC

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

R. Carbon (Doc. #2908, SBC-047200)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the deleterious effects of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to many serious health conditions, including cancers, immune suppression, and developmental harm.

The EPA's proposed rule would help provide safer drinking water to the millions of people in communities across the USA where the drinking water is contaminated by PFAS. This proposal could save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I am writing to urge you to finalize the regulations of these six initial PFAS chemicals as swiftly as possible, implement a rule that is health protective, and then begin supporting the research to address additional types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Cremo (Doc. #2909, SBC-047201)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. The US needs to catch up to other countries that have banned these dangerous chemicals and protect the health of its citizens.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barry Fass-Holmes (Doc. #2910, SBC-046238)

I strongly urge you to quickly finalize regulations of the six highly toxic PFAS chemicals found in drinking water, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathryn Fox (Doc. #2911, SBC-047202)

Dear Administrator Regan:

I'm one of those people who have suffered from the effects of carcinogens in our environment. I see many many people at the treatment centers suffering needlessly because we can't seem to clean up our air, water and food. This is another pollutant that there needs to be an alternative to. When it comes down to affecting loved ones or yourself, it really brings the problem home.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alan Solomon (Doc. #2912, SBC-047203)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

My name is Alan Solomon. I live in southern California.

I completely agree with and strongly support the above statement/petition today and for many years and generations to come.

Thank you for your time Today.

Alan Solomon

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julie Glover (Doc. #2913, SBC-047204)

Dear Administrator Regan:

PLEASE FINALIZE the regulations AGAINST six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome FIRST step to protecting our families and communities from the scourge of PFAS.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. AS YOUR CONSTITUENT, I'M ASKING YOU TO DO SOMETHING ABOUT THIS!!!!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Derek Benedict (Doc. #2914, SBC-047205)

Dear Administrator Regan:

How long is too long before we take stringent measures on ensuring that our next generation has a healthy environment to grow up in? We've known the science for over five decades, but very little has been done to make our country cleaner for our children.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Saundra Hodges (Doc. #2915, SBC-047206)

Dear Administrator Regan:

it is unfathomable that water, that is so vital to our survival is not yet subject to appropriate controls. A sincerely appreciate the action taken by the EPA to address the insufficient scrutiny that has been applied to PFAS. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mel Ginsberg (Doc. #2916, SBC-047207)

Dear Administrator Regan:

I urge you to support the strongest regulations possible to protect us from PFAS chemicals.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Richard Swartz (Doc. #2917, SBC-047208)

Dear Administrator Regan:

We drink a lot of water, water that makes up a considerable portion of our body's weight. Now, water is increasingly contaminated by chemicals WE have allowed to infiltrate our aquifers. Stopping now would not magically "cleanse" our most important liquid, but would limit the extent of the pollution - which will otherwise continue to grow. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karen Mallam (Doc. #2918, SBC-047209)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I am particularly concerned as I live in NC, where most of our water has been found to contain PFAS. I've already had thyroid cancer and had to have my thyroid removed.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Williams (Doc. #2919, SBC-046186)

Forever affected. No escape.

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Hille (Doc. #2920, SBC-047210)

Dear Administrator Regan:

Considering all the chemicals that saturate our communities getting the worst ones out of the environment or at least preventing more from entering would help reduce disease and illness.

Rather than just limiting to 6 PFAS chemicals perhaps banning whole classes of them so there are fewer to contend with would make controlling them easier. Don't let industry control you.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dawn Williams (Doc. #2921, SBC-047211)

Dear Administrator Regan:

We are ALL affected. Please do everything you can to get rid of the PFAs in our drinking water. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Louan Fisher (Doc. #2922, SBC-047212)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

As my husband and I age we moved from our rural home and delicious well water to a development with water coming from a water treatment plant. We are concerned with ALL of the chemicals we are tasting in our water now and concerned about those we can't taste. PFAS are dangerous compounds that must be regulated now to keep us and our grandchildren safe! Please do what's right and require companies to reduce the use of PFAS and to disclose the amount of PFAS in their products.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dion Duckett (Doc. #2923, SBC-047213)

Dear Administrator Regan:

We NEED EPA's proposed national drinking water regulations for six PFAS chemicals NOW.

It is a welcome first step to protecting our families and communities from the scourge of PFAS - infamous for their extreme persistence, widespread pollution and linked to cancer, immune suppression, and developmental harm.

Well Fracking Chemicals MUST BE NEXT! We are literally pumping PFAS into our water supply.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carmen Rodriguez (Doc. #2924, SBC-047214)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and also widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thank you and thank you for reading -------- this.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynne Grifo (Doc. #2925, SBC-047215)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is an essential and welcome first step to protecting our families and communities from the scourge of PFAS.

As I have been learning from many reputable scientific sources over the past several months, PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. I am old and so I worry most about the exposure of children and youth over their lifetimes.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melinda Merryfield-Becker (Doc. #2926, SBC-047216)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I spent my career working to protect groundwater in managerial roles at The Ohio EPA and the Los Angeles Regional Water Quality Control Board, and later lived in Minnesota where multiple municipal drinking water wells were closed because of PFAS contamination. We cannot afford to write off these important drinking water supplies, nor should we turn a bind eye to the potential health impacts of drinking water with lower concentrations of PFAS contaminants. The persistence of these pollutants is such that the only way to address future concerns is to prohibit manufacturing.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dianne McCauley (Doc. #2929, SBC-047217)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

In conclusion, I honestly cannot believe that I have to send this letter in the 21st century to a first world country. For decades we have known the dangers of PFAS and yet, I still have to write a letter begging the government to fix the problem. This is embarrassing, disgraceful, and shameful!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Leslie Leslie (Doc. #2930, SBC-047218)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.please do the right thing. We have such a huge body burden to carry into the future ! Please help us have healthy children and a healthy planet.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mara Factor (Doc. #2931, SBC-047219)

Dear Administrator Regan:

I live near the Woburn, MA superfund site featured in the 1998 movie "A Civil Action". While the area has gone through mitigation, not all of the contaminated materials can or have been removed so we do occasionally have high levels of unhealthy chemicals in our water.

Preventing the contamination to begin with would have eliminated the need for very expensive mitigation.

Let's learn from the past...

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Imagine how much easier and less expensive preventing PFAS contamination would be than to mitigate it in the future.

Thank you

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Emily Jennings (Doc. #2932, SBC-047220)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

PFAS chemicals are an issue where I live in Michigan. Our drinking water meets current EPA standards, but those standards are too low. My partner and I have a filter on our sink to remove them, which shouldn't be necessary. Not everyone can afford a filter. Clean water should be free for everyone.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hallie Bulleit (Doc. #2933, SBC-046492)

Dear Administrator Regan:

I am writing today to express my concern about PFAS in drinking water. I was encouraged to hear about the EPA's proposal for new national drinking water regulations for six PFAS chemicals, PFAS are already lurking in so many of the products we use & clothes we wear; Americans should not be worried about ingesting these disease-causing chemicals in our water.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judith Porter (Doc. #2934, SBC-047221)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for millions in communities where drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joshua Kneidl (Doc. #2935, SBC-047222)

Dear Administrator Regan:

Thank you for proposing national drinking water regulations for several of the "forever" PFAS chemicals. They are an invisible scourge to public health.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kenneth Owens (Doc. #2936, SBC-047223)

Dear Administrator Regan:

I welcome the EPA's proposed national drinking water regulations for six PFAS chemicals as a first step to protecting consumers from PFAS.

PFAS are infamous for their extreme persistence and widespread presence in drinking water. They're linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would improve drinking water quality for millions of people in communities across the U.S. where PFAS.contamination is present. This proposal, if implemented, would prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations for six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Donna Wilson (Doc. #2937, SBC-047224)

Dear Administrator Regan:

Please stop letting companies poison us. Companies should have to prove a substance is safe before they can use it. Poisoning everyone and everything and than banning it (while better than nothing) really is ridiculous

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2938, SBC-046274)

I am writing in strong support of the proposed PFAS drinking water regulations. These regulations will prevent a great deal of human suffering and death. In addition, even a cost-benefit analysis that--by its own admission--underestimates or fails to monetize many of the benefits of these regulations, finds positive net benefits at a reasonable discount rate. Passing this regulation is a no brainer.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Eric Thompson (Doc. #2939, SBC-047225)

Dear Administrator Regan:

The idea that dangerous chemicals that are extremely resistant to breakdown should be released into our environment strikes me as a very questionable practice. Anything that is proven harmful to life should not be even allowed to be produced. The fact that this harm could last longer than we will makes that fact even more critical.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jim Powell (Doc. #2940, SBC-046439)

Dear Administrator Regan:

Your agency's proposed national drinking water regulations for six PFAS chemicals are a great start for protecting everyone from PFAS.

Please finalize the regulations as soon as possible so we can start getting rid of these and other PFAS.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kenneth Dunn (Doc. #2941, SBC-047226)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sheryl Kerby (Doc. #2942, SBC-047227)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

It should not be too hard to invent something that neutralizes the PFA's as we are the most intelligent nation in the world but it begs the question, how much will it cost? Answer: What price do you put on Human Life? Perhaps your own lives and those of your loved ones? Look beyond the money and look toward the future.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Benita Coffey (Doc. #2943, SBC-047228)

Dear Administrator Regan:

What we take into our bodies makes a difference...a huge difference to our health.. Please pay close attention to what follows and represent us , the common people who count on your service.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia LeBeau (Doc. #2944, SBC-047229)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Keep chemicals out of our drinking water except fluorine which strengthens teeth and those that protect us from harmful bacteria or viruses.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amy Vanderbilt (Doc. #2945, SBC-047230)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I respectfully urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS - AND - require manufacturers to begin listing all forms of PFAS and similar "forever chemicals" in their production and products.

The EPAs groundbreaking new regulations on six highly toxic PFAS chemicals found in drinking water is a crucial first step toward tackling this massive public health crisis – but we need the EPA to do more to protect against PFAS.

Unfortunately, PFAS are almost impossible to avoid. They are found in our homes, our offices, our supermarkets, our toiletries and cosmetics – practically everywhere! What's worse, manufacturers don't have to disclose to consumers that they're using them. It needs to stop!!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Commission (Doc. #2946, SBC-046559)

The Environmental Protection Agency (EPA) is committed to using and advancing the best available science to tackle per- and polyfluoroalkyl substances (PFAS) pollution, protect public health... you mean your committed to forcing other people against their will to tackle the supposed problem.

Just because a person in St Paul Minnesota area gets liver cancer in an area of elevated PFAS in the drinking water does not mean there is a connection between the water and the cancer. Thousands of others ingested the same water without getting the same cancer and thus common sense would say it is not from the PFAS.

99 percent of the water delivered to the customers is not ingested so it should not need to be treated for PFAS at the water utility but it should be the customers responsibility to remove it if the levels are deemed to be uncomfortable for them. The cost to remove the PFAS chemicals far exceeds the provable benefit and EPA is charged under the safe drinking water act with considering this.

The EPA is unconstitutional and should not be protecting public health. The EPA is a political weapon of the tyrants with an agenda that is not based on science or truth. EPA has twisted the definition of science and many other words.

EPA Response: Generally, please see section 1.3 of the EPA response in this *Response to Comments* document.

The EPA disagrees with this comment. First, the comment states that the commenter believes there is a general question about whether PFAS exposure in drinking water is linked to cancer. The EPA disagrees with this statement. The EPA has shown that the best available science supports the regulation of six PFAS, taking into consideration toxic effects as well as feasibility. The EPA has considered PFAS health effects information, evidence supporting dose-additive health effects from co-occurring PFAS, as well as national and state data for the levels of multiple PFAS in finished drinking water. Current scientific research and available evidence have shown the potential for harmful human health effects after being exposed to some PFAS. Drinking water is one of several ways people can be exposed to PFAS, as seen in drinking water data, and can be found together and in varying combinations as mixtures. Please see the PFAS NPDWR FRN for continued explanation of how the PFAS NPDWR meets statutory requirements and fulfills SDWA's purpose to protect public health by addressing contaminants in the nation's public water systems. For additional information specifically regarding health effects of PFAS, please see the Toxicity Assessments in the supporting documents.

Second, the commenter makes statements about the percentage of "water delivered to the customers [that] is not ingested" but not does not cite or provide underlying data or rationale for this factual assertion. Therefore, EPA is unable to respond to this part of the comment due to insufficient information provided by the commenter.

Third, the commenter states that the cost to remove PFAS exceeds the benefits. EPA disagrees with this statement. In the PFAS NPDWR FRN, the EPA provides how the agency has effectively evaluated the benefits and costs of the rulemaking as specified under the SDWA HRRCA requirements and the EPA Administrator has determined that the benefits of the NPDWR justify the costs. Please see section 13 of the EPA response in this *Response to Comments* document for additional discussion on the EPA's benefit and cost analysis. For those reasons, the EPA disagrees with the commenter's statement because the EPA determined that the benefits of the PFAS NPDWR justify the costs as required by the SDWA. Also, the EPA notes that the commenter does not cite or provide underlying data or rationale to support this statement.

Lastly, for topics outside the scope of this PFAS NPDWR, such as the commentors opinions of the agency, please see section 15 of the EPA response in this *Response to Comments* document.

Sarah Prados (Doc. #2947, SBC-046872)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Sarah Prados

Nokesville, VA 20181

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julio Navarro (Doc. #2949, SBC-047231)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. This idea is reinforced by Dr. R. Vogl in his book, Principle of Ecological Principles, " Water is a key or limiting factor in the occurrence and distribution of organisms and ecosystems in soil, air and water" Dr. R. Vogl, Primer of Ecological Principles. 2014. What this represents is the fact that water is the important contributor to your well being, apart from warmth. Therefore this regulation would be directly benefiting not only our generation but the children of our children.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Henson (Doc. #2950, SBC-047232)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. These illnesses and their causes are insidious, and their causation by PFAS are difficult to document. Yet scientific evidence supports the discovered chain of evidence. And would be extremely difficult to provide post-release remediation over large populations. So we must rely on preventing their release into our potable water sources.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the commenter regarding the scientific evidence for PFAS causation and illnesses, the EPA notes that it has considered PFAS health effects information, evidence supporting dose-additive health effects from co-occurring PFAS, as well as national and state data for the levels of multiple PFAS in finished drinking water. Current scientific research and available evidence have shown the potential for harmful human health effects after being exposed to some PFAS. Drinking water is one of several ways people can be exposed to PFAS, as seen in drinking water data, and can be found together and in varying combinations as mixtures. To clarify, this PFAS NPDWR is for removing PFAS in drinking water, and this rule does not regulate the release of PFAS into drinking water sources.

Mark Steuer (Doc. #2951, SBC-046509)

Dear Administrator Regan:

I support EPA's proposal to protect national drinking water supplies for six PFAS chemicals as a step toward protecting our communities from these persistent and harmful chemicals, which are linked to a litany of harmful health and environmental effects.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Matthew Explosion (Doc. #2952, SBC-047233)

Dear Administrator Regan,

Yeah okay so the message below is the canned NRDC message about PFAS, but I read and agree with everything here. We need the government's help to protect our selves and our families from these chemicals which, by all accounts, are quite dangerous. Given how long they take to break down, the longer we wait, the more danger we'll be in.

Thanks,

-Matt

NRDC message:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thanks,

-Matt

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jean Schulz (Doc. #2953, SBC-047234)

Dear Administrator Regan:

I live in a state and a county that has open meetings of the Board of Public Utilities.

For over 2 years I monitored this Board for our chapter of The League of Women Voters. Because the meetings were open to the public, I, and any other citizen, could hear and see what was going on, what decisions were being made and how they were being paid for.

That does not happen in many states and counties. The EPA MUST oversee its regulations and standards in those areas where citizens do not know their areas may be harmed by regulators trying to save money at the citizens expense. (or maybe through ignorance.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynne Atherton-Dat (Doc. #2954, SBC-047235)

Dear Administrator Regan:

We, the American Public, count on you to protect us from dangerous chemicals that shorten our lives and/or sicken us.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome First step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hannah Lee (Doc. #2955, SBC-047236)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

All over Wisconsin city wells have had to be shutdown due to PFA pollution. Here in Madison, which prides itself on its beautiful four lakes, beaches can't open because the water is unswimmable due to PFAS. Fish from these lakes aren't safe to eat. And Madison is relatively clean compared to other cities in Wisconsin; ALL the wells in Wausau have been shut down!

This cannot continue. We are being poisoned by polluters, huge among them the U.S. Military.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Betty Merten (Doc. #2956, SBC-046489)

Dear Administrator Regan:

I'm writing in strong support of the EPA's proposed national drinking water regulations for six PFAS chemicals, an overdue first step toward making our water safe to drink.

As you know, PFAS have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm, and they persist!

I urge you to finalize without delay the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Betty A. Merten

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Georgia Hickson (Doc. #2957, SBC-047237)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I have been able to smell the chlorine the our city has added to our water. It is effecting my family. We have dry skin, dry hair, etc. I can't imagine what it is doing to our bodies. Our animals drink it all day long and it is harmful to them as well.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Seiden (Doc. #2958, SBC-047238)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fritz Stumpges (Doc. #2959, SBC-047239)

Dear Administrator Regan:

I'm VP of a small water company and am trying to get our water test schedule to include Phthalates. So far it's not required. We had to install two huge "rubber bladders" lining our reservoirs to protect from animal bacteria but I worry about the Phthalates more! Glad we don't have PFAS! Please help with both of these regulations.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joshua Hassol (Doc. #2961, SBC-047240)

Dear Administrator Regan:

Even in today's divisive political climate, clean, safe drinking water should be something everyone can agree is important.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to implement new rules to control and eliminate PFAS in our water.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fred Cressman (Doc. #2962, SBC-047241)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. The only way to do this is to ban PFAS. We banned DDT because of birds, we can ban PFAS because of people!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Fitzgerald (Doc. #2963, SBC-047242)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I also urge you to require statea to report on the extent of PFAS contamination of all lands and waters by using a selective sampling method and tracking.

Please also report this year on your potential options for trade controls and liability and recovery from mfgrs as well as options if the US were to Ratify the treaties addressing such hazardous materials.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Blythe Clark-McKitrick (Doc. #2964, SBC-046873)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Blythe Clark-McKitrick

Portland, OR 97214

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gena Cline (Doc. #2965, SBC-046874)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Jennifer Russell (Doc. #2970, SBC-046459)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country.

Please finalize them as quickly as possible so our drinking water is safe from these dangerous chemicals.

Sincerely,

Jennifer Russell

Walnut Creek, CA 94595

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Campbell (Doc. #2971, SBC-046894)

Dear Michael Regan,

I'm grateful to you for having both the foresight and courage to take this first step in regulating dangerous PFAS in our drinking water!

We've known for decades that PFAS poison drinking water.

And the result is devastating.

Millions of Americans have increased rates of cancer, developmental and reproductive harm, and other serious diseases. THIS is why your actions are so vital.

EPA's proposed drinking water standards will give critical, long overdue protections against six of these toxic chemicals.

I STRONGLY SUPPORT THE PROPOSED STANDARDS.

I ALSO URGE EPA TO FINALIZE THEM ASAP.

PFAS are a large, long-lasting, and highly dangerous class of chemicals.

They're called "forever chemicals" for a very good reason!

PFAS stay in the environment for hundreds of years, build up in our blood and organs, and keep causing harm decades after they are released into the environment.

They have:

-- contaminated drinking water for approximately 200 million people

-- contaminated the blood of nearly every person in the United States, including newborn babies who are exposed in utero.

But in spite the serious health risks created by PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule will:

-- guarantee safer drinking water for communities from coast to coast

-- save thousands of lives

-- prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA has acknowledged the cumulative impacts on the millions who have been exposed to multiple PFAS.

By issuing this proposal, EPA is one step closer to fulfilling its commitment to start regulating PFAS in drinking water -- a commitment made under the 2021 PFAS Strategic Roadmap.

I URGE YOU -- MOVE QUICKLY TO:

1. finalize these standards

2. implement a rule that is the most health-protective

3. resist industry's efforts to weaken the standards.

Sincerely,

Nancy Campbell

Kansas City, MO 64112

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sara Roderer (Doc. #2972, SBC-046883)

Dear Michael Regan,

As a rural senior citizen voter and ardent supporter and defender of our planet and anything that harms or damages humans, animals, our land, air or water. Please continue the fight to regulate PFAS in our drinking water. Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Helene Zera (Doc. #2974, SBC-046476)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. And thank you for not stopping there!

You have a tough job fighting against wealthy and entrenched capitalist interests. But wouldn't it be deeply significant and appreciated if you could actually take a stand against them to purify our water supply and thereby save lives?!

Best Wishes,

Helene

Sincerely,

Helene Zera

New York, NY 10011

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pamela Weaver (Doc. #2975, SBC-046881)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

The time to act is now! Please move as quickly as possible on this. For years we have known that many lakes, gravel pits and people's wells have been contaminated around Fairbanks, North Pole and Salcha. And please, do not allow north slope drillers in Alaska be allowed to continue using these chemicals.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Pamela Weaver

Fairbanks, AK 99709

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gregory Grant (Doc. #2976, SBC-047667)

Our (The People's, not industry's) EPA needs to be stopping this pollution from the noted 6 PFAS chemicals and much, much more to protect everyone's health from the polluters. The polluters will not and, indeed, cannot voluntarily accomplish this on their own, since any one polluter acting on its own would simply be putting themselves out of business, to be replaced by some other business/source that has done nothing to avoid polluting our water.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melissa Carlson (Doc. #2977, SBC-046879)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

FOREVER IS TOO LONG FOR A DANGEROUS CHEMICAL TO LAST IN DRINKING WATER. PLEASE FINALIZE THE STANDARDS QUICKLY. THERE IS NO NEED TO DUMB DOWN AND SICKEN THE HUMAN POPULATION, FOR SHORT TERM PROFIT OF A VERY FEW.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Melissa Carlson

Rochester, NY 14610

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diego Carrasco (Doc. #2978, SBC-047312)

The Environmental Protection Agency (EPA) is requesting the public's input on the proposed rule about rules regulating six PFAS also known as chemicals that have been found to be harmful to humans since the 1940s. I think that the proposed rule for requiring the state and city public water systems to monitor these PFAS and notify the public when the levels of drinking water exceed the proposed standard is an excellent proposal that should have been created a long time ago. Giving the public access to the PFAS analytic tool will be very beneficial because it gives individuals information to make their own decisions. Governmental agencies should use this situation with the PFAS as a template for what should be done every time a chemical compound such as PFAS is created. This would allow them to have more control over the regulations and have updated data readily available for the citizens of this country.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

K Danowski (Doc. #2979, SBC-046546)

I urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this contamination and keep countless Americans safe from enduring the health risks associated with these dangerous substances.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in humans, wildlife, aquatic life, plants, and our environment. This contamination poses a direct threat to our health and our ecosystems. PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive problems, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless Americans.

I urge your support for these badly-needed regulations to better protect humans and our rivers, oceans, lakes, and wildlife from PFAS contamination.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Timothy Bardell (Doc. #2980, SBC-046880)

Dear Michael Regan,

I live in Minnesota, not far from the large plume of PFAS in ground water contaminated by 3M. It amazes me that we continue to allow corporations to introduce a new chemical into our environment, and eventually our bodies, without first proving that it is safe.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every

individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Timothy Bardell

Minneapolis, MN 55416

Kathryn Wild (Doc. #2981, SBC-046903)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water and continuing to resist big industry's efforts to elevate profit over the heath of our blue planet.

Respectfully

Sincerely,

Kathryn Wild

San Diego, CA 92126

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Debra Dunson (Doc. #2982, SBC-046904)

Dear Michael Regan,

I am an organic chemist who is concerned about hazardous PFAS chemicals in our environment. I fully support the EPA's proposal to set concentration limits for PFAS in drinking water. 3M,

the world's largest manufacturer of PFAS have announced "3M will: Exit all PFAS manufacturing by the end of 2025: 3M will discontinue manufacturing all fluoropolymers, fluorinated fluids, and PFAS-based additive products". This is clear evidence that industry finally acknowledges that PFAS contaminates drinking water supplies of millions of people across the country. Furthermore, due to our exposure over decades of household use, we have ingested and breathed the vapors of these dangerous chemicals. Accumulation of PFASs in the human body has been correlated with the risks of disease and deformities, including various types of cancer and birth defects. Despite the serious health risks from PFAS, the latest EPA proposal is the first to impose federal limits on PFAS levels in drinking water. Please follow through and finalize the rules to institute long overdue protections against six PFAS chemicals found in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Debra Dunson

Spring Hill, TN 37174

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melissa Quesinberry (Doc. #2983, SBC-047669)

Why do we have to ask the EPA to protect the environment and all life forms Keep up with the science and stop protecting corporate polluters and the chemical industry. Companies can adopt a B-corporation model of conscious capitalism or become obsolete. Our very survival and the future depends on how willing and courageous the EPA is to create and hold companies to a higher standard that does not harm ecological systems and life forms. We know have a better understanding of the impact of plastic on our oceans and our bodies. Companies managed to create and sell their products before we created plastic. This is not up for debate. Respect the science, not the dollar bill, and do your damn job!!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-

saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gay Mikelson (Doc. #2984, SBC-046905)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Virginia Lee (Doc. #2987, SBC-046908)

Dear Michael Regan,

I am writing as a

- Utah Republican precinct chair (SLC074),

- biologist (1977 BS Biology, magna cum laude, Phi Beta Kappa, Utah Secondary Teaching Certificate 1977-1992),

- lawyer (1979 JD),

- member of the Union of Concerned Scientists, and

- member of Patriotic Millionaires.

Thank you for taking the first step to regulate PFAS in drinking water.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country.

Contaminated drinking water has resulted in

- increased rates of cancer,

- developmental and reproductive harm, and

-mother serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

We strongly support the proposed standards.

I urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals.

Often called "forever chemicals,"PFAS

- persist in the environment,

- build up in our blood and organs, and

- continue to cause harm decades after they are released into the environment.

PFAS have contaminated drinking water supplies

- for approximately 200 million people,

- and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero.

Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast.

By establishing strong limits on six widely detected PFAS, the proposal would

- save thousands of lives, and

- prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS.

By issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I urge you to quickly finalize these standards.

I urge EPA to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Virginia Lee

Salt Lake City, UT 84105

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lorraine Wilson (Doc. #2988, SBC-046909)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water after decades of contamination resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. Your proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast by establishing strong limits on six widely detected PFAS, saving thousands of lives and preventing tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize these standards and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Lorraine Wilson

Lafayette, CO 80026

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Reimers (Doc. #2989, SBC-046910)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

My cousin in Wilmington, NC, has been directly impacted by PFAS in the water. She had to have a large lump on her throat surgically removed, though she is only middle aged. (PFAS are known to cause thyroid problems.) Her Wilmington friends, also her age, are experiencing similar health threats.

We're talking about parents trying to raise their children.

Please protect families, not polluters.

Sincerely,

Andrea Reimers

Granite Falls, NC 28630

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mike Hobbs (Doc. #2990, SBC-046911)

Dear Michael Regan,

Our forefathers established a government 'of the people, by the people, for the people.' Not just some of the time but at all times. Your agency is the most important of all regulatory bodies. Without a healthy, sustainable ecosystem ALL other issues will not matter. Please protect US from the immoral, unscrupulous practices of the corporations that threaten our very lives.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. mike hobbs

Hanford, CA 93230

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lucinda R. Murphy (Doc. #2991, SBC-046912)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

I am in strong support of your proposed rule to reduce PFAS in drinking water. As a lung cancer survivor I am particularly concerned with the presence of any chemicals likely to cause cancer. Improving the quality of drinking water is an excellent step in the right direction.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Lucinda R Murphy

Baltimore, MD 21214

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Bogart (Doc. #2992, SBC-047243)

Dear Administrator Regan:

We work hard here in Elgin to keep our water clean -- and to keep it available period. Many publications and organizations are currently seeking guidance and assistance with "forever"

chemicals." The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vicki Berglund (Doc. #2994, SBC-047244)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from deadly, persistent PFAS.

I urge you to quickly finalize the regulations of the identified PFAS chemicals and implement a rule that protects the health of citizens and communities.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Norman Norvelle (Doc. #2995, SBC-047671)

I am a retired industrial chemist and a past longtime member of the American Chemical Society. In the last 50 years the number of new materials and compounds we have developed are amazing. But many of these are dangerous to us and the environment. Please develop new limits on these materials and especially on PFAS.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephanie Hysmith (Doc. #2996, SBC-046613)

Dear Assistant Administrator Fox,

It's inconceivable that the SCOTUS found in favor of West Virginia's Attorney General to undermine your authority. Patrick Morrissey has never had the health of our citizens in mind as he does all he can to support industry.

I have been following the history of these forever chemicals since they were first discovered in early 2000s in Parkersburg, WV coming from the DuPont Teflon manufacturing facility. At the time, I lived in Athens County, Ohio, one county north of Meigs whose residents were tested for C8 in their blood and whose health is carefully monitored. It's absolutely shameless that DuPont could get away with this.

My clipping file of newspaper articles includes all the findings and manipulations by DuPont at the time which have been meticulously documented and summarized in more recent articles and dramatized in the film, "Dark Waters."

Now that I'm living in West Virginia, I'm furious that these chemicals are still polluting the drinking water of WV citizens. It's dangerous and unforgivable.

Thank you for the opportunity to comment on the EPA's proposed National Primary Drinking Water Regulation for six per- and polyfluoroalkyl substances (PFAS). I support the EPA's proposal to set strong, science-based drinking water standards and commend the EPA's recognition that both individual PFAS and chemical mixtures of PFAS threaten human health. PFAS-contaminated water has harmed the health of West Virginians for decades; this is a critical and long overdue step to protect our public health.

Again, thank you for the opportunity to add my comments.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Todd Snyder (Doc. #2997, SBC-046614)

I support EPA's plans to regulate and limit harmful PFAS in drinking water and the environment.

Considering the potentially devastating health impacts of PFAS exposure, it is unacceptable for these chemicals to be released into and remain in the environment at unsafe levels (https://salud.to/PFASbm).

While researchers have made strides in destroying PFAS in water, we must address PFAS contamination at the source with enforced regulations, as even undetectable levels of PFAS can pose human health risks including damage to fetal growth and increased cancer risk (https://salud.to/pfasdes).

PFAS affect everyone but may impact some populations more than others. For instance, Latino families are more likely to live in neighborhoods where there is a lack of clean and safe drinking water (https://salud.to/nitrate) and where utility companies have less funding to meet community needs.

Therefore, environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure, such as Latinos. I applaud EPA's proposed plans to regulate and limit PFAS chemicals in drinking water and the environment, which could help ensure a healthier future with less exposure to potentially harmful chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see section 13.4-13.9 of the EPA response in this *Response to Comments* document that outlines the quantifiable and nonquantifiable benefits of this NPDWR that may address the commenter's concern of low levels of PFAS that can pose human health risks. In response to the comment that states that "environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure", as part of its environmental justice analysis for this regulatory action, the EPA evaluated the distribution of baseline PFAS exposure in drinking water across demographic groups. For additional discussion on this topic, please see the EPA's EJ analysis in section 8 of the EA (USEPA, 2024a) and section 14.10 of the EPA response in the *Response to Comments* document.

Laurie Seeman (Doc. #2998, SBC-047279)

These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

·I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals.

I have been aware ir rhis threat since it was first announced and seen the tremendous effort by countless people; citizens, researchers, government officials, organizational leaders to tackle this dilemma and to create a restoration response and pathways for a safe and healthy water and our future. It is more than impressive how cohesive this shared effort has been. And now the the best steps to take are before you, awaiting your vote and support. Please proceed with the proposed plan and begin the wide spread change. This will by virtue of best right action undoubtedly lead to other beneficial actions for human and planetary health going forward.

Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

·Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

·The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

·These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

·There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

·EPA should immediately halt the approval of all new PFAS.

·While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

Thank you for your consideration of my thoughts and concerns. I am hopeful that together we can find the best ways forward.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jacquelyn Drechsler (Doc. #2999, SBC-047280)

We are very concerned about the level of toxic PFA's and PFOA's that contaminate our water here in Rockland County and now have an extra concern regarding the tiny PFA's that escape capture, which we understand are even more dangerous to people.

Industry always seems to find a way around regulations, for instance in creating alternatives to the PFA problem, which creates more problems.We can not allow the industry lobbyist to stop the EPA from instituting strong, strict standards for the health of the public.

Where I live in Rockland County, were are tied to Veolia Water, which took over from Suez - neither company has moved forward with the remediation plan for PFA's - always citing "supply chain issues".

PFA's - even at the lowest detectable levels are extremely dangerous especially for the health of fetuses, babies, children, pregnant women, immuno-compromised people and elders.PFA's are known carcinogens: birth defects, several types of cancer, auto-immune illnesses and fertility issues. The health consequesnce are enormous - and carries an enormous cost and burden to healthcare systems and individuals pocket books.

We need safe water in Rockland County and we only have wells, aquifers and Lake DeForest - we are not allowed to get water from outside of our borders.

Please do not let your draft regulation get watered down. Your draft regulations will promote safer drinking water standards that must be adhered to, to ensure less illnesses and diseases. If this draft does not pass, our horrible water company, Veolia - which wants a rate hike of 14% will not be forced to clean up our water.

The combined standard the EPA is proposing will really make a difference to public health. We know it is not possible in this exact moment in time to make regulations for all PFA's - which include up to 12,000 PFA's, but we feel that your regulations should be extended to cover ALL PFA's.

We also believe that the EPA should stop allowing any new PFA's to make their sneaky ways into our finaite water supply.

We appreciate this opportunity to comment.

Jacquelyn Drechsler and

Jocelyn DeCrescenzo

Valley Cottage, N.Y. 10989

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Victoria Eells (Doc. #3000, SBC-046913)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Victoria Eells

Gold Beach, OR 97444

Stuart Knappmiller (Doc. #3002, SBC-046915)

Dear Michael Regan,

We both worked for 3M. I used DuPont polypropylene to make facemask and oil sorbent material. I wore a mask in our pilot plant room where the air was full of asbestos like white particles. My wife computerized the process I controlled with my hands and mind. My father polluted our rural church's well applying anhydrous ammonia to corn fields. I'm sure he would

have wanted to stop if he knew the damage he was creating while earning money to pay for our farm.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Fred Davis (Doc. #3003, SBC-046916)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS has contaminated drinking water for millions across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed

drinking water standards would provide essential and long overdue protections against six of these toxic chemicals. We strongly support the proposed measures and urge EPA to finalize them as quickly as possible.

PFAS is a significant, long-lasting, and hazardous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the atmosphere. PFAS has contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies exposed in utero. Yet despite the severe health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing solid limits on six widely detected PFAS, the proposal would save thousands of lives and prevent thousands of PFAS-related severe illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities that are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to finalize these standards quickly and to implement a most health-protective rule, resisting the industry's efforts to weaken them.

Respectfully I remain

FRED R DAVIS, ("MORTAL"- As Are We All)

Sincerely,

FRED DAVIS

Tampa, FL 33613

dfred0454@gmail.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Daniel Rostan (Doc. #3004, SBC-047353)

Because my health and that of my family and my neighbors will be affected by the outcome of regulations on this matter I write in strong support of the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. In Rockland County, New York where I live, nearly all of our drinking water is contaminated with PFAS chemicals. Many of those wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards which means that unless the draft EPA regulations are passed filtration will not be required for the majority of Rockland's contaminated wells. If the draft EPA PFAS regulations are adopted unchanged, many more of Rockland's water sources

will be cleaned up, making our water supply far safer. Many of Rockland County's drinking water sources are contaminated with multiple PFAS chemicals. The combination of multiple PFAS could be resulting in additive or synergistic health impacts on Rockland's residents. But New York State currently regulates only two of these chemicals. The draft EPA regulations are written for combined standards (hazard index), and therefore make human health a higher priority than easy-to-meet regulations. The draft EPA regulations therefore would require many more of these chemicals to be cleaned up. The New York State Dept. of Health is waiting for EPA's finalized regulations. The Dept. of Health is required by law to regulate 23 additional PFAS, but they are waiting for the EPA regulations to be finalized first. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS. The draft EPA regulations would require cleanup for no less than six (6) PFAS chemicals. The hazards posed by these six chemicals are well documented by dozens of human health studies and hundreds of experimental studies in animals. These regulations will send a strong signal to the chemical industry to invest in safe alternatives now. There are over 12,000 PFAS chemicals in all. Many scientists believe that the entire class of chemicals is toxic. We need a precautionary approach to protect human health and the health of the environment. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class. EPA should immediately halt the approval of all new PFAS;

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kate Perkins (Doc. #3005, SBC-046917)

Dear Michael Regan,

Thanks for taking the first step toward regulating harmful PFAS in drinking water. For many decades, PFAS have contaminated the water supply for millions of people across the country, inflicting cancer, developmental and reproductive harm, and other serious diseases. The EPA's proposed standards for drinking water would provide important, overdue protections against 6 of these toxic chemicals. We strongly support the proposed standards and urge the EPA to finalize them as quickly as possible.

PFAS are a big, long-lasting, and highly dangerous class of chemicals. Also called "forever chemicals,"they persist in the environment, build up in human blood and organs, and continue to cause harm decades after they are released into the environment. They are in the blood of nearly every individual in the United States, including newborns who are exposed in utero. Yet despite the incredibly serious health risks associated with PFAS, there are currently NO federal limits on PFAS levels in drinking water!!

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of

lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Kate Perkins

Brooklyn, NY 11233

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Thank you for finally taking action. I would believe that every person on the globe except for the industrial leaders and their stockholders would be unconditionally grateful. We never really have a say, but most of the world is trying to clean us up. Please help us. Big warning labels on all materials, pots, pans anything people would purchase. Give us a place and make it be known where to recycle old items. That is always lacking. I would be more than happy to assist if needed. I am grateful we are moving forward. Industry does not have a say. We want to live clean. If they know, shame on them. Let's go for it. Please also, make the public aware.

Sincerely,

Christina Bibeau

Mokena, IL 60448

Susan Bishop (Doc. #3007, SBC-046919)

Dear Michael Regan,

Dear Administrator Regan

Please read this letter by starting at the end of it. I talk about a family member who is dead now because of of Teflon. Thank you!

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to

multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

My sister-in-law, Kathy Novotny Bishop from LaGrange, Illinois got GIST cancer. It is a stomach cancer. She told us it was from "Teflon"and other similar compounds. She died so early in her life. Please don't continue to allow businesses to make and sell them! GIST is a horrible cancer!

Sincerely,

Susan Bishop

Louisville, AL 36048

Bryan Burke

Bellingham, WA 98229

EPA Response: The EPA acknowledges and appreciates this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Cramp (Doc. #3009, SBC-046920)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to

cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

We must stop the scourge of cancer from killing Americans. My family members have been killed, young and old, by cancers. Where we know answers, like with PFA's, we must follow the science to protect people. Industry must understand that the EPA's job is to protect the environment for the safety and benefit of all Americans. This proposed rule will let them know that you will put people's safety over industry profits. Thank you.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Elizabeth Cramp

Clifton, VA 20124

Jean Naples (Doc. #3010, SBC-046616)

I am writing as a family physician and a public health/ environmental advocate that strongly opposes any exposure to or use of toxic PFAS or forever " chemicals.

Please be aware that PFAS or per- and polyfluoroalkyl substances, are a class of more than 12,000 chemicals that are used to make products water-, grease- and stain-resistant. I am very concerned because these chemicals have been found in crops, animals, water and even humans on farms where biosolids from sewage were used.

At this time, I strongly urge you to please designate perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS), including their salts and structural isomers, as hazardous substances. As companies have been producing and using these chemicals throughout the 20th century, it is imperative these chemicals are designated as hazardous so our country can begin

the clean-up process and hold industries and federal agencies accountable for the damage that has been done.

I am alerting you to the fact that industrial organizations are dumping toxic "forever chemicals" in our sewage. This sewage waste, is being turned into fertilizer and, according to recent findings, this sludge is spread on 20 million acres of land where farmers are growing our food.

I am very concerned because this practice represents a clear threat to our public health and protection for our environment, and this threat must stop now. It is crucial to understand that these PFAS chemicals never break down once they are sprayed in our environment.

Exposure to these chemicals has been associated with the development of immune issues, and birth defects. Any use of PFAS chemicals, which have been found in our drinking water, in cities across the US and in farm fertilizer, have been linked to the development of Hodgkin's lymphoma and kidney, testicular, prostate, breast, liver, and ovarian cancers.

I am very concerned about the fact that all Americans are exposed to PFAS in many aspects of our lives, through use of our everyday products, our food, and our drinking water. Please understand that these daily exposures to PFAS chemicals are placing us and our families at greater risk of development of serious disease. PFAS have polluted the tap water of at least 16 million people in 33 states and Puerto Rico, in addition to groundwater in at least 38 states. The water is contaminated through two main sources which include firefighting foam and industrial discharges.

At this time, I thank you for your consideration of my letter and my request. It is crucial for our country to hold the polluters accountable, especially as mounting research links PFAS to a wide range of health problems. For instance, PFAS have been linked to various types of cancer, birth defects, and have even been shown to reduce the efficacy of vaccines. Scientists have discovered unusual clusters of serious medical effects in communities with heavily PFAS-contaminated water, many of which are near military bases.

As a physician and public health advocate, I strongly urge you to please designate these toxic PFAS chemicals as hazardous and please remove them from exposure in our everyday lives!

Sincerely,

Jean Marie Naples, MD-Ph.D.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that many of the topics raised in this comment regarding PFAS regulation beyond drinking water under SDWA, including PFAS as a “hazardous substance” and PFAS in sewage, are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition,

although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs.

Robert Tompkins (Doc. #3011, SBC-047281)

• I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

• I live in Rockland County, New York where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

• Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

• The New York State Dept. of Health is waiting for EPA's finalized regulations. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

• These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

• There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

• EPA should immediately halt the approval of all new PFAS.

• While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sherry Masiulaniec (Doc. #3012, SBC-047511)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barry Fass-Holmes (Doc. #3013, SBC-046921)

Dear Michael Regan,

I strongly urge you to quickly finalize the EPA's proposed rule on PFAS chemicals that would provide safer drinking water for communities from coast to coast. Please implement a rule that is the most health-protective, and resist the chemical industry's efforts to weaken the rule.

Sincerely,

Barry Fass-Holmes

San Diego, CA 92108

Janet Gilbert (Doc. #3016, SBC-046924)

Dear Michael Regan,

As a grandmother of two adorable grandkids I am grateful that you are making positive change. I Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them. We need safe non-toxic water to build healthy children. It is a needed investment in our children's future to clean up our environment. I implore you to create meaningful strong standards regulating PFAS to nil; such benefits us all. Thank you.

Sincerely,

Janet Gilbert

Crescent City, CA 95531

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Christine Williams (Doc. #3017, SBC-046925)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. The EPA's proposed drinking water standards would provide extremely important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who were exposed in utero. Yet despite the very serious health risks associated with PFAS, there are currently NO federal limits on PFAS levels in drinking water. This cannot continue.

This needs to be changed immediately, before more Americans, like my parents, are harmed by PFAs. My dad suffered for years from early-onset Alzheimer's disease, which studies have partly linked to PFAs. My mother has recently been diagnosed with Parkinson's disease, which has also been partly linked to PFAs. I, myself, am in an 80% risk group for breast cancer, mostly due to genetics; however, I don't want my cancer risk increased more by exposure to PFAs.

I have owned a Pür brand pitcher for water filtration, for over 20 years, to help keep our drinking water safe while my son grew up. It filters dozens of things, including lead. Now I'm reading about PFAs in drinking water - and there is no filter for that. We are all at risk. Every single American.

The EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, the EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

My family, and countless others, urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, firmly resisting Big Industry's efforts to weaken these standards.

Please do everything in your power, very soon, to address this issue, which is so detrimental to American health and American lives. Thank you!

Sincerely,

Christine Williams

Nottingham, MD 21236

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Roger Martin (Doc. #3018, SBC-046926)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

When I was an Air Force bomber pilot on active duty, I responded to requests for bomber crewmembers to participate in firefighter exercises at an airplane. Sometimes, the firefighters would spray AFFF onto the ground, and we would have to walk through it. We were always told the foam was perfectly safe.

I have a degree in Biology. About a year ago, I had basal-cell carcinoma removed from just above the top-of-fling-boot line from my left calf. I doubt that cancer spot will be my last.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Roger Martin

Tacoma, WA 98466

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sally Davis (Doc. #3019, SBC-046617)

Dear Michael Regan,

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

Sincerely,

Sally Davis

Fishers, IN 46038

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jennifer Ruiz (Doc. #3020, SBC-046618)

Dear Michael Regan,

We urge you to do something to stop PFAS from infecting the environment. Do something NOW. DO NOT WAIT ANY LONGER. Everyone's health depends on you to do something about this - EPA's proposed drinking water standards are a critical step toward addressing the PFAS drinking water crisis, and helping communities across the country remove these dangerous chemicals from their water,

Urging you to Act quickly to finalize EPA's proposed national drinking water regulations for six PFAS chemicals.

Sincerely,

Jennifer Ruiz

Madera, CA 93638

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Douglas Emery (Doc. #3021, SBC-046927)

Dear Michael Regan,

Let me first thank you for taking the first step to regulate PFAS in drinking water. PFAS have been a growing problem for our society but little serious containment has been initiated, let alone reduction. In fact, for decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. My family strongly supports the proposed standards, and we urge EPA to finalize them as quickly as possible.

We have known for years now that PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS now persist in our environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment.

Today PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently still no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

My family urges you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's strong lobbying efforts to weaken them.

Sincerely,

Douglas Emery

Sebastopol, CA 95472

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ann Finneran (Doc. #3023, SBC-047282)

I strongly support the EPA draft regulations proposed for six PFAS chemicals, and I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114

- An extraordinary number of locations in New York State, in particular the Hudson Valley and "downstate" areas, including my own residential town of Fallsburg, have PFAS drinking water levels exceeding proposed limits.

- The NYS Dept of Environmental Conservation (DEC) is looking to increase the permitting of the spreading of PFAS contaminated sewage sludge on croplands in the state, a practice the state of Maine has banned because the dairy cows' milk on such lands became contaminated with PFAS, destroying the cows' health and farmers' business. Sewage sludge spreading on crop fields will exacerbate the continual accumulation of PFAS in drinking water through runoff and leachate from such fields. The new regulations may help dissuade the NYS DEC from this very unwise plan.

- In the geographically small but densely populated county of Rockland, just north of New York City, nearly all of their drinking water is contaminated with toxic PFAS chemicals. Many of the Rockland wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells — unless the draft EPA regulations are passed.

- Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

- The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

- There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

- EPA should immediately halt the approval of all new PFAS.

- The NYS Dept of Environmental Conservation is looking to increase the permitting of the spreading of PFAS contaminated sewage sludge on croplands in the state, a practice the state of Maine has banned because the dairy cows' milk on such lands became contaminated with PFAS, destroying the farmers' market products. Sewage sludge spreading on crop fields will exacerbate the continual accumulation of PFAS in drinking water through runoff and leachate from such fields. The new regulations may help dissuade the DEC from this very unwise plan.

- While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals, which bio accumulate and are nearly impossible to destroy.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that the topics raised in this comment regarding PFAS regulation beyond drinking water under SDWA, including "PFAS contaminated sewage sludge", are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition, although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs.

Linda PaolinoPaolino (Doc. #3024, SBC-046336)

I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells — unless the draft EPA regulations are passed.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patrick Oharris (Doc. #3025, SBC-046928)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Patrick Oharris

poharris@hotmail.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Justin Sweet (Doc. #3026, SBC-046325)

Please consider adopting or strengthening these regulations. In addition to the PFAS chemicals that need to be further regulated, the area where I live is in close proximity to New York City and has multiple other threats to our drinking water. Please act in the interest of the citizens you represent and not the corporations who continue to pollute our drinking water for profit. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cynthia Walter (Doc. #3027, SBC-046326)

I am a biologist with 35 years of experience teaching and writing about pollution sources, impacts and solutons. I learned today, the deadline, about the EPA plans re PFAs . I strongly encourage rules that indicate there is no safe level of many PFAs, such as goals for 0 MCL. Also, we need a low national standard for drinking water, because there are ways to meet those standards - my city installed such technologies. Finally, we need prohibitions on using PFAs , so we stop the releases in materials and exposures to workers in manufacturing. For decades, I have lectured about the substantial scientific evidence of serious health problems from PFAs; I am enouraged by this effort to begin to address this serious forever chemical.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response*

to Comments document. The EPA notes that the topics raised in this comment regarding PFAS regulation beyond drinking water under SDWA, including "prohibitions on using PFAS", are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach.

Jennifer Studwell (Doc. #3028, SBC-046337)

It is crucial to the health of Rockland County's residents that the water supply is monitored closely & treated for the unacceptable, unsafe levels of PFAS. Please do not jeopardize the long term health of our babies, children & all vulnerable Nyers!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maria Coupe (Doc. #3029, SBC-047283)

Please be sure to say that your comments are for Docket ID: EPA-HQ-OW-2022-0114.

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. As a long time Rockland County resident where I now work and raise my family I've grown increasingly concerned about the water available to drink.

I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells — unless the draft EPA regulations are passed.

Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

The New York State Dept. of Health is waiting for EPA's finalized regulations. Many other states may be doing the same. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

EPA should immediately halt the approval of all new PFAS.

While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Scott Lauffer (Doc. #3031, SBC-046327)

I support the EPA draft regulations proposed for six PFAS chemicals. The EPA knows from its own studies that these chemicals are harmful to human health. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Glassman (Doc. #3032, SBC-046929)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. I am a two time cancer survivor. My mother died from cancer, as did my grandmother and my cousin. My brother, (2 kinds of lymphoma and breast cancer), and my nephew have also survived cancer. My father died from a brain tumor.

Because I have held mistrust of non-stick pans, I have been careful to buy pans without the non - stick surfaces. I have looked in vain for cookie sheets without the non-stick coating, for 2 years.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

John Havrilla (Doc. #3037, SBC-047675)

See attached file(s)

I am writing to support the EPA in its effort to regulate six PFAS chemicals. This is a critical matter for the well being people in Rockland County, NY where a vast number of wells and water sources are contaminated with a host of PFAS. I applaud those who are making the effort to clean our water sources, and I challenge those who seek not to regulate these chemical because of a profit motive. While a profit motive is commendable, it cannot be at the expense of the health of the wider community.

Furthermore, I believe that the costs these contaminants are inflicting on the health of our people are far greater than the profit these chemicals produce. From a personal point of view, the well being of my grandchildren is paramount. I believe that they should be able to live in a community where the well being of all people is supported by community groups, corporations and government agencies. Because the profit motive is a strong impetus, the voice of the people must be heard through its elected officials and the structures of government in protecting our community. That is a central purpose of government-to protect our citizenry.

Therefore, I urge the EPA to adopt the proposed regulations of the six chemicals named. This is especially needed in New York State because only two PFSA chemicals are presently regulated. If adopted, this stance will be a platform for tackling the challenging effort to provide clean water sources for all people in our community and beyond by regulating even more PFAS chemicals. Because I live in a county where so much of the water supply has been violated by harmful chemicals, I urge the adoption of the EPA draft without delay, followed by NY State acting on an expanded plan that would require the clean-up of our water sources from all harmful chemicals.

Clearly, a comprehensive ban in NYS must be established so that the manufacture and sale of products containing PFAS ends. Further, PFAS as a class are to be regulated with Maximum Contaminant Levels for PFAS. Lastly, ensure the safe disposal of harmful chemicals that are removed from our drink water in such a way that the greater environment is not negatively impacted.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Suggs (Doc. #3038, SBC-047462)

To Whom It May Concern,

I am writing in regards to the proposed rule for Per- and Polyfluoroalkyl Substances (PFAS) to be included into the National Primary Drinking Water Regulations.

On March 14, 2023, the EPA proposed the first ever national drinking standards with regards to PFAS in public drinking water. EPA is issuing a preliminary regulatory determination to regulate PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA, PFOS and a mixtures of these PFAS as contaminants under SDWA.

PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA and PFOS have all been found in large concentrations across North Carolina.

The Chemours plant in Bladen County produces GenX, and discharges upwards of 250 different PFAS chemicals into our drinking water.

The PFAS production at the site is responsible for groundwater and surface water contamination in the surrounding area, according to water samples from Chemours and the N.C. Department of Environmental Quality.

Since learning about our PFAS water contamination in 2017, we have learned how harmful PFAS are to populations that are exposed to "forever chemicals".

Pregnant women, young children, low income communities and people of color are extremely vulnerable.

PFAS are dangerous chemicals that bioaccumulate in the body's organs. Continuous small exposures can lead to larger health effects that can be harmful to people who are ingesting PFAS.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Suzannah Glidden (Doc. #3039, SBC-046329)

I strongly support the draft regulations as written (instead of letting them be watered down by the chemical industry. We need to regulate PFAS NOW,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jeffrey Saunders (Doc. #3040, SBC-046930)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jeffrey Saunders

Philadelphia, PA 19107

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tor Olsson (Doc. #3041, SBC-047464)

5/6/23

With regards to the proposed rule for Per- and Polyfluoroalkyl Substances (PFAS) to be included into the National Primary Drinking Water Regulations, Throughout my undergraduate education, I have been learning how harmful PFAS is to populations that are exposed to these "forever chemicals,"specifically harming communities of low income, people of color. As someone who lives only 6 miles from a 3M Cottage Grove historical dumpsite, I firmly and wholeheartedly support the adoption of these new regulations. For Amara Strande. For the thousands of 3M employees just at Cottage Grove. For the millions who are directly affected by PFAS. Towards accountability mechanisms for companies like 3M who have engaged in misinformation campaigns against the EPA, government, and us.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dorothea Leicher (Doc. #3042, SBC-047245)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

My father was a chemist and so I have a high respect for the power of chemicals and great concern about our reckless use of chemicals without due regard for toxicity.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Essman (Doc. #3043, SBC-047246)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

The science is clear as well as our hubris in thinking that we can continue to poison our children with these, now known, toxic chemicals. To continue to do so to help the profit margins of the chemical use industries and to avoid the hard lift of cleaning up our well intentioned ignorance of what we have done in the past or to remain comfortably ignorant is no longer a responsible option. Now that we see we are digging a deep toxic hole–please stop digging.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Faith Fusillo (Doc. #3044, SBC-046339)

I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells — unless the draft EPA regulations are passed. Please hear us, please help us!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Deena Craig (Doc. #3045, SBC-047465)

Robin Schnell (Doc. #3046, SBC-046931)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals,"PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Robin Schnell

Portsmouth, NH 03801

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ann Payne (Doc. #3047, SBC-047247)

Dear Administrator Regan:

PFAS chemicals came to my attention decades ago when their presence in children's pajamas caused those garments to be removed from the shelves. Children were developing brain tumors as a result of exposure to those pajamas. We (and stores) had to discard that clothing. And yet today, our exposure to dangerous PFAS chemicals apparently continues unabated. We know the serious dangers. The time to act is far overdue.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. My family's water supply here is contaminated with PFAS. Imagine a nation feeling our government is actively protecting us . . .

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Erin Stephens (Doc. #3048, SBC-047248)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting people from the scourge of PFAS.

The EPA's proposed rule will provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

This proposal will save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chantra Montoya-Pimolwatana (Doc. #3049, SBC-047249)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I have an autoimmune disease that I am sure the tap water I drank since my childhood contributed to. I now have a young baby of my own and I don't want her exposed to the same toxins that I was growing up. Please help us and all of humanity.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Richard Wissler (Doc. #3050, SBC-047250)

Dear Administrator Regan:It is under your attention and "leadership" that we are fishing out AND polluting our oceans, atmosphere and land with chemicals, unusable animal waste and an unassailable stupidity to the extent that we are cancelling our ticket here on planet Earth.... Where are you going when this place is burnt down , flooded out or blown flat by the results of your version of "husbandry " ? - eh ? WHERE ?!

Your priorities amaze, sadden and disgust us .

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tracy Weldon (Doc. #3051, SBC-047251)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Everyone deserves clean water. I am worried about the children growing up now. Who knows what kinds of damage the chemicals in our water are doing to them. This affects not only all of us but generations to come.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Ihara (Doc. #3052, SBC-047252)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

While the chemical industry will forcifully push back on any regulations, it's the health of the people of this nation that will, I hope, always be uppermost in your mind. Thank you for bringing forth this proposal.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

J. Whiting (Doc. #3053, SBC-047253)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

The proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

PLEASE! I urge you--quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carolyn Henne (Doc. #3054, SBC-047254)

Dear Administrator Regan:

as a resident of Michigan, the issue of PFAS and other forever chemicals has become an incredibly important concern. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Priscilla Auchincloss (Doc. #3055, SBC-046620)

Dear Administrator Regan,

I'm writing to you from Upstate NY, where awareness of PFAS chemicals - their prevalence and the harms they cause - is growing, along with determination to end their use. It is great news that the EPA has proposed national drinking water regulations for six PFAS chemicals.

I urge you to move forward promptly to finalize the regulation of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS chemicals.

I'm sure you are aware that PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. The question is - why haven't we done something about it?

I understand that the EPA's proposed rule would provide safer drinking water to literally millions of people in communities across the nation where the drinking water is contaminated by PFAS. Let's imagine the lives saved and health improved by enforcement of the EPA's proposal, and let that vision of vitality and health propel us to do even more to stop chemical contamination of our water, air, and soil across the U,S,

Thank you for your work and commitment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pamela A. Lowry (Doc. #3056, SBC-046932)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Pamela A. Lowry

Grand Junction, CO 81503

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Clark Bell (Doc. #3057, SBC-046933)

Dear Administrator Regan:

I welcome EPA's proposed national drinking water regulations for six PFAS chemicals; this is a good first step in protecting our families and communities from PFAS.

I understand EPA's proposed rule would:

• provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS;

• save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Because PFAS are known to be extremely persistent in the environment, very widespread, and linked to a long list of health effects, such as cancer, immune suppression, and developmental harm, I urge you to:

• quickly finalize the regulations of these six PFAS chemicals;

• implement a rule that is health protective;

• begin addressing all of the other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lys Burden (Doc. #3058, SBC-047255)

To Administrator Regan:

My family and I (four taxpaying and voting residents of Washington State) applaud EPA's proposed national drinking water regulations for six PFAS chemicals as a welcome first step to protecting our families and communities from the everlasting and terrible impacts of PFAS.

We are well aware of PFAS for their extreme persistence and widespread pollution and their long list of health effects, including cancer, immune suppression, gender impacts and fetus developmental harm.

We support EPA's proposed rule that would provide safer drinking water for millions of people in communities across this nation where drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious and deadly PFAS-related illnesses each year.

We urge you to quickly finalize regulations for these six PFAS chemicals, implement rules that protect health, and then begin addressing all other types of PFAS and places where they contaminate our lives, such as in our food system through packaging, fast-food and processed food. It is imperative to address these extremely harm-inducing chemicals. They also harm our fish, wildlife and children and induce contamination of soil, solid waste stream, even the air we breathe. They are in our clothes, rugs, furniture and dust. PLEASE help our way of life become less contaminated by these "forever" chemicals.

Dan and Lys Burden

Mike and Dan Brant

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marion Thorne (Doc. #3059, SBC-046621)

Dear Administrator

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Doyle (Doc. #3061, SBC-047256)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protect our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution. They have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that protects health, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcee Silver (Doc. #3062, SBC-047257)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are causing enormous medical and household wealth problems. Not passing the proposed national drinking water regulations for the six PFAS chemicals will incur a huge ongoing cost for us all, so please get them in place ASAP.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Karen Dukovich (Doc. #3063, SBC-046683)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. It's easier to make improvements now than deal with more negative consequences later.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Jerilyn Hall (Doc. #3064, SBC-046934)

Dear Michael Regan,

If we use and believe in Science that improves our lives medically and in many other areas of our lives, then we must accept that Science also tells us what to avoid in our environment to keep us safe and healthy.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jerilyn Hall

Bonney Lake, WA 98391

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Naia Mitchell (Doc. #3065, SBC-047673)

We deserve clean water and if companies are putting the publics health at RISK, they MUST be held responsible and barred from doing business ever again. We are not hard enough on entities that are putting us at risk, and its the EPA and the governments' job to keep us safe.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Ellen Biemer (Doc. #3066, SBC-047258)

Dear Administrator Regan:

Please protect our water! It's essential for life, and we deserve not to be poisoned by it.

Now the form letter:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Larry Menkes (Doc. #3067, SBC-046935)

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking Docket ID: EPA-HQ-OW-2022-0114

Dear Administrator Regan,

Thank you for taking this historic step to keep our drinking water safe from PFAS contamination. For decades, PFAS chemicals have contaminated both public and private drinking water supplies across the country. PFAS contamination exposes communities to serious health risks, including cancers, impacts to the immune and reproductive systems, and other harms. The EPA's proposed drinking water standards would provide long overdue federal protections against six types of highly toxic PFAS.

I am am a victim of AFFF laced tap water. I have cancer, my wife and father-inlaw died of their cancer. Keep up the good work.

I strongly support this proposed rule and urge EPA to move swiftly to finalize health-protective standards to reduce PFAS in our drinking water.

The PFAS crisis is widespread, contaminating the blood of humans, fish, and wildlife worldwide. Communities of color and low-income communities are particularly impacted by PFAS exposure, where health impacts are often compounded because these communities tend to face cumulative effects from multiple environmental injustices and public health hazards.

EPA's proposal would significantly reduce exposure to PFAS in our drinking water for millions of people by setting strong, science-based drinking water standards for six types of PFAS. While this proposal is an important first step towards addressing PFAS exposure, it is critical that EPA also expedite efforts to prevent these chemicals from entering our waters and environment in the first place, before it even reaches our taps.

These proposed regulations are long overdue and I fully support this first step of regulating six dangerous PFAS in drinking water. In addition, I encourage the EPA to take a comprehensive approach to regulating the entire class of chemicals in order to reduce overall PFAS exposure, and improve drinking water safety in thousands of communities across the country.

Thank you for your consideration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Barbara Halpern (Doc. #3068, SBC-046622)

Every American has a right to safe drinking water.

For the health of Latinos and all Americans, I support EPA's plans to regulate and limit harmful PFAS in drinking water and the environment.

Considering the potentially devastating health impacts of PFAS exposure, it is unacceptable for these chemicals to be released into and remain in the environment at unsafe levels (https://salud.to/PFASbm).

While researchers have made strides in destroying PFAS in water, we must address PFAS contamination at the source with enforced regulations, as even undetectable levels of PFAS can pose human health risks including damage to fetal growth and increased cancer risk (https://salud.to/pfasdes).

PFAS affect everyone but may impact some populations more than others. For instance, Latino families are more likely to live in neighborhoods where there is a lack of clean and safe drinking water (https://salud.to/nitrate) and where utility companies have less funding to meet community needs.

Therefore, environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure, such as Latinos. I applaud EPA's proposed plans to regulate and limit PFAS chemicals in drinking water and the environment, which could help ensure a healthier future with less exposure to potentially harmful chemicals.

The limit should be zero as these chemicals accumulate in the body they are forever chemicals. Water providers must be required to remove them from drinking water

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see sections 13.4-13.9 of the EPA response in this *Response to Comments* document that outlines the quantifiable and nonquantifiable benefits of this NPDWR that may address the commenter's concern of low levels of PFAS that can pose human health risks. In response to the comment that states that "environmental regulation of harmful PFAS is critical for all Americans, but especially those who are vulnerable to exposure", as part of its environmental justice analysis for this regulatory action, the EPA evaluated the distribution of baseline PFAS exposure in drinking water across demographic groups. For additional discussion on this topic, please see the EPA's EJ analysis in section 8 of the EA (USEPA, 2024a) and section 14.10 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Carol De Angelo (Doc. #3069, SBC-047269)

My name is Carol De Angelo, and I am a supporter of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water. I work with many groups who are concerned with the amount of PFAS in their drinking water. Once place is Rockland County where we have several retired Sisters of Charity living.

I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. These regulations would not only protect the health of humankind but will also benefit nature and wildlife. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mass comment campaign submitted by Arthur Bell (Doc. #3071, SBC-047467)

Copy and paste this statement to your EPA comment

To Whom It May Concern,

I am writing in regards to the proposed rule for Per- and Polyfluoroalkyl Substances (PFAS) to be included into the National Primary Drinking Water Regulations.

On March 14, 2023, the EPA proposed the first ever national drinking standards with regards to PFAS in public drinking water. EPA is issuing a preliminary regulatory determination to regulate PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA, PFOS and a mixtures of these PFAS as contaminants under SDWA.

PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA and PFOS have all been found in large concentrations across North Carolina.

The Chemours plant in Bladen County produces GenX, and discharges upwards of 250 different PFAS chemicals into our drinking water.

The PFAS production at the site is responsible for groundwater and surface water contamination in the surrounding area, according to water samples from Chemours and the N.C. Department of Environmental Quality.

Since learning about our PFAS water contamination in 2017, we have learned how harmful PFAS are to populations that are exposed to "forever chemicals".

Pregnant women, young children, low income communities and people of color are extremely vulnerable.

PFAS are dangerous chemicals that bioaccumulate in the body's organs. Continuous small exposures can lead to larger health effects that can be harmful to people who are ingesting PFAS.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Slingshot and National PFAS Contamination Coalition (Doc. #3072-14, SBC-046345)

Good afternoon, my name is Dana Colihan. I am co-Executive Director of Slingshot, and co-Facilitator of the National PFAS Contamination Coalition. I am testifying in support of the proposed EPA drinking water standards for six PFAS. Slingshot is an environmental justice organization working alongside communities most impacted by environmental health threats to take aim at polluters and build community power. We envision a PFAS-free world, where we do everything we can to address the horrific impact these chemicals have had on our communities and environment, which is why we strongly support these proposed drinking water standards. We also co-facilitate the National PFAS Contamination Coalition, which is comprised of 30 community groups from across the country who are directly impacted by PFAS. The coalition is fighting for a world where people are not exposed to any PFAS, where there is justice for the victims of PFAS exposure, and where laws and regulations prevent contamination and disasters like this from ever happening again. From this work, we have witnessed firsthand the impacts PFAS have had on our bodies, our families, and our environment. These standards are thanks to the tireless organizing of community members across the country. It reflects what these leaders

already knew to be true; that there are no safe levels of PFAS in our water. For too many Americans who live every day in the shadow of pollution, enough is enough. We commend the EPA for taking this long overdue step to protect millions of Americans from these dangerous chemicals in our drinking water. We applaud the acknowledgment that individual PFAS and PFAS mixtures can have an impact on our health. We believe using mixtures as a regulatory tool is an incredibly useful framework for regulating additional groups of PFAS. We hope to see the implementation of this as soon as possible, as we know all of these chemicals have a cumulative health impact on our bodies. We know there is a profound cost to inaction on PFAS. Delaying federal regulation of these chemicals will continue to take tolls on our bodies. We will get sick, we will not be able to work, we will incur medical expenses. It is not only morally and environmentally strategic to enact national PFAS drinking water standards, but also incredibly economically advantageous. We urge EPA to keep these standards as low and restrictive as possible. We seriously caution against any delays to implementation, or any standards that are less than health-protective or ignore the science. Ultimately, we also urge the EPA to regulate these chemicals as a class, turn off the tap of contamination by stopping the approval of any new PFAS chemicals, and ensuring that polluters are made to pay. We look forward to your swift and steadfast action to protect our communities and our environment from the horror of PFAS. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Camp Grayling Restoration Advisory Board (Doc. #3072-15, SBC-046346)

Okay, I am Marcia Koppa, Wayne's wife. I don't know how that happened but I'm with the Camp Grayling Restoration Advisory Board. Camp Grayling is in Crawford County, which is in beautiful lower Northern Michigan. We started out primarily as a Michigan National Guard Training Camp and has expanded into even joining and training NATO troops. But we have three areas of contamination. One is the Grayling Army Airfield. That airfield had used Aqueous Film Forming Foam, AFFF, in the past, and that plume of groundwater is heading toward a trout fishing stream, the Au Sable River. And that river travels east passing Oscoda, which is another former Air Force base that is also contaminated, ends up in Lake Huron. Just a little ways west is the cantonment area, the main camp of Camp Grayling, which is on the south side of Lake Margrethe, which also has a lot of residential areas around it. It is also very contaminated. That lake drains into eventually Manistee River, which heads west to Lake Michigan. And so, we have an area that is affecting much of Northern Lower Michigan and its contamination. We are working very hard with the CERCLA group, and we are making progress, but we are a bit stymied at this point for bureaucratic reasons. So, we're very excited that EPA is deciding to make stricter standards and we really appreciate that. Anything you can do will be greatly appreciated. Thank you so much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Integrated Resource Management (Doc. #3072-16, SBC-046347)

Great, thank you Rob. I would like to introduce myself as Bob Bowcock, I'm with Integrated Resource Management. I work with community groups and drinking water utilities virtually in all 50 states. I strongly support the proposed MCL and health index. I would like to thank staff for their many years of work that have gone into this proposed regulation. This is not something new, this is not a surprise. EPA and drinking water utilities have been working on these chemical contaminants for years. I encourage full implementation as soon as possible with the requirements of the Safe Drinking Water Act. There is no room for continued excuses or delays. Water utilities have known this was coming for years and no extension should be granted. I strongly encourage all systems, regardless of size, receive assistance to come into compliance sooner than later. Many of our small and very small systems are schools that are generally not receiving any information about this regulation or treatment techniques. This is where we send our children and many of the PFAS levels found in their source water are extremely high, like 80,000 parts, guys. Waste residuals must be subject to RCRA, and we must close the loop. As important as setting these MCLs as soon as possible, we must address continued discharges. We must immediately stop the practice of spreading contaminated biosolids from our wastewater treatment plants, stop the dumping of landfill leachate at wastewater treatment plants, and swiftly establish regulations for wastewater discharges. Thank you for this opportunity to provide public comment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that many of the topics raised in this comment related to the RCRA, biosolids, wastewater treatment plants, wastewater discharges, and landfill leachate, are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition, although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs. Please see Section XI.D of the FRN and section 12 of the *Response to Comments* document for the EPA's response regarding extensions and the compliance date for this NPDWR.

NRDC (Doc. #3072-13, SBC-047366)

We certainly support EPA's MCLG of zero for PFOA and PFOS, and the one health MCLG for the health index for the other four PFAS. Best available technology is clear: it can achieve the

EPA proposed standards. There is granular activated carbon for some of the PFAS, ion exchange, reverse osmosis, so this is achievable, and we certainly urge EPA to move forward. The benefits far exceed the costs, even though that is not a required finding. It is feasible to achieve these standards. And the last point I wanted to emphasize is that the cost to industry of cleaning up Superfund sites or DOD cleanup sites is legally not relevant under the statute, and should not be a driver, and frankly would not be a lawful driver in this. So, we would urge EPA to withstand the pressure to try to consider such cost because they are not legally relevant. Thanks so much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA agrees with the commenter's statements regarding not including the costs to cleanup PFAS-contaminated sites, like from industry or other federal government agencies, as part of the HRRCA requirements for MCL NPDWR in SDWA section 1412 and the Administrator's determination that the benefits of this rule outweigh the costs. For more information on the Administrator's benefit cost determination, please see section 13.8 of the EPA response in this *Response to Comments* document. Additionally, disposal costs are discussed in section 8 of the EA (USEPA, 2024a).

North Carolina Conservation Network (Doc. #3072-19, SBC-046349)

Hi, my name is Stephanie Bishop Schweickert, and I'm the senior campaign organizer with North Carolina Conservation Network. Thank you for the opportunity to give comments on the proposed drinking water standards, and I'd like to commend EPA for the proposed standards. NC Conservation Network started working on PFAS the day that news broke in 2017 that Cape Fear River Basin residents had been overexposed to forever chemicals for decades because of Chemours' pollution. Since then, I've met far too many community members and families with personal stories about how forever chemical pollution has harmed their lives. In this time, we've also found out that the problem extends far beyond the Cape Fear Basin, and have found PFAS in drinking water throughout our state. NC Conservation Network strongly supports the proposed drinking water standards for PFOS and PFOA, as well as the use of a hazard index for additional PFAS chemicals. I urge EPA to move swiftly to finalize this proposal. Further, we ask the EPA to add even more PFAS chemicals to the hazard index. Here in North Carolina, residents cannot afford one more drop of PFAS. Please protect our public health, and finalize these standards. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Community Water Center (Doc. #3072-22, SBC-046351)

Thank you. My name is Eric Orellana. I'm a senior policy advocate with Community Water Center, an environmental justice organization who works in farmer communities to realize the human rights of water in California's Central Valley and Central Coast. Community Water Center is in strong support of the proposed legislation for the six PFAS chemicals. Many of the communities we conduct outreach and engagement in are served by water systems impacted by PFAS contamination, or have not been tested for PFAS because of their reliance on small water systems or private, domestic wells. We urge the Agency to adopt the proposed regulation, continue regulating other PFAS chemicals, hold responsible corporations accountable for putting profits over people, and provide small water systems across the country with the adequate support to treat for PFAS chemicals. I also urge the EPA to include a plan to support residents reliant on domestic wells to address PFAS contamination. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

West Virginia Rivers Coalition (Doc. #3072-21, SBC-047369)

Thank you for the opportunity to be heard. My name is Heather Sprouse. I'm the Ohio River Coordinator with the West Virginia Rivers Coalition. I'm also an impacted resident of Hurricane, West Virginia, where levels of PFOA and PFOS contamination are 8.7 parts per trillion in the raw water of our source in Hurricane Creek near the Ohio River. I wholeheartedly support these MCLs and Hazard Index to protect my family, my community, and all who drink from the waters of the Ohio River Basin. My role as the Ohio River Coordinator is to connect with communities across West Virginia, listen to their water quality priorities, and amplify their concerns and desired solutions to decision-makers. I've spoken with residents and groups all along the 300 Ohio River miles in West Virginia, and what I hear is that people want PFAS out of their drinking water now, and that polluters need to pay for cleanup, not taxpayers or ratepayers.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Albemarle County Board of Supervisors and Rivanna Water and Sewer Authority Board of Directors, Virginia (Doc. #3072-28, SBC-046355)

Good afternoon. I am Ann Mallek. I represent the White Hall District on the Albemarle County Board of Supervisors in Virginia. I support the EPA regulation process for the six PFAS at the lowest possible regulatory level. I speak today about the concerns of citizens for their personal safety, for local governments for their permitting and purchasing decisions, and for local water systems who are expected to provide safe water to their customers. We all need your help at all

levels as soon as possible. Local water systems in Virginia are already facing high levels of PFAS contamination, which challenge their ability to clean up and also challenge their financial resources. Local governments need guidance for procurement to avoid future risk and to best protect the health and safety of our citizens. Citizens are concerned that those producers must pay for the cleanup or the citizens will have to. Yes, these chemicals are everywhere, but that should not be any excuse to move slowly. We need help now to prevent future contamination of drinking water from many sources, industrial discharges, compost and biosolids as examples. Yes, the producer's knew decades ago about the health impacts, yet they keep producing and selling. We need EPA to carry out your process for regulation without delay, to put a stop to production and sale and to require recall of contaminated products. Once these essential steps are taken, safe alternatives will be developed by the private sector. Yes, in my opinion, one can live without a non-stick pan. Stopping that sale should be easy. Alternative fire gear for protection is already available, yet fire companies around the country are waiting for regulation. Local governments are waiting for regulatory standards on which to base decisions. Every day, components of PFAS are entering drinking water supplies. Development of regulations will prevent bad chemicals from being replaced by equally bad ones about which we know little. The precautionary principles should be the basis of all government decisions as it is in other developed countries. I support designation of PFAS as a HAZMAT under Superfund. I support EPA to prioritize PFAS under TSCA. After these essential tasks are complete, please also repeal the grandfathering of existing chemicals which have proven after the fact to be so dangerous. Thank you for considering my views. Your work is important and needed ASAP.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that the topics raised in this comment beyond drinking water under SDWA, including those related to the "production and sale" and "recall" of products containing or "contaminated with" PFAS and regulation of PFAS under CERCLA and TSCA, are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the EPA response in this *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition, although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs.

Savanna Science Co (Doc. #3072-30, SBC-046356)

Hello, I'm Kris Hansen. I have a PhD in chemistry and I have been a scientist for over 30 years, including five years in 3M's Environmental Lab between 1996 and 2001 during the "discovery" of PFAS in the blood of most humans and in the environment. I urge the EPA to implement the proposed rule as soon as possible and to continue efforts leading to the ban on PFAS excepting cases of critical use. All PFAS eventually reach a state of indestructibility in the environment and

given the complexity and understanding the effects of these human-made compounds, regulating PFAS individually is scientifically implausible. Further, allowing industry to self-regulate has proven ineffective. In the long history of PFAS, the fluorochemical industry has repeatedly demonstrated reluctance to share information transparently and to take accountability for their chemicals. These deficits have led to global human and environmental exposure to exceptionally long-lived chemicals with proven toxicity. Working at 3M in the 1990s, I understood that PFOS was "discovered" and characterized in the blood of the general population at that time. Nearly one year after the "discovery", I was told that scientists at 3M had made the same discovery of PFOS in the blood of the general population in 1975 over 20 years earlier. Even within the company there was lack of transparency and collaboration. As others have documented since 1975, 3M, DuPont and others have employed what social scientists called Unseen Science, Undone Science, and were active in manufacturing Dow. Thus, it's not surprising that it took over 20 years for the public disclosure of widespread PFAS contamination in humans and another 20 years for the health effects to be characterized. In the early 2000s, industry leaders announced their exit from manufacturing long chain PFAS and their decision to pursue a replacement strategy with short chain PFAS. Compounds they knew were environmentally indestructible, another lost opportunity. Studies have since demonstrated that short chain PFAS are widespread in the global environment and are associated with significant health effects. Despite nearly 50 years of PFAS revelations, the chemical industry has fought against accountability. Their claims that EPA's proposed regulations are too expensive and too complex are disingenuous and disrespectful. Their inability to understand and control their own products is no excuse for leniency. I live in a community with widespread groundwater contamination of PFAS. The anxiety within families who raise children on this groundwater and on city governments grappling with how to protect their citizens is of much greater concern than those of a multi-billion-dollar company claiming they lack funds to take accountability for their chemicals. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maine Organic Farmers & Gardeners Association (Doc. #3072-32, SBC-046357)

Good afternoon. I am Sharon Treat speaking on behalf of the Maine Organic Farmers and Gardeners Association in strong support of the proposed rule. For more than 50 years, MOFGA has worked to create a healthy, diverse and sustainable food system. We certified 535 organic farms in Maine and also processing operations. This rulemaking will improve the lives and health of Maine's farming families and communities. Since 2016, when PFAS was found contaminating water, soils and milk in a Maine dairy farm, the state has been acting to protect the public in the absence of enforceable federal rules. It's been a lonely and expensive journey with Mainers investing more than $100 million dollars to develop drinking water standards, test soil, water and food, install filtration systems, conduct research, fund farm assistance, and provide testing and monitoring for farmers and others with high PFAS levels in their blood.

Investigations so far show that 56 farms and more than 300 private drinking water wells are contaminated with PFAS, exceeding Maine's PFAS standard. Is Maine an outlier? We doubt it. Maine is the only state methodically investigating every site where sludge spreading may have occurred over the last 40 years, but PFAS contaminated sludge and compost is still being spread on fields across the nation. We support EPA setting an MCLG at zero for PFOA and PFOS. As testing technologies become more sensitive and reliable, the 4 parts per trillion MCL should ratchet down. We agree with EPA that the rules shouldn't be limited to PFOA and PFOS and support the Hazard Index approach for other PFAS. While PFOA and PFOS continue to contaminate water and soil even 30 years after sludge was spread, newer chemicals including GenX are also ubiquitous and pose health hazards. For example, a recent study in 16 states, which included Maine, detected 26 unique PFAS in water samples, including 12 not covered by current EPA testing methods. EPA's proposed rule will save lives and protect health and should be adopted without delay. Additionally, to prevent future contamination, EPA should ban wastewater sludge spreading as Maine has done and provide funding for safer disposal options. Thank you for your work and the opportunity to testify today.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that the topics raised in this comment beyond drinking water under SDWA, including those related to wastewater sludge, are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition, although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs.

Clean Cape Fear (Doc. #3072-33, SBC-046358)

Thank you for having me. My name is Emily Donovan. I'm co-founder of Clean Cape Fear. I want to thank everyone at the EPA who worked tirelessly to create this proposal and I implore the EPA to vigorously defend it from certain industry opposition. Three years after we moved to the Wilmington, North Carolina area, my husband developed a brain tumor. We may never know what caused his tumor, but when we learned about PFAS in our tap water, we couldn't help but wonder, is this why? Our state regulators and the utility servicing Wilmington, North Carolina knew about high levels of GenX in our tap water for a full year before the public was notified. The utility never alerted us because there was no legally enforceable mechanism in place requiring them to act. In 2017, we finally learned Chemours and DuPont for decades trashed our primary source of drinking water with literally hundreds of different PFAS compounds. Chemours's facility has contaminated the drinking water in eight counties, impacting over 6,000 private wells in several public water systems servicing over half a million residents. It's been six years and we still don't know the full scope of our crisis. My tap water is still contaminated with

some of the highest levels of PFAS in the nation per multiple tap water studies. I am still sending my children to school every day where the water fountains have unhealthy levels of PFAS. Without enforceable drinking water standards, we are left fending for ourselves. Not only are we paying for water we don't feel is healthy to drink, but we are also paying extra for in-home filtration to stop these chronic exposures. This has created inequity between the haves and the have nots. We are experiencing rare or re-occurring cancers at ages far too young to pass off as normal. Serious illnesses and diseases are common conversations. The amount of GoFundMe's I receive from medical related financial strain is alarming. There's also these hidden costs we continue to pay due to decades of federal inaction on PFAS. Access to healthy and affordable water is a fundamental human right protected under multiple international treaties, many of which the United States is legally bound to uphold. Failure to defend access to healthy water, we believe is a human rights violation and my community group, Clean Cape Fear, is currently seeking redress from the United Nations. These proposed drinking water standards must not be delayed or diluted. Had the EPA acted more swiftly years ago, my neighbor Amy would be here today making summer plans with her daughter. My friend Sarah and Tom would've watched their daughters complete their first year of college. For some of us, it's too late. For the rest of us, we are begging you do not extend the public comment period. Defend your work, implement these proposed standards swiftly and begin regulating PFAS as a class with a whole-of-government approach. Thank you for your time.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Zone 7 Water Agency (Doc. #3072-29, SBC-047376)

Good day. I'm also thanking you for the opportunity to speak. My name is Laurene Green. I live in Pleasanton, California, which is part of the Tri-Valley Area east of San Francisco. I'm a director on the board of the Zone 7 Water Agency. However, I'm not specifically speaking on the Agency's behalf, rather on behalf of myself and my constituents. We've had an ongoing discussion about PFAS and I'm very aware of the Tri-Valley residents' concerns, which I share. Although there are some thoughts on ways to improve the proposed MCLGs and MCLs for the first six PFAS chemicals, I trust my colleagues to articulate them and instead prefer to say, first, thank you. It's taken the better part of a century to recognize and grapple with this problem now via the roadmap and decades for the U.S. EPA to propose PFAS regulation. Thanks to the EPA for persevering and finally crossing that line. It appears to have been arduous at times, so thanks for putting the energy and resources and getting it done. Our Tri-Valley area and indeed the nation will be so much safer and healthier because of this effort.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National PFAS Contamination Coalition (Doc. #3072-34, SBC-046359)

Hello. Thank you for letting me speak. My name is Sandy Wynn-Stelt and I'm from Belmont, Michigan. I am the co-chair of the Great Lakes PFAS Action Network, and I'm also a member of the leadership team of the National PFAS Contamination Coalition. My story began in 2016 when my husband Joel was diagnosed with liver cancer and died just three weeks later. I was devastated. I hate being a widow. While the grief changes over time, it never really leaves. I think about him every day and ironically, today is our anniversary and we would've been married 31 years. I start with this because this is just one of many stories that you hear from community members who have been impacted by this class of chemicals. Joel and I lived in our home for 23 years, drinking the water. I later learned that my water and the water of 25 square miles of my community was contaminated with PFAS at incredibly high levels from tannery waste from Wolverine Worldwide. I have some of the highest levels of PFAS in blood that's been seen, and I myself was diagnosed with thyroid cancer two years ago. I have neighbors who have experienced repeated miscarriages, who have kidney cancer, testicular cancer, and liver disease. I have seen children on my block with thyroid disease at three years old, with immune problems, and with vaccines that are not effective. We have no way to protect ourselves from these chemicals since we cannot see them or taste them in our water. The only protection we can get is from strong standards that are set federally. So, I applaud the EPA at taking these measures to put some impressive drinking water standards in place for some of these chemicals. It is a great start and they should be commended for following the science and working to protect the health and safety of our country. We do not have time to wait as any delay simply puts us at risk for further contamination. But please note, this is just the beginning. There are thousands more of these chemicals in a group that all need to be regulated. I look forward to working with the EPA to continue to protect the citizens in our country. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hope Grosse (Doc. #3072-35, SBC-046360)

Hi, my name's Hope Grosse, an affected community member and a Buxmont Coalition co-founder of Safer Water. I want to thank you for proposing these strict MCLs on some PFAS. I'm eager to hear when this will happen and grateful that you will continue to consider other PFAS chemicals to be added to the list as you move forward in an urgent manner. I was born in Warminster and lived directly across the street from the Warminster Navy Base the first 25 years of my life. My home was adjacent to a firefighting training center where firefighting foams containing PFAS were used and washed into the ground for over 50 years. 50 years. We watched the daily firefighting operations on my front porch. My family and others have private wells. Public water was not available to our homes, surrounding at the Navy base until 1996, when TCE and PCE and other volatile organic chemicals, heavy metals were found at high levels and the base was deemed a Superfund site. This was our first round of poisoning. Little did we know,

Round 2 PFAS, until 18 years later. Our well was in the front lawn of our property, 25 feet from the Navy's training area. We not only drank the contaminated water, we brushed our teeth in it, we swam in it in our pool, we showered in it, but most sickening was that my mother fed us baby formula mixed with this toxic chemical. I was one of six in my family, poisoned unknowingly. Growing up, all eight of our family pets died of tumorous cancers. Then in 1990, my father died from cancer at 52 years old. It wasn't just in my family. Our neighbor, he passed away from cancer three months prior to my father, and three months after burying my father, at age 25, I was diagnosed with Stage 4 cancer, which means this has been a lifelong sentence for me. During my treatments for cancer, doctors reportedly found and removed other rare tumors in my body. I've been dealt a lifelong cancer sentence, and this isn't the end. I just want to say that this is sickening and we need accountability as soon as possible. It's not just my town. We have so many people that are dying and ill from this poison, this invisible poison. So please act quickly. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Newburgh Clean Water Project (Doc. #3072-36, SBC-046361)

Good afternoon and thank you for this opportunity to speak. My name's Jennifer Rawlison. I'm one of the 30,000 residents living in the City of Newburg. It's a historic city situated along the Hudson River in the beautiful Hudson Valley, New York, and with all that beauty we face the realities so many environmental justice communities are burdened with, the harmful industrial shadows of the past, and now present day, forever chemicals. I speak today as a member of Newburg Clean Water Project, a grassroots organization formed in response to the discovery that PFAS was running off our local Air National Guard Base and had contaminated our city's primary drinking water source and watershed for decades. I don't know how those decades of exposure to my family and neighbors have ultimately shaped my community. I cannot answer how different our lives may have been otherwise, but I can say our health and sense of security would've been stronger. Family and friends would still be here with us and our drinking water would be safe to drink. I speak today in support of the EPA and the proposed regulations and want to recognize they are long overdue. We know drinking water is a major form of exposure to PFAS and so establishing these regulations to prevent and reduce the exposure to these harmful chemicals is crucial. And as I listen to some bring up costs associated being used as debate or to have a pause, I can only say there is nothing more expensive than the disregard to the health and safety of communities across this nation. Our health cannot and should not be compromised, and therefore the chemical industry, utilities, and those responsible for the poisoning of our communities should bear the burden to clean up their messes and take responsibility for the harms they've caused. And lastly, I ask the EPA to recognize and regulate PFAS as a class, that way to ensure the most health protective steps for all Americans. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan League of Conservation Voters (Doc. #3072-38, SBC-046362)

Thank you so much for the opportunity to give public comment on these critical drinking water protections. My name is Bentley Johnson. In my day job, I work for the Michigan League of Conservation Voters, but today I'm really speaking as a resident of Ann Arbor, Michigan, which has had its source of drinking water contaminated with PFAS, the Huron River. And I really applaud and commend the EPA for proposing these strong limits on the six PFAS in our drinking water. It's long overdue. But these are really lifesaving protections and safeguards and I really encourage you to finalize them and make them as strong as possible as quickly as possible while also doing all your due diligence. In Ann Arbor, like I said, we've had harmful chemicals from a plating facility upstream in the Huron River watershed. We know that those chemicals continue to flow into the Huron River from that facility and other sources. And you know, we're blessed and we're privileged enough that we have the resources here in the city to take steps to filter the water. We need these national standards to ensure that every other community takes action. Even with the action at the city level at our water treatment plant, I'm still concerned. I have a seven-year-old and a four-year-old. I've gotten reverse osmosis filters at my house to make sure that my family is protected. But I think about it literally every day about what they might be consuming and what it might be doing to their health in the long term. So, these proposals and other proposals will literally save lives. We're really encouraged that EPA is proposing to use a hazard index on some of these to inform risks of chemical mixtures. And as you move forward, please take a comprehensive approach to regulating the entire class of chemicals and taking many other steps to prevent exposure from different pathways. Thank you so much and I stand ready to work with EPA to help move these along.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Great Lakes PFAS Action Network (Doc. #3072-39, SBC-046363)

Thank you. My name is Anthony Spaniola. I am a co-founder of the Need Our Water (NOW) PFAS Community Action Group in Oscoda, Michigan. I am also a co-founder and co-chair of the Great Lakes PFAS Action Network comprised of PFAS-impacted residents and groups across the Great Lakes region. I am also personally impacted by PFAS contamination from the former Wurtsmith Air Force Base in Oscoda, Michigan, the first publicly reported PFAS site in the nation, operated by the Department of Defense, the largest and worst known PFAS polluter in the United States. On behalf of my organizations, my community, and my family, I am here today to voice support in the strongest possible terms for the EPA's proposed PFAS National Primary Drinking Water Regulation and to call for its implementation with all deliberate speed.

PFAS contamination in my community of Oscoda, Michigan was first publicly reported more than 13 years ago. In our community, we have been living for a number of years under five separate PFAS public health warnings issued by our state health department. We know what it's like to be told that the fish we'd been eating for decades is unsafe. We know what it's like to be told that the water we'd been drinking for decades is unsafe. We've watched for years as cancers and other adverse health conditions have stricken our neighbors, our friends, and our families at alarmingly high rates. And we've watched for years as scientific gas lighters have tried to pretend it all away. The science is clear. The time for gaslighting and pretending is over. The EPA's proposed drinking water regulation will save lives. It will save productive human lives, human beings, real people like my neighbors, friends, and family, and those who have spoken before me here today, and millions of others across the nation. For those who devalue humanity, for those who look at this with only dollar signs in sight, I say in your terms, the costs of inaction is far greater than the costs and benefits of adopting and swiftly implementing the EPA's proposed regulation. We need safer drinking water. We need PFAS regulated as a class. We need all, but we need the current regulation adopted now. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Faith Agarwal (Doc. #3072-40, SBC-046364)

Hello. Yes. So, I have two daughters and a son, and the PFAS chemicals that I've been drinking throughout my life has negatively affected their children. We know that this is a multi-generational toxin and needs to be swiftly regulated and stopped from our drinking water. So, I strongly support the proposed drinking water limits that the EPA has proposed for these six PFAS chemicals. And due to the slow pace of regulatory agencies, many Americans have been drinking these harmful amounts of PFAS chemicals for decades. So, the rules will speed the implementation of this lifesaving water treatment for communities across the U.S. Therefore, the Agency must finalize these rules as quickly as possible. In addition to the strong standards that the EPA's proposing for the PFOS and PFOA, I support EPA’s expedited action on the four chemicals that it's regulating with that Hazard Index approach. The method allows water managers to account for the additive impacts of exposure to multiple PFAS chemicals, and the EPA should extend this to include the other PFAS chemicals when your toxicological potency values are available. And consider ways that a hazard index can also account for the potential additive impacts of the hundreds of other PFAS chemicals found in the water supplies for which that health information is more scarce. And next, the EPA should act with haste to address the unchecked emissions of these and other PFAS chemicals from industrial sites and consumer products. It must halt the approval of new PFAS chemicals, restrict dumping of the PFAS waste into the wastewater system, limit pollution caused by the biosolid sludge fertilizers, and set health-based limits for the PFAS in substance, fish, and other wild foods. I've seen people locally, young people getting sick, cancers, dying, teachers, people, you know, that we know and limiting this is very important work. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes that the many topics raised in this comment beyond drinking water under SDWA, including emissions of "these and other PFAS chemicals from industrial sites and consumer products", the approval of new PFAS chemicals, PFAS in wastewater, biosolid sludge fertilizers, and "health-based limits of PFAS in substance, fish, and other wild foods", are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, please see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach. In addition, although outside the scope of this action, please see section 10.4.2 of the EPA response in this *Response to Comments* document for discussion of disposal of spent drinking water materials under possible future regulatory actions and costs.

Northeastern University (Doc. #3072-42, SBC-046365)

Thank you very much. As a food safety expert and professor, I'm here to lend my support to the proposed National Primary Drinking Water Regulation that would establish minimum contaminant levels for PFAS in drinking water. The potential health effects of PFAS exposure are of great concern to us all, but are especially troubling for our youngest consumers. These substances have been linked to developmental issues, immune system dysfunction, cancer, and other concerns. Children are particularly vulnerable to the negative health effects of PFAS due to their small body size and developing organ systems. Thus, establishing legally enforceable levels for PFAS in drinking water is a critical step in protecting public health, especially for our children. Last year, the worldwide recall of powder infant formula resulting from a deadly outbreak of Cronobacter infections caused empty store shelves and desperation from worried parents looking for safe products to feed their infants. The safety of powder infant formula depends on the safety of the water parents use with the powder to feed their babies. If the water used to prepare infant formula contains high levels of PFAS, it can pose a serious risk of health to infants. Like earlier speakers, the risk of two infants through the food and water they need for nourishment and healthy development is something I know of from firsthand experience having buried my 16-month-old son, Riley, 30 years ago, due to high levels of pathogens in food that have since been further regulated. It is imperative that we set these standards for PFAS in drinking water to help prevent exposure to harmful contaminants that can have serious long-term health consequences from cradle to grave. I urge you to support the proposed regulation in favor of legally enforceable levels for PFAS in drinking water. By doing so, we can take an important step towards protecting the health and wellbeing of our communities and especially our young, most vulnerable consumers. Thank you for your work and for the opportunity to provide a statement for my support on this regulation. I give my time to fellow speakers.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jonathan Needham (Doc. #3072-50, SBC-046370)

Yes. Thank you for your time. I just wanted to make a few brief comments. First of all, I wanted to congratulate the EPA on this groundbreaking paradigm-shifting effort. It is to be commended and supported. My concern is that things will take too long and we might get into a period of negotiation or reduction of the impact of this reducing levels, etc., so I would urge this to get wrapped up soon. And my final comment is to urge the EPA to consider extending these requirements. Obviously, drinking water is the #1 priority, but I would urge you to consider extending these requirements to include agricultural irrigation water as well as water used in industrial production processes. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bedford Citizen Representative on NH PFAS Commission & Bedford Town Councilor (Doc. #3072-52, SBC-046371)

Thank you, Mr. Willis. My name is Michael Strand. I currently serve as a Bedford New Hampshire Town Counselor as well as the local citizen, advocate, or representative on the New Hampshire PFAS Commission. I will be brief, I don't need the full two minutes. We'll bring it back locally. So, in New Hampshire we are an environment where our current MCL or standard is 0.12 or 12 parts per trillion. This unfortunately has led to large swaths of residential areas and wells that are slightly below that limit without any reimbursement, remuneration or remediation for PFAS contamination caused by a local private entity. It is my belief that should this regulation succeed and we actually have a viable standard for water that is safe and drinkable, that it will actually empower state regulatory bodies to probably recover and have more success at remediation and getting additional funds from the polluters who cause this. That's my primary concern. And I will also say, as much as I realize the cost associated with enforcing this seems prohibitive and scares folks with the spectrum of an unfunded mandate, I do believe that this has to be the first step without which we will have no ground to stand on or no ability to try and hold responsible parties more fiscally and ethically liable for what they cost. And I'll also say, we have recently seen, I think, some encouraging and promising results at the local level to improve municipal water treatment and standards working towards an MCL that actually is reflective of the value of clean water and public safety. Thank you very much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Buxmont Coalition for Safer Water (Doc. #3072-56, SBC-046373)

Hi, my name is Joanne Stanton, co-founder of the Buxmont Coalition for Safer Water in Pennsylvania. I think it's really important that the EPA hears from impacted community members to understand the critical need to finalize these drinking water regulations. My personal PFAS story started when I was a young mother. I was naive. I thought if water came out of my kitchen faucet, it was safe. I had no idea that we had over 40,000 chemicals in consumer use with less than 10% of them ever tested for human health effects. We shouldn't have to worry that untested and unregulated chemicals like PFAS can easily make their way into our drinking water. Eight years ago, we learned that our community's drinking water was contaminated with PFAS for close to 50 years, with some of the highest levels of PFAS pollution ever detected from public drinking water wells. Our contamination source was two Department of Defense sites just outside Philly. As a mom, I started to read everything I could get my hands on about PFAS, and when I began researching the health effects, I learned that some of these chemicals can cross the placenta and affect a developing fetus, cause tumors, cancers, neural developmental problems, and even second-generation health effects. As I read this, my mind raced back to an earlier time when my son was diagnosed with cancer at age six. Back then, after my son's surgery, epidemiologist came into our hospital room and began asking my husband and me very pointed questions. Where do you live? Where was your early pregnancy? Have you or your husband ever worked with chemicals? They told us they found embryotic tissue in the center of my son's cancerous tumor, that meant it started to form during my pregnancy. There were three of us who grew up together on the same street within a few houses of each other, and all three of us had children with the same type of cancerous tumors with embryotic tissue found at the core. Our doctors immediately questioned our environmental exposures to chemicals and we eventually learned that we all drank PFAS contaminated water throughout entire childhood and during our pregnancies. As a mother, it was gut-wrenching for me to be told that my PFAS exposure might have caused my child's cancer. My story's not unique. We have families in my community and communities across this country that have been severely affected by PFAS. We have three-year-old's in town with kidney cancer and moms that don't feel they can safely breastfeed their babies because of the high levels of PFAS found in their breast milk. This is why we need to finalize without delay the proposed PFAS national drinking water regulation. It will save lives. I urge the EPA not to stop here. The EPA can prevent tens of thousands of cancer diagnoses across our country by simply requiring American manufacturers to adopt the precautionary principle where the burden of proof is on the emitter to prove a compound is safe before discharging it into the environment. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan League of Conservation Voters (Doc. #3072-57, SBC-046374)

Thank you for providing the opportunity to comment on these critical drinking water protections. My name is Jace Bylenga and I'm from Grand Rapids, Michigan and I applaud the Environmental Protection Agency for proposing strong limits on six widely detected PFAS in our drinking water. My great grandfather lived on the water in West Michigan and raised my grandfather and dad fishing on the Grand River, Spring Lake and Lake Michigan nearby, and my dad also raised me fishing there as well. I have recently learned that the levels of PFAS in fish in these bodies of water are very high and consuming one fish is as bad as drinking contaminated water for an entire month. These bodies of water are also downriver from the Wolverine World Wide PFAS contamination site, one of the worst in the nation in Rockford, Michigan. Many years ago, my dad was diagnosed with late-stage cancer, but he fought it and won at great cost, and although I can't say if there is a certain connection here, I know so many others have suffered so much from PFAS contamination in this same watershed and there is a very possible link. I doubt I will ever eat a fish out of those water bodies again and that is just heartbreaking. Would you feed your family one of those fish? That damage is priceless and arguments about the economics of this problem are ridiculous in the face of this toxicity and human suffering. Now I am a lifelong advocate for water protection and will continue to work with the Great Lakes PFAS Action Network and the Michigan League of Conservation Voters to ensure that strong protections for our families are put into place and enforced. We urge you to finalize these standards as quickly as possible. While this is an important first step, in order to fully protect the health of our people, communities, and the environment, we urge the EPA to move toward regulating PFAS as an entire class of chemicals instead of one by one. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS related illnesses each year. These exposures are linked to serious health issues including increased rates of cancer, developmental and reproductive harm and other diseases. Thank you so much for instituting strong standards and thank you so much for your time.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Greenville Utilities Commission (Doc. #3072-53, SBC-047386)

PFAS compounds should be regulated at a point of use by the manufacturers. The proposed rule notes that these compounds are harmful to many systems, including cardiovascular and immune systems. These effects can be limited if the government will restrict the use of these compounds at the source rather than requiring the water industry to remove them once in the environment. Significant capital and annual operating costs will be needed to remove PFAS compounds to the proposed levels. The cost of the associated strategies to remove PFAS will increase due to the significant increase in demand for these strategies to meet the proposed compliance goals. The water industry is facing an aging infrastructure challenge that will require large investments to

ensure clean and safe water is provided to our customers. Funds should not be diverted from infrastructure needs to address contamination from multi-billion-dollar companies. Thank you.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA notes the topic of regulating PFAS in manufacturing raised in this comment is outside the scope of this NPDWR rulemaking under SDWA. Please see section 15 of the EPA response in this *Response to Comments* document for topics out of scope of this NPDWR. Section 15 of the *Response to Comments* document also discusses other actions the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach.

Clean Water Action (Doc. #3072-58, SBC-046375)

Yes, you did state my name correctly. Thank you. And I am speaking today on behalf of the thousands of members of Clean Water Action here in California. I am also a resident of San Jose, California, and my local water system has had to take my water supply offline after finding high levels of PFOS. On behalf of our members, we do support EPA's proposed regulation. California often gets overlooked in terms of the national picture because we do not manufacture PFAS in the state, yet after testing only 3% of our water systems, we know that the drinking water of 16 million people in this state have one or more PFAS in them. As monitoring expands, we know that number will go much higher, and a recent study showed that low-income communities of color served by smaller systems in domestic wells will bear an even greater burden. So, for us in this state, this is an environmental problem, a public health problem, and an environmental justice problem. So why do we support this proposal and what do we need moving forward? We support this because PFAS threatens lives at extremely low levels and as some of the people on this line have already indicated, no one wants to suffer health consequences because of their drinking water. We are sick of hearing about economic analyses and costs; cancer and other health effects are expensive and create tragedy. We support the hazard index approach because it is a first step to a class approach. We need this because we fear for inadequate treatment investments that don't capture other PFAS that will add cost to the future and send a false sense of safety in the interim. What we need as this regulation moves forward is for all of EPA to promote research on cost effective monitoring, treatment, and environmentally sound disposal of PFAS. Most of all, we need to stop this disaster from getting worse. While we in the state have made significant strides in eradicating uses of PFAS, we need to go bold and stop their use for all but a few essential uses and we need transparency as to the true scope of their use, and we're looking to EPA to do that as well. Thank you for this opportunity and we look forward to this moving forward.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fountain Valley Clean Water Coalition (Doc. #3072-60, SBC-046376)

Hello, my name is Mark Anthony Favors. I'm a U.S. Army Vet, born and raised in Colorado Springs, Colorado. And my family has been exposed to PFAS for decades from Peterson Air Force Base in Colorado Springs without their consent and without their knowledge, until 2015. At least 16 of my family members have had cancer subsequently because of that, and many of them, you know, while serving in the U.S. Military as veterans. The CDC and the University of Colorado have found that the adults and children in the exposed areas have had significantly higher levels of PFAS in their blood when compared to people who weren't exposed. In fact, I had a cousin at age 14 who had sudden acute kidney failure and had to receive a new kidney and the doctors said it couldn't have been caused by genetics, so most likely environmental, and his mother had lived in the contamination area since she was age 10, because they believe our contamination started in the early 1970s. And like I said, many of my family members while serving combat tours for the United States Military had their families exposed here in the southern Colorado. In fact, my cousin PK who died of cancer last November, he was drafted during the Vietnam War and he reported, he didn't take any deferments and he reported and served in the military and he survived Vietnam, but only now to be buried in a U.S. military National Cemetery here in Colorado because he had been unknowingly drinking contaminated water by the government. So, you just think about that and there's several of our family members that died of cancer that are like that. They survived combat tours in either Vietnam, Korea, or the Middle East, but yet they survived that, but then now they're buried in military cemeteries after being poisoned by PFAS. And we all know it's all documented how the EPA and the Department of Defense have known for decades that these chemicals were toxic. So that's why I asked that the EPA, without any further delay, implement and regulate these PFAS chemicals quickly to save the lives of our adults and children all across the United States and military families and environmental justice communities. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Raymond Choma (Doc. #3072-59, SBC-047390)

Hello, my name is Raymond Choma and I want to express my concern regarding the prevalence of PFAS chemicals in our drinking water. As a concerned citizen, I understand the impact that these forever chemicals can have on the environment and public health. I urge the EPA to finalize the PFAS National Primary Drinking Water Regulation to protect public health and deliver safe drinking water to all communities across America. As mentioned earlier, the EPA says there is no safe level of PFOA and PFOS, which are the most notorious forms of PFAS exposure. Exposure to PFAS chemicals can lead to several harmful health effects, including increased risk of cancer, decreased fertility rates, reduced immune system function, increased cholesterol levels, and developmental impacts to fetuses and infants. Implementing these new rules will help protect Americans and their communities. The impact, the EPA has a chance to

set a new and higher standard for safe tap water nationwide. Currently only seven states have enforceable drinking water standards for some PFAS. By enforcing stronger national protections, we can ensure that every community, especially those in lower income communities and communities of color, will be able to benefit.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan League of Conservation Voters (Doc. #3072-63, SBC-046379)

Alright. Hello, my name is Madeleine Samuels. I work with the Michigan League of Conservation Voters and I would like to voice my support for the EPA's standards as I know how important it is that we set these boundaries for MCLs. I have sat in many meetings with community members impacted personally by PFAS contamination in West Michigan, namely the Rockford Belmont area. Corporations like Wolverine have been able to poison people and decimate their lives with contamination and it's time that they're held accountable. The steps that the EPA is taking are a great first step, but let's not forget that corporations have been putting people's lives in danger for generations with little to no accountability. I strongly urge you to do as much as you can to stop these greedy corporations from putting their profits over the lives of innocent people. Thank you for the opportunity to speak.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Midwest Environmental Advocates (Doc. #3072-65, SBC-046380)

My name is John Noonan, and I am here on behalf of Midwest Environmental Advocates to express our strong support for EPA's proposed National Primary Drinking Water Regulations for the PFAS in question. We support the promulgation of these proposed regulations because the substances meet the endangerment criteria set out in section 1412(b)(1)(A) of the Safe Drinking Water Act. Exposure to PFAS will likely be problematic for the health of persons. There's a substantial likelihood that PFAS contaminate public water systems at a frequency and level that is harmful to public health and the regulations present a meaningful opportunity to reduce public health risk. First, the PFAS chemicals may have adverse effects on the health of persons. EPA has provided enough scientific basis to support its findings. Second, there's a substantial likelihood that drinking water contamination will occur in public water systems at a frequency and level that is harmful to public health, and occurrence data in Wisconsin further supports EPA’s finding on this criterion. Currently, 20 communities across Wisconsin have detected PFAS in their public water systems. These include the City of Marshfield, a community of 18,000 people in West-Central Wisconsin, which detected PFOS concentrations as high as 101 parts per trillion in 2022. The City of Rhinelander, a community of over 7,700 people in northern

Wisconsin, which detected PFHxS concentrations at a high level of 90.1 parts per trillion in 2019, and the City of Madison in central Wisconsin where our organization is located. Madison serves around 235,000 people and there have been frequent detections of PFOS, PFOA, and PFHxS in this public water system since 2019. Third, these regulations present a meaningful opportunity for health risk reduction for persons served by public water systems. Thus far, more than 500,000 people comprising 20 communities in Wisconsin are served by public water systems that have detected PFAS chemicals in the recent past and will be helped by these regulations. We urge EPA to finalize this rulemaking expeditiously for the benefit of the public. My comments will be supplemented by written testimony. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

GRS Inc. (Doc. #3072-67, SBC-046382)

Hello, I'm Jocelyn Lee, principal food safety consultant and director on the board of GRS Inc., involved in the food industry for 25 years and located in San Francisco Bay Area, California. I wholeheartedly support the EPA proposed rule. As a food safety consultant, my primary focus is on ensuring the safety of food products for public's consumption. Safe drinking water is also essential for maintaining public health, and it is important to consider the potential risks associated with water contamination. In particular, PFAS can accumulate in food products that are grown and raised using contaminated water as well as contaminated municipal water used as a raw ingredient and process aid, all which pose a risk to consumers. While verifying water quality via lab testing, water agency quality reports and certificates of analysis are a mandatory food safety code practice. PFAS is not in the testing criteria. Though a good many processors treat their site’s water, the PFAS level may not be reduced to acceptable levels. Processing sites need further PFAS mitigation and funding assistance to reduce and monitor the PFAS level in the water at the point of use within their sites according to the proposed MCL and standards proposed. Rapid PFAS tests for onsite monitoring and mitigation would be ideal for the food industry and our homes. PFAS contaminated water poses a significant risk to consumers leading to a range of illnesses and diseases. As such long overdue, it's never too late to implement important preventive controls and reintroduce monitoring programs to ensure that drinking water is safe for consumption and use in the food industry. It is critical that public health agencies and policy makers take swift action to address this issue and protect the public from further harmful effects of PFAS exposure. This must include implementing more stringent regulations and monitoring of PFAS in water sources, as well as providing resources for affected communities to address this issue. Please do not delay in enforcing this initiative. Our lives depend on this. And thank you for your work and opportunity to comment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response*

to Comments document. For additional information regarding risk communication and resources, please see section 1.2 of the EPA response in this *Response to Comments* document.

Citizens Campaign for the Environment (Doc. #3072-64, SBC-047392)

Thank you. My name is Brian Smith and I'm the Associate Executive Director for Citizens Campaign for the Environment, an 120,000-member environmental advocacy organization working in New York State. We are grateful that EPA has taken this action and are supportive of adopting the proposed regulations with recommendations to further strengthen them. While New York State has been a national leader and an early adopter of MCLs for PFOA and PFOS, EPA's proposed regulations follow latest science and further enhance public health protections for New Yorkers and all Americans. With unprecedented investment in clean water infrastructure from the federal government as well as states such as New York, communities now have access to resources to install treatment technology needed to protect drinking water from PFAS. We support strong enforceable standards for PFOA and PFOS to what is likely the strongest, most health protective standard that is technically feasible at this point, at 4 ppt. Adopting these MCLs will help protect health of New Yorkers currently at risk. In fact, we analyzed the drinking water quality reports for just Long Island in New York State and found that 1.48 million residents were served by systems of levels of PFOA and/or PFOS lower than 10 ppt, which is New York's current MCL, but higher than EPA's proposed standard of 4 ppt. That's about a million and a half people that would receive additional protections with these regulations. We do support the Hazard Index for four additional PFAS chemicals, which addresses the combined impact of these chemicals. However, we do recommend the EPA include a mechanism to add additional PFAS chemicals to this Hazard Index to avoid lengthy delays associated with starting new regs from scratch.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional details on incorporating additional PFAS into the Hazard Index, please see section 4.3.5 of the EPA response in this *Response to Comments* document.

Clean Water Action (Doc. #3072-75, SBC-046385)

Hello, my name is Lynn Thorp and I'm the National Campaigns Director for Clean Water Action. We support EPA's proposal. EPA has appropriately analyzed health and occurrence information as well as feasibility of treatment to propose MCLs for PFOA and PFOS and to develop a Hazard Index approach for the four other PFAS chemicals. I wish we were not finding PFAS chemicals in drinking water around the country. We are likely to find more in data from the fifth round of unregulated contaminant monitoring going on right now. When this proposal is finalized, water systems will devote considerable effort and cost to comply with this regulation and their customers will help pay for that. However, knowing what we know about the wide range of public health risks from these chemicals, we cannot wait to take action to limit them in drinking water in keeping with all the statutory requirements. The federal government needs to

help water systems and communities hold PFAS manufacturers and users responsible for the drinking water contamination that has led us to this point. EPA estimates that drinking water can be 20% of our exposure to these chemicals. That means there are many other sources of exposure including food, air, products we handle like food packaging, workplace exposures and more. This proposal should, therefore, be a wake-up call. This National Primary Drinking Water Regulation proposal cannot be the only bold action taken in regard to PFAS. The Safe Drinking Water Act does not give EPA authority to keep chemicals out of drinking water, but we urge the Office of Groundwater and Drinking Water to do everything in its power to ensure that other parts of EPA and all federal partners are taking equally decisive action to reduce PFAS exposures and get these chemicals out of use. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see section 15 of the EPA response in this *Response to Comments* document for actions outside of the PFAS NPDWR under SDWA that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach.

Merrimack Citizens for Clean Water (Doc. #3072-68, SBC-047396)

Thank you. My name is actually Laurene Allen. I didn't realize that the Zoom was under my business name. I'm a clinical social worker. I am located right now in Milford, New Hampshire. I am the co-founder of Merrimack Citizens for Clean Water. We learned in 2016 that the water that we believe to be safe and pristine in our beautiful natural New Hampshire environment here was in fact contaminated and we had been drinking this water for decades. Our polluter is identified; it's Saint-Gobain Performance Plastics. The same travesties occurred in Hoosick Falls, New York, and in Bennington, Vermont. Discharges to environment have ruined our aquifers for miles. Currently, the investigation has expanded. We're seven years into this, we have over 100,000 impacted people at least that are acknowledged. And when we first learned about this, we were really minimized. You know, people looked around and shared stories. I thought about not only my personal observations, but my clinical work and all the health patterns I had seen that really puzzled me, neurologically, physically, etc. It matches all the research that we see. So, when you came out with your health advisory in June of last year, I was choked up. I was so validated. Everyone here just felt really seen by that acknowledgement that there is no safe level of PFOA and PFOS in a minimum. We also know we are exposed as a class, you know that also. I love the fact that you have taken this step for the hazardous index. It is brilliant. It is the way we need to go. We can't wait to prove what caused the illnesses that we see. And I will tell you what we see here in this community. The majority of people are at levels that were under that initial 70-part screening level and some of the homes in the area have relatively low exposure rates, yet their health patterns are similar to what we see absolutely everywhere. So, by setting this law, it's long overdue. You know, I really believed we had regulations to prevent this from happening, but unfortunately we have toxic chemicals that have evaded the label of toxicity for more than 20 years.

South Easton, MA 02375

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Clean Water Action (Doc. #3072-78, SBC-046387)

Thank you. My name is Jed Thorp and I'm the Rhode Island Director for Clean Water Action and we're pleased to have the opportunity to express our support for the EPA's proposed standards for PFAS in drinking water. As others have noted, these standards are long overdue. Just last year the Rhode Island General Assembly passed legislation setting state level standards for PFAS in drinking water, groundwater, and surface water. We've also banned PFAS in food packaging and legislation to ban non-essential uses of PFAS in a variety of consumer products is also currently under consideration, because we won't ultimately get PFAS out of our water or out of our bodies until we get PFAS out of products being sold. Many of the previous speakers have discussed the various health risks associated with PFAS exposure. We support the proposed 4 parts per trillion standard as it reflects the seriousness of those health risks. These proposed limits on PFAS in drinking water will prevent serious illness and they will save lives. As more testing is done over time, we'll likely find more and more sources of PFAS contamination, and we know that complying with these standards will be a challenge for some municipalities. While federal funding will help cities and towns meet these new standards, we hope that PFAS manufacturers will also be held financially accountable for contaminating drinking water, when the sources of contamination are clearly identified. While they may not give verbal testimony today, we know that the chemical industry and the folks responsible for this problem will be working hard to weaken these standards, but we urge EPA to do what you're charged to do, which is to protect the environment and public health and finalizing these proposed standards will do just that. Lastly, we urge EPA to work with other federal partners to think upstream, if you will, and take steps to get PFAS out of consumer products and ultimately to completely phase out their use. Thank you for your time.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

League of Conservation Voters (Doc. #3072-82, SBC-046391)

Good afternoon. My name is Lizzy Duncan, and I am with the League of Conservation Voters. LCV works to advance equitable policy solutions that ensure clean air, clean water, and access to our democracy are not a privilege but a right afforded to every community. Thank you for providing the time to speak today. I'm here today to urge the EPA to finalize the strongest possible standards for PFAS in drinking water. PFAS are extremely harmful forever chemicals that don't break down in the environment and are linked to serious health issues including liver

damage, cancer, asthma, and developmental harms. These health issues are often exacerbated in children. PFAS have been found to contaminate drinking water supplies of nearly 200 million people in the U.S. and this number is likely much higher because not every community is testing for PFAS. Even more frightening, more than 95% of the U.S. population already has PFAS in our bodies, which is unacceptable. The EPA's proposed rule to require monitoring, public notification and actions to eliminate and reduce PFAS exposure is critical and overdue. We are pleased to see that this rule has potential to prevent tens of thousands of PFAS related illnesses. Clean water is a basic human right. Our families and communities should be able to trust that the water coming out of the tap is safe. I'm urging EPA to do its duty of protecting the environment and safeguarding our health. Please move swiftly to finalize the strongest possible standards for PFAS in drinking water. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Clean Water Action (Doc. #3072-84, SBC-046393)

Thank you all. Thanks for the opportunity to testify. My name is Cynthia Luppi and I'm the National Field Director for Clean Water Action. And I'm here today to reiterate that Clean Water Action supports EPA's proposed National Primary Drinking Water Regulations. Clear science and strong health imperatives support EPA's proposed action as many speakers have mentioned. We are driven to testify today on behalf of our members across the country and what they've experienced. This is a very local community-based issue for many of the grassroots leaders and members that we work with. And it's a very personal issue for families like that of Amara Strandis, who was diagnosed with Stage 4 liver cancer as a teenager. Growing up in Minnesota, she lived in the 3M plume and attended Tartan High School with other students directly affected by cancer. Amara spent the last weeks of her life urging action to comprehensively address PFAS pollution at all levels of government. Amara's story is a really powerful one and for all the Amaras and communities that are directly affected, we urge EPA to swiftly move forward with this proposed regulation. We know it's only a part of the PFAS action needed, but you know, clearly, we also need to ban PFAS in all but the currently or unavoidable uses in the many products in which it is found. But EPA's action today to pass the strongest possible rules are a central part of a protective PFAS agenda, and we thank you for moving forward in this way and again, thanks for the opportunity to testify.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Advisory Committee for Alachua County, Florida (Doc. #3072-102, SBC-046405)

Okay. Yeah. My name is David Moritz, I'm a resident of Florida and I'm a member of an advisory committee for Alachua County as well as being one of the people who started an amendment to the constitutional of Florida, petition at least to get it on the ballot. We haven't had much luck getting even where there is something that the EPA has put in place, getting the state to enforce it, and they seem to take away from the EPA whatever they can so they can enforce it themselves, so we kind of feel that the way to really go is to have state amendments, that green amendments, if you will, that essentially will give citizens the right to clean water, which means essentially that they can then go and sue their state government. Whether there's the governor or anyone in the Florida Department of Environmental Protection in our case, or any one of the other executive agencies in Florida that are responsible for enforcing the law. I agree with many of the comments made. I think the main problems are, the main problem is we found in Florida, you can't just leave this up to cleaning up the water after the fact, you've got to keep it out. You've got to get it to the source. And to that standpoint, you know, you just can't let these PFAS chemicals be made in the first place. They can't be put into products. They can't be distributed. They can't be allowed to be put back into the water when the companies have it in their waste system, waste stream. So that has to stop before we're going to be able to do anything with company. Otherwise, the utilities are going to be spending fortunes just to try and clean up after the companies and then as others have pointed out, we, the citizens will have to pay for it. The other thing I have a problem with is just limiting it to the six different specific PFAS chemicals when there's hundreds of them out there, and as soon you cut down on one, they're going to say, "Oh well, we'll we just move something over here, move this group over here, carbon or whatever we've got to do to get us to still work but be a different enough chemical that it is no longer regulated." Because you know that's what they're going to do. So, if we don't have something in place that takes the PFAS chemicals out as a class, as people have been saying and, we're not going to get anywhere with this. Thank you very much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on incorporating additional PFAS into the Hazard Index, please see section 4.3.5 of the EPA response in this *Response to Comments* document. The EPA notes that the many topics raised in this comment beyond drinking water under SDWA, including the manufacturing, use, and distribution of PFAS and PFAS in wastewater, are outside the scope of this rulemaking. For more information on topics outside the scope of the final PFAS NPDWR, see section 15 of the EPA response in this *Response to Comments* document. Section 15 of the *Response to Comments* document also discusses other actions that the EPA and other federal agencies are or may consider taking to address PFAS through a whole-of-government approach.

Christine Géhant (Doc. #1871, SBC-047286)

Dear Michael Regan,

Merci d'avoir fait le premier pas pour réglementer les SPFA dans l'eau potable. Pendant des décennies, les SPFA ont contaminé les réserves d'eau potable de millions de personnes à travers le pays, entraînant une augmentation des taux de cancer, de dommages au développement et à la reproduction et d'autres maladies graves. Les normes proposées par l'EPA pour l'eau potable fourniraient des protections importantes et attendues depuis longtemps contre six de ces produits chimiques toxiques. Nous appuyons fermement les normes proposées et nous exhortons l'EPA à les finaliser le plus rapidement possible.

Les PFAS sont une classe de produits chimiques de grande taille, durables et très dangereuses. Souvent appelés « produits chimiques éternels », les SPFA persistent dans l'environnement, s'accumulent dans notre sang et nos organes et continuent de causer des dommages des décennies après leur rejet dans l'environnement. Les PFAS ont contaminé les réserves d'eau potable d'environ 200 millions de personnes et le sang de presque tous les individus aux États-Unis, y compris les nouveau-nés exposés in utero. Pourtant, malgré les risques graves pour la santé associés aux SPFA, il n'y a actuellement aucune limite fédérale sur les concentrations de SPFA dans l'eau potable.

La règle proposée par l'EPA fournirait de l'eau potable plus sûre aux communautés d'un océan à l'autre. En établissant des limites strictes pour six SPFA largement détectées, la proposition sauverait des milliers de vies et préviendrait des dizaines de milliers de maladies graves liées aux SPFA chaque année. L'EPA reconnaît et aborde les impacts cumulatifs sur les communautés qui sont exposées à de multiples PFAS, et en publiant cette proposition, l'EPA fait un pas de plus vers la réalisation de son engagement dans le cadre de la feuille de route stratégique 2021 des PFAS de commencer à réglementer les PFAS dans l'eau potable. Nous vous exhortons à finaliser rapidement ces normes et à mettre en œuvre une règle qui protège le mieux la santé, résistant aux efforts de l'industrie pour les affaiblir.

Sincerely,

Christine Géhant

Member of Congress (Doc. #3073, SBC-047676)

May 30, 2023

Administrator Michael S. Regan

U.S. Environmental Protection Agency

EPA Docket Center, OW Docket

Mail Code 28221T

1200 Pennsylvania Ave. NW Washington, DC 20460

Administrator Regan:

We write in strong support of the U.S. Environmental Protection Agency's (EPA's) proposed National Primary Drinking Water Regulations for per- and polyfluoroalkyl substances (PFAS). This proposal to regulate six types of PFAS, as individual chemicals and chemical mixtures, is critical to protecting our public health and environment. We are encouraged by the Biden administration's efforts thus far to address these toxic forever chemicals and strongly urge the EPA to finalize the standards as quickly as possible.

For far too long, the federal government has failed to set national standards to limit the concentration of PFAS in drinking water. PFAS chemicals pose grave danger to human health and our communities. They are persistent in the environment and human body, and many may be linked to serious health problems including thyroid, kidney, liver, heart and reproductive conditions.

Drinking water is a significant pathway of PFAS exposure, which is why we must address contamination before it reaches our communities' water systems. EPA estimates that 94 million Americans currently have drinking water contaminated by PFAS chemicals at levels above the limits proposed by EPA. Even at low levels of exposure, PFAS in drinking water may cause long term adverse health effects. We were pleased to see under EPA's proposal that drinking water utilities would be required to test water for PFOA and PFOS, as well as GenX, PFBS, PFNA, and PFHxS .

GenX, PFBS, PFNA, and PFHxS are among the thousands of forever chemicals that make up the class of PFAS, which have similar chemical structures and cause similar health effects. Testing for these chemicals as a mixture will provide a framework to address additional PFAS variations and mixtures of chemicals in the future.

As members of the bipartisan Congressional PFAS Task Force, we look forward to continuing our work with you to protect all Americans from harmful PFAS chemicals.

Sincerely,

Daniel T. Kildee

Edward Cullen (Doc. #3075, SBC-047722)

Re: Docket ID No. EPA-HQ-OW-2022-0114, PFAS National Primary Drinking Water Regulation Rulemaking

I agree with the US EPA's plan to regulate per- and polyfluoroalkyl substances (PFAS) in US drinking water, as described in the March 29, 2023 Federal Register ("PFAS National Primary Drinking Water Regulation"; FR 88, 18638). I also urge the EPA to implement the new rules as soon as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045644)

[Attachment 2: Appendix A - Detailed Technical Comments on PFAS Toxicological Assessments : See Docket ID: EPA-HQ-OW-2022-0114-1759]

Appendix A

Detailed Technical Comments on PFAS Toxicological Assessments

Comments on the Proposed Regulation for Per - and Polyfluoroalkyl Substances (PFAS)

[Table of Contents: See Docket ID: EPA-HQ-OW-2022-0114-1759]

1. Introduction

This document provides comments on the science considered and technical methods and approaches applied in the development of the US Environmental Protection Agency's (USEPA) proposed National Primary Drinking Water Regulation (NPDWR) for six per- and polyfluoroalkyl substances (PFAS) including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA and its ammonium salt, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS). Our review for these

comments includes the documentation of these methods and approaches in the following public comment drafts:

• Toxicity Assessment and Proposed Maximum Contaminant Level Goal for Perfluorooctanoic Ace (PFOA) in Drinking Water (USEPA 2023a) and Appendices (USEPA 2023b);

• Toxicity Assessment and Proposed Maximum Contaminant Level Goal for Perfluorooctane Sulfonic Acid (PFOS) in Drinking Water (USEPA 2023c) and Appendices (USEPA 2023d);

• Economic Analysis for the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (USEPA 2023e) and Appendices (USEPA 2023f);

• Maximum Contaminant Level Goal (MCLG) Summary Document for a Mixture of Four Per- and Polyfluoroalkyl Substances (PFAS): HFPO-DA and its Ammonium Salt (also known as GenX Chemicals), PFBS, PFNA, and PFHxS (USEPA 2023g); and

• Framework for Estimating Noncancer Health Risks Associated with Mixtures of Per- and Polyfluoroalkyl Substances (PFAS) (USEPA 2023h).

EPA Response: The EPA acknowledges this comment. The EPA is addressing comments directly in other sections of the Response to Comments document organized by topic. Please see the applicable sections of the Response to Comments document responding to each detailed comment topic listed by the commenter. For an overview of how the EPA has met the requirements under the SDWA to promulgate this PFAS NPDWR, please see section 1.1 of the EPA response in this Response to Comments document. For additional high-level discussion of some of the points the commenter lists, please see section 1.3 of the EPA response in this *Response to Comments* document.

1.4 Entities to which the Action Applies

Summary of Major Public Comments and EPA Responses

The EPA has received comments related to applicability of this final PFAS NPDWR to various entities. Some commentors state that they believe the rule is unclear for whom it applies, with specific concerns around the applicability of this rule to wholesale and consecutive systems (also referred to as secondary systems). Some comments suggest that the rule should also apply to TNCWSs, or that the rule should apply to entities that do not meet the definition of a PWS under the SDWA. A few comments reflect concerns around private well owners and bottled water consumers.

Some comments request clarity around the definitions of systems that are included within this rulemaking, and to provide clarifying rationale as to why these systems are included or not. The EPA describes the entities in which this rule applies in section I.B in the preamble of the FRN. As defined under SDWA (42 USC 300f(4); 40 CFR 141.2), a PWS is "a system for the provision to the public of water for human consumption through pipes or, after August 5, 1998, other constructed conveyances, if such system has at least fifteen service connections or regularly

serves an average of at least twenty-five individuals daily at least 60 days out of the year". NPDWRs that are regulated under the SDWA only regulate PWSs if they meet these requirements. The EPA does not have the legal authority to regulate anything that is not defined as a PWS. PWSs can be classified as a community water system (CWS) or a non-community water system (transient and non-transient). Forty CFR 141.2 defines a CWS as a "public water system which serves at least fifteen service connections used by year-round residents or regularly serves at least twenty-five year-round residents;" and a non-transient non-community water system (NTNCWS) is defined as a "public water system that is not a community water system and that regularly serves at least twenty-five of the same persons over six months per year." As described in Section I.B of the final rule preamble, all CWSs and NTNCWSs are subject to the rule requirements under this PFAS NPDWR. Additional details regarding consecutive systems are included below.

Most comments provided in this section describe how the EPA has failed to differentiate the exact system classifications within the definition of a PWS that are required to monitor under this NPDWR. Because of this, commentors request that the EPA exempt consecutive systems, or systems that purchase from wholesale systems, from monitoring for the regulated contaminants within this NPDWR because it would be a waste of water system resources and would exacerbate existing laboratory capacity issues for these systems to test for PFAS, especially if the wholesale system is also already required to monitor under the NPDWR. Although no distinction for PWSs was included in the monitoring and compliance requirements (section VIII of the FRN), the EPA did provide clarifying language regarding consecutive systems in section I.B of the preamble and therefore believes that the language is clear. The requirements these consecutive systems must implement to comply with this regulation may be, and often are, much less extensive than for systems which draw untreated water from a given source water (i.e., non-consecutive systems).

For clarity, 40 CFR 141.2 defines a wholesale system as "a public water system that treats source water as necessary to produce finished water and then delivers some or all of that finished water to another public water system. Delivery may be through a direct connection or through the distribution system of one or more consecutive systems." Forty CFR 141.2 then defines a consecutive system as a "public water system that receives some or all its finished water from one or more wholesale systems." For finished water that is provided through a system interconnection (defined in 40 CFR 141.29 as the connection point between one or more PWSs), the wholesale system is responsible for conducting the PFAS NPDWR monitoring requirements at the EPTDS. Because the wholesale system will be conducting compliance monitoring for all regulated PFAS, and the EPA does not anticipate that concentrations of these PFAS will fluctuate between the wholesaler and purchasing systems or within the distribution system, the EPA will not require any monitoring to be conducted at a system interconnection point of a consecutive system. If an MCL violation does occur at an EPTDS, the wholesale system must notify their consecutive systems of this violation and the consecutive systems must provide PN to their customers. Wholesale systems must also provide any information on monitoring data and violations to their consecutive water systems. Those consecutive water systems must then

include this information in their CCR so their customers are informed about the quality of their water. In short, consecutive systems that receive all their finished drinking water from a wholesale system are not responsible for compliance monitoring for this NPDWR and are only responsible for providing their customers with a CCR regarding their water quality and PN if there is a violation of the NPDWR. This approach on consecutive system requirements, as well as for monitoring frameworks requiring entry point monitoring rather than distribution system monitoring, is consistent with other synthetic organic chemical (SOC) contaminants that the EPA currently regulates. For more information about the monitoring and compliance requirements, please see section 8 of the EPA response in this *Response to Comments* document. For more information about the CCR or the public notification requirements, please see section 9 of the EPA response in this *Response to Comments* document.

The EPA disagrees that this rule should apply to all public water systems, specifically TNCWSs. Forty CFR 141.2 defines a TNCWS as a "non-community water system that does not regularly serve at least 25 of the same persons over six months per year" (e.g., campgrounds, gas stations). TNCWSs are generally required to monitor for contaminants that exhibit an acute nature of exposure that results in immediate life-threatening health impacts, such as indicators for acute microbial contaminants like total coliforms (40 CFR Part 141.851) or nitrate and nitrite (40 CFR Part 141.23). Therefore, the EPA has determined that TNCWSs are to be excluded from this rulemaking, as exposure to the regulated PFAS in drinking water are not known to represent immediate acute health effects. This is consistent with the requirements under the Chemical Contaminants Phase II/V rules, (56 FR 3526 and 57 FR 31776, respectively), the Lead and Copper NPDWR (40 CFR Part 141 Subpart I), and most disinfection byproducts described in the Stage 2 Disinfectants and Disinfection Byproducts NPDWR (40 CFR Part 141 Subpart L), as examples. Importantly, the EPA allows primacy agencies (such as states or Tribes) to impose more stringent requirements than those described within NPDWRs. The EPA's NPDWR serves as the least stringent requirements and leaves room for primacy agencies to provide additional requirements for systems excluded by this rule, like for systems that are classified as transient but are serving schools or gas stations. Therefore, determination of system type can be done on a case-by-case basis. For additional discussion on why the six PFAS under this final regulation are determined to not represent immediately life-threatening health impacts, please see the section 9.2 of the EPA response in this *Response to Comments* document. For further discussion of the EPA's characterization of health effects from PFAS exposures, please see section 5.1.1 and 5.2.1 of the EPA response in this *Response to Comments* document for PFOA and PFOS, respectively; for health effects of the other PFAS subject to regulation under this rule, see section III.B of the preamble to the final rule. For comments that explicitly ask about protection for school systems and the EPA's response to those comments, please see the EPA response to comment Doc. #1473, SBC-042309 in section 1.4 in this *Response to Comments* document.

As previously described, the EPA only has the authority to promulgate a NPDWR for PWSs. Therefore, as noted above, this PFAS NPDWR only applies to PWSs that are CWSs and NTNCWs and does not apply to private wells or bottled water entities. The regulation of bottled water or management of private wells are outside the EPA's authority for promulgating an

NPDWR under the SDWA and therefore, outside the scope of this rulemaking. Though beyond the scope of the rulemaking, the EPA notes that the Food and Drug Administration (FDA) ensures that the quality standards for bottled water are compatible with the EPA's standards for public drinking water. See section 15 that discusses topics that are out of scope of this rulemaking. Please visit the EPA website to learn more about bottled water (https://www.epa.gov/sites/default/files/2015-11/documents/2005_09_14_faq_fs_healthseries_bottledwater.pdf) and private drinking water wells (https://www.epa.gov/privatewells).

Individual Public Comments

Jorge Diaz Castello (Doc. #1473, SBC-042309)

In closing schools have a responsibility to provide safe drinking water to their students and staff, and they should be held to the same standards as other public water systems. Furthermore, as children are particularly vulnerable to the effects of PFAS contamination, it is imperative that we take every possible step to protect them. By ensuring that schools are monitoring for PFAS and adhering to the MCLs, we can help to prevent the negative health impacts associated with these compounds.

Therefore, I urge you to directly address schools as NTNCWS for EPA's Proposed PFAS NPDWR.

Thank you for your consideration of this important issue.

Sincerely:

Jorge Diaz Castello diazcastello@gmail.com

786 381 8592

EPA Response: Many schools are served by CWSs and therefore the water they receive would be subject to the PFAS monitoring and MCLs at the CWS level. Schools that are NTNCWSs would also be subject to the PFAS monitoring and MCL requirements. A school that is not served by a CWS may be considered a NTNCWS if it meets the definition in 40 CFR 141.2. For schools that are not PWSs, the EPA does not have the authority to regulate them. As described in the section 1.4 of the EPA response in this *Response to Comments* document, the EPA only has the authority in a NPDWR to regulate a PWS so schools that are not considered a PWS are outside of the EPA's NPDWR authority. The EPA expects that the final rule would provide additional protection to both children and adults who consume drinking water supplied by the affected systems. The EPA also expects that the benefits of the final rule, including reduced health risk, will provide significant benefits to infants and children. SDWA Section 1412(b)3(C)(V) requires that in the HRRCA the EPA consider "[t]he effects of the contaminant on the general population and on groups within the general population such as infants, children, pregnant women, the elderly, individuals with a history of serious illness, or other

subpopulations that are identified as likely to be at greater risk of adverse health effects due to exposure to contaminants in drinking water than the general population." For discussion of the benefits (including those for children) that were considered for the HRRCA of this NPDWR, please see section XII.E-G of the FRN and Section 6.2.2 of the EA. Consistent with SDWA Section 1412(b)(3)(C)(i)(V), when setting the MCLG, the EPA considers the effects of the contaminant on the general population and sensitive subpopulations, which includes for infants, children, and pregnant women. The PFAS NPDWR sets the MCLGs for PFOA and PFOS to zero and the MCL is set as close as feasible to these MCLGs. The NPDWR is protective against health effects in children that are described in more detail in sections IV and V of the FRN. Lastly, the EPA evaluated the environmental health or safety effects of the regulated PFAS found in drinking water on children and estimated the risk reduction benefits to children associated with the final rule to reduce these PFAS in drinking water, which is described further in the agency's analysis for *Executive Order 13045: Protection of Children from Environmental Health and Safety Risks* (section XIII.G of the FRN).

Jorge Diaz Castello (Doc. #1473, SBC-042307)

Ashley Greene

Standards & Risk Management Division

The Office of Groundwater & Drinking Water Environmental Protection Agency

1200 Pennsylvania Ave.

Washington, DC 20460

RE: EPA's Proposed PFAS NPDWR; Docket ID No. EPA-HQ-OW-2022-0114

Dear Mrs. Greene:

I am writing to express my support for EPA's Proposed PFAS NPDWR. As you may know, PFAS compounds have been linked to numerous health risks, and it is crucial that we take steps to limit exposure to these substances.

However, I urge you to consider directly addressing the applicability of schools as public water systems. While they may not fit the traditional definition of a public water system, they do meet the definition of a non-transient non-community water system (NTNCWS) as defined by the proposed regulation; an entity that provides water to at least 25 of the same people at least six months per year.

Schools must be responsible for ensuring that the water is safe for their students to drink. Given that children are particularly vulnerable to the effects of PFAS contamination, it is imperative that we take every possible step to protect them. By including schools in the regulation, we can

ensure that all children have access to safe drinking water, regardless of where they attend school.

EPA Response: The EPA acknowledges the commenter's support for the PFAS NPDWR rulemaking. Regarding applicability of the rule's requirements to schools, please see section 1.4 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1473, SBC-042309 in section 1.4 in this *Response to Comments* document.

Jorge Diaz Castello (Doc. #1474, SBC-042310)

Applicability of proposed rule. See attached

March 30, 2023

Ashley Greene

Standards & Risk Management Division

The Office of Groundwater & Drinking Water

Environmental Protection Agency

1200 Pennsylvania Ave.

Washington, DC 20460

RE: EPA's Proposed PFAS NPDWR; Docket ID No. EPA-HQ-OW-2022-0114; Applicability to Non-transient, non-community water systems (NTNCWSs)

Dear Mrs. Greene:

Please address each scenario and advise if Proposed PFAS NPDWR applies:

1. Schools with more than 25+ students that also have drinking fountains or a cafeteria.

2. Office buildings with 25+ employees that also have drinking fountains, cafeteria, or kitchens.

3. Hotels with 25 employees that also have drinking fountains, cafeteria/restaurant.

4. Any facility with 25+ employees that also have drinking fountains, or cafeteria.

Let's get this right and leave out ambiguity.

Sincerely

Jorge Diaz Castello diazcastello@gmail.com

786 381 8592

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. Regarding applicability of the rule's requirements to schools, please see section 1.4 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1473, SBC-042309 in section 1.4 in this *Response to Comments* document. Whether individual schools and other facilities meet the legal requirements included in this rule are evaluated on a case-by-case basis. Many schools, office buildings, hotels, and other facilities with 25+ employees are served by CWSs and therefore the water they receive would be subject to the PFAS monitoring and MCLs at the CWS level. A school, office building, hotel, or other facility with 25+ employees that is not served by a CWS may be a NTNCWS if it meets the criteria in 40 CFR 141.2. Facilities that meet the definition for NTNCWSs would also be subject to the PFAS monitoring and MCL requirements. As described in section 1.4 of the EPA response in this *Response to Comments* document, the EPA only has the authority in a NPDWR to regulate a PWS so any of the listed facilities that are not considered a PWS are outside of the EPA's NPDWR authority.

Great Lakes Water Authority (GLWA) (Doc. #1558, SBC-042548)

Sampling Clarification

The proposed language currently uses Community Water System (CWS) terminology when defining systems required to sample. This language does not distinguish between treatment providers and receivers in consecutive systems. Therefore, each CWS would be required to sample for PFAS concentrations. Requiring samples by secondary systems is not warranted and only adds to the burden of sampling and analysis costs for our Member Partners while also straining laboratory capacity. GLWA further asserts that our member partners without connections to other water service providers should be eligible for sampling exemption status.

EPA Response: The EPA agrees that purchasing or consecutive systems are not subject to the rule's monitoring requirements. Regarding applicability of the rule's requirements to consecutive systems, please see section 1.4 of the EPA response in this *Response to Comments* document. For finished water that is provided through a system interconnection, wholesale systems will be responsible for conducting the monitoring requirements at the EPTDS. The final regulation does not require that any monitoring be conducted at a system interconnection point. For additional discussion on monitoring requirements, please see section 8.1.2 of the EPA response in this *Response to Comments* document. For more discussion on extensions and exemptions requirements, please see section 12 of the EPA response in this *Response to Comments* document.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042729)

Regulated Entities:

EPA proposes that Community Water Systems and Non-Transient, Non-Community Water Systems will be subject to this rule. If EPA is so concerned about drinking water as an exposure

pathway, MWUA believes that standards should also apply to Transient Non-Community Water Systems where employees could be drinking the water every day. More importantly, we additionally wonder why the Biden Administration is not moving forward with regulations (under the appropriate regulatory authority, if not EPA) to require testing of private wells. The inhabitants of a home drinking water from a private well are doing so in the same manner as customers served by a PWS. Similarly, the Food and Drug Administration should be regulating PFAS in bottled water. If PFAS is as dangerous as EPA is suggesting, we think that the EPA and the states' regulatory agencies should be as concerned about private well owners and bottled water consumers as they are about customers of PWSs and find the appropriate mechanisms to make all consumers aware of PFAS.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

National Tribal Water Council-Tribal PFAS Working Group (NTWCTPWG) (Doc. #1598, SBC-042336)

Monitoring

On page 18734 of the FRN, it is stated that:

This action has tribal implications, it imposes direct compliance costs on tribal governments, and the Federal government will not provide funds necessary to pay those direct compliance costs. However, EPA notes that the Federal government will provide a potential source of funds necessary to offset some of those direct compliance costs through the BIL.

EPA has identified 998 PWSs serving tribal communities, 84 of which are federally owned. EPA estimates that tribal governments will incur PWS compliance costs of $5 million per year attributable to monitoring, treatment or non-treatment actions to reduce PFAS in drinking water, and administrative costs, and that these estimated impacts will not fall evenly across all tribal systems. The proposed PFAS NPDWR does offer regulatory relief by providing flexibilities for all water systems to potentially utilize pre-existing monitoring data in lieu of initial monitoring requirements and for groundwater CWSs and NTNCWSs serving 10,000 or fewer to reduce initial monitoring from quarterly monitoring during a consecutive 12-month period to only monitoring twice during a consecutive 12-month period. These flexibilities may result in implementation cost savings for many tribal systems since 98 percent of tribal CWSs and 94 percent of NTNCWs serve 10,000 or fewer people.

[In the above paragraphs, BIL indicates Bipartisan Infrastructure Law (Infrastructure Investment and Jobs Act; Public Law 117-58), CWSs indicates Community Water System, defined by EPA as a public water system that supplies water to the same population year-round, and NTNCWSs indicates Non-transient non-community water systems, which is defined by EPA as a public water system that regularly supplies water to at least 25 of the same people at least six months per year. Some examples of NTNCWSs given by EPA are schools, factories, office buildings,

and hospitals that have their own water systems. The following definitions are added for completeness. EPA defines a transient Non-Community Water System (TNCWS) as a public water system that provides water in a place such as a gas station or campground where people do not remain for long periods. Finally, a public water system provides water for human consumption through pipes or other constructed conveyances to at least 15 service connections or serves an average of at least 25 people for at least 60 days a year. A public water system may be publicly or privately owned. https://www.epa.gov/dwreginfo/information-about-publicwater-systems.]

The NTWC-TPWG recommends that language be included that recognizes the problems inherent in applying the (proposed) regulation to the numerous small tribal water systems that fail to meet the 25-person criterion for classification as a public water system and that speaks to monitoring guidance for such systems. This guidance could be located on a webpage hosted by EPA and be updated from time to time as PFAS understanding, experience and awareness improves, as compared to lodging the guidance as a static item in the (proposed) regulation.

EPA Response: The monitoring requirements of the final rule will be publicly available in the CFR. Water systems not defined as a PWS under SDWA, which are defined by the statute as providing water for human consumption to at least 15 service connections or serving an average of at least 25 people for at least 60 days a year, could consider using these monitoring requirements to inform the development of any voluntary sampling programs or processes, although they would not be required under the rule. As described in section 1.4 of the EPA response in this *Response to Comments* document, under SDWA, an NPDWR establishes requirements applicable to PWSs. Since the definition of a PWS is prescribed by statute in the SDWA, the EPA cannot amend that definition through an agency rulemaking. Further, NPDWR requirements for water systems that do not meet the requirements for a PWS, as defined in SDWA, are beyond the EPA's authority under the SDWA and therefore, outside the scope of this rulemaking. Regarding production of additional guidance and communication materials, please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion around the EPA's pre-proposal Tribal consultation and outreach, please see section 14.6 of the EPA response in this *Response to Comments* document and section XIII.F of the final rule preamble.

The EPA acknowledges the challenges that the commentor has described regarding small Tribal water systems. Small water systems that do not meet the definition of a PWS as prescribed in the SDWA may receive assistance from the EPA's Training and Technical Assistance for Small Systems program (https://www.epa.gov/dwcapacity/training-and-technical-assistance-small-systems-funding), which provides support to small water systems as well as private well owners to improve water quality. Communities may request assistance from this and other EPA technical assistance programs using the WaterTA Request form (https://www.epa.gov/water-infrastructure/forms/water-technical-assistance-request-form). As described in the EPA response to comment Doc. #1784, SBC-045804 in section 14.10 in this *Response to Comments* document, the EPA is also working with Tribal drinking water systems to ensure they have resources to

address PFAS and other emerging contaminants. BIL has made substantial resources available to Tribes to help them identify and address PFAS and other Emerging Contaminants in drinking water through both the Drinking Water Infrastructure Grants Tribal Set-Aside and Emerging Contaminants in Small or Disadvantaged Communities Grant programs, with more information found here: https://www.epa.gov/tribaldrinkingwater and https://www.epa.gov/dwcapacity/emerging-contaminants-ec-small-or-disadvantaged-communities-grant-sdc. There are no cost-sharing requirements for these programs. Federally recognized Tribes are eligible to access these funds from both grant programs through the EPA Regional offices and are encouraged to reach out directly to the Regional Tribal Coordinators listed here to get more information on how to monitor for PFAS: https://www.epa.gov/tribaldrinkingwater/regional-tribal-drinking-water-coordinators.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042879)

Regulated Entities:

EPA proposes that Community Water Systems and Non-Transient, Non-Community Water Systems will be subject to this proposed regulation. Due to EPA's high level of concern regarding drinking water as an exposure pathway, MWWA believes that the standards should also apply to Transient Non-Community PWS where employees could be drinking the water every day. In addition, if reducing/eliminating public exposure to PFAS through drinking water is considered this urgent, MWWA wonders why the Biden Administration is not moving forward with regulations (under the appropriate agency's regulatory authority, if not EPA) to require testing and remediation of private wells. The inhabitants of a home where drinking water is supplied from a private well are utilizing water in the same manner as customers served by a PWS. Similarly, the Food and Drug Administration should be regulating PFAS in bottled water. If PFAS is as dangerous as EPA is suggesting, we contend that the EPA and the states' regulatory agencies should be as concerned about private well owners and bottled water consumers as they are about customers of PWSs and work with other governmental agencies to find the appropriate regulatory mechanisms to require PFAS protections for all water consumers.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1567, SBC-042729 in section 1.4 in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042900)

While private wells are not currently being regulated, homeowners may choose to remove PFAS from their private wells if they are aware of their presence. A point of entry treatment system currently costs approximately $6,000 in Massachusetts (this entails a sediment filter, water softener, and 2 carbon vessels). If the 311 private wells that had PFAS6 detections above 4 ppt were to install similar treatment that would amount to $1,866,000. The private well sampling that was conducted in Massachusetts represents a small percentage of these wells, so the magnitude

of costs would undoubtedly be more significant if every private well was tested. These systems will also have ongoing maintenance costs with the schedule of media replacement, largely dependent on the water use in a particular home.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. As discussed in that response to comment and acknowledged by the commenter, private wells are not covered by this rulemaking and beyond the scope of the EPA's authority to regulate public water systems through a NPDWR under the SDWA and this regulatory action.

Oakland County Water Resources Commissioner (WRC) (Doc. #1615, SBC-042929)

Additionally, the proposed regulations need clarifying language regarding the definition of a Community Water System (CWS) that is required to sample for PFAS concentrations. The current language does not distinguish between treatment providers and receivers that do not provide any treatment in consecutive systems. Without any distinction, each CWS is required to sample. For many of our customer communities, the Great Lakes Water Authority (GLWA) is the sole treatment provider. GLWA, as the treatment provider, should be required to sample for PFAS concentrations. However, water systems that directly receive treated water from GLWA, without connections to other water service providers, should be eligible for sampling exemption status or monitoring waiver. This would help reduce the financial burden of sampling and analysis costs and relieve strain on laboratory capacity.

Thank you for the opportunity to provide comments on this critically important matter. Please consider my office as an available resource as the EPA continues to develop the proposed regulations.

Sincerely,

Jim Nash

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044090)

ASDWA recommends that EPA exempt water systems that purchase their water from other public water systems from monitoring requirements within the NPDWR.

The final rule should clarify and explain its reasoning on whether systems that purchase their drinking water from other public water systems will be required to monitor under the NPDWR. The Agency's proposed language uses the terms "ground water" and "surface water" when referring to both community water systems and non-transient non-community water systems, but terms are undefined. The Agency's definitions lack clarity regarding the inclusion of purchasing systems (or not). ASDWA recommends that EPA include an exemption from the monitoring

requirements for purchasing systems in the final rule, which would be consistent with existing exemptions for other chemical contaminants. Levels in the purchasing system would be controlled by the producing system, and there should not be an instance where the purchasing system would exceed the MCL if the producing system does not. Requiring purchasing systems to test for PFAS would be a waste of water system resources and exacerbate existing laboratory capacity issues.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044145)

Additionally, the proposed PFAS NPDWR is applicable to public water systems but not private wells. We urge EPA and the President to work with Congress to ensure that the tens of millions of rural Americans served by both public water systems and private wells have the financial and technical assistance needed to protect themselves from these known carcinogens.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Citizens Against Ruining the Environment (CARE) (Doc. #1638, SBC-043444)

CARE further asserts that private well users should be protected from reduced home values that result from PFAS contamination of their groundwater.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. The impact of PFAS contamination on owners of homes served by private wells is beyond the scope of this regulatory action.

Citizens Against Ruining the Environment (CARE) (Doc. #1638, SBC-043455)

EPA Must Address Communities Excluded from the Benefits of the Proposal

Many CARE members reside in the Will County area where there is known PFAS contamination of groundwater and they rely on private wells to supply their drinking water. CARE understands that private well water regulation has historically been outside the scope of NPDWR, but nevertheless believes this is a critical environmental justice issue that should be addressed by EPA in this rulemaking. At this time, private well users are responsible for testing their well water for PFAS. This presents a financial burden and is time consuming for individual well users to navigate. Moreover, not all well users have the option to switch to a public system or a community well and those that do have the theoretical option often do not have the financial means to do so.

Thank you for your consideration of these comments.

Keith Harley, Attorney for Citizens Against Ruining the Environment

Greater Chicago Legal Clinic, Inc.

17 N. State St., Suite 1710

Chicago, IL 60602

(312) 726-2938

kharley@kentlaw.iit.edu

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

National Rural Water Association (NRWA) (Doc. #1641, SBC-043269)

Lastly, NRWA requests clarification on the applicability of the proposed rule on consecutive water systems. Consecutive systems receive water that is understood to be compliant with the NPDWR standards. Consecutive systems should not be responsible for monitoring when they don't control the source. Most consecutive systems have little if any infrastructure. Installing any required treatment would be incredibly expensive.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044188)

9. NCDEQ recommends that EPA exempt water systems that purchase their water from other public water systems from monitoring requirements within the NPDWR.

The rule should clarify and explain its reasoning on whether systems that purchase their drinking water from other public water systems will be required to monitor under the NPDWR. The Agency's proposed language uses the terms "ground water" and "surface water" when referring to both community water systems and non-transient non-community water systems, but those terms are undefined. It is unclear whether the Agency's definitions include purchasing systems. NCDEQ recommends that EPA include an exemption from the monitoring requirements for purchasing systems within the final rule. Levels in the purchasing system would be controlled by the producing system, and there should not be an instance where the purchasing system would exceed the MCL if the producing system does not. Requiring purchasing systems to test for PFAS is unnecessary and will exacerbate existing laboratory capacity issues.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Inland Empire Utilities Agency (IEUA), California (Doc. #1666, SBC-043390)

Moreover, Section XIII Health Risk Reduction and Cost Analysis indicates that State and Tribal Agencies responsible for drinking water regulatory development and enforcement, and Public Water Systems (PWSs), such as Community Water Systems (CWSs) and Non-Transient, Non-Community Water Systems (NTNCWSs) will be affected by the proposed regulation. EPA does not mention utilities recharging recycled water as being impacted by new Federal MCLs upon adoption;

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. Any system recharging recycled water must follow the SDWA. These systems would be subject to the MCL under this action if they meet the definition of a CWS or NTNCWS as defined by 40 CFR 141.2. For an overview of how water reuse is regulated at the federal level, please visit the EPA's Water Reuse Program's webpage at https://www.epa.gov/waterreuse/basic-information-about-water-reuse.

Arizona Corporation Commission (ACC) (Doc. #1735, SBC-045187)

SAMPLING CLARIFICATION

The current proposed language uses the term "Community Water System" (CWS) to define the systems that are required to conduct sampling. However, this language fails to differentiate between treatment providers and receivers in consecutive systems. As a result, every CWS, including secondary systems, would be obligated to perform sampling for PFAS concentrations and potential additional remediation. This requirement of sampling by secondary systems is unnecessary and imposes additional costs, while also putting pressure on already constrained laboratory capacity.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

LSP Association (LSPA) (Doc. #1742, SBC-043602)

Slide 27: Costs are assessed as the expenses incurred by public water systems to monitor for the six PFAS included in the NPDWR, install and operate treatment technologies, inform consumers, and perform record-keeping and reporting responsibilities. State (or primacy agency) costs are assessed as expenses incurred to administer and implement the rule.

• One serious LSPA concern is the fact that roughly 15% of the US (over 40 million people, based on USGS data) use private residential wells to supply their water. USEPA's proposed regulations do not address these drinking water supplies. Many towns are already linking private well standards (which must be met after drilling a new well or, oftentimes, prior to a transaction of a home with an existing well) to federal or state drinking water standards for metals and organic compounds. Because residential drinking water wells are often present where on-site

septic systems are in use, a potential also exists for private well impacts as a result of PFAS discharges to residential septic systems. However, even private septic systems can result in concentrations of PFAS, particularly PFOA and PFOS, higher than the proposed PFAS MCLs. Public funds and grants are generally not available to private residents so costs for the installation, maintenance, and disposal of treatment materials would be borne by the homeowner.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

LSP Association (LSPA) (Doc. #1742, SBC-043604)

The LSPA agrees with the MWWA in their May 26, 2023 comment letter regarding regulated entities (p. 8): "If PFAS is as dangerous as EPA is suggesting, we contend that the EPA and the states' regulatory agencies should be as concerned about private well owners and bottled water consumers as they are about customers of PWSs and work with other governmental agencies to find the appropriate regulatory mechanisms to require PFAS protections for all water consumers."

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Environmental Protection Network (EPN) (Doc. #1773, SBC-043872)

EPN is concerned that the proposed rule does not specifically address monitoring requirements for seasonal non-transient non-community water systems (e.g., schools and camps/resorts) and seasonal sources (e.g., sources that are online as needed to handle peak or seasonal demand above normal levels). We strongly recommend the addition of these monitoring requirements to the final rule in order to ensure health protection.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. This rule applies to CWSs and NTNCWSs. If a seasonal system meets the definition of CWS or NTNCWS under 40 CFR 141.2, it would be subject to the requirements of this rule.

Neuse Regional Water and Sewer Authority (Doc. #1822, SBC-044569)

1. The Proposed Rulemaking should address how the regulation applies to water wholesalers who supply multiple independent water systems.

NRWASA asks EPA to revise the Proposed Rulemaking to address how operations similar to NRWASA's multi-system approach are covered. Specifically, we recommend that EPA clarify what category of system applies to water authorities. In addition, the final rule should address the location at which a water wholesaler must test its water before supplying customers.

The Proposed Rulemaking mentions systems with more than one water supply source, but not systems with more than one customer distribution system before water reaches consumers [FN2: EPA, PFAS National Primary Drinking Water Regulation Rulemaking, Federal Register Vol. 88, No. 60 page 18751.]. NRWASA has one source of water, the Neuse River, for distribution among eight system customers, and therefore asks EPA to ensure that the final rule provides clear and workable instruction on (i) whether NRWASA must test its water before supplying the water to each of its members; (ii) whether each of NRWASA's members must test after receiving supply from NRWASA and before distributing water to consumers; or, (iii) whether both NRWASA and its members must test NRWASA water.

EPA Response: For additional clarity on where within the CWS that monitoring will be required, please see section VIII of the FRN. To address the points listed, yes NRWASA will be required to test its water prior to providing water to its members. No, it is unlikely that each of NRWASA's members will be required to test the supplied water prior to distributing to their customers, unless the receiving members also have their own source of water that they use to supplement the NRWASA water. The final question on whether both NRWASA and its members must test NRWASA water depends on if the purchasing members supply or treat any of their own water as well. Please see section 1.4 of the EPA response in this *Response to Comments* document for additional clarity around the monitoring requirements for wholesale and consecutive systems, like NRWASA and its members.

New England Water Works Association (Doc. #1836, SBC-045380)

Regulated Entities:

EPA proposes that Community Water Systems and Non-Transient, Non-Community Water Systems will be subject to this rule. If EPA is so concerned about drinking water as an exposure pathway, NEWWA believes that standards should also apply to Transient Non-Community Water Systems where employees could be drinking the water every day. More importantly, NEWWA wonders why the Biden Administration is not moving forward with regulations (under the appropriate regulatory authority, if not EPA) to require testing and remediation of private wells. The homeowners drinking water from a private well are doing so in the same manner as customers served by a PWS.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1953, SBC-047432)

My concern with regulating PFAS through the NPDWR, however, is that legal, enforceable standards only apply to public water systems. Consequently, many private sources of drinking water will not be held to a federal enforceable standard. Up to half of the US population is at risk of consuming unregulated and untreated waters from small, private systems (Weinmeyer et al.

2017, 1022). Such a risk potentially jeopardizes school children as some schools depend on independent systems.

Without federal oversight, we risk unregulated, PFAS contaminated drinking water to children. Children should not be victims of legal technicalities. Public schools cannot be exempt from regulating safe drinking water for their students. In these cases, public water drinking sources should be redefined to include the protection of public schools. We need to ensure that local, state, and federal agencies are fulfilling every possible step to protect children from PFAS contamination.

Thank you,

Concerned citizen.

Weinmeyer, Richard, Annalise Norling, Margaret Kawarski, and Estelle Higgins. "The Safe Drinking Water Act of 1974 and its role in providing access to safe drinking water in the United States." AMA Journal of Ethics 19, no. 10 (2017): 1018-1026

EPA Response: Regarding applicability of the rule's requirements to schools, please see section 1.4 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1473, SBC-042309 in section 1.4 in this *Response to Comments* document.

Duck River Utility Commission (Doc. #2310, SBC-046507)

This rule as written is extremely wasteful of utility funds and laboratory capacity. Only water producers need to test for PFAS compounds. There is no reason for the numerous utilities that purchase all of their water to test water they do not produce. It is testing the same water that the source utilities are already testing. PFAS is a source water contaminant. It only needs to be tested by utilities with source water. Utilities that purchase their water can get the results from their supplier utility. This duplication of cost is massive and also wastes laboratory capacity.

Please change the rule to only require utilities that produce water from a source to test for this contaminant. They can share those results.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2373, SBC-047425)

Comments on EPA's Proposed PFAS NPDWR

Docket ID: EPA-HQ-OW-2022-0114

While in general support of this new proposed regulation, there are still improvements that I believe could be made. The main issue I saw in this proposed rule is that it would not apply to all public water systems. All water systems (including transient non-community systems) should be required to meet this new PFAS standard to protect public health. At the very least, a cost-benefit analysis needs to be implemented. While the transient systems generally do not have the regular consumers in other water systems, I would argue it is still of great importance to enforce these same standards.

Our economy is highly dependent on businesses with transient water systems, and consumers should not question whether drinking water is safe for consumption or not. While I understand the perspective the EPA is coming from, I do not agree with not having any regulations for these transient systems. At the very least, there should be alternative limits that these systems have to meet instead of the more stringent requirements for other public water systems. However, I would still highly suggest that the proposed limits should be required for transient water systems since people are still consuming these waters regularly. What about the people who work at these businesses and consume their water on a regular basis? Collectively, this must account for many hundreds of thousands of people.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Sherry Hoffman (Doc. #2412, SBC-046502)

Docket ID No. EPA-HQ-OW-2022-0114

Our home is in Stone Meadow, Greenland, NH. We live one mile from Coakley Landfill Superfund site and with no access to town water; we have a well. For 17 years we have been to meetings, written letters, and lived very uncomfortably with extreme concerns for the status of our water. No level of PFAS exposure has proven to be safe. EPA's health advisories state that fact, advising that enforecment levels should be the lowest they can be. We implore you to hold that standard to reduce the risk with which we are living. This needs immediate support and attention.

Thank you,

Art and Sherry Hoffman

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document. For additional discussion regarding the final MCLs for this PFAS NPDWR, please see section 5 of the EPA response in this *Response to Comments* document.

Vanderbilt University Drinking Water Justice Lab (Doc. #3072-97, SBC-047410)

But Katie, you mentioned private wells, that is also a concern that private wells are not regulated by the Safe Drinking Water Act. So, if we find presence of PFAS in communities and we know that they are adjacent to communities that are using private wells, what do we do then? So, I know that would be an overhaul, congressional overhaul, the Safe Drinking Water Act, but we cannot continue to fail, the failure of not looking at drinking water quality in private wells. And I will close with, I really appreciate Paul DiLorenzo, your comments on these man-made chemical compounds. What's after PFAS? We know that was GenX, there's going to be something else. So, we also need to adopt, what was mentioned earlier, precautionary principles and get chemists involved to look at what chemical compounds are being used as part of U.S. manufacturing process because we have the ability to know what's dangerous and we need to create legislation to protect families like the Bryants. Thank you.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document.

Great Lakes Water Authority (GLWA) (Doc. #1558, SBC-042550)

GLWA Responses to specific EPA Questions

In addition to the above GLWA concerns, EPA requested comment on many specific issues. GLWA responses to several issues are provided below.

Underlying assumptions that sufficient laboratory capacity will be available with the proposed MCLs; that demand will be sufficiently distributed during rule implementation to allow for laboratory capacity; and on the cost estimates related to these assumptions

The currently proposed language uses Public Water Supply (PWS)/Community Water Systems (CWS) terminology which includes secondary systems and requires sampling at the entry point to the distribution system (EPTDS). This language does not distinguish between treatment providers and receivers of consecutive systems and would require samples by the receiving communities. In the case of GLWA, that means 112 entities unnecessarily sampling water given that it has no opportunity to increase PFAS concentration following treatment and transmission.

Therefore, additional samples by secondary (or consecutive systems) is not warranted and only adds to the system's burden of sampling and analysis cost while also straining laboratory capacity. GLWA strongly requests that EPA consider defining the water treatment supplier as the only responsible sampler at the EPTDS.

EPA Response: Please see section 1.4 of the EPA response in this *Response to Comments* document regarding the terminology used for systems required to monitor for the NPDWR. For commenter concerns regarding feasibility with respect to laboratory capacity, capability, or other analytic challenges to reliably measure samples for the final NPDWR, please see section 5.1.2 of the EPA response in this *Response to Comments* document. For cost

considerations when setting the MCL, please see section 5.1.3 of the EPA response in this *Response to Comments document*.

2 Background

2.1 Definitions; What are PFAS?

Summary of Major Public Comments and EPA Responses

One commenter expressed strong support for the rule. Some commenters asked for clarification on the term "PFAS," which stands for Per- and Polyfluorinated Substances (PFAS), as well as which PFAS were being regulated by this action. PFAS is a general nonspecific name encompassing a group of substances. For the purposes of the fifth Contaminant Candidate List (CCL5), the EPA defined PFAS to include chemicals that contain at least one of these three structures: 1) R-(CF2)-CF(R′)R″, where both the CF2 and CF moieties are saturated carbons, and none of the R groups can be hydrogen 2) R-CF2OCF2-R′, where both the CF2 moieties are saturated carbons, and none of the R groups can be hydrogen, and 3) CF3C(CF3)RR′, where all the carbons are saturated, and none of the R groups can be hydrogen. The Organization of Economic Co-operation and Development (OECD), the United States Environmental Protection Agency (EPA), the World Health Organization (WHO), and the research community have all used various definitions as there is no singular consensus on exactly what features constitute the class of PFAS. The definition changes depending on the entity or regulatory body, scope, and application. An early definition was put forth by Robert Buck in a paper titled "Perfluoroalkyl and polyfluoroalkyl substances in the environment: Terminology, classification, and origins" which defined PFAS as "highly fluorinated aliphatic substances that contain 1 or more C atoms on which all the H substituents (present in the nonfluorinated analogues from which they are notionally derived) have been replaced by F atoms, in such a manner that they contain the perfluoroalkyl moiety C_nF_{2n+1}–." To address gaps in that definition, a more recent definition was put forth by the OECD in a paper titled "Reconciling Terminology of the Universe of Per- and Polyfluoroalkyl Substances: Recommendations and Practical Guidance," which wrote that "PFASs are defined as fluorinated substances that contain at least one fully fluorinated methyl or methylene carbon atom (without any H/Cl/Br/I atom attached to it), i.e. with a few noted exceptions, any chemical with at least a perfluorinated methyl group (–CF_3) or a perfluorinated methylene group (–CF_2–) is a PFAS." As stated, PFAS is a very broad chemical class. For example, under the OECD definition, Fluoxetine, sold under various the brand names including Prozac, is a PFAS as well as many propellants used in inhalers and most anesthetic gases such as enflurane, isoflurane, desflurane, sevoflurane, and methoxyflurane. See section II.A of the proposal for a general description of PFAS. As explicitly stated in the rule proposal, this rule covers six specific PFAS in any form such as isomers, derivatives, or associated salts that may be created or identified. The exact technical definitions of the six regulated PFAS are found in section II.B of the rule proposal and in §141.2 of the Code of Federal Regulations (CFR) for the final rule.

Individual Public Comments

Pennsylvania Department of Environmental Protection (Doc. #1626, SBC-044879)

• DEP has identified several concerns related to definitions, including new proposed definitions in the rulemaking as well as terms that DEP believes should be defined. Specifically:

o EPA has not added a proposed definition for "PFAS." This acronym is used in the proposed definition for Hazard Index (HI) and in many other locations in the proposed rulemaking. DEP believes that it should be defined for clarity.

o EPA has not added a proposed definition for the term "regulated PFAS." This term is used throughout the proposed rulemaking and is not used consistently in all instances. This term may also have different meaning and significance than the acronym "PFAS" and should be defined separately. For example:

• [sec] 141.01(b)(l) states that analyses for "regulated PFAS" must be conducted by certified laboratories; it is implied that, in this case, it is referring to all six PFAS for which approved methods have been identified.

• The HI definition also uses the phrase "regulated PFAS," but PFOA and PFOS are not included in the HI calculation.

o DEP believes that the proposed definition for HI should include the calculation for determining compliance with the HI MCL. The calculation is only specified as a footnote to the tables in[sec] 141.50 and[sec] 141.61. DEP believes that it is inappropriate to only list this calculation in a footnote to a table.

o The proposed definition for HI also includes the phrase "regulated PFAS component" but does not identify the specific PFAS included in the HI MCL. Since PFOA and PFOS would also be considered regulated PFAS under the proposed rulemaking, this definition should clarify which PFAS are included, or the phrase "regulated PFAS component" should be defined.

o In the proposed definition for Hazard Quotient (HQ), DEP questions the use of the phrase "potential exposure to a substance" when it is actually the measured concentration used in the equation. DEP also suggests that instead of "the level at which no health effects are expected", the definition should refer to the health based water concentration (HBWC), which is also a newly defined term.

o In the proposed definition for HBWC, DEP suggests that instead of "levels protective of health effects" it should read "levels at which no health effects are expected".

EPA Response: Please see section 2.1 of the EPA response in this *Response to Comments* document. The six PFAS regulated by this rule are defined in §141.2 of the CFR and in the background section of the proposal preamble. Analyses for any/all of the six regulated PFAS must be conducted by certified laboratories. As the commenter notes, the requested

calculation is already included in a table footnote. The Hazard Index is comprised of four PFAS, (PFHxS, HFPO-DA, PFNA, and PFBS), which are defined in section 2. The proposal and the final rule clearly identify these four PFAS as the only components of the Hazard Index. The EPA notes that most water provided by utilities is not used for cooking or drinking so PFAS in drinking water that is used for example to water a lawn would not necessarily imply exposure despite it being a measured concentration. The EPA has updated the CFR §141.2 definition for the hazard quotient (HQ) with respect to the Health Based Water Concentration (HBWC) for additional clarity. The updated definition states that the HQ is the ratio of the measured concentration in drinking water to the HBWC (CFR § 141.2 Definitions).

Washington State Department of Health (DOH) (Doc. #1665, SBC-044391)

(1) General Comments

The Washington DOH strongly supports the EPA proposed PFAS drinking water standards. This is an important step in reducing exposure to PFAS to consumers of drinking water supplied by public water systems. There are areas within the proposed rule we would like to see clarification, additional information, further evaluation, and more specific guidance to help support successful implementation of the proposed PFAS rule at the state and local level.

• DOH requests that EPA provide clear definitions of all PFAS terms, including how they relate to levels of PFAS in drinking water.

EPA Response: The EPA refers the commenter to section 2.1 of the EPA response in this *Response to Comments* document noting that discussions of PFAS and definitions for the six regulated PFAS are provided in sections II.A and II.B of the proposed rule.

Thurston Public Utility District (PUD), WA (Doc. #1729, SBC-043583)

I would like to further ask, comment and request that:

1. The EPA provide clear definitions of all PFAS terms, including how they relate to levels of PFAS in drinking water.

2. The EPA clarifies language for health effects above the MCL and differentiates between health advisory language addressing potential health effects and lower PFAS levels.

EPA Response: Please see section 2.1 of the EPA response in this *Response to Comments* document and the EPA response to comment Doc. #1665, SBC-044391 from the Washington State Department of Health (DOH). Information on health effects of PFAS, including at concentrations above the Maximum Contaminant Levels (MCLs), may be found in sections 4 and 9.2 of the EPA response in this *Response to Comments* document.

American Chemistry Council (ACC) (Doc. #1841, SBC-044815)

Comments of the American Chemistry Council on Proposed National Primary Drinking Water Regulation for PFAS 88 Federal Register 18638

March 29, 2023

Table of Contents

46 EPA Does Not Provide Evidence to Support the Benefits Attributed to the HI MCL

48 Key Information Has Not Been Made Public

49 EPA Cannot Determine that the Benefits of the Proposal Justify the Costs

50 SDWA Does Not Authorize EPA to Issue a Preliminary Regulatory Determination Simultaneously with a Proposed Standard

51 EPA has not Provided Information on an Appropriate Range of Regulatory Alternatives

52 Executive Summary

The Safe Drinking Water Act (SDWA) authorizes EPA to establish national drinking water standards for contaminants that it has determined may have an adverse health effect, are known or expected to occur in public water systems and for which there is a meaningful opportunity for health risk reduction. [FN1: 42 U.S.C. Section 300g-1(b)(1)A)] The Act outlines a multi-step process for data collection and evaluation of scientific, technical, and economic information with multiple opportunities for public comment and scientific peer review. Under its SDWA authority EPA has proposed to establish maximum contaminant levels (MCLs) and MCL goals (MCL Goals) for six per-and polyfluoroalkyl substances (PFAS) including perfluorooctanoate (PFOA), perfluorooctanesulfonate (PFOS), perfluorobutane sulfonate (PFBS), perfluorononanoate (PFNA), perfluorohexane sulfonate (PFHxS) and 2,3,3,3- tetrafluoro-2-(heptafluoropropoxy)propanoate (HFPO-DA). [FN2: Additional clarification is required on the definition of the materials covered by the proposed regulation. Although the proposal identifies the Chemical Abstract Service registration number for each substance, the definition for each also includes “any salts, derivatives, isomers or combinations thereof” for each.]

EPA Response: Please see section 2.1of the EPA response in this *Response to Comments* document. The EPA’s final rule includes data-driven drinking water standards that are based on the best available science and meet the requirements of the Safe Drinking Water Act (SDWA). The proposal identified one form that these chemicals are likely to be present in in drinking water however, as detailed in the rule proposal, “these PFAS may exist in multiple forms, such as isomers or associated salts and each form may have a separate CAS Registry number or no CAS at all.” The Chemical Abstract Service (CAS) was provided for the form most likely to be encountered in drinking water. For example, there are at least 11 substances with chemical formula $C_8HF_{15}O$ which have a CAS and at least 39 possible PFOA isomers that each may have many salts. The bullets presented here are addressed in various sections of this *Response to Comments* document. For additional discussion on the Maximum Contaminant Level Goals (MCLGs) and the EPA’s Health Risk Reduction and Cost Analysis (HRRCA), please see sections 4 and 13, respectively. Bullets related to the regulatory process are addressed in section 1of the EPA response in this *Response to Comments* document. Bullets related to the number of water systems affected are addressed in section 6 of the EPA response in this *Response to Comments* document.

Colorado Water Utility Council (CWUC) (Doc. #1622, SBC-044058)

36. General comment for consideration. Please clarify what is meant by HFPO-DA "and its ammonium salt". Using that language makes it seem as though it is an additional parameter that must be analyzed for and included in compliance calculations. Perhaps just drop this terminology, or clearly explain that it is not an additional/separate parameter.

EPA Response: Please see section 2.1 of the EPA response in this *Response to Comments* document and the EPA response to comment Doc. #1665, SBC-044391 from the Washington State Department of Health (DOH). Section II.B "Definitions" states that the six PFAS proposed for regulation may exist in multiple forms, such as isomers or associated salts and each form may have a separate CAS Registry number or no CAS at all. The regulation covers all salts, isomers and derivatives of the chemicals listed, including derivatives other than the anionic form that might be created or identified. EPA methods 533 and 537.1 measure the anionic forms that, at environmentally relevant pHs, these PFAS are expected to be in. The ammonium salt of HFPO-DA is expected to dissociate in water at environmentally relevant pHs and be measured as the anionic form.

2.2 Chemistry, Production and Uses, Human Health Effects

Summary of Major Public Comments and EPA Responses

Many commenters suggested that there should be universal PFAS restrictions and questioned why the EPA limited itself to these specific PFAS in one specific media (drinking water). The agency notes that the SDWA is one of multiple statutory authorities used by the EPA as a basis for actions to protect public health and the environment. SDWA applies specifically to drinking water and the EPA is promulgating this regulation under SDWA authority. Other actions may be taken by other agency programs to address other media using other statutory authority. Under SDWA, the EPA regulates contaminants that meet specific regulatory criteria as outlined in section 3 of this *Response to Comments* document. . This National Primary Drinking Water Regulation (NPDWR) addresses the removal of six PFAS (including HFPO-DA) known to cause adverse health effects as well as have a substantial likelihood to occur in public water systems (PWSs) with a frequency and levels of public health concern, consistent with the SDWA regulation criteria. As described in the EPA's *PFAS Strategic Roadmap*, the agency is committed to addressing PFAS contamination, including through the development of this PFAS NPDWR. The latter is a key action within this whole-of-agency approach (please see https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024 and section 15 of this document for discussion on the PFAS Roadmap). The EPA's approach considers the full PFAS lifecycle, and is based on getting upstream of the problem, holding polluters accountable, ensuring science-based decision making, and prioritizing disadvantaged communities. Specifically, the Roadmap sets timelines by which the EPA plans to take specific actions and commits to new policies to safeguard public health, protect the environment, and hold polluters accountable. The actions described in the PFAS Strategic Roadmap each represent important and meaningful steps to safeguard communities from PFAS contamination.

Cumulatively, these actions should lead to more enduring and protective solutions. In the Roadmap, the EPA notes that the agency "will bring deeper focus to preventing PFAS from entering the environment in the first place—a foundational step to reducing the exposure and potential risks of future PFAS contamination." Additionally, in the Roadmap, the EPA notes that "intervening at the beginning of the PFAS lifecycle—before they have entered the environment—is a foundational element of the EPA's whole-of-agency approach." PFAS manufacturing has been addressed via several significant new use rules and the agency's New Chemicals Program continues to review new PFAS before approving commercialization. More information on PFAS as a class is in section 2.3 of the EPA response in this *Response to Comments* document. Other EPA rules such as the as the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) designation are discussed in section 10.4.2, Treatment, of the EPA response in this *Response to Comments* document. The Office of Research and Development (ORD) as well as the Office of Science and Technology (OST) are evaluating and developing technologies for reducing PFAS in the environment to inform decisions on health effects, drinking water and wastewater treatment, contaminated site cleanup and remediation, air emission controls, and end-of-life materials management.

Additionally, the agency considers whether PFAS uses may be beneficial enough in specific applications or under appropriate controls to warrant use. As stated in the previous section, there is also no uniform agreed upon definition of PFAS and most definitions are written for specific purposes; as a result, there can be no perfect test method for PFAS as there is no fixed definition of what constitutes PFAS. This problem can compound if exemptions are made for beneficial uses. Additionally, current proxy methods such as a total organic fluorine test lack the analytical sensitivity to measure low enough concentrations to protect human health as these methods can reliably measure to approximately 100 ng/L and the health-based water concentrations for all but one of the PFAS species included in this rule are at least an order of magnitude below that. A total organic fluorine test also does not provide information on the specific constituents, so a 200 ng/L reading could either be very harmful to human health if it was composed of PFOS, for example but would not necessarily be harmful if it was PFBS for example. There may also be fluorinated chemicals that are not PFAS that this kind of test may measure. Imposing a rule without a mechanism to enforce or monitor will very likely not make a very effective rule for public health protection. Finally, there can be co-removal benefits where non-targeted PFAS are removed by default in trying to remove some of the targeted PFAS; this concept is discussed further in section 10.3 of the EPA response in this *Response to Comments* document as well as the final rule preamble. For more information on comments outside the purview of the SDWA please see section 15. For more information on the health effects, please see section 4 as well as the individual toxicity assessments.

Some commenters suggest that the EPA has dismissed thousands of PFAS as harmless to human health. Instead, the EPA, as it must by statute, has used the best available science in crafting this regulation. These are specific decisions that follow the regulatory process. For regulation under the SDWA, a contaminant must have an adverse health effect as well as be present at frequency and levels of public health concern in enough water systems that there is a meaningful

opportunity for public health risk reduction. In developing this rule, the agency considered the best available science on health effects, engineering, analytical methods, occurrence, and economics. The EPA also considered benefits and disbenefits from this regulation, as required under the SDWA. More information on the EPA's regulatory determinations can be found in section 3 of the EPA response in this *Response to Comments* document. More information on the health effects can be found in section 4 of the EPA response in this *Response to Comments* document. More information on how the EPA considered benefits and disbenefits can be found in section 13 of the EPA response in this *Response to Comments* document.

Some commenters suggested that the EPA is not moving quickly enough. The EPA is working as quickly as feasible under its statutory authority. More information on the SDWA rulemaking process including timelines can be found in section 1.1, the SDWA Rulemaking Process. Some commenters also stated that the EPA must move faster because their primacy agency is not moving quickly enough. The EPA creates a national baseline that others may build on. Primacy agencies may enact rules according to their authorities on their own timeline and are not precluded from enacting stricter rules than the EPA.

Some commenters pointed out there are other exposure pathways that the six PFAS included in this rule could follow to impact the health of Americans. For noncarcinogens, the EPA accounts for exposure to contaminants from non-drinking water sources by applying a relative source contribution (RSC) to the MCLG, health reference level (HRL), and HBWC. More information on RSCs is provided in sections 3 and 4.3 of the EPA response in this *Response to Comments* document.

Some commenters stressed the environmental justice (EJ) considerations in this rule. The EPA's EJ analysis for the final rule demonstrates that communities of color are anticipated to experience elevated baseline PFAS drinking water exposures compared to the entire sample population. However, the EPA believes that this action is likely to reduce existing disproportionate and adverse effects on people of color, low-income populations, and/or indigenous peoples. The EPA's EJ analysis finds that, across all health endpoints evaluated by the EPA, communities of color are anticipated to experience the greatest quantified benefits associated with the final rule. When examining costs anticipated to result from the final rule, the EPA finds that cost differences across both race/ethnicity and income groups are typically small, with no clear unidirectional trend in cost differences based on demographic group. To alleviate potential cost disparities identified by the EPA's analysis, there may be an opportunity for many communities to utilize Bipartisan Infrastructure Law (BIL) (P.L. 117-58) funding to provide financial assistance for addressing emerging contaminants. BIL funding has specific allocations for both disadvantaged and/or small communities and emerging contaminants, including PFAS. For more information on the EPA's EJ analysis, please see Chapter 8 of USEPA (2024a) and Appendix M of USEPA (2024b). For responses to comments related to the agency's EJ analysis, please see section 14.10 of the of the EPA response in this *Response to Comments* document. More information on BIL and EJ is in section 2.4.

Individual Public Comments

Anonymous (Doc. #1506, SBC-042578)

Although we believe EPA's regulations could be improved, there are some tradeoffs to these revisions. More stringent control over water regulation and compensation for those affected will result in a greater overall cost. However, we argue a lack of firm regulation now will result in greater medical costs in the future. Meaning spending more money on regulation upfront will be cheaper in the long run. PFAs also serve a useful role in our lives, contributing to the comfort and ease we experience as consumers. This means any regulation that inhibits the implementation of PFAs into these products will result in less convenience. We argue that comfort and convenience should not be prioritized at the cost of wellbeing. In addition, the durability associated with PFAs makes them difficult to eliminate from the environment (Darlington et al., 2018). However, we believe, although difficult, the effort to remove these chemicals has tremendous benefits. Overall, we highly encourage the EPA to modify their regulations to maximize well being and minimize harm for the entire ecosystem.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Liliana Salcido (Doc. #1509, SBC-042582)

According to a journal written by Wendee Nicole, and published by Environmental Health Perspectives in the NCBI database, PFOA is found in the blood of 98% of Americans, and there is a strong association between PFOA exposure and 6 different diseases, most of which are

cancers (Nicole, 2013). Because most of the research has only been done in high exposure cohorts, it is extremely important for further research to be made amongst the general public as well.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document, which includes discussion of the EPA's PFAS Strategic Roadmap. Among the elements of the Roadmap is additional agency research.

Jon Raclin (Doc. #1511, SBC-042593)

This source adds some details as to why the chemicals cause sickness and what sicknesses. The article mainly focuses on the policy change and not the underlying issue at hand. I understood this not as a bias, but as a written perspective from the EPA.

From just reading the EPA article no, I do not know enough yet, however I do feel like I could guess where I would vote at the end.

Some additional evidence that I could find was in the National Institute of Health, the NIH, stating, "People are most likely exposed to these chemicals by consuming PFAS-contaminated water or food, using products made with PFAS, or breathing air containing PFAS". Also the NIH said, "The research conducted to date reveals possible links between human exposures to PFAS and adverse health outcomes. These health effects include altered metabolism, [Link: https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote2], fertility, [Link: https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote3], reduced fetal growth and increased risk of being overweight or obese, [Link: https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote4], increased risk of some cancers, and reduced ability of the immune system to fight infections. [Link: https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote5]".

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Christian Garcia (Doc. #1513, SBC-042603)

PFAS are a group of chemicals used to make fluoropolymer coatings and products that resist heat, oil, stains, grease, and water. [FN1: CENTERS FOR DISEASE CONTROL AND PREVENTION, Per- and Polyfluorinated Substances (PFAS) Factsheet, https://www.cdc.gov/biomonitoring/PFAS_FactSheet.html (last visited Apr. 21, 2023).] PFAS are routinely referred to as "forever chemicals" because they breakdown extremely slowly, can move through soils and contaminate drinking water sources, and can build up (bioaccumulate) in people and animals. [FN2: National Institutes of Health, Perfluoroalkyl and Polyfluorinated Substances (PFAS), U.S. Dep't of Health and Human Svcs., https://www.niehs.nih.gov/health/materials/perfluoroalkyl_and_polyfluoroalkyl_substances_508.pdf (last visited Apr. 21, 2023).] Exposure to PFAS "increases the risk of cancer, harms the

development of the fetus and reduces the effectiveness of vaccines." [FN3: Sydney Evans, David Andres, Ph.D., Tasha Stoiber, Ph.D. & Olga Naidenko, Ph.D., PFAS Contamination of Drinking Water Far More Prevalent Than Previously Reported, https://www.ewg.org/research/national-pfas-testing (last visited Apr. 21, 2023).] Biomonitoring studies by the Centers for Disease Control and Prevention show that the blood of nearly all Americans is contaminated with PFAS. [FN4: CENTERS FOR DISEASE CONTROL AND PREVENTION, Per- and Polyfluorinated Substances (PFAS) Factsheet, https://www.cdc.gov/biomonitoring/PFAS_FactSheet.html (last visited Apr. 21, 2023)]

PFAS found in drinking water can make up a significant portion of a person's total PFAS exposure. [FN5: U.S. ENVIRONMENTAL PROTECTION AGENCY, EPA's Proposal to Limit PFAS in Drinking Water (March 2023),https://www.epa.gov/systems/files/documents/2023-04/Fact%20Sheet_PFAS_NPDWR_Final_4.4.23.pdf (last visited Apr. 21, 2023).]The Environmental Working Group has mapped PFAS contamination of drinking water or ground water in almost 1,400 sites in 49 states. [FN6: Sydney Evans, David Andres, Ph.D., Tasha Stoiber, Ph.D. & Olga Naidenko, Ph.D., PFAS Contamination of Drinking Water Far More Prevalent Than Previously Reported, https://www.ewg.org/research/national-pfas-testing (last visited Apr. 21, 2023).] As a result, the Environmental Working Group estimates that water supplies for over 110 million Americans may be contaminated with PFAS. [FN7: Id.] Such PFAS exposure, could lead to detrimental health effects. Most of the widely known adverse health effects include developmental effects affecting unborn children, breast cancer, thyroid disease, liver damage, kidney cancer, and increased cholesterol levels. [FN8: Suzanne E. Fenton et al, Per- and Polyfluoroalkyl Substance Toxicity and Human Health Review: Current State of Knowledge and Strategies for Informing Future Research, 40(3) ENVIRON. TOXICOL. CHEM. 606, 606-630 (2021).] According to recent studies, animals experience similar health effects. [FN9: Id.] Additionally, there may be further links adverse effects of PFAS on the nervous system, including reported neurotoxicity of PFAS in cell culture as well as altered behavioral responses and deficits in learning and memory ability. [FN10: Id.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Daniel Varon (Doc. #1518, SBC-042722)

As it stands, the EPA has an advisory level of 70 ng/L maximum recommend levels in drinking for lifetime consumption. [FN8: JENNIFER L. GUELFO ET. AL., EVALUATION AND MANAGEMENT STRATEGIES FOR PER- AND POLYFLUOROALKYL SUBSTANCES(PFASS) IN DRINKING WATER AQUIFERS: PERSPECTIVES FROM IMPACTED U.S. NORTHEAST COMMUNITIES 2 (2018).] This means that over an individual's lifetime, if they drink water with 70 ng/L exposure daily, the EPA still thinks they will be protected from adverse health effects. The studies used to suggest a correlation between PFAS, and health consequences vary vastly from the EPA advisory level. [FN9: Id.]

The large studies that the CDC relies on in determining the "correlation" between PFAS and adverse health effects is the C8 Health Study. [FN10: AGENCY FOR TOXIC SUBSTANCE AND DISEASE REGISTRY, supra note 7.] These studies, self-admittedly "limited" in nature, yield interesting results. [FN11: Id.] First, some of the studies suggesting a strong correlation were shown with "high" levels of PFAS contamination—as high as 1700 ng/L. [FN12: Eva. M. Andersson, et al., High Exposure to Perfluorinated Compounds in Drinking Water and Thyroid Disease. A Cohort Study from Ronneby, Sweden, 176 ENV'T RSCH. 1 (2019).] Even if not to this extreme of a level, other studies evidencing correlation still showed levels above the EPA's recommended level. [FN13: GUELFO, supra note 8; Yiyi Xu, et. al., Inflammatory Bowel Disease and Biomarkers of Gut Inflammation and Permeability in a Community with High Exposure to Perfluoroalkyl Substances through Drinking Water, 181 ENV'T RSCH. 1 (2020).] Thus, the levels evidencing negative PFAS health consequences are above what the average American consumes.

Furthermore, studies indicated that 72% of PFAS detections comes from groundwater sources. [FN14: GUELFO, supra note 8] Groundwater is the water source for 33% of public water supplies, and 90% of the supplies in rural regions. [FN15: Id.] This indicates two things: (1) PFAS in contaminated water has a disparate impact across the United States, impacting rural regions more so than urban ones; and (2) perhaps attacking groundwater contamination could fight how PFAS end up in human's systems. Either option further shows that blanket regulation on every city's water systems may not be the most cost-effective policy.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. Commenter has cited 2016 EPA health advisory (HA) values, which were updated and lowered in 2022. For more information on this final rule and evaluation of health effects, including MCLGs and HBWCs, please see section IV of the final rule preamble.

Isabelle Dominguez (Doc. #1525, SBC-042625)

As the agency is well aware, per- and polyfluoroalkyl Substances (PFAS) are chemicals that are often used for their water- and oil-repellant properties. [FN1: Paul Frysh, PFAS: What to Know, WEBMD, https://www.webmd.com/a-to-z-guides/what-is-pfas (last reviewed June 16, 2022).] PFAS are used in fire repellants, electronics, and cookware, making them nearly omnipresent in today's society. [FN2: Id.] PFAS are known as "forever chemicals" because their carbonfluorine bonds make them "incredibly strong" and allow them to build up and "linger [in the environment] on geologic time scales." [FN3: Per- and Polyfluorinated Substances (PFAS), CDC, https://www.cdc.gov/biomonitoring/PFAS_FactSheet.html (last updated May 2, 2022) [hereinafter CDC PFAS].] This includes the buildup of PFAS in our drinking water. [FN4: Seen generally David Q. Andrews & Olga V. Naidenko, Population-Wide Exposure to Per- and Polyfluoroalkyl Substances from Drinking Water in the United States, 7 ENV'T SCI. TECH. LETTER 931 (2020).] This is the issue that the proposed regulation seeks to remedy.

There is conclusive evidence that PFAS exposure is rampant throughout the United States. Since 1999, "CDC scientists have found four PFAS (PFOS, PFOA, PFHxS…and PFNA) in the serum of nearly all people tested. This indicates widespread exposure to the PFAS in the U.S. population." [FN5: CDC PFAS, supra note 3. For the full report and data, see National Report on Human Exposure to Environmental Chemicals, CDC, https://www.cdc.gov/exposurereport/ (last reviewed Dec. 15, 2022).] Academic studies by independent institutions have come to the same conclusion. [FN6: See Andrews & Naidenko, supra note 4, at 933; see also Zhen Zaho et al., Perfuoroalkyl and Polyfuoroalkyl Substances (PFASs) in Groundwater: Current Understandings and Challenges to Overcome, 29 ENV'T SCI. AND POLLUTION RSCH. 49513, 49515-16 (2022); see also Elise M. Sunderland et al., A Review of the Pathways of Human Exposure to Poly- and Perfluoroalkyl Substances (PFASs) and Present Understanding of Health Effects, 39 J. EXPOSURE SCI. & ENV'T EPIDEMIOLOGY 131, 133-34 (2019).] Moreover, studies demonstrate that levels of PFAS have increased in accumulation in drinking water over the past few decades. [FN7: Xindi C. Hu et al, Tap Water Contributions to Plasma Concentrations of Poly- and PerfluoroalkylSubstances (PFAS) in a Nationwide Prospective Cohort of U.S. Women, 12(6) ENV'T HEALTH PERSPS. 067006-1, 067006-7 (2019).]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Water Environment Federation (WEF) (Doc. #1529, SBC-043313)

Research: Continued research is necessary in understanding the exposure impacts of PFAS from manufacturing, point of use, and fate and transport in the environment. Transparent and concise documentation of the results of the research and what it means to the public is essential.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Robert Adamski (Doc. #1530, SBC-043333)

At the present time there is no strong link between the chemicals and any effects on human health. EPAs own Science Advisory Board said, "While the SAB agrees with the "likely" designation for PFOA carcinogenicity based on new evidence and prior evidence included in the 2016 HESD, a more structured and transparent "weight of evidence" discussion to support the rationale behind this designation is needed." Further the National Academy of Science states, "there is inadequate or insufficient evidence of many other health impacts."

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. The EPA also refers the commenter to the MCL and MCLG Derivation sections as well as the supporting documentation such as the *Toxicity Assessment and Proposed Maximum Contaminant Level Goal for Perfluorooctanoic Acid (PFOA) in Drinking Water*, the *Final Human Health Toxicity Values for Hexafluoropropylene Oxide (HFPO) Dimer Acid and*

Its Ammonium Salt (CASRN 13252-13-6 and CASRN 62037-80-3) Also Known as "GenX Chemicals," and other related supporting documents.

Linda Shosie (Doc. #1533, SBC-043964)

There is growing evidence that even at the lowest levels of exposure to PFAS can cause very large and varying sets of serious health effects, including cancer, reduced immune system function, and disrupt the human endocrine system and threaten the developing fetus. Furthermore, these toxic chemicals are highly persistent in the environment and accumulate in human bodies, and in the food chain, posing a significant threat to health, wildlife and ecosystems.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Greenville Utilities Commission (Doc. #1534, SBC-042636)

May 1, 2023

Michael S. Regan

US Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Comments for Docket ID #: EPA-HQ-OW-2022-0114; PFAS National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan,

The proposed Maximum Contaminant Levels (MCL's) of 4 parts per trillion (ppt) for PFAS compounds and the goal of 0 ppt are unprecedented regulatory actions and it will be extremely difficult and expensive for many water providers to meet. PFAS compounds are ubiquitous not just near known spills or contamination sites due to these compounds being used in many products encountered in our lives each day including food wrappers, cookware, personal care products, clothing, and cosmetics. Drinking water is only one of several routes of exposure to PFAS compounds, and the drinking water industry should not be disproportionately targeted by government's regulatory action to reduce PFAS exposure.

EPA Response: The EPA agrees that drinking water is only one route of exposure to PFAS. For noncarcinogens, the EPA accounts for exposure to contaminants from non-drinking water sources by applying a RSC to the MCLG, HRL, or HBWC. More information on RSCs is provided in section 3 and section 4.3 of the EPA response in this *Response to Comments* document. MCL derivation may be found in section 5 of the EPA response in this *Response to*

Comments document. The EPA also agrees that a holistic approach for handing these chemicals is required as outlined in the PFAS Strategic Roadmap. The EPA disagrees that the drinking water industry is disproportionately targeted by PFAS regulation. Please see the health risk reduction and accost analysis section. Please also see the summary of major public comments for this section.

Sarah Taylor (Doc. #1535, SBC-042640)

April 25, 2023

Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation: The Dangers of PFAS and a Proposal of How the EPA Can Help

Our nation's emergency response team have been exposed to PFAS provided medical resources for many decades. An example is our firefighting teams, using fire repelling spray foam every day to help our nation during devasting times; these foams are loaded with PFAS and cause exposure to our firefighters.

This leads to a chain reaction – although our firefighters are striving to help their community, they are also harming it along the way by contaminating the community with these PFAS each time they spray the foam. These contaminants end up in our soil and ground waters throughout their lifecycle, ultimately ending up in our drinking waters.

This is just one example of how PFAS end up in our environment, and ultimately in our bodies. PFAS are found in cosmetic products, cleaning products, clothing, papers, fabrics, shampoos, flosses, and even nonstick cookware (1). [FN1: https://www.dhs.wisconsin.gov/chemical/pfas.htm] The lifecycle of PFAS in these substances causes danger to human and environmental health.

Previous studies have indicated that PFAS in our bodies can lead to a plethora of health issues, including but not limited to increased risk of tumors, cancers, birth defects, reproductive harm, ulcerative colitis. Additionally, PFAS have been linked to decreasing thyroid function, liver function, kidney function, and infant birth weights.

The EPA website on PFAS states:

"Current peer-reviewed scientific studies have shown that exposure to certain levels of PFAS may lead to:

• Reproductive effects such as decreased fertility or increased high blood pressure in pregnant women.

• Developmental effects or delays in children, including low birth weight, accelerated puberty, bone variations, or behavioral changes.

• Increased risk of some cancers, including prostate kidney, and testicular cancers.

• Reduced ability of the body's immune system to fight infections, including reduced vaccine response.

• Interference with the body's natural hormones

• Increased cholesterol levels and/or risk of obesity" (2) [FN2: https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas]

Additionally, research has been conducted on how these PFAS truly affect human health. Dr. Impinen and colleagues conducted a study analyzing the relationship between PFAS exposure and health outcomes. The study revealed a correlation between PFAS exposure in pregnant women and health ailments, such as diarrhea and airway infections (3). [FN3: Impinen A, Nygaard UC, Lodrup Carlsen KC, Mowinckel P, Carlsen KH, Haug LS, Granum B. 2018. Prenatal exposure to perfluoralkyl substances (PFASs) associated with respiratory tract infections but not allergy- and asthma-related health outcomes in childhood. Environ Res 160: 518–523.]

The evidence of how PFAS harm human health does not stop there. Dr. Kvalem and colleagues concluded that there is a relationship between PFAS exposure in infants/children and the development of immunosuppressive effects, ultimately leading to lower respiratory tract infections (4). [FN4: Kvalem HE, Nygaard UC, Lodrup Carlsen KC, Carlsen KH, Haug LS, Granum B. 2020. Perfluoroalkyl substances, airways infections, allergy and asthma related health outcomes—Implications of gender, exposure period and study design. Environ Int 134:105259] This data indicates that PFAS have a direct correlation to suppressing the human immune system.

Liver disease and cancer is also a primary concern regarding PFAS exposure. Long-chain PFAS primarily target the liver, leading to toxic hepatocyte infiltration (5). [FN5: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7906952/] This leads to the concerns of the development of carcinomas and adenomas. PFAS also cause the liver to produce higher level of liver enzymes (for example, alanine aminotransferase) resulting in a change in enzymatic liver behavior.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Lawrence and Penelope Higgins (Doc. #1545, SBC-042863)

Exposure to PFAS can cause serious health effects, such as increased cholesterol levels, reduced immune system function, thyroid disease, liver damage and some forms of cancer. Chemical companies have continued to manufacture PFAS despite knowing for decades that they are unsafe, poisoning communities along the way. A 2018 study by the CDC showed that nearly all Americans have detectable levels of PFAS in their blood.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Gabriella Thoppil (Doc. #1551, SBC-042699)

The Problem with PFAS

PFAS are a class of at least 9000, but potentially over 12,000, synthetic chemicals with unique properties that have led to their global use in consumer and industrial applications. [REF3: PFAS | NIOSH | CDC. Accessed April 20, 2023. https://www.cdc.gov/niosh/topics/pfas/default.html; REF4: Our Current Understanding of the Human Health and Environmental Risks of PFAS | US EPA. Accessed April 20, 2023. https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas; REF5: Sunderland EM, Hu XC, Dassuncao C, Tokranov AK, Wagner CC, Allen JG. A Review of the Pathways of Human Exposure to Poly- and Perfluoroalkyl Substances (PFASs) and Present Understanding of Health Effects. J Expo Sci Environ Epidemiol. 2019;29(2):131. doi:10.1038/S41370-018-0094-1; REF6: Jha G, Kankarla V, McLennon E, et al. Per- and Polyfluoroalkyl Substances (PFAS) in Integrated Crop–Livestock Systems: Environmental Exposure and Human Health Risks. Int J Environ Res Public Health. 2021;18(23):12550. doi:10.3390/IJERPH182312550; REF7: Kurwadkar S, Dane J, Kanel SR, et al. Per- and polyfluoroalkyl substances in water and wastewater: A critical review of their global occurrence and distribution. Science of The Total Environment. 2022;809:151003. doi:10.1016/J.SCITOTENV.2021.151003; REF8: T Gaines LG, Linda T Gaines CG. Historical and current usage of per- and polyfluoroalkyl substances (PFAS): A literature review. Am J Ind Med. 2023;66(5):353-378. doi:10.1002/AJIM.23362; REF9: Glüge J, Scheringer M, Cousins IT, et al. An overview of the uses of per- and polyfluoroalkyl substances (PFAS). Environ Sci Process Impacts. 2020;22(12):2345-2373. doi:10.1039/D0EM00291G; REF10: CompTox Chemicals Dashboard. Accessed April 20, 2023. https://comptox.epa.gov/dashboard/chemical-lists/pfasmaster] Their unique properties involve resistance to natural erosion, chemical, physical, or biological degradation processes, high temperatures and pressures, and corrosive environments, which makes PFAS very versatile and useful in many various use cases like construction, military, aviation, textiles, medicine, household products, and even fire-fighting foams. [REF7: Kurwadkar S, Dane J, Kanel SR, et al. Per- and polyfluoroalkyl substances in water and wastewater: A critical review of their global occurrence and distribution. Science of The Total Environment. 2022;809:151003. doi:10.1016/J.SCITOTENV.2021.151003; REF8: T Gaines LG, Linda T Gaines CG. Historical and current usage of per- and polyfluoroalkyl substances (PFAS): A literature review. Am J Ind Med. 2023;66(5):353-378. doi:10.1002/AJIM.23362] Despite their incredible usefulness, the durability of PFAS directly translates to the extreme longevity in which they remain in the natural environment, as tests have detected traces of PFAS in air, water, soil, and sediment. [REF7: Kurwadkar S, Dane J, Kanel SR, et al. Per- and polyfluoroalkyl substances in water and wastewater: A critical review of their global occurrence and distribution. Science of The Total Environment. 2022;809:151003. doi:10.1016/J.SCITOTENV.2021.151003; REF8: T Gaines LG, Linda T Gaines CG. Historical and current usage of per- and polyfluoroalkyl substances (PFAS): A literature review. Am J Ind

Med. 2023;66(5):353-378. doi:10.1002/AJIM.23362; REF9: Glüge J, Scheringer M, Cousins IT, et al. An overview of the uses of per- and polyfluoroalkyl substances (PFAS). Environ Sci Process Impacts. 2020;22(12):2345-2373. doi:10.1039/D0EM00291G] With the combined exposure to PFAS from everyday products and the natural environment, it is no wonder that an astonishing 97% of Americans have traces of PFAS in their blood. [REF5: Sunderland EM, Hu XC, Dassuncao C, Tokranov AK, Wagner CC, Allen JG. A Review of the Pathways of Human Exposure to Poly- and Perfluoroalkyl Substances (PFASs) and Present Understanding of Health Effects. J Expo Sci Environ Epidemiol. 2019;29(2):131. doi:10.1038/S41370-018-0094-1; REF6: Jha G, Kankarla V, McLennon E, et al. Per- and Polyfluoroalkyl Substances (PFAS) in Integrated Crop–Livestock Systems: Environmental Exposure and Human Health Risks. Int J Environ Res Public Health. 2021;18(23):12550. doi:10.3390/IJERPH182312550] This is an alarming statistic because many scientific studies have demonstrated the adverse effects of specific PFAS like perfluorooctanesulfonate acid (PFOS) and perfluorooctanoic acid (PFOA) on human health, such as their link to liver and kidney disease, cancer, and complications related to the immune system, reproductive system, and child development. [REF5: Sunderland EM, Hu XC, Dassuncao C, Tokranov AK, Wagner CC, Allen JG. A Review of the Pathways of Human Exposure to Poly- and Perfluoroalkyl Substances (PFASs) and Present Understanding of Health Effects. J Expo Sci Environ Epidemiol. 2019;29(2):131. doi:10.1038/S41370-018-0094-1; REF6: Jha G, Kankarla V, McLennon E, et al. Per- and Polyfluoroalkyl Substances (PFAS) in Integrated Crop–Livestock Systems: Environmental Exposure and Human Health Risks. Int J Environ Res Public Health. 2021;18(23):12550. doi:10.3390/IJERPH182312550] Unfortunately, thousands of PFAS still remain undiscovered and untested, and unregulated in our ecosystem. [REF2: Fenton SE, Ducatman A, Boobis A, et al. Per- and Polyfluoroalkyl Substance Toxicity and Human Health Review: Current State of Knowledge and Strategies for Informing Future Research. Environ Toxicol Chem. 2021;40(3):606-630. doi:10.1002/ETC.4890; REF5: Sunderland EM, Hu XC, Dassuncao C, Tokranov AK, Wagner CC, Allen JG. A Review of the Pathways of Human Exposure to Poly- and Perfluoroalkyl Substances (PFASs) and Present Understanding of Health Effects. J Expo Sci Environ Epidemiol. 2019;29(2):131. doi:10.1038/S41370-018-0094-1] Though many countries have implemented regulations and bans on certain PFAS, many industries continue to utilize unregulated PFAS and develop newer compounds to replace legacy and regulated PFAS by the year. [REF7: Kurwadkar S, Dane J, Kanel SR, et al. Per- and polyfluoroalkyl substances in water and wastewater: A critical review of their global occurrence and distribution. Science of The Total Environment. 2022;809:151003. doi:10.1016/J.SCITOTENV.2021.151003] We simply cannot scientifically dismiss these thousands of unstudied PFAS as harmless to human health.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Safe Healthy Playing Fields, Inc. (Doc. #1621, SBC-042941)

Safe Healthy Playing Fields Inc.

www.safehealthyplayingfields.org

27 May 2023

Public comments on Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

Docket ID No. EPA-HQ-OW-2022-0114.

Submitted via https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0001

Thank you for this opportunity to participate in this vitally important conversation. These comments are submitted by Safe Healthy Playing Fields, Inc. (SHFPI), an all-volunteer 501-c-3 non-profit. Our constituency ranges from concerned individuals to community/civic organizations, legal, healthcare and science professionals, municipal leaders and state legislators.

On behalf of our members and chapters around the US and beyond, SHPFI hereby requests that the US EPA give urgent and serious consideration to a largely unrecognized source of PFAS contamination littered across our communities and country: The per- and polyfluoroalkyl substances (PFAS) in synthetic turf playing fields. Specifically, we request that the US EPA consider:

● The presence of PFAS in synthetic, plastic turf playing fields and other plastic turf applications that are known to leach into soil, air and water.

● The need to set standards at a level protective of both human and environmental health, as reflected by ability of commercial laboratories to detect PFAS at 2ppt.

● Regulation of PFAS as a class of chemicals.

PFAS [Link: https://dtsc.ca.gov/scp/treatments-with-pfass/] can cause multiple reproductive disorders [Link: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8743032/] (including a 40% decrease in female fertility; [Link: https://www.mountsinai.org/about/newsroom/2023/exposure-to-chemicals-found-in-everyday-products-is-linked-to-significantly-reduced-fertility] a decrease of 62.3% total sperm count in males) [Link: https://academic.oup.com/humupd/article/29/2/157/6824414?login=false]; Crohn's disease [Link: https://journals.lww.com/environepidem/Fulltext/2019/10001/Ulcerative_colitis,_Crohn_s_disease_and_other.1369.aspx#:~:text=Background%3A%20Per-%20and%20polyfluoroalkyl%20substances%20%28PFAS%29%20can%20act,Disease%20%28CD%29%20and%20other%20inflammatory%20bowel%20disease%20%28IBD%29]; breast [Link: https://www.bcpp.org/resource/pfas-forever-chemicals-pfoa-pfos/], testicular, kidney [Link: https://www.sciencedirect.com/science/article/abs/pii/S0013935120315899, prostate [Link: https://journals.sagepub.com/doi/10.1177/11786302221076707] and liver [Link: https://cdas.cancer.gov/approved-projects/2555/] cancers. They cross the blood brain barrier and are related to Autism Spectrum Disorder [Link: https://pubmed.ncbi.nlm.nih.gov/33387879/],

Attention Deficit Hyperactivity Disorder [Link: https://www.news-medical.net/news/20230328/ADHD-symptoms-linked-to-early-childhood-exposure-to-polyfluoroalkyl-substances.aspx#:~:text=The%20scientists%20found%20significant%20associations%20between%20PFAS%20exposure,second%20or%20third-quartile%20exposures%20compared%20to%20the%20first], increased deaths from Parkinson's and Alzheimer's diseases [Link: https://pubmed.ncbi.nlm.nih.gov/35921496/]; immunological effects [Link: https://www.healthandenvironment.org/webinars/96552]; increased serum cholesterol [Link: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7071576/]; effects on infant birth weights [Link: https://ehp.niehs.nih.gov/doi/10.1289/EHP9875]; impaired glucose metabolism, insulin resistance, dyslipidemia and adiposity in children and adolescents [Link: https://ehp.niehs.nih.gov/doi/10.1289/EHP11372]; thyroid hormone disruption [Link: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7851056/] (including neonatal) and thyroid cancer [Link: https://journals.sagepub.com/doi/10.1177/11786302221076707]. Because they are bioaccumulative, PFAS exposure can impact multiple generations [Link: https://vimeo.com/563823549].

The presence of PFAS in synthetic turf is beyond dispute. The volume of current, "retired" and planned playing fields and the rush to roll out plastic grass carpets by individuals, businesses and municipalities falsely believing it to be an answer to drought conditions, and the increasing frequency with which cities and boards of education are deliberately seeking to place plastic playing fields near or over waterways, single source aquifers and drinking water reservoirs speaks to the urgency that both the PFAS chemicals and the product itself must be regulated. SHPFI requests you be acutely aware of the human health ramifications of hundreds of thousands of children and athletes often exposed for multiple hours per day and multiple days per week. We ask you to employ the precautionary principle in regards to both the chemicals and the product.

The Environmental Justice considerations for the development of the Proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation (NPDWR) requires that you look beyond sports fields A petrochemical product, synthetic turf covers millions of acres of land: residential, commercial, daycare facilities, spas, batting cages, dog parks, landfill daily cover and closure turf, lining of storm drains and more. All of these applications create ongoing contamination [Link: https://www.youtube.com/watch?v=hoipI2Yj1DA] of air, soil and water.

To date, studies undertaken by US EPA, CDC, CPSC and California's OEHHA have looked only at the used-tire crumb infill – the only infill [Link: https://docs.google.com/document/d/18JSI1dofG6ENpiU5OV9ptjF-ZpsB9wLPIfZRoKyyEjE/edit] material used in synthetic turf for decades.

ALL [Link: https://docs.google.com/document/d/1B-ztYj_jw1p5BYISr5J6lHkW9h3wlshBTdiASI_W-s4/editsynthetic] turf tested to date contains per- and polyfluoroakyl substances- PFAS. The industry trade association, the Synthetic Turf

Council, admits to PFAS in plastic grass carpets, though they continue to attempt to greenwash the t rruth [Link: https://drive.google.com/file/d/1fJDsNTIPp-YMT_7aQ0TDvTaLg2lB5PMA/view?pli=1].

[Image: See Docket ID EPA-HQ-OW-2022-0114-1621]

The University of Notre Dame, Yale, the non-profit The Ecology Center in Ann Arbor, MI and Stockholm University have undertaken extensive research on PFAS in synthetic turf systems: the carpet backing, blades, shock pads and infills.

A partial list of PFAS found in synthetic turf and components (shock pads and plant based infill) to date (from public records):

- PFOS
- PFOA
- 6:2 FTSA
- GenX
- D3-N-MeFOSAA
- D2-N-EtFOSAA
- PFPeA
- PFHxA
- PFHpA
- PFBS
- PFBA
- PFNA
- PFDA
- PFHxS
- PPF Acid
- R-EVE
- PTFE
- PVDF
- 13C2-4:2 FTS
- 12C2-6:2 FTS

● 13C2-8:2 FTS

● 8:2 FTOH

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. See also section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

National Association of Manufacturers (NAM) (Doc. #1655, SBC-043193)

EPA PFAS National Primary Drinking Water Regulation Rulemaking Preliminary Regulatory Determination and Proposed Rule

Docket ID No. EPA-HQ-OW-2022-0114 88 Fed. Reg. 18638 (Mar. 29, 2023)

Submitted on regulations.gov

May 30, 2023

Introduction

As the nation's largest manufacturing association, the National Association of Manufacturers (NAM) represents nearly 14,000 small, medium and large manufacturers in every industrial sector and in all 50 states. The NAM's members are committed to the communities in which they live and serve, and are dedicated to protecting the health, safety and vibrancy of those communities. The NAM appreciates the opportunity to comment on EPA's proposed rule.

Through constant innovation, investment and dedication, the NAM's members have become leaders in environmental stewardship and sustainability, while continuing to be the engine that drives our economic growth and prosperity. Today's domestic manufacturing sector is a clean and efficient operation that is technology driven and dedicated to the planet and its people. The NAM's members are committed to ensuring that progress continues.

Essentiality of PFAS substances

PFAS are a diverse group of chemicals that we rely on daily and that make modern life possible. They are critical to the NAM's members – without PFAS substances, we would not have modern infrastructure including water distribution systems and our current electric grid. Our country cannot make a clean energy transition without PFAS which supports batteries, electric vehicles, green hydrogen, semiconductors and solar components. Finally, PFAS substances are critical to national defense as aircraft, batteries for the warfighter, communications devices and many other functions are not possible without PFAS.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. This rule does not apply to all PFAS and it does not apply to all uses of

PFAS; the EPA encourages the commenter to submit comments in response to other proposed rulemakings, as appropriate.

Aurora Water, City of Aurora, Colorado (Doc. #1669, SBC-043729)

Health Impacts

As proposed, the rule suggests that by requiring water systems to treat their drinking water to an MCLG of 0 ppt all health impacts from PFAS will be mitigated. However, the chemical's presence in drinking water is only one small source of exposure for consumers. As indicated by the EPA, people can be exposed to PFAS through other sources such as eating PFAS contaminated fish, breathing PFAS contaminated air, swallowing contaminated dust, or using products made with PFAS chemicals. Commonly used products in the daily lives of consumers include food wrappers, household products, clothing and personal care products, to name just a few. It is also important that EPA considers sources other than PFAS for the health issues indicated by EPA as potential effects from exposure to PFAS.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. In publishing this rule, the EPA is not suggesting that "all health impacts from PFAS will be mitigated." As the commenter pointed out there are other exposure pathways that the six PFAS included in this rule could follow to impact the health of Americans.

American Dental Association (ADA) (Doc. #1671, SBC-043688)

U.S. Environmental Protection Agency

Office of Ground Water and Drinking Water

Mail Code 2822IT

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114—PFAS National Primary Drinking Water Regulation

To Whom It May Concern:

On behalf of our 159,000 members, we would like to comment on the Environmental Protection Agency's proposal to reduce exposure to several per- and polyfluoroalkyl substances (PFAS) in drinking water. We offer these comments in response to your Federal Register notice of March 29, 2023 (88 FR 18638).

EPA has determined that several PFAS—colloquially termed ‘‘forever chemicals”—pose serious health risks at currently regulated exposure levels. These chemical compounds, which are exceedingly slow to degrade, are commonly found in everyday products (e.g., clothing, cosmetics, toilet paper) or are the unintended byproducts of certain manufacturing processes. Their widespread use has led them to now be found in blood, air, fish, soil, and other places, including drinking water.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies (ACWA) (Doc. #1675, SBC-044927)

I. Introduction

PFAS are a group of thousands of manmade chemicals that have been used extensively since the 1950s in consumer products, such as Teflon pans, fast food packaging, firefighting foams and other materials designed to be waterproof, stain-resistant, or non-stick. Although certain PFAS chemicals are no longer manufactured in the United States, these chemicals are still produced internationally and imported into the country through consumer goods.

EPA Response: Please see the summary of major public comments for this section.

Mass Comment Campaign sponsored by Slingshot. (email) (Doc. #1681, SBC-045709)

Exposure to PFAS can cause serious health effects, such as increased cholesterol levels, reduced immune system function, thyroid disease, liver damage and some forms of cancer. Chemical companies have continued to manufacture PFAS despite knowing for decades that they are unsafe, poisoning communities along the way. A 2018 study by the CDC showed that nearly all Americans have detectable levels of PFAS in their blood.

The EPA's proposed rule reflects what communities across the country already know to be true: There is no safe level of PFAS in our water. For too many Americans, especially those of us who live every day in the shadow of environmental pollution, including PFAS contamination, enough is enough.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Mass Comment Campaign sponsored by Slingshot. (email) (Doc. #1682, SBC-045712)

Exposure to PFAS can cause serious health effects, such as increased cholesterol levels, reduced immune system function, thyroid disease, liver damage and some forms of cancer. Chemical companies have continued to manufacture PFAS despite knowing for decades that they are unsafe, poisoning communities along the way. A 2018 study by the CDC showed that nearly all

Americans have detectable levels of PFAS in their blood. We have been used as a toxic experiment by companies willing to poison our bodies and environment for profit.

The EPA's proposed rule reflects what communities across the country already know to be true: There is no safe level of PFAS in our water. For too many Americans, especially those of us who live every day in the shadow of environmental pollution, including PFAS contamination, enough is enough. It is well past time to turn off the PFAS tap and hold polluters responsible for the costs.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

National Wildlife Federation et al. (Doc. #1702, SBC-043512)

The use of PFAS chemicals in everything from baby products and toothpaste to the water-proofing in outdoor clothing and the non-stick in pans, has exposed many communities to the toxic chemicals. PFAS chemicals can also enter our air, soil, crops, and waters through sources such as industrial discharges from manufacturing facilities, military bases, airports, wastewater treatment plants, petroleum refineries, and areas where PFAS-containing firefighting foams have been used. These long-lasting, toxic, “forever chemicals” can enter ground and surface water, contaminating our nation’s drinking water supplies, accumulating in fish and wildlife across the nation. They are found in the blood of nearly every individual in the United States.

PFAS contamination exposes people and wildlife to serious health risks, including cancers, impacts to the immune and reproductive systems, and other harms. Communities of color and low-income communities are particularly impacted by PFAS exposure, where health impacts are often compounded because these communities tend to face cumulative effects from multiple environmental injustices and public health hazards.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. See also section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045721)

A. Minnesota has faced the brunt of PFAS contamination in the United States

The ubiquity of PFAS in our environment is well-documented. These synthetic chemicals have been detected in soils, [FN3: Ziyad Abunada et al., An Overview of Per- and Polyfluoroalkyl Substances (PFAS) in the Environment: Source, Fate, Risk & Regulations, 12 Water 3590 (2020), https://www.mdpi.com/2073-4441/12/12/3590/pdf.] drinking water, [FN4: Id.] and wildlife [FN5: Id.; Jacqueline Bangma et al., Understanding the Dynamics of Physiological Changes, Protein Expression, and PFAS in Wildlife, 159 Environmental International 107037 (2022), https://www.sciencedirect.com/science/article/pii/S0160412021006620/pdfft?md5=ca09c75b9d48c373a22e32a65e7b1203&pid=1-s2.0-S0160412021006620-main.pdf.] across the globe. Not even ice from remote glaciers in the arctic is safe from PFAS contamination. [FN6: https://www.sciencedirect.com/science/article/pii/S004896972300445X] But while PFAS have reached all parts of the globe, their impacts have not been evenly felt.

Minnesotans have been on the frontlines in the fight against PFAS for decades. 3M is an American multinational conglomerate based in Minnesota that operates in the fields of industry, worker safety, healthcare, and consumer goods. The company first developed perfluorochemicals in the late 1940s, and for decades 3M manufactured PFOA, PFOS, and other PFAS at facilities in the Twin Cities metropolitan area and shipped in products around the world. [FN7: Complaint at ¶¶ 7, 8, Minnesota v. 3M Co., No. 27-CV-10-28862 (Minn. Dist. Ct. Dec, 30, 2010), available at https://www.mncourts.gov/mncourtsgov/media/High-ProfileCases/27-CV-10-28862/Complaint-123010.pdf ¶¶ 7, 8.] 3M's manufacture of PFAS ceased only recently, and the company's disposal of waste from PFAS manufacturing at four locations in the East Metro is directly responsible for a nearly 100 square mile plume of contaminated groundwater that hundreds of thousands of Minnesotans rely upon every day for drinking water. [FN8: https://www.mncourts.gov/mncourtsgov/media/High-Profile-Cases/27-CV-1028862/Complaint-123010.pdf ¶¶ 6, 10. Id. at ¶¶ 6, 10.] As the state of Minnesota alleged in its 2010 lawsuit against the company, "3M is responsible for releasing [PFAS] into the Minnesota environment, causing pollution of groundwater, surface water, and sediments and resulting in injury, destruction and loss of natural resources of the State." [FN9: https://www.mncourts.gov/mncourtsgov/media/High-Profile-Cases/27-CV-1028862/Complaint-123010.pdf ¶ 19. Id. at ¶ 19.] 3M's actions devastated drinking water supplies in the region. And although Minnesota settled its lawsuit against 3M for $850 million, [FN10: Minnesota 3M PFAS Settlement, Minn. Pollution Control Agency, https://3msettlement.state.mn.us/ (last visited May 30, 2023).] communities in the East Metro continue to struggle to provide uncontaminated drinking water to their residents. [FN11: See, e.g.,

https://www.mprnews.org/story/2020/01/10/woodbury-takes-emergencyaction-to-tackle-water-contamination. See, e.g., Kirsti Marohn, Woodbury Takes Emergency Action to Tackle Water Contamination, MPRNEWS, Jan. 10, 2020, https://www.mprnews.org/story/2020/01/10/woodbury-takes-emergency-action-totackle-water-contamination (last visited May 30, 2023).]

Most significantly, 3M's illegal actions have led to tragic and avoidable public health impacts. Tartan High School, located in the East Metro city of Oakdale, has been at the center of a decades-long cancer cluster. [FN12: See Carrie Fellner, Toxic Secrets: The Town That 3M Built–Where Kids Are Dying of Cancer, SYDNEY MORNING HERALD (Jun. 15, 2018), https://www.smh.com.au/world/northamerica/toxic-secrets-the-town-that-3m-built-where-kids-are-dying-of-cancer20180613-p4zl83.html (last visited May 30, 2023).] The consumption of drinking water contaminated with PFAS has led to the death and lifelong ailments of many Oakdale children and families. These children have been left battling cancer with a persistent fear of remission well into adulthood, a fear that remains and resurfaces with each sip of tap water. These battles are felt by family and friends who observe the crippling effects of PFAS poisoning, who spend money on treatments and take time off work to provide care and transport, and who would give up everything to find a remedy. Minnesotans know all too well what the true social cost of PFAS is and why national drinking water standards are needed to ensure others across the country do not suffer the same fate. Some of these stories, told in greater detail below, explain the staggering costs borne by a few Minnesotans and their families, and justify the EPA's cost-benefit determination supporting the agency's proposed standards.

1. Amara Strande [FN13: Attachment 1, Declaration of Amara Dolore Strande, written by Dana Fath Strande and Michael Strande, May 5, 2023.]

Before her cancer diagnosis, Amara Strande did everything. She wrote music, she was in the theatre, she played sports, was in Girl Scouts, and was heavily involved with the Church. She dreamed of professionally composing music, of dating, of going out into the world to experience all the excitement of life. With the time that Amara had on this earth, she took it by storm.

Amara was full of light, song, and creativity. Kittens, rocks, music, and dark humor made her smile. She was loved and she loved fiercely in return. Through this grit, Amara made her world better, and she uplifted those around her. Before, during, and after cancer, Amara's presence affected change. When asked to describe Amara, one of the first stories her parents relayed was the reason that Amara called a refrigerator a "refrigerlater" is because "you put food in it to eat later."

Throughout Amara's life, the Strandes lived in Woodbury and St. Paul, Minnesota. Their water was supplied by local public drinking water systems, and they filtered it at home. Amara also drank the water at Tartan High School. For Amara's entire life, she was living above groundwater contaminated with PFAS from 3M's dumping. The Strandes were told that their water was safe and that the substances were non-cancerous.

In the fall of 2017, when she was just 15, Amara was diagnosed with a rare liver cancer called fibrolamellar carcinoma. This was after a year of misdiagnoses because her cancer was rare: so rare that the health insurance companies did not have a code for it. Amara swiftly started fighting. She underwent over 20 surgeries; she dealt with chemotherapy, radiation, and a host of treatments and therapies. But as Amara put it, cancer was a "whack a mole."

Through the pain, both physical and emotional, and compounded with becoming a teenager, Amara never stopped advocating and supporting others who needed their voices to be lifted and heard. She developed friendships and support groups for other Tartan High School students dealing with cancer, and she started support networks for children across the country. Because of the amount of time Amara and her family spent at hospitals, she put together a booklet for others on lessons learned in making hospital stays more manageable and less fearful. That booklet remains at the hospital, still helping others.

As Michael and Dana, Amara's parents, will tell you, cancer is not an experience that just affected Amara. As Dana puts it, when one person has cancer, the whole family has cancer. Nora, Amara's younger sister, spent her childhood and adolescence witnessing her sister's battles. As a result, Nora has been experiencing her own trauma, her own battle with loss and fear, and what it means to feel invisible to the outside world.

Dana, Michael, and Nora have lost so much from contaminated water. They fear the ability to build a retirement fund after having spent nearly all of what was saved to keep their family afloat. They have experienced job loss, missed time with their own aging parents, and uncertainty about how they will support Nora's future. There is concern that these same toxins that hurt Amara are running through Nora's body as well. And then there is simply the physical toll that stress and incremental loss takes on the bodies of loved ones, the emotional strain of continuing on when everything feels like it is falling apart.

When asked to approximate the financial expenses related to Amara's care, the Strande's estimated spending at least $50,000 annually over the course of Amara's five-year battle. They estimated that their insurance company spent at least $5 million for the innumerable surgeries, hospital visits, appointments, and other medical obligations attendant to cancer. Their first medical bill, of which there have been so many, was $900,000. And this is one person, one family affected by PFAS in drinking water.

Amara spent her life dealing with the true costs of PFAS. She spent her last few months battling its effects on her body. And she spent those final months advocating before the Minnesota Legislature to push for strict non-essential use ban on PFAS. Amara left this earth earlier this year, and her parents, Dana and Michael, provided the attached declaration. Dana and Michael have written these words to share with EPA who Amara was, what she stood for, and what PFAS contamination has cost them.

2. Senator Tou Xiong [FN14: Attachment 2, Testimony of Senator Tou Xiong, written in support of Minnesota's Legislative PFAS Disclosure and Ban on Non-Essential Use.]

Minnesota State Senator Tou Xiong also attended Tartan High School, and he witnessed first-hand what these substances do to communities. But more importantly, Senator Xiong saw how far families will go and expend to save their loved ones.

In 2005, when Tartan High School first realized the connection between PFAS and drinking water in the Oakdale community, no one wanted to talk about it. No one wanted to scare the students with news about cancer. But as Senator Xiong put it, there was no way to "hide the obvious." When Senator Xiong first moved to Oakdale, he did not fully understand why the school's end of year Relay for Life event was such a big deal in the community. The whole town, all the social groups, turned up for the event. And then it became clear: this was a step of action that the community could take to address the pain and suffering they had experienced all year long. Throughout Senator Xiong's four years at Tartan High School, he remembers the regular announcements the principal made. They let students know who to pray for, who had recently passed away, and when funerals would be held.

3. John Doe and Ben Rule [FN15: JD and Ben provided their consent to use the interviews they gave to Deena Winter at the Minnesota Reformer. See Deena Winter, There Must Be Something in the Water, MINN. REFORMER (Dec. 14, 2022), https://minnesotareformer.com/2022/12/14/there-must-besomething-in-the-water/ (last visited May 30, 2023).]

John Doe (JD) [FN16: To protect the confidentiality of this individual, their name has been changed to John Doe, or JD.] was first diagnosed with brain cancer at the age of 14. [FN17: JD provided testimony before the Minnesota Legislature's 2023 Session in support of the recently passed PFAS non-essential use ban. See Attachment 4.] JD's childhood home was just a few miles from where 3M dumped PFAS waste in an unlined pit. As a child, JD underwent extensive surgery to remove a tumor the size of a baseball from the back of his head. He had to relearn his basic motor skills, including walking. He still lives in Oakdale and remains constantly fearful of whether this experience with cancer will ever truly be over. He struggles with short-term memory retention. He may never be able to have children of his own. He watched friends die of cancer. He watched his friend's parents die of cancer. Cancer and PFAS have become a life-long battle for JD. It has become a part of his story.

JD's high school experience was immersed in cancer. Just as a typical high school has jocks, popular kids, and nerds, Tartan High School had another social class—the cancer kids. JD watched his classmates and neighbors receive their cancer diagnoses. He watched some of them die. In fact, JD considers himself to be one of the lucky ones because he did not have to undergo chemotherapy. Steroids were able to shrink the tumor to the point where surgery could remove it from his brain. But what he also lost were his memories. He lost the laughter with friends, the hugs from parents, and the adventures of youth. What JD kept is a permanent traumatic brain injury that leaves him susceptible to concussions and problems building new memories.

Ben Rule also grew up in Oakdale. [FN18: Attachment 3, Declaration of Benjamin Rule, May 19, 2023.] At 16, Ben learned that he had Acute Lymphoblastic Leukemia. Cancer cells were in

his blood and marrow. As Ben grew, so did his cancer. Pancreatitis led to the removal of his spleen. Complications from treatments led to Ben slipping into a coma for two weeks. He awoke up with Type 1 diabetes. Chemotherapy lasted five years. He needed to have his hip replaced. And Ben was not alone. Because of PFAS, Oakdale has a lymphocytic leukemia cancer rate nearly 30% higher than that of the rest of Minnesota.

Before cancer, Ben was a normal teenager. He was learning to drive, working his first job, and going to high school. He had no family history of cancer, no bad habits, no life factors that would lead to cancer. The days leading up to his diagnosis were full of pain. What Ben remembers from the day of his diagnosis, was the firm knowledge that his life would never be the same. He was correct; Ben has been suffering from severe depression as a result of coming into adulthood battling cancer. At a time when most kids are learning who they are, considering who to ask to prom, what colleges they want to apply to, and how excited they are to get out into the world, Ben was fighting for his life. He missed so many of the formative experiences that make a teenager into an adult. And he still feels lost in that purgatory of being an adult, but not having fully developed who he was during those life-shaping times.

4. The Others

When we tell the stories of how contaminants harm or kill people, we so often focus on those who are actively undergoing treatment or have lost their battle with the disease. But there are others. These are the ones who have had to watch; the ones who have caretaken, who have buried, and who have been silenced by the pain of those they love. They are the parents who are left with holes in their hearts after losing a child. They are the siblings who have grown up steeped in a whole family immersed in cancer battles—who have lost, who feel invisible, who grow up with an identity attached to sickness. They are children who will never get to know their parents as adults, as humans, because they have lost them to cancerous substances.

And then there's the burdensome financial costs that families and communities go through. The treatments, the travel, the hotel stays, the never-ending bills, the lost retirement wages, the time away from school and work that stalls a career path, the GoFundMe's, the future medical bills to keep the cancer at bay, the physical therapy, the mental health therapy, the wigs, the costs of a funeral, and the persistent fear of "who's next."

As we expand our knowledge of the harms of PFAS in our drinking water, we expand our fears. Parents, physicians, neighbors, siblings, all want change. They want action. They want their voices to be heard. And they want these stories to be a thing of the past, not a cautionary tale for the future.

EPA Response: The EPA thanks the commenter for submitting case studies regarding PFAS exposure and adverse human health effects. Please see section 2.2 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045403)

Contamination from the class of chemicals known as per- and polyfluoroalkyl substances, or PFAS, is an urgent public health crisis. The use of PFAS across multiple industries is ubiquitous, and experts have identified more than 1,400 individual PFAS in over 200 use categories. [FN1: Juliane Glüge et al., An Overview of the Uses of Per- and Polyfluoroalkyl Substances (PFAS), 22 ENV'T. SCI. PROCESSES 2345 (2020), https://pubs.rsc.org/en/content/articlepdf/2020/em/d0em00291g] A peer-reviewed analysis identifies a staggering 41,862 potential PFAS dischargers, many of which likely pollute sources of drinking water. [FN2: David Andrews et al., Identification of Point Source Dischargers of Per and Polyfluoroalkyl Substances in the United States, AWWA WATER SCI. 1252 (2021), https://doi.org/10.1002/aws2.1252.] EWG has identified 2,854 sites contaminated with PFAS in 50 states,[FN3:See Env't Working Grp., PFAS Contamination in the U.S., https://www.ewg.org/interactivemaps/pfas_contamination/ (last updated June 8, 2022).] and estimates that more than 200 million Americans may have PFAS in their drinking water. [FN4: David Q. Andrews & Olga Naidenko, Population-Wide Exposure to Per- and Polyfluoroalkyl Substances from Drinking Water in the United States, 7 ENV'T SCI. & TECH. LETTERS 931 (2020),https://pubs.acs.org/doi/10.1021/acs.estlett.0c00713.]

Exposure to PFAS is associated with a range of serious health harms including negative impacts on fetal growth after exposure during pregnancy, on other aspects of development, reproduction, liver, thyroid, immune function, and/or the nervous system; and increased risk of cardiovascular and/or certain types of cancers, and other health impacts. [FN5: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18638 (March 29, 2023).] The six PFAS covered by the proposal have especially strong evidence of harm, as delineated in the proposal[FN6: Id. at 18645-18647.] and supplemented by additional technical comments to the proposal. [FN7: Earthjustice et al., Comments on PFAS National Primary Drinking Water Regulation Rulemaking, EPA-HQ-OW-2022-0114-0027, at 21-27.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Chattahoochee Riverkeeper (CRK) (Doc. #1730, SBC-043561)

May 30, 2023

Michael S. Regan Administrator

U.S. Environmental Protection Agency

Washington, D.C.

RE: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (Docket ID: EPA-HQ-OW-2022-0114)

Dear Mr. Regan,

Chattahoochee Riverkeeper (CRK) would like to thank EPA for providing us the opportunity to comment on the proposed "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation" (Docket ID: EPA-HQ-OW-2022-0114). We urge EPA to swiftly implement drinking water protections for per- and polyfluoroalkyl substances (PFAS) that will protect our water supply and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

Established in 1994, Chattahoochee Riverkeeper (CRK) is an environmental advocacy and education organization in Georgia with nearly 10,000 members dedicated to making the Chattahoochee River a sustainable resource for the five million people who depend on it as a source of drinking water. Our mission is to advocate and to secure the protection and stewardship of the Chattahoochee River, its lakes, tributaries, and watershed, in order to restore and preserve their ecological health for the people and wildlife that depend on one of the Southeast's hardest working river. Our watershed is home to numerous landfills, land applications sites, carpet and textile manufacturers and military bases that are potential and known sources of PFAS contamination to the Chattahoochee River and its tributaries.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. These "forever chemicals" are linked to increased incidence of cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions. Though experts estimate that more than 200 million Americans are exposed to PFAS through drinking water, there are no binding, enforceable regulatory standards in place to protect the public and our nation's waters from this serious health hazard.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. The EPA notes that this rule will now be a binding, enforceable drinking water standard. The Clean Water Act (CWA) governs discharges to navigable waters of the United States and is outside the scope of this rulemaking.

Rio Grande Waterkeeper and WildEarth Guardians (Doc. #1732, SBC-045422)

I. PFAS in Drinking Water Poses a Serious Public Health Threat Warranting the Adoption of New Drinking Water Standards

There is no doubt in the scientific community that PFAS are harmful and incredibly widespread, accumulating in people, wildlife, and waterways. PFAS have been linked to cancer, liver damage, decreased fertility, and increased risk of asthma and thyroid disease. [FN1: Health Risks of Widely Used Chemicals May Be Underestimated, HARVARD T.H. CHAN SCH. OF PUB. HEATH, https://www.hsph.harvard.edu/news/hsph-in-the-news/pfas-health-risks-underestimated (last visited May 23, 2023).] As of June 2022, there are more than 2,800 sites known to be

contaminated by PFAS in the United States, according to the Environmental Working Group (EWG). [FN2: PFAS Contamination in the U.S., ENV'T WORKING GRP. (June 8, 2022), https://www.ewg.org/interactive- maps/pfas_contamination/.] A recent EWG analysis of newly available EPA data also found that more than 41,000 industrial and municipal facilities are known to use or are suspected of using toxic PFAS chemicals, including airports, sewage and wastewater treatment plants, and landfills. [FN3: Suspected Industrial Discharges of PFAS, ENV'T WORKING GRP., https://www.ewg.org/interactive-maps/2021_suspected_industrial_discharges_of_pfas/map/ (last visited May 23, 2023).' An extensive Waterkeeper Alliance study found that 83% of the 114 waterways tested across the US are contaminated by PFAS. [FN4: Invisible, Unbreakable, Unnatural, WATERKEEPER ALL., https://waterkeeper.org/pfas/ (last visited May 23, 2023).]

PFAS contamination of drinking water is a major source of human exposure to these toxic chemicals. A peer reviewed Ecotoxicology and Public Health study (2020) estimated that between 18 and 80 million Americans receive tap water with a PFOA and PFOS concentration at or above 10 ppt, more than double the EPA's proposed maximum contaminant level. Further, the study estimates that over 200 million Americans, almost two thirds of the nation's population, are likely to be receiving tap water with a PFOA and PFOS concentration at or above 1 ppt. [FN5: David Q. Andrews & Olga V. Naidenko, Population-Wide Exposure to Per- and Polyfluoroalkyl Substances from Drinking Water in the United States, ENV'T. SCI. & TECH. LETTERS (2020), https://pubs.acs.org/doi/10.1021/acs.estlett.0c00713.]

Currently, we are without substantive and universal restrictions on PFAS. There are no effective safeguards ensuring that our drinking water and everyday goods do not contain PFAS. Without comprehensive and effective standards to protect against the widespread threat of PFAS in the environment, our families, communities, and future generations remain at risk.

Of particular concern to Rio Grande Waterkeeper and WildEarth Guardians, PFAS contamination is a significant issue in the Rio Grande Basin with economic, environmental, and public health consequences. According to EWG's interactive map of PFAS contamination in the United States, PFAS are known to have contaminated water at least four military sites in New Mexico and it is likely there are many more contaminated sites. [FN6: PFAS Contamination in the U.S., ENV'T WORKING GRP. (June 8, 2022) https://www.ewg.org/interactive-maps/pfas_contamination/.] Two of these contaminated sites, Cannon Air Force Base (AFB) and Holloman AFB, have used PFAS-containing firefighting foam and have been discharging wastewater containing PFAS into the environment. Groundwater below Cannon AFB was found to be contaminated with PFOA and PFOS at combined concentrations as high as 26,200 ppt in 2018. [FN7: Groundwater War – New Mexico's Toxic Threat, N.M. PBS, https://www.newmexicopbs.org/productions/groundwater-war/timeline/ (last visited May 23, 2023).] PFAS contamination was also discovered in off-base wells supplying homes and dairies with water in Clovis. [FN8: PFAS Detected in Clovis Public Drinking Water System, N.M. ENV'T DEPT. (Feb. 10, 2020), https://www.env.nm.gov/wp-content/uploads/2020/02/2020-02-10-Clovis-PR-final.pdf.] In response to this groundwater contamination, the area's municipal

water provider took ten production wells off-line, and local dairy farmers were forced to euthanize thousands of cows contaminated with PFAS. [FN9: Theresa Davis, Cannon PFAS Destroyed Longtime Clovis Farmer's Dairy, ALBUQUERQUE J. (May 28, 2022), https://www.abqjournal.com/2503560/cannon-pfas-destroyed-longtime-clovis-farmers-dairy.html.] Separately, groundwater tested under Holloman AFB was found to contain PFAS levels of 1,294,000 ppt (18,000 times higher than the EPA's lifetime PFAS limit of 70 ng/L). [FN10: Laura Paskus, 2018 Report Shows Off-the-Charts Contamination in Holloman AFB Water, NM POL. REP. (Feb, 2, 2019) https://nmpoliticalreport.com/2019/02/02/2018-report-shows-off-the-charts-contamination-in-holloman-afb- water/.] Litigation between New Mexico and the Air Force about the discharge and cleanup of PFAS from Holloman AFB and Cannon AFB is ongoing. Meanwhile Cannon AFB continues discharging wastewater without taking precautions against PFAS contamination required by the NM Environment Department. [FN11: Megan Gleason, Battle Between New Mexico and US Air Force to Track Toxic Chemicals Drags On, SOURCE NM (Apr. 17, 2023), https://sourcenm.com/2023/04/17/battle-between-new-mexico-and-us-air-force-to-track-toxic- chemicals-drags-on/.]

PFAS has also been discovered at alarming levels in fish in the Middle Rio Grande just downstream from Albuquerque, which relies on the Rio Grande for its drinking water. [FN12: Where Our Water Comes From, ALBUQUERQUE BERNALILLO CNTY. WATER UTIL. AUTH.,https://www.abcwua.org/wp-content/uploads/Your_Drinking_Water-PDFs/Figure1_Where_Our_Water_Comes_From.pdf (last visited May 23, 2023).] Common carp in the Middle Rio Grande were found to contain 28,400 ppt of PFOS, and a total PFAS concentration of 43,183 ppt. [FN13: Forever Chemicals' in Freshwater Fish, ENV'T WORKING GRP. (Jan. 2023), https://www.ewg.org/interactive- maps/pfas_in_US_fish/map/.] This is concerning because eating even one fish at this level of contamination could be the equivalent of drinking water contaminated with PFAS above the EPA's new drinking water standard for months. [FN14: Nadia Barbo, et al., Locally Caught Freshwater Fish Across the United States Are Likely a Significant Source of Exposure to PFOS and Other Perfluorinated Compounds, 220 ENV'T RSCH. 115165 (Mar. 1, 2023). https://doi.org/10.1016/j.envres.2022.115165.] The discovery of PFAS-contaminated fish is also concerning as an indicator of PFAS contamination in the water that residents of New Mexico are drinking.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. As the commenter pointed out there are other exposure pathways that the six PFAS included in this rule could follow to impact the health of Americans. This rule does not apply to all PFAS and, consistent with SDWA, is focused on particular PFAS in drinking water.

<u>New Mexico Environment Department (NMED) (Doc. #1766, SBC-044247)</u>

Attachment 1:

Comments on EPA's Proposed PFAS National Primary Drinking Water Regulation

May 30, 2023

Introduction

The EPA has published a proposed rule designating four PFAS [FN1: The proposed rule addresses perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS.] as contaminants under the Safe Drinking Water Act, establishing a National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for these four PFAS and their mixtures as well as for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS). PFAS have been used in food packaging, cleaning products, stain resistant carpet treatments, nonstick cookware and firefighting foam, among other products. Due to the widespread use of PFAS and the fact that they bioaccumulate, they are found in the bodies of people and animals all over the world, as well as ground and surface water and other natural resources.

The health effects of these contaminants are clear. Scientific research indicates that some PFAS affect reproductive health, increase the risk of some cancers, affect childhood development, increase cholesterol levels, affect the immune system, and interfere with the body's hormones. EPA and others have presented extensive documentation on PFOA and PFOS toxicity, mobility, persistence, and widespread presence in the environment, which result in substantial danger to public health and welfare and to the environment, including animals.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Sierra Club of Hawai'i (Doc. #1771, SBC-044730)

Public Health

As the agency has reported, PFAS chemicals bioaccumulate in the environment and are linked to a variety of health problems including kidney and testicular cancer, damaged immune systems, and harm to the liver, thyroid, and pancreatic function. More than 200 million people in the United States are estimated to currently have unhealthy levels of PFAS in their drinking water, and nearly every American has some amount of PFAS in their bodies—even newborns. The long-term effects of ingesting these chemicals can be serious if not deadly. Indeed, no levels of PFAS in our water is safe to drink, and setting limits as close to zero is necessary to protect human health.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

PFAS National Primary Drinking Water Regulation Rulemaking

Docket ID: EPA-HQ-OW-2022-0114

INTRODUCTION

Americans are exposed to Per- and poly-fluoroalkyl substances ("PFAS") through products such as food packages, carpets, non-stick cookware, and cosmetics, among other things. [FN1: Earthjustice, Breaking Down Toxic PFAS, EARTHJUSTICE, Oct. 19, 2021, https://earthjustice.org/feature/breaking-down-toxic-pfas.] PFAS are termed "forever chemicals" because they do not break down easily and persist in the environment and human bodies for decades. [FN2: Id.] Research has shown that PFAS has significant health effects on individuals, including negative impacts on fetal growth and child growth after exposure during pregnancy, impacts on the liver, thyroid, immune function, and/or the nervous system; and increased risk of cardiovascular and/or certain types of cancers. [FN3: Mindi F Messmer, Jeffrey Salloway, Nawar Shara, Ben Locwin, Megan W Harvey, Nora Traviss, Risk of Cancer in a Community Exposed to Per- and Poly-Fluoroalkyl Substances, NATIONAL LIBRARY OF MEDICINE (2022), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8842173/.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

PFAS Project Lab (Doc. #1786, SBC-044711)

Exposure to PFAS is associated with cancers, weakened immune response, developmental and reproductive harm, hormonal disruption, thyroid toxicity, and liver and kidney diseases, among other adverse health outcomes (ATSDR, 2021).

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Mindi Messmer (Doc. #1788, SBC-044708)

3. Our children are already experiencing increasing rates of cancer (Ugai, et al, 2022) – we must do what we can to prevent additional cases and preserve the health and well-being of future generations.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Peggy Kurtz (Doc. #1799, SBC-046046)

This is also the best way to cut future filtration costs: turn off the spigot. Stop producing the chemicals that are polluting our air and water.

I have a blood cancer, myself. I will never know what the source is, but it is not hereditary. I often wonder whether it could be from our drinking water. As a matter of fact, like everyone else over age fifty, many of the people I know have had some form of cancer – and of course, I know quite a few people who have died of cancer. It is long overdue that we take the threat of chemical pollution far more seriously.

We are poisoning ourselves and the wildlife around us. It is time for a precautionary approach.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Peggy Kurtz (Doc. #1799, SBC-046041)

To: EPA

Re: Docket ID: EPA-HQ-OW-2022-0114, PFAS Regulations

Date: May 29, 2023

I am writing to ask the EPA to finalize as quickly as possible the draft PFAS regulations as proposed in Docket ID: EPA-HQ-OW-2022-0114. I want to thank the EPA for stepping up to take this strong action. The risks of at least some PFAS have been well researched and widely known to regulators at least since the early 2000s. This action is long overdue, but very welcome.

Since learning that our water is contaminated with PFAS, I've become involved with efforts to pass state legislation in New York State and to get stronger drinking water standards. I am the leader of Rockland Sierra Club and an appointed member of the Rockland County Water Task Force.

I live in Rockland County, New York. Nearly every single one of our public drinking water sources are contaminated with some level of PFAS chemicals.

Like about 90% of the county's residents, I am a customer of Veolia Water New York. According to a report by Riverkeeper, out of 63 different water sources managed by Veolia, all but one of them is contaminated.

New York State currently regulates only two PFAS: PFOA and PFOS. However, many of our wells are contaminated with multiple PFAS, eight different PFAS in all, so there is also the potential for additive or synergistic effects.

However, many of our wells and reservoirs are contaminated at levels below the NYS Maximum Contaminant Levels (MCLs). And six of the PFAS found in our drinking water are not regulated in NYS. So, approving the draft EPA PFAS regulations makes all the difference to us in Rockland County between continuing to drink water that is contaminated with PFAS – or not.

I am particularly concerned with the impacts on fetuses, infants, and children. It is just unacceptable to continue to expose children and babies to chemicals with known toxicity.

The New York State Department of Health is mandated by law to regulate 23 more PFAS, in addition to PFOA and PFOS. These regulations are now about one year overdue, past the mandated time frame for new regulations. However, the Department of Health told a group of environmentalists that they are waiting for the EPA regulations to move ahead. Many other states are likely doing the same. If EPA moves ahead with strong regulations, that will make it much easier for states to go even further to regulate additional PFAS, using the same science and the same principles.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Millie Garcia-Serrano (Doc. #1803, SBC-044284)

ASTSWMO's PFAS Position Paper, drafted by the Association's Contaminants of Emerging Concern (CEC) Steering Committee, and updated and approved by our Board in November 2022, recommends that EPA evaluate classes of PFAS that have common characteristics, to more expeditiously designate PFAS compounds as CERCLA hazardous substances and RCRA hazardous constituents. However, the summary document (EPA-822-P-23-004) distributed for public comment on the combined Maximum Contaminant Level Goals (MCLGs) does not adequately explain why PFHxS, GenX chemicals, PFNA, and PFBS, four seemingly disparate PFAS, were selected. ASTSWMO recommends more careful consideration of PFAS functional groups, chain length, and toxic endpoints, and the use of a more-refined approach for the combined regulation of these chemicals.

EPA's promulgation of health-based MCLGs for the aforementioned PFAS compounds would advance federal and State efforts to compel responsible and potentially-responsible parties to investigate and remediate contamination nationwide, especially when private wells and public water supply systems are impacted. This is a critical step for impacted communities' access to financial resources for costly mitigation and cleanup.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. This regulatory action focuses on drinking water. Mitigation and cleanup are addressed under other statutes (e.g., CERCLA). For more information on why certain PFAS were selected, please see section 3.1 of the EPA response in this *Response to Comments* document.

Earthjustice et al. (Doc. #1808, SBC-046097)

I. EPA Must Expeditiously Finalize Health-Protective PFAS Drinking Water Standards

A. EPA Should Move Quickly to Finalize PFAS MCLs

As described by Dr. Patrick Breysse, the former Director of the Center for Environmental Health in the U.S. Centers for Disease Control and Prevention, PFAS present "one of the most seminal public health challenges for the next decades." [FN4: Pat Rizzuto et al., CDC Sounds Alarm on Chemical Contamination in Drinking Water, Bloomberg Env't (Oct. 17, 2017), https://news.bloomberglaw.com/environment-and-energy/cdc-sounds-alarm-on-chemical-contamination-in-drinking-water.] When Dr. Breysse made that statement in October 2017, he estimated that "up to 10 million Americans" could be drinking water with unsafe levels of PFAS. [FN5: Id.] Today, that estimate is approximately 200 million. [FN6: See Andrews & Naidenko (2020); Annie Sneed, Forever Chemicals Are Widespread in U.S. Drinking Water, Sci. Am. (Jan 22, 2021), https://www.scientificamerican.com/article/forever-chemicals-are-widespread-in-u-s-drinking-water/.] Impacted communities experience increased risks of cancer and other severe effects, with some exposed to PFAS levels that are tens of thousands of times higher than the levels that EPA has already determined present serious health risks. [FN7: See, e.g., EPA, Hoosick Falls, New York, Drinking Water and Groundwater Contamination, Frequently Asked Questions (Jan. 12, 2016), https://www.epa.gov/sites/default/files/2016-01/documents/hoosickfalls_faqs.pdf (describing PFOA detections of 600 parts-per-trillion (ppt) in drinking water in Hoosick Falls, New York—150,000 times higher than EPA's health advisory level of .004 ppt); WRAL News, Report: Extremely High Levels of GenX-like Chemicals in Wilmington Drinking Water for Years (Oct. 9, 2019), https://www.wral.com/story/report-extremely-high-levels-of-genx-like-chemicals-in-wilmington-drinking-water-for-years/18688129/ (describing GenX detections of 130,000 ppt in the Cape Fear River near Wilmington, NC, drinking water intake—13,000 times higher than EPA's health advisory level of 10 ppt).]

Because of their chemical structure, PFAS are highly persistent, "indicat[ing] the potential for long-lasting environmental and human exposure … that is difficult to control and reverse." [FN8: See, e.g., Ian T. Cousins et al., Why is High Persistence Alone a Major Cause of Concern?, 21 Env't Sci. Processes & Impacts 781 (2019), https://doi.org/10.1039/C8EM00515J.] Many PFAS also bioaccumulate in animals and people, with low-level exposures building up in people's bodies and causing serious harm. More than 98% of people tested in the United States have PFAS in their blood. [FN9: Antonia M. Calafat et al., Polyfluoroalkyl Chemicals in the U.S.

Population: Data from the National Health and Nutrition Examination Survey (NHANES) 2003–2004 and Comparisons with NHANES 1999–2000, 115 Env't Health Persp. 1596 (2007), http://doi.org/10.1289/ehp.10598.] Communities of color often experience the greatest PFAS exposures and risks; a recent study found that the "watersheds serving higher proportions of Hispanic/Latino and non-Hispanic Black populations had significantly greater odds of containing PFAS sources." [FN10: Jahred M. Liddie et al., Sociodemographic Factors Are Associated with the Abundance of PFAS Sources and Detection in U.S. Community Water Systems, Env't Sci. Tech. (2023), https://pubs.acs.org/doi/pdf/10.1021/acs.est.2c07255.]

The health risks associated with PFAS are well established and have been widely recognized by international scientific organizations, [FN11: See United Nations Env't Programme, UNEP/POPS/POPRC.2/17/Add.5, Report of the Persistent Organic Pollutants Review Committee on the Work of its Second Meeting add. 25–26 (Nov. 2006) (Risk Profile on Perfluorooctane Sulfonate), http://chm.pops.int/Portals/0/download.aspx?d=UNEP-POPS-POPRC.2-17-Add.5.English.PDF; United Nations Env't Programme, UNEP/POPS/POPRC.12/11/Add.2, Report of the Persistent Organic Pollutants Review Committee on the Work of Its Twelfth Meeting add. 24–26 (Oct. 2016) (Risk Profile on Pentadecafluorooctanoic Acid (PFOA, Perfluorooctanoic Acid), its Salts and PFOA-related Compounds), http://chm.pops.int/Portals/0/download.aspx?d=UNEP-POPS- POPRC.12-11-Add.2.English.PDF.] federal and state regulatory agencies, [FN12: Agency for Toxic Substances and Disease Registry, Toxicological Profile for Perfluoroalkyls, at 5–21, 26–29 (May 2021) ("ATSDR 2021"), https://www.atsdr.cdc.gov/toxprofiles/tp200.pdf; Cal. Env't Protection Agency, Public Health Goals: Perfluorooctanoic Acid and Perfluorooctane Sulfonic Acid in Drinking Water (First Public Review Draft), Off. of Env't Health Hazard Assessment, at 62–166 (July 2021), https://oehha.ca.gov/sites/default/files/media/downloads/crnr/pfoapfosphgdraft061021.pdf.] and other leading scientific bodies. [FN13: Nat'l Acad. of Sci., Eng'g, & Med., Guidance on PFAS Exposure, Testing, and Clinical Follow-Up, at 6–8 (2022) ("NAS 2022"), https://nap.nationalacademies.org/catalog/26156/guidance-on-pfas-exposure-testing-and-clinical-follow-up; see also Arlene Blum et al., The Madrid Statement on Poly- and Perfluoroalkyl Substances (PFASs), 123 Env't Health Persp. A107 (2015), https://ehp.niehs.nih.gov/doi/epdf/10.1289/ehp.1509934 (statement of more than 250 scientists expressing "concern[] about the production and release into the environment of an increasing number of [PFAS]").] Individually, the PFAS covered by EPA's Proposed Rule are associated with cancer (PFOA, PFOS, and GenX), developmental harm (PFOA, PFOS, PFHxS, GenX, PFNA, and PFBS), reproductive harm (PFOA, PFOS, GenX, and PFNA), immune system toxicity (PFOA, PFOS, GenX, and PFNA), liver toxicity (PFOA, PFOS, PFHxS, GenX, and PFNA), thyroid toxicity (PFOA, PFOS, PFHxS, and PFBS) and kidney toxicity (PFOA, PFOS, GenX, and PFBS), among other adverse effects. [FN14: See Proposed Rule, 88 Fed. Reg. at 18,645–47, 18,656–63, 18,704, 18,718.] Because of these common health effects, people who are exposed to multiple PFAS—whether through their combined presence in drinking water or from other sources—face even greater risks of harm. Studies have shown that exposure to PFAS

mixtures alter critical biological processes in the developing fetus, infants, and children that are separately associated with an increased risk of developmental disorders, cardiovascular disease, and many types of cancer. [FN15: Jesse A. Goodrich et al., Metabolic Signatures of Youth Exposure to Mixtures of Per- and Polyfluoroalkyl Substances: A Multi-Cohort Study, 131 Env't Health Persp. Art. No. 27005 (2023), https://ehp.niehs.nih.gov/doi/epdf/10.1289/EHP11372.] Recent human birth cohort studies also reported associations between multiple PFAS exposures during pregnancy and adverse health outcomes, including an increased risk of gestational diabetes and altered glucose levels during pregnancy, altered levels of thyroid hormones in pregnant people and newborns, and liver injury in children. [FN16: Guoqi Yu et al., Environmental Exposure to Perfluoroalkyl Substances in Early Pregnancy, Maternal Glucose Homeostasis and the Risk of Gestational Diabetes: A Prospective Cohort Study, 156 Env't Int'l Art. No. 106621 (2021), https://pubmed.ncbi.nlm.nih.gov/33984575/. i: 10.1016/j.envint.2021.106621; Blanca Sarzo et al., Maternal Perfluoroalkyl Substances, Thyroid Hormones, and DIO Genes: A Spanish Cross-sectional Study, 55 Env't Sci. Tech. 11144 (2021), https://pubs.acs.org/doi/10.1021/acs.est.1c01452; Arash Derakhshan et al., Association of Per- and Polyfluoroalkyl Substances with Thyroid Homeostasis During Pregnancy in the SELMA Study, 167 Env't Int'l Art. Environmental Working Group et al. (Doc. #1810, SBC-044686)

National standards to limit the concentration of PFAS in drinking water are long overdue. For decades, PFAS have been used in thousands of applications, and a peer-reviewed study estimates that PFAS may be present in the drinking water of more than 200 million Americans. EPA's proposal for six PFAS would set the national standard for PFOA and PFOS at the lowest detection level approved by the agency, and would establish limits on GenX, PFBS, PFNA, and PFHxS using a hazard index. EPA estimates that 94 million Americans currently receive drinking water contaminated by one or more these PFAS chemicals at levels above the limits proposed by EPA. The regulation of PFAS will improve drinking water safety for millions of Americans.

Not only are PFAS widespread in drinking water, these "forever chemicals" persist throughout the environment and pose risks to public health even in trace amounts. They are found in the blood of virtually everyone on Earth, and build up in our organs. Very low doses of PFAS in drinking water have been linked to suppression of the immune system [Link: https://www.atsdr.cdc.gov/pfas/health-effects/index.html] and are associated with an elevated risk of cancers and reproductive and developmental harms [Link: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8743032/], among other serious health concerns [Link: https://www.atsdr.cdc.gov/pfas/health-effects/index.html].

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Sharon Levy (Doc. #1824, SBC-044275)

To Whom It May Concern,

I am writing in regards to the proposed rule for Per- and Polyfluoroalkyl Substances (PFAS) to be included into the National Primary Drinking Water Regulations.

On March 14, 2023, the EPA proposed the first ever national drinking standards with regards to PFAS in public drinking water. EPA is issuing a preliminary regulatory determination to regulate PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA, PFOS and a mixtures of these PFAS as contaminants under SDWA.

PFHxS, HFPO-DA (also known as GENX), PFNA, PFBS, PFOA and PFOS have all been found in large concentrations across North Carolina.

The Chemours plant in Bladen County produces GenX, and discharges upwards of 250 different PFAS chemicals into our drinking water.

The PFAS production at the site is responsible for groundwater and surface water contamination in the surrounding area, according to water samples from Chemours and the N.C. Department of Environmental Quality.

Since learning about our PFAS water contamination in 2017, we have learned how harmful PFAS are to populations that are exposed to "forever chemicals".

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Plymouth Village Water & Sewer District (Doc. #1827, SBC-044557)

PVWSD supports NHDES's efforts, along with the necessary resources, to establish standards based on peer-reviewed scientific data regarding the health risks and a comprehensive understanding of the impact and practicality of the recommended standards. NHDES continues to research new health studies on PFAS compounds as well as risk management approaches that are scientifically valid that may address any compounding effects between chemicals.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

National PFAS Contamination Coalition (Doc. #1830, SBC-044551)

As you are aware, PFAS are highly persistent, toxic chemicals that pose significant health risks to humans and the environment. There is growing evidence that even the lowest level of exposure to PFAS is linked to a large and varying range of health problems, including various cancers, immune system dysfunction, and developmental delays. These chemicals are highly persistent in the environment and can accumulate in the food chain and our bodies, posing a significant threat to wildlife and ecosystems.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. See also section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Little Hocking Water Association (Doc. #1835, SBC-045505)

VIA ELECTRONIC SUBMITTAL

U.S. Environmental Protection Agency EPA Docket Center

May 30, 2023

Re: PFAS National Primary Drinking Water Regulation Rulemaking, Docket No. EPA HQ-OW-2022-0114

To Whom It May Concern:

These comments are submitted on behalf of the Little Hocking Water Association ("LHWA" or "Little Hocking") regarding the PFAS National Primary Drinking Water Regulation Rulemaking,

88 Fed. Reg. 18638 (March 29, 2023). LHWA, located at 3998 Newbury Road, Little Hocking, Ohio 45742, is a rural non-profit water system in southeastern Ohio.

Background and basis for comments

Little Hocking has first-hand knowledge of the immediate and future costs of failing to regulate and delaying regulation of PFAS. This perspective on the real cost of regulation, delay in regulation, and of the failure to regulate contribute to these comments.

LHWA's 45-acre wellfield in Ohio is located 1,300 feet across the Ohio River from the Chemours (formerly DuPont) Washington Works West Virginia plant. LHWA first started to learn about the extensive contamination of its wellfield in 2002. In contrast, DuPont knew by 1984, via testing it kept secret, that water from Little Hocking's wellfield contained PFOA contamination from the Washington Works plant. During DuPont's period of silence between 1984 and 2002, DuPont actually doubled its PFOA usage, despite, as litigation-obtained documents show, the internal fear of DuPont's business leaders that the health concerns about PFOA would cause the legal and medical arms of DuPont to terminate all PFOA use.

Following the 2002 revelation of the fact that PFOA was found in its wellfield, LHWA went on to learn that it held the dubious distinction of being the public water system with the consistently highest concentrations of PFOA of any known public water supply. Next, LHWA learned the levels of PFOA in the blood of its customers averaged 227.6 ug/L in 2005 -2006 and are displayed on a table on the ATSDR (2022) website as an example of a population severely affected by PFOA contamination. In addition, LHWA customers also had elevated levels of additional PFAS in their blood-including PFOS and PFHxS (ATSDR, 2022). See below (source: ATSDR, 2022). It took years for the social costs of this contamination to start to develop and that cost picture is still developing.

[Figure 1: see docket ID EPA-HQ-OQ-2022-0114-1835]

[Figure 2: see docket ID EPA-HQ-OQ-2022-0114-1835]

[Figure 3: see docket ID EPA-HQ-OQ-2022-0114-1835]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. The EPA appreciates the submitted data.

Amigos Bravos (Doc. #1844, SBC-045398)

Administrator Michael S. Regan

U.S. Environmental Protection Agency

EPA Docket Center, OW Docket

Washington, DC 20460

Submitted via EPA Docket Portal at https://www.regulations.gov/commenton/EPA-HQ-OW-2022-0114- 0027

May 30, 2023

Re: The Environmental Protection Agency's National Primary Drinking Water Regulation for PFAS (NPDWR) and PFAS in New Mexico Re: Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Reagan,

Amigos Bravos is a statewide water conservation organization (based in Taos, NM) guided by social justice principles and dedicated to preserving and restoring the ecological and cultural integrity of New Mexico's water and the communities that depend on it. While rooted in science and the law, our work is inspired by the values and traditional knowledge of New Mexico's diverse Hispanic and Native American land-based populations, with whom we collaborate. Our areas of expertise and accomplishment include: broad-based advocacy campaigns; community organizing; the creation of effective socio-economically and culturally diverse coalitions; successful legal, regulatory, and legislative campaigns at the local, state, and federal level; community water quality monitoring programs; and, ecosystem restoration initiatives.

PFAS in New Mexico

Per- and poly- fluoroalkyl (collectively: PFAS) substances threaten the integrity of New Mexico's water quality and directly harms our land-based peoples, the Sovereign Native Nations that reside within New Mexico, as well as our traditional, cultural ways of life by the continuous introduction and exposure to these dangerous chemicals that enter into our agriculture and then into our citizens- from the food we eat to the milk and water we drink. These toxic substances also contaminate the air, soil, and water cycle that repeatedly cycles PFAS throughout our environment causing persistent and ubiquitous exposure via inhalation and ingestion. Amigos Bravos also cares about the health of the economy of New Mexico, which is also negatively impacted through PFAS contamination that come from every day items including equipment for food (e.g. pots and pans, etc.), clothing and textiles, and health care products that touch our bodies and that result in bio-uptake that may degrade our bodies.

Per- and poly- fluoroalkyl substances have negatively impacted the health of New Mexico's citizens, environment, and economy. PFAS have been found at Cannon and Holloman Air Force bases in New Mexico and in the surrounding groundwater. Subsequently, milk at dairies located near New Mexico Department of Defense (DoD) sites were found to have PFAS levels above the water health advisory, and milk tested above the limit was pulled from store shelves. According to the EPA: "There may still be some foam containing PFOS held or in use... around the country, including at airports, bulk fuel terminals and other locations which handle large quantities of liquid hydrocarbon fuels."

Concentrations of non-regulated PFAS have been found New Mexico's groundwater. The PFAS Groundwater Plume in Clovis, New Mexico, has migrated into the Ogallala Aquifer, which is one of the world's largest aquifers underlying eight U.S. states. The Ogallala Aquifer also provides over 21 million acre-feet of irrigation water for agricultural, traditional and cultural use.

Due to their chemical structure and physical properties such as oil and water-repelling capabilities, PFAS are manufactured extensively and used worldwide in industrial applications, and common household products and appliances.

PFAS have been found in New Mexico's:

• Air

• Drinking water

• Humans

• Irrigation water

• Land & water dwelling animals

• Rivers and lakes

• Soil

• Nearly all agricultural products–organic and otherwise–including plants and animals

PFAS do not simply vanish when they leave the source site, nor are they securely attached to any surfaces they coat. PFAS can aerosolize either from the source industry or from the object they coat thus travelling through the atmosphere and entering the air, soil, water cycle and infiltrate many pathways to human exposure without immediate noticeable detection unless monitored. When released, PFAS wash into water systems, and are not always captured by most wastewater treatment plants as they can slip past many filtration systems and structures. PFAS are released into rivers, lakes and oceans, and can accumulate in groundwater aquifers.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. See also section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045820)

First, the scientific evidence supporting EPA's findings that these substances may pose adverse health effects is incontrovertible. Toxicity studies and epidemiological studies have linked these PFAS to a plethora of adverse health effects, including cancers. And, as shown below, the endangerment finding does not require certainty of harm, merely the possibility thereof.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Mary Anderson (Doc. #1863, SBC-045843)

Due to widespread use of PFAS chemicals in numerous products and industries, PFAS chemicals have become ubiquitous in the environment, including our soil, air, and drinking water. Testing has revealed PFAS in water sources in communities across our nation.

Studies show that human exposure to PFAS is widespread and that nearly all people in the United States have some PFAS compounds in their blood. Exposure to PFAS can lead to higher rates of kidney and testicular cancer, higher cholesterol levels, thyroid problems, adverse developmental effects and decreased immune response in children, and other adverse health impacts.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document.

Laura Spilotros (Doc. #1864, SBC-045847)

Due to widespread use of PFAS chemicals in numerous products and industries, PFAS chemicals have become ubiquitous in the environment, including our soil, air, and drinking water. Testing has revealed PFAS in water sources in communities across our nation.

Studies show that human exposure to PFAS is widespread and that nearly all people in the United States have some PFAS compounds in their blood. Anonymous (Doc. #1877, SBC-047309)

The medical costs and debilitation associated with the treatment of these potential chronic illnesses and disorders far exceeds the costs of remediation. The affected population are victims. The polluters need to be held accountable to the highest extent of the law. There is much to do as far as policy such as requiring PFAS testing in routine blood work (PFAS is inherently stable in the blood with a half life of 6-10 years) particularly in those areas were drinking water is contaminated along with liver profiles especially in children so that parents and pediatricians can help make informed medical decisions. Infants/children drink more water per pound of body weight than older individuals leading to increased toxicity in their formidable years as their tissue/organs are developing. The schools need to make sure the water filter stations not only filter out lead but also these carcinogenic chemicals. There needs to be policies in place in the school systems as far the the water that the kids are consuming in the schools, the chemicals used for cleaning etc. Pregnant mothers, infants, children are victims to this with the great potential for adverse health outcomes in their lives. Non germ-line pediatric and adult cancers of endocrine glands, increased cancers in pets goes on and on. The molecular biological etiology as far as if PFAS is implicated either directly or indirectly in the damage or loss of the TP53 gene need to be further investigated as TP53 is the most frequently missing or damaged gene in 50% of cancers. Thank you. Thank you. Thank you.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on the health effects, see also section 4 of the EPA response in this *Response to Comments* document. The HBWC MCLGs are designed to protect the most vulnerable groups with an adequate margin of error.

Anonymous (Doc. #1927, SBC-047321)

In my opinion I believe that this proposed rule does not serve justice as it stands today. The reason for this is because although we can monitor, notify, and reduce the amount of PFAS in the

water supply we should also be limiting the amount that is put into our water supply in the first place. The companies with the new PFAS are not required to present studies that show whether these products are safe for the environment before production starts. They are also not presented with proper ways to dispose of these PFAS if they are potentially harmful. The majority of the PFAS are used to make industrial products and "aqueous film forming foams for firefighting" (Pelch, Reade, Wolffe, Kwiatkowski, p1). This makes it evident of how much PFAS are being processed in our daily lives. These chemicals are also known as "forever chemicals" since they are an alkyl chain with one or more fluorinated carbon atoms (Pelch, Reade, Wolffe, Kwiatkowski, p1). Knowing this about the atom bonds, it shows that this atom is hard to break down and explain the reason as to why they call these PFAS a "forever chemical." To conclude, based on this information these chemicals will never go away so disposing of these within our environment would be critical seeing these are not only harmful to the environment, but also for those living within it. You might be asking how this is affecting the individual's health of individuals who are being exposed to these PFAS. Well, PFAS can impact "cancer, immune function, metabolic outcomes, and neurodevelopment" of individuals within their body. This is crucial since these are major and important components of the human body or could be detrimental if they were to occur.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. The EPA is taking a whole of agency approach to its response to PFAS as indicated in the PFAS Strategic Roadmap. Other EPA rules, such as the CERCLA designation, are discussed in section 10, Treatment, of the EPA response in this *Response to Comments* document.

Annabelle Ott (Doc. #1949, SBC-047455)

Some of my knowledge of the chemical PFAS comes from articles by NPR's Erika Ryan, Mary Louise Kelly, Patrick Jarenwattananon, and Nathaniel Rich of the New York Times.

In the NPR article Ryan, Kelly, and Jarenwattananon provide some general information about PFASs, also known as the "forever chemical" in the article PFAS 'forever chemicals' are everywhere. Here's what you should know about them. The information they provided states that even a trace amount of the chemical may impose threats on humanity. The article also uses a discussion between them and, biophysical chemist, Arlene Blum. She states that studies around PFAS have been deemed harmful and may affect the human body systems. These effects include increased cholesterol levels, testicular cancer, damage to the liver, high blood pressure in middle-aged people who were assigned females at birth, and general immune system issues.

Nathaniel Rich's article The Lawyer Who Became DuPont's Worst Nightmare goes down more of the story route. In the article, it is described that farmer Wilbur Tenant claimed his cows were quote "dying left and right" (Rich, Nathaniel, The Lawyer Who Became DuPont's Worst Nightmare). Tennant believed that the death of his cows was at the hands of DuPont, who had an

operating chemical sight in Parkersburg, West Virginia, not far from his farm. Tennant investigated and learned that DuPont dumped chemical waste into a river near where the cows grazed and that they started acting odd when DuPont first started doing such. The PFASs chemical was affecting their behavior and their lives. For example, Tennant describes deer and cattle, which had died with blood running from their noses and mouths, and the water they drank was bubbly with chemical waste. DuPont also affected. As part of the investigation, they had to submit files and documents to Taft's headquarters from their scientists. Interestingly to me, America has a not guilty until proven policy allowing companies like DuPont to produce these chemicals until proven unsafe. Even when they are, they are not regulated to extremes, and variants of these chemicals are still allowed due to chemical or chemical composition-specific rules. Because of this, I think the EPA's regulation is based more on what is efficient rather than what is safe for human and animal health. The EPA website also claims that there are still things that unknown about the chemical compound like how to detect and measure it in the air, water, soil, and fish/wildlife, how much exposure people have to it, how harmful it actually is, and how to manage/dispose of it. However, with the previous information shared it is my belief that the chemical compound poses threat and I, again, wish to have it regulated if not fully removed.

Sources supporting this argument:

Gardella, John P., PFAS Regulation: Business Should Plan Now for Financial Impacts, BloomBerg Law, 9, February 2021, https://news.bloomberglaw.com/environment-and-energy/pfas-regulation-business-should-plan-now-for-financial-impacts

Ryan, Erika, Kelly, Mary Louise, Jarenwattananon, Patrick, PFAS "˜forever chemicals' are everywhere. Here's what you should know about them, NPR, 23, June 2023, https://www.npr.org/2022/06/22/1106863211/the-dangers-of-forever-chemicals

Rich, Nathaniel, The Lawyer Who Became DuPont's Worst Nightmare, The New York Times, 6, January 2016, https://worldclass.regis.edu/content/enforced/299939-RSS_EC200_RU01_23SSEM/The%20Lawyer%20Who%20Became%20DuPont%E2%80%99s%20Worst%20Nightmare%20-%20The%20New%20York%20Times.pdf?_&d2lSessionVal=s6XHxbvhod68TVd49psvGVV6y

Environmental Protection Agency, PFAS Explained, Environmental Protection Agency, Last updated 28, April 2022, https://www.epa.gov/pfas/pfas-explained

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. PFAS is not an individual "chemical compound" but, as detailed in the background section of the proposal and in §141.2 of the CFR, a chemical class comprised of many differing chemical compounds. This rule regulates six of these chemicals in drinking water as requested by commenter. It is important to note that there is no singular consensus on exactly what constitutes PFAS and the definition changes depending on the entity or regulatory body, scope, and application of the definition. It is important to note that even within the EPA there is no singular definition as the meaning should be fit for purpose. The six PFAS regulated by this rule are defined in the background section of the proposal preamble and in §141.2 of the CFR.

For example, fluoxetine is on the WHO's List of Essential Medicines and contains a perfluorinated methyl group, so it could be considered PFAS but would not necessarily meet the definition here.

The EPA is required to take feasibility into account when setting MCLs (SDWA 1412(b)(4)(D)). In the SDWA 1412(b)(4)(D), "the term "feasible" means feasible with the use of the best technology, treatment techniques and other means which the Administrator finds, after examination for efficacy under field conditions and not solely under laboratory conditions, are available (taking cost into consideration)," so the EPA has done exactly this and indeed taken feasibility into account. The EPA has set the MCLs as close to the MCLGs as is feasible. Please see the summary of major public comments for this section.

Thomas Driscoll (Doc. #2074, SBC-047433)

April 28, 2023

Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, D.C. 20004

Re: New Federal Drinking Water Standards for PFAS

To Whom It May Concern,

I am writing in support of your latest proposal that would raise federal drinking water standards for pre- and polyfluoroalkyl substances (PFAS). My name is Thomas Driscoll, and I am a Master of Public Policy (MPP) candidate at the University of Virginia.

During my time at U.Va., I have extensively studied environmental issues, including the growing body of research which suggests that exposure to PFAS, even in small doses, is associated with adverse health consequences. These include an elevated risk for developing the following conditions: certain cancers (most notably prostate, kidney, and testicular cancers), high cholesterol, obesity, decreased fertility, compromised immune system, reduced vaccine response, high blood pressure in pregnant women, and developmental delays in children. These findings are deeply alarming as it is estimated that more than 200 million people have tap water contaminated with a mixture of PFAS at concentrations of one part per trillion (ppt) or higher.

PFAS are a broad family of synthetic compounds that have been used since the 1940s in a wide array of commercial, industrial, and military applications. Their hydrophobic and oleophobic properties have made them a popular choice among manufacturers of waterproof and grease-resistant packaging. PFAS are also commonly found in nonstick cookware (e.g. Teflon), cleaning products, cosmetics, and paint sealants. However, it is these same hydrophobic and oleophobic qualities that have made it so challenging for officials to remove PFAS from the environment. In fact, these substances are commonly referred to as "forever chemicals" because they do not

naturally break down. Instead, they accumulate over time in contaminated areas such as rivers and streams as well as in the bodies of organisms that have been exposed.

It is for these reasons why it is so important for federal officials to regulate the concentration of PFAS in drinking water as repeated exposure to small doses, over time, can have lasting consequences.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Mary Raven (Doc. #2435, SBC-047444)

Dear, EPA,

Regarding Docket ID No. EPA-HQ-OW-2022-0114, please set the allowable levels for PFOA and PFAS as low as they can be detected-- which means even lower than your current 4ppt.

I am asking you to do this because PFAS has probably had a profound negative impact on my life.

My husband, a 28-year resident of Merrimack, NH, where we know the water is contaminated with PFAS, had testicular cancer and I'm concerned that the PFAS chemicals in our water, which has been linked to testicular cancer, may have caused or contributed to it. Here is our story.

I noticed that something did not feel right with my husband's right testicle and mentioned that he should have it checked out. At least a month passed before he finally made a doctor's appointment, and he came home from that doctor's appointment white as a sheet and visibly upset.

"I have testicular cancer and tomorrow morning I need to get my right nut chopped off." We were both in shock. So soon? Right away? Doesn't a diagnosis usually take months?

Not with testicular cancer. It travels VERY quickly to other organs in the body. Once a diagnosis is made, an Orchiectomy (the technical term for having a nut chopped off) is done as soon as possible.

In our society, we have lots of euphemisms for testicles. Nuts, balls, the family jewels. But we don't talk seriously about testicles very much. It was really awkward even, to call his manager and tell him that he'd be out for a week because he had testicular cancer and had to have a "ball-ectomy."

After dropping our 2 children off at school the next morning we headed to the hospital. I will never forget the doctor coming out of surgery holding a big, white, metal pan with my husband's bloody testicle in it. It had been sliced in half. He showed me all the tumors. The worst part was, they were not sure they got everything – because it spreads so fast. He'd need radiation as well.

The radiation rendered him sterile. And he missed more work because the radiation made him very tired.

Testicular cancer had a profound effect on our family, our sex life, our relationship, and maybe even his career due to missed work.

We were fortunate that we already had 2 children so the fact that we could not have any more was not a huge blow to us, but it might be to some people. Testicular cancer can occur in any man at any age (compared to prostate which tends to occur with older men). Imagine if you were in your 20's and found out that this cancer made you unable to ever have children? Or, if the cancer spreads to both testicles and both need to be amputated, you'd never be able to get an erection. No amount of Viagra can help if you have no testicles.

Knowing if there are PFAS in your water can protect not only men from testicular cancer, but also women and children from other types of cancer.

How much are the "family jewels" worth? I think we'd all agree they are priceless. I am asking that you support legislation to provide notice of PFAS and other groundwater contamination in the purchase and sale of a property.

Thank you very much for hearing my story and considering my request.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. Regulations regarding the purchase and sale of property are beyond the scope of this action.

Jondi Gumz (Doc. #2620, SBC-047420)

None of the fire agencies talks about the impact of PFAS, the forever chemical that doesn't break down in the environment or in our bodies, PFAS—resistant to water, grease, and heat. Studies have linked PFAS to cancers, high cholesterol, thyroid disease, liver damage, asthma, allergies, and reduced vaccine response in children. PFAS have also been linked with decreased fertility, newborn deaths, low birthweight, birth defects, & delayed development. We tossed our Teflon pans & stopped buying new carpet for this reason, but now PFAS can get into our water supply & soil where our food is grown. https://www.hsph.harvard.edu/news/hsph-in-the-news/protecting-against-forever-chemicals/

Companies should stop using PFAS. There must be alternatives. Use good science to find a safer alternative.

Clean drinking water is essential to human life, and reverse osmosis to filter wastes water, which in California is precious.

It's your job to protect us. Please.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Marianne Nurmi (Doc. #2755, SBC-047442)

PFAS have been designed for long-term stability and therefore are meant to be difficult to destroy, meaning that they cycle through our environment and have been given the name of "forever chemicals" for this ability to remain intact (AAAS.org, 2023) This is a concerning fact when combined with research that has linked PFAS to health issues from "cancers and increased cholesterol levels to preeclampsia during pregnancy (AAAS.org, 2023). Not only are these chemicals extremely difficult to break down or destroy, but they are causing harm with little regulation.

I believe the use and exposure to chemicals such as PFAS must be limited until further research is available. A study by the Centers for Disease Control and Prevention found PFAS in the blood of 97% of Americans (NIEHS.NIH.gov, 2023). This is a concerning fact since the full effects of PFAS on humans, animals, and our environment are not fully understood. Until these effects can be further examined and researched, we need to err on the side of caution.

The regulations that are being proposed, such as this one, would help in providing protection to the public and our environment against dangerous chemicals such as PFAS and allow further research to be conducted to increase understanding and assess risk. Other studies conducted by the Centers for Disease Control and Prevention found that chemicals that were removed from consumer products in the early 2000s, such as PFOS and PFOA, have shown reduced levels in blood meaning that our bodies can work to reduce these types of chemicals when given the chance (NIEHS.NIH.gov, 2023).

It is the responsibility of the government to protect the citizens of the United States from companies putting profit over health and safety concerns. Though I understand any type of new regulation requires time to be implemented by those being regulated (in this case, water treatment plants, etc.) It is clear to me that chemicals such as PFAS have no place in our water and need to be regulated as soon as possible to keep the general public safe and allow the ability to fully research and analyze their effects.

Sincerely,

Marianne Nurmi

West Virginia Rivers Coalition (Doc. #3072-3, SBC-047356)

Hello everyone, thank you for providing the opportunity for verbal comment. My name is Jenna Dodson, and I'm the staff scientist at West Virginia Rivers Coalition. West Virginia Rivers Coalition strongly supports EPA's proposal to set strong, science-based drinking water standards for six PFAS. In West Virginia, communities have suffered the health impacts from PFAS-contaminated water for decades. For over 50 years, communities near Parkersburg were exposed to dangerously high concentrations of PFOA discharged by a DuPont manufacturing facility into the Ohio River, which was the community's drinking water supply. Decades-long epidemiological studies have shown that these communities suffer from severe long-term health effects, including high rates of autoimmune disease, testicular cancer, and kidney cancer. In the Eastern Panhandle in Martinsburg, firefighting foam from the Shepherd Field Air National Guard station migrated through the groundwater and caused PFAS contamination to public and private wells. A 2022 exposure assessment by the Agency for Toxic Substances and Disease Registry found that affected community members have PFHxS blood levels 2.5 times higher than the national average. Although it's nearly impossible to fully recover from years of concealed truths and harm, the proposed drinking water standards is a concrete step towards protecting community health. That being said, the proposed regulations are just the first step.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

NRDC (Doc. #3072-13, SBC-047365)

Thank you very much. I would like to first of all thank EPA for issuing this historic proposal. It is a welcome change from a long history of delay on this issue, and we are urging EPA – I'm from the Natural Resources Defense Council – to finalize this rule as soon as possible without delay to get it out, and to get the public health protections out there to protect the up to 94 million people that EPA says may be drinking water that exceeds its proposed standards. We

commend EPA for quantifying and monetizing many of the benefits, such as cardiovascular disease, low birth weight, and renal cell carcinoma, as well as some of the additional benefits of reducing other co-occurring contaminants, such as disinfection byproducts, where bladder cancer and other health effects have been quantified. But we also urge EPA to take another second, hard look at quantifying and monetizing some of the additional health effects that the Agency and scientists around the world have recognized, including thyroid effects, immunotoxicity, some of the liver and/or hepatotoxicity issues, and lactation effects.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. Discussion on the quantifiable and non-quantifiable health endpoints for this NPDWR can be found in the HRRCA section 13.4 of the EPA response in this *Response to Comments* document.

Alliance of Nurses for Healthy Environments (Doc. #3072-27, SBC-047375)

Very low doses of PFAS in drinking water have been linked to suppression of the immune system and are associated with an elevated risk of cancers and reproductive and developmental harms and other serious health concerns. And the National Academies of Science Engineering and Medicine has published in their guidance that there is sufficient evidence that certain PFAS are associated with health outcomes including decreased antibody responses, dyslipidemia, decreased infant and fetal growth, and increased risk of kidney cancer. EPA's proposed drinking water standards align with the Biden administration's commitment to advanced environmental justice, as communities of color and low-income communities have historically faced disproportionate exposure to pollution and cumulative adverse health effects for multiple co-occurring contaminants. As nurses and healthcare providers quickly educate themselves on how to adequately assess patients in communities for PFAS exposure and provide the necessary resources, we are relying on EPA to quickly finalize these drinking water standards and expedite efforts to prevent these forever chemicals from polluting the environment in the first place. We urge EPA to control industrial discharges, reduce unnecessary uses of PFAS, and we urge the EPA to implement a rule that is the most health protective, resisting industry's efforts to weaken them. Thank you.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. See section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Clean Hall River Grassroots Advocacy Group (Doc. #3072-96, SBC-047407)

Good evening I'm Katie Bryant, the co-founder of Clean Hall River Grassroots Advocacy Group out of Pittsboro, North Carolina. I'm a trained microbiologist, the spouse of a retired forward military operator and a mother to two daughters. We get our water from the Hall River where

PFAS and other industrial contaminants have been coming downstream for over 40 known years from the textile industry out of Reedsville, Burlington, and Greensboro, and are responsible for polluting the entire Cape Fear River Basin. One of the largest contributors being Elevate Textiles in Burlington, who has been shown to be discharging PFAS at levels of 33,000 parts per trillion. We have industries discharging whatever they want into our drinking water. We have land applied biosolids and inline landfills leaching into the Hall River as well as firefighting foams. All of this is impacting our water quality. The GenX exposure study published data last year showing Pittsboro blood serum values are four times higher than the national average. We have adults so far off the charts and children with PFAS blood values higher than adults in our country, my children included. This should disturb you because there is a footprint here. The chemicals in these children match the exact chemicals used by industries upstream. Sadly, my community is suffering. Pittsboro water users check every box on a PFAS exposure checklist and show rare and reoccurring cancers and deaths. My children are sick. I can't keep them well enough for school. They have learning disabilities, developmental delays, digestive issues. My husband has lost his gallbladder, has increased cholesterol and is now showing signs of early liver disorder.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Sophia Milone (Doc. #1487, SBC-042702)

My name is Sophia Milone. I'm studying Sustainability at Stockton University in NJ, and I have learned about PFAS and other "forever chemicals" for the last three years of my education. PFAS are known to have many adverse impacts on animal health and public health, as they can cause significiant medical issues in humans; they can also disrupting ecosystem functioning due to their persistence. It goes without saying that exposure to these compounds is not healthy, and should be avoided at all costs.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Kaden Heldt (Doc. #1510, SBC-042590)

Another issue surrounding this decision is how only six of these PFASs have been regulated out of the thousands of them that exist. This regulation is undoubtedly positive, but more needs to be done (Underferth). The allowance of this continues the harm of citizens, putting millions of Americans at health risks. Exposure to PFASs can lead to health complications including immune system issues, hormone interference, reduced effectiveness of vaccines, high cholesterol, low birth rate, kidney cancer, liver damage, testicular cancer, and thyroid disease (Underferth).

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Daniel Varon (Doc. #1518, SBC-042721)

PFAS are a group of chemicals used to make fluoropolymer coatings and products that resist heat, oil, stains, grease, and water. [FN1: CENTERS FOR DISEASE CONTROL AND PREVENTION, NATIONAL BIOMONITORING PROGRAM: PER- AND POLYFLUORINATED SUBSTANCES (PFAS) FACTSHEET, https://www.cdc.gov/biomonitoring/PFAS_FactSheet.html (last visited Apr. 20, 2023).] For this reason, they are most prevalent in cookware, clothing, carpets, and firefighting foam—all household products. [FN2: NATIONAL INSTITUTE OF ENVIRONMENTAL HEALTH SCIENCES, PERFLUOROALKYL AND POLYFLUOROALKYL SUBSTANCES (PFAS), https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm (last visited Apr. 20, 2023).] As these products are used and washed, PFAS can seep into sewers, soil, water, and air. [FN3: Id.] It is important to note that consuming PFAS contaminated water is only one method in which humans are exposed to PFAS, other methods include eating contaminated food—whether it be grains from contaminated soil or livestock eating contaminated grains—and also by breathing air containing PFAS. [FN4: AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, PFAS EXPOSURE AND YOUR BODY, https://www.atsdr.cdc.gov/pfas/health-effects/PFAS-exposure-and-your-body.html (last visited Apr. 20, 2023).] One study conducted by the CDC found that PFAS were in the blood of 97% of Americans. [FN5: NATIONAL INSTITUTE OF ENVIRONMENTAL HEALTH SCIENCES, supra note 3.]

Exposure to PFAS "may" lead to: increased cholesterol levels, changes in liver enzymes, small decreases in infant birth weights, decreased vaccine response in children, increased risk of high blood pressure or preeclampsia in pregnant women, and increased risk of kidney or testicular cancer. [FN6: AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, PFAS HEALTH EFFECTS, https://www.atsdr.cdc.gov/pfas/health-effects/index.html (last visited Apr. 20, 2023).] It is important to note that studies relied on merely "suggest" a correlation between PFAS and these health defects, and even then, the correlation is not "statistically significant." [FN7: AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, PFAS: AN OVERVIEW OF THE SCIENCE AND GUIDANCE FOR CLINICIANS ON PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS) 8 (2019).]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. The EPA agrees that drinking water is only one route of exposure to PFAS. More information about health effects, and about the EPA's use of the RSC to account for multiple PFAS sources, can be found in section 4 of this *Response to Comments* document and the MCLG Summary Document for a Mixture of Four PFAS (USEPA, 2024c).

Isabelle Dominguez (Doc. #1525, SBC-042627)

There are several serious health risks associated with PFAS exposure. [FN11: See generally Sunderland et al., supra note 6.] One such health risk is cancer; several studies have demonstrated that communities with higher levels of PFAS in drinking water have increased cancer risk, particularly in prostate, kidney, and testicular cancers. [FN12: Id at 138-39.] PFAS exposure also affects individuals' immune systems. For example, there is a well-established association between "higher PFAS exposure and suppressed immune response" to vaccination in populations of all ages. [FN13: Id. at 139-40.] Other health issues concern metabolic effects [FN14: Id. at 140-41 (discussing the effects of PFAS on cholesterol, thyroid function, cardiovascular disease, and body weight among other things.)] and neurodevelopment effects. [FN15: Id. at 141-42.] PFAS exposure is particularly dangerous for children [FN16: Id. at 138.] and pregnant people and their fetuses. [FN17: How PFAS Chemicals Affect Women, Pregnancy, and Human Development, INT'L FED'N OF GYNECOLOGY AND OBSTETRICS, (May 20, 2021) https://www.env-health.org/wp-content/ uploads/2021/05/FIGO-PFAS-Fact-Sheet-FINAL-5.20.2021.pdf.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Samantha Matterson (Doc. #1527, SBC-042630)

However, I do not believe that this action gets at the root cause of the issue. PFAS are harmful not only to people but to the surrounding environment. The C8 (another term for PFAS) Science Panel's 2005-2013 study confirmed a probable link between PFAS and "diagnosed high cholesterol, ulcerative colitis, thyroid disease, testicular cancer, kidney cancer, and pregnancy-induced hypertension" (Fletcher et al., 2020). Additionally, PFAS are nicknamed forever chemicals for a reason. For example, the average half-life of PFHxS is 5.3 years, and these chemicals bioaccumulate over time and through the food chain (Li et al., 2017). Meaning that, not only is this affecting humans, but it's affecting animals and plants as well. Given the abundance of evidence for the harmful nature of these chemicals, I am concerned that this action does not do enough to satisfy the extent of the issue.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. This NPDWR is designed to address drinking water as a specific exposure pathway. Other exposure pathways are addressed by other agency programs based on other statutory authority,

Cordell Spires Jr. (Doc. #1541, SBC-042660)

I. Background

Per- and polyfluoroalkyl substances (PFAS) are chemicals produced in the United States since the 1940s. [FN-1: PFAS in Drinking Water, ILLINOIS DEPARTMENT OF PUBLIC HEALTH,

https://dph.illinois.gov/topics-services/environmental-health-protection/private-water/factsheets/pfas-drinkingwater.html#:~:text=Exposure%20to%20high%20levels%20of,odds%20of%20women%20becom ing%20pregnant (last visited April 21, 2023).] They are used in a variety of ways ranging from firefighting to stain and waterproofing consumer products, such as carpet, clothing, and food packaging. [FN-2: Id.] Some PFAS are no longer made due to environmental and health concerns, but they persist in the environment and may contaminate surface waters and groundwaters near sites where they were made or used. PFAS, even those that are no longer made, continue to be detected in human blood. [FN-3: Id.] Meanwhile, new PFAS continue to be created. [FN-4: Id.]

II. Health Effects of PFAS

Exposure to PFAS in contaminated drinking water may result in: increased cholesterol levels, changes in liver enzymes, hormone disruption and increased risk for thyroid disease, decreased odds of women becoming pregnant, high blood pressure or pre-eclampsia during pregnancy, small decreases in infant birth weights, decreased vaccine response in children, and increased risk of kidney and testicular cancers. [FN-5: Id.]

III. Communities Impacted by PFAS Regulation

43% of U.S. Zip codes have had at least one water source where PFAS contamination was detected over the past 20 years. [FN-6: Amanda Hernandez & Mark Nichols, How PFAS are Entering America's Water Supply, ABC News (April 21, 2023, 5:01 AM), https://abcnews.go.com/US/pfas-entering-americas-watersupply/story?id=98479678.] In other words, at least 143 million Americans potentially could have been exposed to PFAS. [FN-7: Id.] PFAS contamination is also more prevalent in ZIP codes that are poorer and more racially diverse than the national average. [FN-8: Id.]Therefore, any regulation will have a significant impact on those communities.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. See section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Alliance of Nurses for Healthy Environments (Doc. #1544, SBC-042668)

Not only are PFAS widespread in drinking water, these "forever chemicals" persist throughout the environment and pose risks to public health even in trace amounts. They are found in the blood of virtually everyone on Earth, and build up in our organs. Very low doses of PFAS in drinking water have been linked to suppression of the immune system [Link: https://www.atsdr.cdc.gov/pfas/health-effects/index.html] [FN5: Agency for Toxic Substances

and Disease Registry (ATSDR). (2022, November1). What are the health effects of PFAS? https://www.atsdr.cdc.gov/pfas/health-effects/index.html] and are associated with an elevated risk of cancers and reproductive and developmental harms [Link: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8743032/], [FN6: Rickard BP, Rizvi I, Fenton SE. (2022). Per- and poly-fluoroalkyl substances (PFAS) and female reproductive outcomes: PFAS elimination, endocrine-mediated effects, and disease. Toxicology, 465:153031. doi: 10.1016/j.tox.2021.153031. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8743032/] among other serious health concerns [Link: https://www.atsdr.cdc.gov/pfas/health-effects/index.html] [FN7: Agency for Toxic Substances and Disease Registry (ATSDR). (2022, November1). What are the health effects of PFAS? https://www.atsdr.cdc.gov/pfas/health-effects/index.html]

The National Academies of Science, Engineering and Medicine has published in their guidance that there is sufficient evidence [Link: https://nap.nationalacademies.org/catalog/26156/guidance-on-pfas-exposure-testing-and-clinical-follow-up] that certain PFAS are associated with health outcomes including:

- decreased antibody responses (in adults and children),
- dyslipidemia (in adults and children),
- decreased infant and fetal growth, and
- increased risk of kidney cancer (in adults). [FN8: Ibid (pp 6-7)]

According to ATSDR's 2019 publication providing guidance for clinicians [Link: https://www.atsdr.cdc.gov/pfas/docs/clinical-guidance-12-20-2019.pdf], human studies have found associations between exposure to PFAS and adverse health effects in many organ systems. [FN9: Agency for Toxic Substances and Disease Registry (ATSDR). (2019). PFAS: an overview of the science and guidance for clinicians on per- and polyfluoroalkyl substances (PFAS). Atlanta, GA: U.S. Department of Health and Human Services, Public Health Service. https:// www.atsdr.cdc.gov/pfas/docs/ ATSDR_PFAS_ClinicalGuidance_12202019.pdf] EPA notes that "PFAS can accumulate and persist in the human body for long periods of time and evidence from laboratory animal and human epidemiology studies indicates that exposure to these compounds may lead to cancer, reproductive, developmental, cardiovascular, liver, and immunological effects. Many known and potential sources of PFAS contamination are near communities already overburdened with pollution."[FN10: EPA (2023, April 14). EPA Takes Important Step to Advance PFAS Strategic Roadmap, Requests Public Input and Data to Inform Potential Future Regulations under CERCLA.

https://www.epa.gov/newsreleases/epa-takes-important-step-advance-pfas-strategic-roadmap-requests-public-input-and-data].

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Lecsy Gonzalez (Doc. #1561, SBC-042869)

Exposure to PFAS through drinking, or tap, water is a serious concern, as PFAS chemicals have been found in 99% of blood samples taken across the United States population between 1999 and 2012. [REF4: Crone, B.C., Speth, T.F., Wahman, D.G., Smith, S.J., Abulikemu, G., Kleiner, E.J. and Pressman, J.G., 2019. Occurrence of per-and polyfluoroalkyl substances (PFAS) in source water and their treatment in drinking water. Critical reviews in environmental science and technology, 49(24), pp.2359-2396.] This is a significant public health concern as even low drinking water concentrations of PFAS can remain in the human body for many years after exposure. [REF5: Domingo, J.L. and Nadal, M., 2019. Human exposure to per-and polyfluoroalkyl substances (PFAS) through drinking water: A review of the recent scientific literature. Environmental research, 177, p.108648.] PFAS exposure, as aforementioned, has been linked to increased liver enzymes, thyroid disorders, pregnancy-induced preeclampsia, reduced fertility, and testicular and kidney cancer. [REF1: Stoiber, T., Evans, S., Temkin, A.M., Andrews, D.Q. and Naidenko, O.V., 2020. PFAS in drinking water: an emergent water quality threat. Water Solutions, 1(40), p.e49; REF4: Crone, B.C., Speth, T.F., Wahman, D.G., Smith, S.J., Abulikemu, G., Kleiner, E.J. and Pressman, J.G., 2019. Occurrence of per-and polyfluoroalkyl substances (PFAS) in source water and their treatment in drinking water. Critical reviews in environmental science and technology, 49(24), pp.2359-2396]. As such, it is crucial to pass this regulation which would decrease PFAS in drinking water sources in a more equitable way.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Wisconsin Conservation Voters (Doc. #1611, SBC-042859)

Every day, we hear more stories about the impact of PFAS contamination in Wisconsin. Across the state, Wisconsinites are worried about the serious, long-term health risks associated with PFAS. This includes an increased risk of complications with pregnancy, childhood obesity, learning and behavioral issues, thyroid disease, heart disease, diabetes, and testicular cancer.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Safe Healthy Playing Fields, Inc. (Doc. #1621, SBC-042943)

Responding to testing results of a newly installed synthetic turf field in Portsmouth, NH, Dr. Graham Peaslee, University of Notre Dame, the leading researcher of PFAS in consumer products, wrote in an email to a colleague:

“Even their [external testing lab] "very low" levels measured from a piece of turf...if multiplied by the size of a field would contaminate significant amounts of surface/ground water above these new limits.

While the regulatory limits (when they come) will likely be set higher, this pronouncement of unsafe levels in drinking water mean[s] trouble for turf grass fields as sources of PFAS...even though the measurable load is only a few ng/L of a few PFAS, there is a lot of turfgrass out there, and this would represent a threat to the local ecology and humans if there were drinking water sources nearby.”

Recent research from the University of Stockholm [Link: https://chemrxiv.org/engage/api-gateway/chemrxiv/assets/orp/resource/item/624ea1cd5a] indicates that synthetic turf fields contain from 1 to 38 pounds of PFAS, per playing field. To date, all reported testing results have found PFAS in all components of synthetic turf fields: the carpet backing, blades, shock pad and infill. PFAS in synthetic turf has been shown to leach from the plastic grass carpet, contaminating soil, WATER [Link: https://www.youtube.com/watch?v=hoipI2Yj1DA] and air (@19:55).

The loss of degrading microplastic blades [Link: https://wjla.com/features/i-team/montgomery-county-sports-field-washing-away-in-rain] from synthetic turf is significant. The International Association for Sports and Leisure Facilities states (27 Aug 2019):

“mechanical wear from high tread loads – as arising during football or rugby – causes tiny particles or blades of artificial grass to break off. This amounts to 250 to 300 kg per year for modern sports pitches.”

That is 551-661 pounds of PFAS laden microplastics readily lofted into the air by field, washed down drains or embedded into soil due to activity or weather- per field, per year. With an estimated 32,400 - 35,000 plus current synthetic playing fields (based on industry statements and industry claims of new installations every three to four days) and a regulation sized field of 80,000 square feet, the estimated amount of synthetic turf playing systems is between 457,000,000 and 505,000,000 square feet of of PFAS containing synthetic turf covering parks and schools across the country. This, of course, is a gross underestimate as it is exclusive of other applications noted above. Additionally, many playing fields are 200,000 to 400,000 square foot installations.

Microplastic synthetic turf blades have been found in Lake Tahoe and the ocean. This makes synthetic turf clearly a major point source of PFAS pollution that cannot go unaddressed.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. There can be many different contamination sources affecting drinking water; this rule is designed to ensure drinking water quality regardless of the source. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

Association of Environmental Authorities (AEA) (Doc. #1635, SBC-042961)

We support comments submitted by NACWA, the Water Environment Federation (WEF), and the American Water Works Association (AWWA), and in particular, the following points:

PFAS chemicals are widespread in our environment – in water, in air, and in soil. PFAS chemicals are in fast food wrapping and dental floss, and they are water-proof clothing, make-up, and literally thousands of other items and products we use every day. Our member utilities are passive receivers of PFAS chemicals.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. The EPA agrees that drinking water is only one route of exposure to the six PFAS regulated by this rule, more information about the agency's use of RSC to account for the drinking water route can be found in section 4 of the EPA response in this *Response to Comments* document. It is also important to distinguish between a potential environmental release and a direct exposure. A PFAS release does not inherently imply human exposure and a release is not inherently risky to specific populations. A product that contains PFAS does not automatically imply risk or release.

Sharon Levy (Doc. #1824, SBC-044277)

PFAS are dangerous chemicals that bioaccumulate in the body's organs. Continuous small exposures can lead to larger health effects that can be harmful to people who are ingesting PFAS.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Gujarat Fluorochemicals Limited (Doc. #1840, SBC-044851)

May 30, 2023

Docket ID: EPA-HQ-OW-2022-0114

Re: Proposed PFAS National Primary Drinking Water Regulation.

To Whom It May Concern:

Gujarat Fluorochemicals Limited ("GFL") respectfully submits these limited comments as pertinent information for the Proposed Rule posted on March 29, 2023: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The Proposed Rule aims to regulate under the Safe Drinking Water Act perfluorooctanoic acid ("PFOA"), perfluorooctane sulfonic acid ("PFOS"), perfluorohexane sulfonic acid ("PFHxS"), hexafluoropropylene oxide dimer acid ("HFPO-DA") and its ammonium salt (also known as "GenX Chemicals") and other PFAS of Concern ("PFOC"). GFL and GFL Americas, LLC (a U.S.-based wholly-owned subsidiary) manufacture certain fluoropolymers used in critical applications necessary for functioning of

modern society. While fluoropolymers themselves are safe and non-toxic substances with high molecular weight, the use of toxic, small, water soluble, mobile and bio-accumulative PFAS molecules as polymerization/processing aids in their manufacture is a cause of concern to be addressed by the industry through the use of safer chemistry. To this end, GFL comments to share information on non-PFAS alternatives developed to replace the use of PFOA, HFPO-DA and other PFAS substances as polymerization aids in the manufacture of fluoropolymers.

In particular, GFL seeks to share information to supplement EPA's decision to strictly regulate HFPO-DA. As EPA states in the Proposed Rule, the "most common use for GenX Chemicals is for emulsion polymerization." The use of PFAS processing aids for this purpose is not necessary for a majority of fluoropolymers, and so GFL supports any regulation to minimize the use of these chemicals or mitigate the effect thereof. Viable alternate technologies exist to produce most fluoropolymers that are circulated in commerce without the use of PFAS processing aids. GFL itself uses such technology to produce four fluoropolymers – polytetrafluoroethylene ("PTFE"), polyvinylidene difluoride ("PVDF"), fluoroelastomer ("FKM") and perfluoroalkoxy alkanes ("PFA") – largely without PFAS processing aids, and by the end of this year will produce its entire fluoropolymer portfolio without the use of these aids. GFL is not alone; fluoropolymer manufacturers like Arkema, Solvay and Honeywell have developed non-PFAS alternatives and have committed to stopping the use of harmful PFAS as processing aids. Other manufacturers are also developing methods to replace PFAS polymerization aids with non-fluorinated aids. In fact, more than 50% of fluoropolymers do not require the use of polymerization aids at all during manufacturing. Of those fluoropolymers that are manufactured with the use of polymerization aids, few use PFAS polymerizations aids (and fewer need to). One study concludes that more than 80% of the fluoropolymers produced globally soon will be manufactured without the use of fluorinated polymerization aids [FN1: "Fluoropolymers: The Safe Science That Society Needs"; Jaime Sales, Francisco Hernández, Deepak Kapoor and Marcel van den Noort. [2022] ICRL. ISSN (Print) 2566-834X.]. Similarly, the International Chemical Regulatory Law Review recently published a special issue on regulatory updates on PFAS detailing this shift towards the use of non-PFAS polymerization aids [FN2: "Developments in Fluoropolymer Manufacturing Technology to Remove Intentional Use of PFAS as Polymerization Aids"; Bruno Ameduri, Jaime Sales and Michael Schlipf. [2023] ICRL. ISSN (Print) 2566-834X ISSN, (Online) 2566-8412.].

EPA Response: The SDWA regulates contaminants that meet specific regulatory criteria as outlined in section 3. This NPDWR will reduce six PFAS (including HFPO-DA) known to cause adverse health effects as well as occur in PWSs, consistent with the SDWA regulation criteria. As outlined in the PFAS Strategic Roadmap, the EPA plans on taking a holistic approach to managing PFAS risks and the EPA shares the goal of safeguarding human health and the environment. This is partially accomplished by evaluating new chemicals to ensure that they are in fact safer alternatives. Please see the summary of major public comments for this section.

Villanova University (Doc. #3072-10, SBC-046344)

Good afternoon, and thank you for this opportunity to provide comments. My name is Dr. Laura Anderko, I'm a registered nurse with a Ph.D. in Public Health at Villanova University. I've been a member of the Children's Health Protection Advisory Committee, the National Drinking Water Advisory Council, and co-author of the recent NASM report, "Guidance on PFAS Exposure, Testing, and Clinical Follow-Up." I'm here to strongly support EPA's proposed drinking water standards for PFAS and thank you, as these are long overdue. EPA's proposal for the six PFAS would set the national standard for PFOA and PFOS at the lowest detection level approved by the Agency, and would establish limits on GenX, PFBS, PFNA, and PFHxS using a Hazard Index. EPA estimates that 94 million Americans currently receive their drinking water contaminated by one or more of these PFAS chemicals above the limits proposed by the EPA. The proposed regulation of PFAS will improve the drinking water safety for millions of Americans, and protect the public's health. PFAS chemicals are found in the blood of virtually every American. Children are particularly vulnerable to these chemicals, with research reporting health effects such as decreased infant and fetal growth, dyslipidemia, and decreased vaccine response. Children are more susceptible to the health effects of water pollution because their bodies, brains, and organs are still developing, and damage from chemical exposure may last a lifetime. PFOS and PFOA are commonly found in breast milk and core blood. Research continues to explore the long-term health effects of these chemicals in children from these sources of exposure. It is encouraging to know that the Bipartisan Infrastructure Law will provide funding for drinking water infrastructure upgrades and other drinking water infrastructure needs for municipalities. Prevention of exposure is key to ensuring the public's health. Therefore, I also urge EPA to expedite efforts to prevent forever chemicals from entering the environment by controlling industrial and military discharges of PFAS into the water. In closing, I'd like to underscore that the proposed PFAS drinking water standards supports the mission of EPA to protect human health and the environment, and I urge the Agency to finalize the standards as quickly as possible. Thank you.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. This rule focuses specifically on drinking water. Discharges to source water are addressed by other agency programs based on other statutory authority.

Jennifer Decker (Doc. #3072-91, SBC-046399)

My full name is Jennifer Decker, Morgan is a nickname. I would just like to invite us all to have moments of silence for those we've lost. I'm thinking about the people who've shared about family members who are gone. I just invite us all to reflect upon the babies who've had cancer. I am really thankful for all the people who've spoken out today on the issue of PFAS. I feel like this is a matter of trust in government. I urge us to follow the model of the European Union that Marguerite Adelman spoke about. I think we do need to follow the precautionary principle in

order to re-establish trust in government. The lack of trust in government has caused chaos in this country. If a foreign power wanted to poison and kill the U.S. public, we declare a war, but when the Department of Defense does it, we have to hold a hearing, and we're in an absurd position, sort of like the book Catch 22, where we're dealing with a government that is supposed to protect all of our life, liberty, and our pursuit of happiness, but instead is destroying that and then is allowed to negotiate. It doesn't make any sense. One of the things that I think is really important for us to consider is the neurological impacts of PFAS. That's something that we need to study more, but I think that we might have avoided a lot of problems in this country if people could have understood that it was these toxins that are causing things like autism and other neurological damage.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Safe Healthy Playing Fields (Doc. #3072-93, SBC-046401)

Good afternoon, this is Diana Conway. I'm a Potomac, Maryland resident just outside of Washington DC. I'm also president of a nonprofit called Safe Healthy Playing Fields. We are 501(c)(3) established in 2019, after more than 10 years of advocacy on why artificial turf fields are a disaster. We knew they were a disaster for athletes, for heat, for injury, for general toxicity, just things like carcinogens or endocrine disruptors. But now we know that each one of those fields, about two acres per field, is loaded with PFAS and that it leaches off, of course. The gentleman who called in from Oak Bluffs on Martha's Vineyard, the town attorney I think, I was pleasantly surprised to hear him there because I know that Island, Martha's Vineyard, as well as Nantucket, are turning back artificial turf fields because they are the sole source aquifers, and if that water is contaminated, they're done. Never mind the tourist season that sustains those communities, they won't be able to drink a drop of their water. So, I'm calling in and I'm so pleased you opened the phones like this. I had no idea I could be able to jump in at the last minute. I really appreciate it. Everything everybody said made sense. Let's get the whole class regulated. Let's be much more aggressive about the regulation. Let's be ready and clear-eyed that the industry's going to come back and say, "Oh wait, oh wait, we have a better idea." This has been for decades. This has been a known problem and it's finally getting said out loud. I am so grateful to all the scientists and activists and the students who chimed in. What I really want to say is, artificial turf is one of the easy ones. A lot of these products that have PFAS in them are things that we may not be able to replace yet. Artificial turf, my goodness, it's two acres of PFAS and we have a classic replacement, it's called grass. It's good for the water, it's a carbon sink, it's a cooling effect instead of a heat island. And you're not rolling your children in chemicals from pre-K through college, and especially of course in PFAS. Montgomery County, Maryland is a suburb of Washington DC. There's a large area of farming community still there. They've had to close two of their only 13 municipal wells in Poolesville because of the excessive PFAS contamination. So, we're going to run out of water to drink. This should be a no-brainer and

artificial turf above all should be one of the first ones to go. We've got choices there. So, thank you again very much for this opportunity.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. There can be many different contamination sources affecting drinking water; this rule is designed to ensure drinking water quality regardless of the source. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

Virginia Clinicians for Climate Action (Doc. #3072-95, SBC-046402)

Hi, thanks very much. So, my name's Paul DiLorenzo. I'm a heart specialist and I am a member of the Virginia Clinicians for Climate Action and I have some interest in reducing health risk to the population as a whole. So, some of my suggestions or questions really are that there is a move to regulate six PFAS chemicals. Congratulations. Great job. I think that's wonderful. Anything is better than nothing at all. But as we know, there will be this negligent substitution or whack-a-mole. And I think you need legislation or rules within EPA to say that the companies must prove safety prior to making the next non-stick pan or that there will be substantial multi-million- or billion-dollar penalties if they're found to be negligent down the road. And then the next thing is I would go along with somebody earlier who looked at low-hanging fruit, foam, which has PFAS, obviously should be banned. Non-stick should be really carefully looked at by the EPA to determine if there are indeed any safe non-stick pans or non-stick pans should be banned. And then artificial turf, which I thought was an excellent suggestion. So, I think what I'm saying is the two things left out are new negligent substituted PFAS and basically ways to not only measure and reduce the water content, but to actually reduce the amount of PFAS that is going into our country. I thank you very much. I hope this was helpful. And by the way, the conference was great. Good job.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. There can be many different contamination sources affecting drinking water; this rule is designed to ensure drinking water quality regardless of the source. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

Kathy Michaels (Doc. #3072-104, SBC-046407)

Hi. Yeah. My name is Kathy Michaels and I'm in Maryland and I just wanted, I came on very late, but I wanted to point out the fact that a lot of PFAS chemicals are entering air, soil, and water from solid waste such as plastics, in particular synthetic carpeting and in particular the huge installations of synthetic turf, which it's like a Trojan horse for PFAS chemicals, and not just leaching out into the nearby soils and water, but because they break down, they form

microplastics that loft into the air and get deposited everywhere. So, they're basically a point source of a huge amount of PFAS pollution and they get discarded every eight years or so. So, they're just building up in the environment that way. So, thank you very much. I wanted to bring that to your attention.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. There can be many different contamination sources affecting drinking water; this rule is designed to ensure drinking water quality regardless of the source. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

Jorge Diaz Castello (Doc. #1473, SBC-042308)

Endocrine disruptors are chemicals that can interfere with the body's endocrine system, which is responsible for regulating hormones and other biological processes. PFAS compounds have been identified as endocrine disruptors, meaning that they interfere with the body's hormonal balance and cause adverse health effects.

In children, who are still developing both physically and hormonally, exposure to endocrine disruptors like PFAS can be particularly concerning. During early life stages, the body's systems are still maturing, and exposure to environmental contaminants can disrupt the normal processes of growth and development. This can lead to a wide range of negative health outcomes, including developmental delays, cognitive impairment, and increased susceptibility to disease.

Moreover, research has suggested that PFAS exposure during pregnancy may have long-lasting effects on a child's health. A study conducted by researchers at Harvard found that higher levels of PFAS in maternal blood were associated with lower birth weights and head circumferences in infants, as well as reduced immune function and increased risk of infection in early childhood.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Shelley V.L. (Doc. #1555, SBC-042558)

Document ID: EPA-HQ-OW-2022-0114

Comments regarding: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation

Thank you for the opportunity to provide public comments regarding this critical piece of legislation. I support the Environmental Protection Agency’s (EPA) proposal to regulate Per- and poly-fluoroalkyl substances (PFAS), such as Perfluorooctanoic acid (PFOA) and Perfluorooctane sulfonic acid (PFOS), in nation’s drinking water. The role and federal authority of the EPA is to

act on the behalf of the people, to "protect people and the environment from significant health risks … and enforce environmental regulations". PFAS or "forever chemicals" within our nations drinking water is well within the agency's authority to take measures to protect public health; moreover, establishing strict PFAS drinking water standards really should be considered the bare minimum of actions to be taken by the EPA.

PFASs are considered "forever chemicals" because it could take thousands of years to breakdown in the environment and, most importantly the chemicals can buildup and remain in the human body potential causing significant health issues. While there is still much more researched to be done to fully understand the adverse effects of PFAS, epidemiological studies have linked PFAS exposure to many adverse effects such as the following: immune and thyroid function, liver disease, lipid and insulin dysregulation, kidney disease, conception, pregnancy and infant development, and cancer. PFASs have been detected in the environment (e.g., groundwater, drinking water, air, and soil). In addition, these chemicals are prevalent in the manufacturing and distribution processes of our food, clothing, and other commercial uses. Given the enormous possibilities for people to be exposed to PFAS, it is prudent for the EPA to act with a sense of urgency in protecting people from these contaminants where possible.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. There can be many different contamination sources affecting drinking water; this rule is designed to ensure drinking water quality regardless of the source. Use of PFAS in commercial products is beyond the scope of this current rulemaking.

Kristina Winter (Doc. #1559, SBC-042542)

Due to widespread use of PFAS chemicals in numerous products and industries, PFAS chemicals have become ubiquitous in the environment, including our soil, air, and drinking water. Testing has revealed PFAS in water sources in communities across our nation.

Studies show that human exposure to PFAS is widespread and that nearly all people in the United States have some PFAS compounds in their blood. Exposure to PFAS can lead to higher rates of kidney and testicular cancer, higher cholesterol levels, thyroid problems, adverse developmental effects and decreased immune response in children, and other adverse health impacts.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Endocrine Society (Doc. #1579, SBC-042426)

The Endocrine Society enthusiastically supports the proposed National Primary Drinking Water Regulation for PFAS, with modifications as described above. This regulation is consistent with the accumulating evidence demonstrating that these chemicals act as endocrine disruptors, can accumulate in the environment and in the human body, and can result in adverse health effects in humans and wildlife. However, we note that there are thousands of other chemicals with similar structure, and presumably the same function, that will remain unregulated.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Association of State and Territorial Solid Waste Management Officials (ASTSWMO) (Doc. #1583, SBC-042402)

Overall, as movement is made toward better regulation and oversight of these contaminants, ASTSWMO's membership recognizes a corresponding need for research, communication, and improved understanding within the following areas:

• development of human health and ecological toxicity values for PFAS;

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Center for American Progress (CAP) (Doc. #1586, SBC-042385)

After nearly 70 years of widespread use in manufacturing, PFAS can be found virtually everywhere in our environment. They enter our water supply through industrial sites, fire response training sites, landfills, and wastewater treatment centers,[FN1: California State Water Resources Control Board, Division of Water Quality, "PFAS – Frequently Asked Questions" (Sacramento, CA: 2020), available at https://www.waterboards.ca.gov/pfas/docs/master_pfas_faq_mar.pdf] and are extremely resistant to breakdown and can stay in the environment for centuries. Humans are frequently exposed to these chemicals by drinking contaminated water directly, eating food—particularly fish—contaminated by PFAS, or breathing contaminated air. It is no surprise that 97 percent of Americans have at least some forever chemicals in their blood,[FN2: Ryan C. Lewis and others, "Serum Biomarkers of Exposure to Perfluoroalkyl Substances in Relation to Serum Testosterone and Measures of Thyroid Function among Adults and Adolescents from NHANES 2011–2012," International Journal of Environmental Research and Public Health 12 (6) (2015): 6098 – 6114, available at https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4483690/], and depending on the level of exposure, the presence of these chemicals in humans can be very dangerous.

More research into the dangers of forever chemicals on human health is needed, but the existing science is clear: exposure to PFAS negatively impacts the human immune system, heart health, reproductive system, and childhood development, and it is associated with an increased risk of cancer. Studies have linked exposure to PFAS with decreased antibody response to disease in both adults and children, high cholesterol in adults and children, decreased fetal and infant growth, and increased risk of cancer in adults [FN3: National Academies of Sciences, Engineering, and Medicine; Health and Medicine Division; Division on Earth and Life Studies; Board on Population Health and Public Health Practice; Board on Environmental Studies and Toxicology; Committee on the Guidance on PFAS Testing and Health Outcomes, "Guidance on PFAS Exposure, Testing, and Clinical Follow-Up"(Washington, DC: 2022) available at https://www.ncbi.nlm.nih.gov/books/ NBK584690/]. Evidence also suggests PFAS can be linked to an increased risk of breast cancer, testicular cancer, thyroid disease and dysfunction, inflammatory bowel disease, and pregnancy-induced high blood pressure [FN4: Ibid].

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Mass Comment Campaign sponsored by Slingshot. (email) (Doc. #1682, SBC-045715)

As you are aware, exposure to PFAS can cause serious health effects, such as increased cholesterol levels, reduced immune system function, thyroid disease, liver damage and some forms of cancer. Chemical companies have continued to manufacture PFAS despite knowing for decades that they are unsafe, poisoning communities along the way. A 2018 study by the CDC showed that nearly all Americans have detectable levels of PFAS in their blood.

The EPA's proposed rule reflects what communities across the country already know to be true: There is no safe level of PFAS in our water. For too many Americans, especially those of us who live every day in the shadow of environmental pollution, including PFAS contamination. Enough is enough!

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Public Employees for Environmental Responsibility (PEER) (Doc. #1683, SBC-044968)

Background. The adverse health impacts associated with ingesting PFAS are numerous and well-known. The proposed rule's Executive Summary states:

Current scientific evidence indicates that consuming water containing the PFAS covered in this proposed regulation above certain levels can result in harmful health effects. Depending on the individual PFAS, health effects can include negative impacts on fetal growth after exposure during pregnancy, on other aspects of development, reproduction, liver, thyroid, immune

function, and/or the nervous system; and increased risk of cardiovascular and/or certain types of cancers, and other health impacts…

Indeed, the preamble to the proposed rule states that, "EPA has determined that PFOA and PFOS are likely to cause cancer (e.g., kidney and liver cancer) and that there is no dose below which either chemical is considered safe" (emphasis added). PEER agrees that the adverse health impacts associated with these – and other – PFAS warrant strict regulation.

EPA has been attempting to grapple with certain PFAS contamination for decades. After a voluntary stewardship agreement with eight major PFAS manufacturers in 2006, [FN1: https://www.epa.gov/assessing-and-managing-chemicals-under-tsca/fact-sheet-20102015-pfoa-stewardshipprogram] EPA erroneously stated that it "believes all uses of PFOA and its salts were phased out by December 31, 2013." [FN2: Fed. Reg. at 2887] Because PFOA is still being manufactured in the United States, not to mention imported, nearly all Americans have PFOA in their blood. [FN3: https://www.health.ny.gov/environmental/investigations/hoosick/docs/pfoa_blood_sampling_q_and_a_6_7_17.pdf] Despite the ubiquity of PFAS in our environment and our bodies, and the adverse health impacts from these chemicals, this is the first time EPA is attempting to regulate certain PFAS in our drinking water.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. The EPA notes that the text quoted by the commenter on PFOA and its salts is not a part of this PFAS NPDWR.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044441)

Background

PFAS are a class of synthetic chemicals that have been used in the United States since the 1940s and are still found in many common products. These chemicals have been widely used because they are resistant to water, heat, and stains. PFAS are highly stable and resistant to degradation—which is why PFAS are known as "forever chemicals." They have been used to produce countless consumer products, including textiles (like waterproof clothing, car seats, strollers, and stain repellent furnishings), non-stick cookware, and food packaging. Firefighting foam containing PFAS [FN5:Aqueous film-forming foam, or AFFF, has been in use since its development in the 1960s.] has also been used for decades by the United States military, airports, industrial facilities, and local fire departments. PFAS are detectable in the blood of most people in the United States. [FN6: Agency for Toxic Substances and Disease Registry, PFAS in the U.S. Population, https://www.atsdr.cdc.gov/pfas/health-effects/us-population.html.] Because of their widespread and long-term use and method of production, PFAS are typically found in mixtures in the environment.

Our states face substantial threats to public health and the environment from PFAS. Many states, including many of the undersigned, have repeatedly urged both Congress and EPA to take prompt and aggressive actions to respond to the unfolding national PFAS crisis. [FN7: See, e.g., Multistate Comments dated April 13, 2022 regarding EPA's Fiscal Year 2022 Spend Plan for PFAS, https://www.michigan.gov/ag/-/media/Project/Websites/AG/releases/2022/April/State_Comments_on_EPAs_PFAS_Spend_Plan_FINAL_751106_7.pdf?rev=761235fc045d4b9c995b1a4427a2ad3c&hash=DB08B30565068BCA058CB3E5C331694C; Multistate Comments dated September 27, 2021 regarding EPA's Proposed TSCA Section 8(a)(7) Reporting and Recordkeeping Requirements for Perfluoroalkyl and Polyfluoroalkyl Substances, 86 Fed. Reg. 33926 (June 28, 2021), https://www.regulations.gov/comment/EPA-HQ-OPPT-2020-0549-0086; Multistate Comments dated September 17, 2021 regarding EPA's Drinking Water Contaminant Candidate List 5 Draft, 86 Fed. Reg. 37948 (July 19, 2021), https://www.regulations.gov/comment/EPA-HQ-OW-2018-0594-0076; Multistate Comments dated May 10, 2021 regarding EPA's proposal to expand monitoring for PFAS under the UCMR5 (May 10, 2021), https://coag.gov/app/uploads/2021/05/510.21_PFAS_Comments.pdf; Multistate Letter to Congress dated July 16, 2021 regarding Support for 2021 PFAS Action Act, https://content.govdelivery.com/attachments/WIGOV/2021/07/23/file_attachments/1886815/Multi-State%20PFAS%20Letter%20071621.pdf; Multistate Comments dated June 10, 2020 regarding EPA's Preliminary Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List, 85 Fed. Reg. 14098, 14120 (Mar. 10, 2020), https://www.regulations.gov/comment/EPA-HQ-OW-2019-0583-0258; Multistate Comments dated April 17, 2020 regarding EPA's Supplemental Proposed Rule on Long-Chain Perfluoroalkyl Carboxylate and Perfluoroalkyl Sulfonate Chemical Substances; Significant New Use Rule, 85 Fed. Reg. 12479 (March 3, 2020), https://www.regulations.gov/comment/EPA-HQ-OPPT-2013-0225-0217; Multistate Comments dated February 3, 2020 regarding Addition of Certain PFAS; Community right to Know Toxic chemical Release Reporting, 84 Fed. Reg. 66369 (Dec. 4, 2019), https://www.regulations.gov/comment/EPA-HQ-TRI-2019-0375-0086; Multistate Comments to Congress dated July 30, 2019 regarding need for comprehensive PFAS Legislation, https://oag.ca.gov/system/files/attachments/pressdocs/Multistate%20PFAS%20Legislative%20Letter_7.30.19_FINAL.pdf.] The science demonstrates that these chemicals are highly toxic to humans and animals, with even miniscule exposures over time associated with significant and diverse adverse human health effects. [FN8: See Pelch KE, Reade A, Kwiatkowski CF, Wolffe T, Merced-Nieves FM, Cavalier H, Schultz K, Rose K, Varshavsky J. 2021. PFAS-Tox Database, https://pfastoxdatabase.org/.] Moreover, PFAS in mixtures can have a dose-additive effect, which makes it critical to regulate combinations of PFAS in addition to individual chemicals, the approach the agency is pursuing in this rulemaking. [FN9: See e.g., Goodrum et al., Application of a Framework for Grouping and Mixtures Toxicity Assessment of PFAS: A Closer Examination of Dose-Additivity Approaches, Tox. Sciences (2021), https://doi.org/10.1093/toxsci/kfaa123.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. The EPA is accounting for mixtures in the Hazard Index approach adopted under this rule. For more discussion on the Hazard Index approach, please see section 4.3.1 of this *Response to Comments* document.

Three Rivers Waterkeeper (3RWK) (Doc. #1689, SBC-044972)

I. PFAS are both dangerous and widespread.

Despite some remaining scientific uncertainty as to the precise medical effects of all PFAS on the human body, the most-studied PFAS are both widespread and associated with serious adverse health effects. [FN1: What Are the Health Effects of PFAS?, Agency for Toxic Substances and Disease Registry, https://www.atsdr.cdc.gov/pfas/health-effects/index.html (Last Accessed May 30, 2023).] Despite this dangerous combination of prevalence and toxicity, a 2021 analysis by the Environmental Working Group found nearly 30,000 new industrial sites known or suspected to be releasing PFAS into the environment, a twelve-fold increase from previous estimates. [FN2: Monica Amarelo, Twelvefold Increase in Suspected Industrial Dischargers of Forever Chemicals, Environmental Working Group, July 14, 2021, https://www.ewg.org/news-insights/news-release/2021/07/twelvefold-increase-suspected-industrial-dischargers-forever.] PFAS accumulate in people, in wildlife, and in waterways. They can be found at dangerous levels in rainwater around the world, on all seven continents. [FN3: Rainwater Unsafe to Drink Due to Chemicals: Study, phys.org, Aug. 10, 2022, https://phys.org/news/2022-08-rainwater-unsafe-due-chemicals.html.] An extensive Waterkeeper Alliance study found that 83% of the waters tested in the U.S. are contaminated with PFAS, but the full extent of PFAS contamination remains unknown. [FN4: Invisible Unbreakable Unnatural, Waterkeeper Alliance, https://waterkeeper.org/pfas/ (Last Accessed May 30, 2023).] Experts estimate that over 200 million Americans are exposed to PFAS through drinking water. [FN5: Id.] Even though we continuously learn more about the adverse health effects associated with PFAS, these chemicals continue to be widely used in both consumer products and industrial processes. [FN6: Id.]

The peer-reviewed studies used by the EPA suggest a wide range of potential health effects including:

● Reproductive effects such as decreased fertility or increased high blood pressure in pregnant women.

● Developmental effects or delays in children, including low birth weight, accelerated puberty, bone variations, or behavioral changes.

● Increased risk of some cancers, including prostate, kidney, and testicular cancers.

● Reduced ability of the body's immune system to fight infections, including reduced vaccine response.

● Interference with the body's natural hormones.

● Increased cholesterol levels and/or risk of obesity. [FN7: Our Current Understanding of the Human Health and Environmental Risks of PFAS, United States Environmental Protection Agency, March 16, 2023, https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas.]

Their unique properties make them toxic even in small doses, which build up over time in the body and in the environment. Furthermore, these harmful effects are not distributed equally among the population. [FN8: Jahred M. Little, Laurel A. Schaider, and Elsie M. Sunderland, Sociodemographic Factors Are Associated with the Abundance of PFAS Sources and Detection in U.S. Community Water Systems, 57 Environmental Science and Technology 7902, 7909, May 15, 2023, https://pubs.acs.org/doi/10.1021/acs.est.2c07255.] Recent studies show disparities in PFAS exposure, with communities marginalized along racial and economic lines being more likely to have elevated PFAS concentrations in their drinking water sources. [FN9: Id.] Systemic socioeconomic factors can expose members of disadvantaged communities to PFAS and other toxins by pushing them into working hazardous jobs, or living downstream of hazardous runoff. This is a serious environmental justice issue, but at the same time, PFAS are so widespread that a 2015 report by the Centers for Disease Control "found PFAS in the blood of 97% of Americans." [FN10: Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS), National Institute of Environmental Health Science, March 9, 2023, https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote1.] They have been found in Antarctica [FN11: Green Science Policy Institute, It's Raining PFAS: Even in Antarctica and on the Tibetan Plateau, Rainwater is Unsafe to Drink, phys.org, Aug. 2, 2022, https://phys.org/news/2022-08-pfas-antarctica-tibetan-plateau-rainwater.html.] and in mothers' breast milk. [FN 12: Guomao Zheng et al., Per- and Polyfluoroalkyl Substances (PFAS) in Breast Milk: Concerning Trends for Current-Use PFAS, 55 Environmental Science and Technology 7510, 7513-17, May 13, 2021, https://pubmed.ncbi.nlm.nih.gov/33982557/.] PFAS are as inescapable as they are dangerous.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. See section 14 of the EPA response in this *Response to Comments* document for discussion of EJ considerations.

Protecting Our Water, Environment, and Ratepayers (POWER) (Doc. #1714, SBC-045928)

I. INTRODUCTION

EPA has proposed a NPDWR for six PFAS chains: perfluorooctanoic acid ("PFOA"), perfluorooctanoic sulfonic acid ("PFOS"), perfluorohexane sulfonic acid ("PFHxS"), hexafluoropropylene oxide dimer acid ("HFPO-DA" commonly known as "GenX"), perfluorononanoic acid ("PFNA"), and perfluorobutane sulfonic acid ("PFBS"). Specifically, EPA seeks to set maximum containment level goals ("MCLG") and maximum containment

levels ("MCL") for the six proposed PFAS chains. EPA proposes MCLGs for PFOA and PFOS at zero and MCLs for PFOA and PFOS at four (4) parts per trillion (ppt). For the four additional chains, EPA is proposing, for the first time under the Safe Drinking Water Act, a hazard index ("HI") approach for both the MCLG and MCL, which would be exceeded with individual concentrations of GenX at 10 ppt, PFBS at 2000 ppt, PFNA at 10 ppt, and PFHxS at 9 ppt, or would be exceeded at far lower levels if multiple of these PFAS substances are present.

These substances are introduced into the water systems nationwide primarily through manufacturing and use of consumer products. Today, PFAS, including the six proposed chains, are found or used in many consumer products such as carpets, clothing, fabrics, cookware, firefighting foam, and many other products and textiles. These chains enter the environment, including drinking water systems, through the manufacturing plants, every home and business, and any place PFAS-containing firefighting foam is or has been used. POWER! believes it is important to move aggressively to stop the introduction of additional PFAS chains into the stream of commerce and the environment, and to develop cleanup, handling, transportation, disposal and/or destruction standards and technologies for each chain. However, without these standards and technologies in place, this proposed rule, as with other rules recently proposed by EPA [FN1: Environmental Protection Agency, Designation of Perfluorooctanoic Acid (PFOA) and Perfluorooctanesulfonic Acid (PFOS) as CERCLA Hazardous Substances, 87 Fed. Reg. 54415 (proposed Sept. 6, 2022).], will cause many unintended consequences and costs for water and wastewater agencies and the public they serve, as described below.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. This NPDWR is designed to address drinking water as a specific exposure pathway. Other exposure pathways are addressed by other agency programs based on other statutory authority. Other EPA rules such as the CERCLA designation are discussed in section 10, Treatment, of the EPA response in this *Response to Comments* document.

Coralie Pryde (Doc. #1781, SBC-043814)

Studies by the US Geological Service (USGS) have shown that wells across Delaware are contaminated with levels of PFAS above the 17 ppt level previously suggested by the EPA. There has been no indication that the state intends to address this contamination until mandatory levels are established. This means that a large number of residents are suffering from high blood serum levels of PFAS. This is particularly true in New Castle County, where I live.

A 2022 study shows that residents of New Castle County (NCC) have the highest levels of PFAS in their blood compared to the national average. [FN3: https://www.atsdr.cdc.gov/pfas/docs/PFAS-EA-Final-Report-Community-Summary-H.pdf] The total levels of all PFAS found there exceeded the levels at nine other sites selected for study by

the Centers for Disease Control and Prevention (CDC) and the Agency for Toxic Substances and Disease Registry (ATSDR) because they were known to have very high levels of contamination.

The extremely high levels of contamination for NCC may partially be the result of measurements on people who were exposed to the very high levels of contaminants found in the city of New Castle and areas near the National Guard air base.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

Silent Spring Institute (Doc. #1784, SBC-045797)

Chemicals in the PFAS family are of concern for many health endpoints, including breast development, lactation, and cancer.[REF1: National Academies of Sciences, Engineering, and Medicine. Guidance on PFAS Exposure, Testing, and Clinical Follow-Up. Washington, DC: The National Academies Press; 2022; REF2: Kay JE, Cardona B, Rudel RA, et al. Chemical Effects on Breast Development, Function, and Cancer Risk: Existing Knowledge and New Opportunities. Curr Environ Health Rep. 2022;9(4):535-562.] Silent Spring Institute previously published peer-reviewed studies on PFAS exposures associated with drinking water,[REF3: Schaider LA, Rudel RA, Ackerman JM, Dunagan SC, Brody JG. Pharmaceuticals, perfluorosurfactants, and other organic wastewater compounds in public drinking water wells in a shallow sand and gravel aquifer. 4) a study funded by the National Science Foundation to investigate policy responses to PFAS at multiple levels of governance. Silent Spring scientists have also reviewed risk assessments that are a basis for drinking water standards proposed by various US states.[REF10: Cordner A, De La Rosa VY, Schaider LA, Rudel RA, Richter L, Brown B. Guideline levels for PFOA and PFOS in drinking water: the role of scientific uncertainty, risk assessment decisions, and social factors. J Expo Anal Environ Epidemiol. 2019.]

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. For more information on occurrence, please see section 6 of the EPA response in this *Response to Comments* document.

Ohio Environmental Council (Doc. #1794, SBC-045322)

National standards to limit the concentration of PFAS in drinking water are long overdue. For decades, PFAS have been used in thousands of applications, and a peer-reviewed study estimates that PFAS may be present in the drinking water of more than 200 million Americans. EPA's proposal for six PFAS would set the national standard for PFOA and PFOS at the lowest detection level approved by the agency, and would establish limits on GenX, PFBS, PFNA, and PFHxS using a hazard index. EPA estimates that 94 million Americans currently receive drinking water contaminated by one or more these PFAS chemicals at levels above the limits proposed by EPA. The regulation of PFAS will improve drinking water safety for millions of Americans.

Not only are PFAS widespread in drinking water, these "forever chemicals" persist throughout the environment and pose risks to public health even in trace amounts. They are found in the blood of virtually everyone on Earth, and build up in our organs. Very low doses of PFAS in drinking water have been linked to suppression of the immune system and are associated with an elevated risk of cancers and reproductive and developmental harms, among other serious health concerns.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. For more information on occurrence, please see section 6 of the EPA response in this *Response to Comments* document.

Safe Drinking Water Branch, Hawaii Department of Hawaii (Doc. #1801, SBC-043757)

The Interim Health Advisory

After the PFAS rule is finalized by the end of 2023, EPA should remove the Interim Health Advisory published in June 2022 to avoid the confusion among the public and make it for the state agency, and water purveyors to communicate with the public.

EPA Response: The SDWA authorizes the EPA to issue HAs for contaminants, even if they are not subject to a NPDWR (42 U.S.C. §300g-1(b)(1)(F)). A HA provides technical information on a contaminant that can cause negative human health effects and is known or anticipated to occur in drinking water (42 U.S.C. §300g-1(b)(1)(F)). HA's are non-enforceable and serve to provide technical information. The EPA issues an interim HA when a contaminant's associated health effects assessment is in draft form, but there is a pressing need to provide information to public health officials prior to finalization of the health effects assessment. That is why the EPA published interim HA's for PFOA and PFOS in June 2022, based on a robust assessment of the best available science at that time. On March 14, 2023, the EPA published a proposed NPDWR for PFOA and PFOS, as well as for four additional PFAS and their mixtures. This rule has considered additional updates to the science and is responsive to peer review feedback provided by the EPA's Science Advisory Board (SAB). In the proposed rule, the EPA presented updated noncancer toxicity values based on evaluating additional scientific information. These updated values are different from those used to calculate the 2022 interim HAs, which the EPA based on the best available science at that time. The EPA solicited public comments on its proposed NPDWR, including on the proposed MCLGs, other supporting information, and the draft 2023 toxicity values for PFOA and PFOS, which are based on the best available science. Note that the MCLGs in the proposed rule were zero. The EPA anticipates developing HAs for additional PFAS as the agency publishes toxicity assessments. The EPA's disposition of its HAs is beyond the scope of this action. The agency is considering options for the 2022 interim HAs for PFOA and PFOS.

Jeanne Forster (Doc. #1865, SBC-045851)

Due to widespread use of PFAS chemicals in numerous products and industries, PFAS chemicals have become ubiquitous in the environment, including our soil, air, and drinking water. Testing has revealed PFAS in water sources in communities across our nation.

Studies show that human exposure to PFAS is widespread and that nearly all people in the United States have some PFAS compounds in their blood. Exposure to PFAS can lead to higher rates of kidney and testicular cancer, higher cholesterol levels, thyroid problems, adverse developmental effects and decreased immune response in children, and other adverse health impacts.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document. For more information on occurrence please see section 6 of the EPA response in this *Response to Comments* document.

K Murphy (Doc. #1866, SBC-045855)

Alyssa Rodriguez (Doc. #1956, SBC-046611)

PFAS Regulation Comment:

The Environmental Protection Agency should be supported in their proposal to regulate PFAS nationally in drinking water. As the Environmental Protection Agency clearly outlines, PFAS cause significant health issues in several systems of the body. Maternal and fetal liver dysfunction increased significantly when PFAS were exposed gestationally to mice (Blake et al., 2022). PFAS disrupt many biological pathways and gene expression rates in these mouse trials showing a significant strain on mice ability to function as a whole (Blake et al., 2022). Trials such as these shed light on the hidden dangers that even a mild build up of these chemicals can have on communities throughout the US. Although Every disease is important, it is vital to stress the impact on the future generations especially when genetic damage proven probable. Virtually every way a PFAS can enter the body causes significant damage.

Furthermore, another concern of PFAS is the inherent risks associated with inhalation due to their burning in landfills or the inadequately neutralized PFAS being incinerated. A study done by the National Resource Defence Council reported in 2021 that approximately ninety percent of PFAS were under-reported because they were incinerated (NRDC, 2021). Incineration has not been proven to neutralize PFAS and these now air born PFAS can further spread without documentation. This resistance to being burned is evident by their use in Aqueous film forming foam which can put out fires and so on. Many of these airborne or not quite neutralized PFAS surely do end up in our water systems but the inhalation of these chemicals should also be regulated because inhalation of PFAS can be more readily absorbed by the body. As demonstrated by a research study that coated dust particles with PFAS and then exposed rats to the dust. The study collected several blood samples after PFAS dust exposure and samples of various organ tissues to measure the amount of PFAS on the rats compared to oral ingestion. The

researchers found that, "The Cmax following inhalation was four times higher compared to oral exposures. At 48 h post exposure, the levels of PFOA in the plasma, liver, and kidney were twice as high from inhalation exposures. This shows that PFOA is readily bioavailable and has a rapid systemic distribution following an inhalation or oral exposure to house dust coated with PFOA" (Gustasson et al., 2022). This demonstrates the necessity to not only combat PFAS in the ground water but add additional regulations on inefficient disposal methods as they may cause more harm than good such as incineration.

Although this argument is centered on a deontological sense of ethics focusing on our obligation to perform a task for the greater good, it is important to note that this PFAS cleansing does come at a cost. At least part of that cost should be contributed from the companies that produce them. An environmental safety tax could at the very least aid in the financial burden on states' financial needs to meet the proposed expectation of PFAS in their drinking water and may discourage the production of PFAS like material.

An environmental safety tax is beyond the scope of this rule making action.

Kelly Casey (Doc. #2572, SBC-046658)

Dear Administrator Regan-

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. The EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. The EPA should address the whole class of PFAS chemicals wherever possible.

I am also a citizen of the State of MN, and by now I am sure you are aware of the recent bill passed here banning PFAs. This bill is named Amara's Law, after my friend Amara Strande. Amara was just 2 days shy of her 21st birthday when she died from Fibrolamellar Hepatocellular Carcinoma. This complicated liver cancer is linked to the kind of toxic chemicals found in 3M's illegal dumping of PFAs in the neighborhood near her high school, Tartan High School in Oakdale, MN. That school has a disproportionate history of students and families with cancers, genetic abnormalities, and other illnesses associated with PFA exposure. Amara mustered all the strength she could in her final days to testify before both the MN House and Senate about the need to remove and ban these hazardous substances.

Amara was a gifted actor, musician, and composer. She formed the Teen Cancer Alliance for kids with cancer as part of her Gold Award in the Girl Scouts. She was a fierce fighter for the underdog, whether that be the planet, its animals, or its people. She had a low threshold for injustice.

Amara's mother, The Rev. Dana Fath Strande, is my parish priest. Dana, her husband Michael, and Nora, Amara's younger sister, continue their passionate work in Amara's memory to make the companies who invent and use PFAs and PFOs pay for the clean-up and the medical costs associated with these rare skin, blood, and other cancers and genetic anomalies. No one should go through what my beloved friends have. Please do not bend to industry and business when it comes to our safety. There must be consequences for those who flush the toilet upstream without caring for the effects of their actions downstream. 3M and others have destroyed the public trust. Please restore that public trust by holding these criminals and tycoons accountable.

All parts of the EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail the use of PFAS chemicals. Placing the burden on our communities, our drinking water and our health is not the right way to solve the PFAS challenge.

Thank you.

EPA Response: Please see section 2.2 of the EPA response in this *Response to Comments* document. For more information on health effects, see also section 4 of the EPA response in this *Response to Comments* document.

2.3 Statutory Framework and PFAS Regulatory History

Summary of Major Public Comments and EPA Responses

Some commenters stated that 60 days was not a long enough comment period and requested more time. The EPA is following the process outlined in the SDWA and regulating PFAS in drinking water is a significant step toward protecting the health of hundreds of millions of people. Moreover, the EPA anticipates that over many years this action will save thousands of lives and prevent tens of thousands of serious illnesses that would otherwise result from long-term exposure to PFAS. Therefore, it is an EPA priority that the agency finalize this regulation expeditiously to reduce PFAS exposure in communities across the country.

The EPA announced the proposed PFAS NPDWR on March 14, 2023. To provide the public with additional time to review and prepare comments on the proposed rule and key supporting documents, the agency simultaneously made publicly available a pre-publication version of the proposed rule Federal Register Notice (FRN) (USEPA, 2023a), as well as several of the significant underlying technical supporting documents, including the *Economic Analysis* (USEPA, 2023b) and Appendices (USEPA, 2023c)*, Toxicity Assessment and Proposed Maximum Contaminant Level Goal (MCLG) for PFOA* (USEPA, 2023d) and Appendix (USEPA, 2023e), *Toxicity Assessment and Proposed MCLG for PFOS* (USEPA, 2023f) and Appendix (USEPA, 2023g), *Framework for Estimating Noncancer Health Risks Associated with Mixtures of PFAS* (USEPA, 2023h), *MCLG Summary Document for a Mixture of Four PFAS* (USEPA, 2023i), and the *EPA's Response to Science Advisory Board Recommendations on Draft Documents for the Proposed PFAS NPDWR* (USEPA, 2023j). Subsequently, the proposed rule was published in the FR on March 29, 2023, officially initiating the public comment period. That period concluded on May 30th, 62 days later. Considering the agency's pre-publication announcement of the proposed rule, commenters had access to the proposed-rule text and these key supporting documents for a total of 77 days. During the proposed rule development period that occurred before the pre-publication announcement of the proposed rule, the EPA sought to actively involve stakeholders and members of the public in the rulemaking process, seek their input, and provide information through various consultations and engagements. The EPA greatly appreciates the feedback and information shared during this time, which meaningfully informed the proposed rule. Following the proposed-rule announcement, the EPA also offered opportunities for the public to learn more about the proposal, including through two public webinars that the EPA hosted on March 16, 2023, and March 29, 2023 for both general public and technical stakeholders. These webinars, as well as other supporting materials, were made available on the EPA's PFAS NPDWR website as a resource (https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas). Additionally, the EPA held a public hearing for the proposed NPDWR on May 4, 2023, where members of the public had the opportunity to share their comments with the EPA on the proposed rule. The EPA deeply values public input on its proposed rules. Based on the opportunities outlined presented above, the public comment period time provided for this particular action is reasonable, while also allowing the EPA to fulfill its

mission of protecting people and the environment from exposure to negative PFAS health effects as quickly as possible.

Some commenters suggested that there should be universal PFAS restrictions (i.e., regulations for all PFAS in all media). The SDWA regulates contaminants that meet specific regulatory criteria as outlined in section 3. For example, 42 U.S.C. § 300g–1 (b)(1)(A)(ii) includes the requirement that there is a substantial likelihood that contamination will occur in PWSs at a level of public health concern and 42 U.S.C. § 300g–1 (b)(1)(A)(i) requires an adverse effect on the health of persons. PFAS is a term encompassing a diverse group of substances. The Organization of Economically Developed Countries , the USEPA, the WHO, and the research community have all used various definitions as there is no singular consensus on exactly what constitutes PFAS. The definition changes depending on the entity or regulatory body, scope, and application of the definition. An early definition was put forth by Robert Buck in a paper titled "Perfluoroalkyl and polyfluoroalkyl substances in the environment: Terminology, classification, and origins," which defined PFAS as "highly fluorinated aliphatic substances that contain 1 or more C atoms on which all the H substituents (present in the nonfluorinated analogues from which they are notionally derived) have been replaced by F atoms, in such a manner that they contain the perfluoroalkyl moiety C_nF_{2n+1}–." To address gaps in that definition, a more recent definition was put forth by the OECD in a paper titled "Reconciling Terminology of the Universe of Per- and Polyfluoroalkyl Substances: Recommendations and Practical Guidance," which defined PFAS as "fluorinated substances that contain at least one fully fluorinated methyl or methylene carbon atom (without any H/Cl/Br/I atom attached to it), i.e. with a few noted exceptions, any chemical with at least a perfluorinated methyl group (–CF_3) or a perfluorinated methylene group (–CF_2–) is a PFAS." For the purposes of CCL5, the EPA defined PFAS to include chemicals that contain at least one of these three structures: 1) R-(CF2)-CF(R′)R″, where both the CF2 and CF moieties are saturated carbons, and none of the R groups can be hydrogen, 2) R-CF2OCF2-R′, where both the CF2 moieties are saturated carbons, and none of the R groups can be hydrogen, or 3) CF3C(CF3)RR′, where all the carbons are saturated, and none of the R groups can be hydrogen. As stated, PFAS is a very broad chemical class. For example, under this definition, Fluoxetine, sold under various the brand names including Prozac, is a PFAS as well as many propellants used in inhalers and most anesthetic gases such as enflurane, isoflurane, desflurane, sevoflurane, and methoxyflurane. Other PFAS uses that may be considered critical are in labs, for example, in high performance liquid chromatography, safety/protective clothing, or other areas where high performance is necessary and limited by technology, such as by the National Aeronautics and Space Administration (NASA). For more information on why certain PFAS were selected for this rule, please see sections 3.1 and 2.2 of the EPA response in this *Response to Comments* document.

As described in the EPA's PFAS Strategic Roadmap, the agency is committed to addressing PFAS contamination, including through the development of this PFAS NPDWR. The latter is a key action within this whole-of-agency approach (please see https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024 and section 15 of the EPA response in this *Response to Comments* document for discussion on the PFAS Roadmap). The EPA's

approach considers the full PFAS lifecycle, and is based on getting upstream of the problem, holding polluters accountable, ensuring science-based decision making, and prioritizing disadvantaged communities. Specifically, the Roadmap sets timelines by which the EPA plans to take specific actions and commits to new policies to safeguard public health, protect the environment, and hold polluters accountable. The actions described in the PFAS Strategic Roadmap each represent important and meaningful steps to safeguard communities from PFAS contamination. Cumulatively, these actions should lead to more enduring and protective solutions. In the Roadmap, the EPA notes that the agency "will bring deeper focus to preventing PFAS from entering the environment in the first place—a foundational step to reducing the exposure and potential risks of future PFAS contamination." Additionally, in the Roadmap, the EPA notes that "intervening at the beginning of the PFAS lifecycle—before they have entered the environment—is a foundational element of the EPA's whole-of-agency approach." PFAS manufacturing has been addressed via several significant new use rules and the New Chemicals Program continues to review new PFAS before approving commercialization. Other EPA rules such as the CERCLA designation are discussed in section 10, Treatment, in this *Response to Comments* document. The ORD as well as the OST are evaluating and developing technologies for reducing PFAS in the environment to inform decisions on health effects, drinking water and wastewater treatment, contaminated site cleanup and remediation, air emission controls, and end-of-life materials management.

Additionally, the agency considers whether PFAS uses may be beneficial enough in specific applications to warrant use. As stated in section 2.2 of the EPA response in this *Response to Comments* document, there is also no uniform agreed upon definition of PFAS and most definitions are written for specific purposes; as a result, there can be no perfect test method for PFAS as there is no fixed definition of what constitutes PFAS. This problem can compound if exemptions are made for beneficial uses. Additionally, current proxy methods such as a total organic fluorine test lack the analytical sensitivity to measure low enough concentrations to protect human health as these methods can reliably measure to approximately 100 ng/L and the health-based water concentrations for all but one of the PFAS species included in this rule are an order of magnitude below that. A total organic fluorine test also does not provide information on the specific constituents, so a 200 ng/L reading could either be very harmful to human health if it was composed of PFOS, for example, but would not necessarily be harmful if it was PFBS, for example. There may also be fluorinated chemicals that are not PFAS that this kind of test may measure. Imposing a rule without a mechanism to enforce or monitor it will very likely not make a very effective rule.

Some commenters stated that the EPA was not working quickly enough or encouraged the EPA to work more quickly. EPA is working as quickly as feasible while maintaining statutory requirements, high quality analysis, and best available science. This rule is a key EPA priority under the *PFAS Strategic Roadmap* and the *PFAS Action Plan*. More information on the SDWA rulemaking process including timelines can be found in section 1.1, the SDWA Rulemaking Process, in this *Response to Comments* document. Some commenters also stated that the EPA must move faster because their primacy agency is not moving quickly enough. The EPA creates

a baseline that others may build on. Primacy agencies are welcome to enact rules according to their authorities on their own timeline and are not precluded from enacting stricter or quicker rules than the EPA.

Individual Public Comments

Emma Jenevein (Doc. #1514, SBC-042705)

April 20, 2023

Submitted via Regulations.gov

Michael Regan, Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Ave. NW

Washington, D.C. 20460-0001

RE: Docket ID No. EPA-HQ-OW-2022-0114, Environmental Justice Considerations for the Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (NPDWR)

Dear Administrator Regan,

Thank you for the opportunity to comment on the proposed National Primary Drinking Water Regulation (NPDWR). I am a resident of Dallas, Texas, as well as a student at SMU Dedman School of Law studying environmental law.

I would like to provide further support for concerns raised regarding EPA's proposed National Primary Drinking Water Regulation (NPDWR):

1. EPA should expand the definition of PFAS to cover the entire class of PFAS chemicals as regulation of individual fluorinated compounds is insufficient to protect public health.

EPA Response: Please see section 2.3 of the EPA response in this *Response to Comments* document, the SDWA regulates contaminants that meet specific regulatory criteria using the best available science as outlined in section 3 of the EPA response in this *Response to Comments* document. At this time, lacking a clear PFAS definition, it does not make sense to regulate all PFAS, as explained in the preambles to the proposed and final rule and elsewhere in these responses to comments. While some PFAS classes may warrant regulation in the future, at the present time this is not supported through the best available science and the SDWA regulatory process.

Emma Jenevein (Doc. #1514, SBC-042707)

In summary, I urge EPA to promptly finalize this proposal and establish a National Primary Drinking Water Regulation (NPDWR) that will require monitoring for the entire class of PFAS in public water systems and provide mechanisms to address exceedances that threaten public health. Please see below for additional details and pertinent literature.

Sincerely,

Emma C. Jenevein

EPA should expand the definition of PFAS to cover the entire class of PFAS chemicals

Per- and Polyfluoroalkyl Substances ("PFAS") are a class of synthetic chemicals characterized by chains of linked carbon and fluorine atoms; these carbon-fluorine bonds are among the strongest chemical bonds, as a result PFAS do not degrade easily in the environment. [FN1: NAT'L INST. OF ENV'T HEALTH SCI., PERFLUOROALKYL AND POLYFLUOROALKYL SUBSTANCES (PFAS) (March 09, 2023), https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote.] PFAS, sometimes referred to as "forever chemicals," can last eight years in the human body, leading to bioaccumulation; the most studied chemicals, PFOA and PFOS, will not naturally degrade in the environment. [FN2: Tom Johnson, Breaking down the Forever Chemicals –What are PFAS?, CLEAN WATER ACTION (Aug. 2, 2018), https://cleanwater.org/2018/08/02/breaking-down-forever-chemicals-what-are-pfas#:~:text=Some%20PFAS%20can%20last%208,naturally%20degrade%20in%20the%20environment.] Further, PFAS have been used in consumer products around the world since about the 1950s and overtime have leaked into the soil, water, and air. [FN3: NAT'L INST. OF ENV'T HEALTH SCI., PERFLUOROALKYL AND POLYFLUOROALKYL SUBSTANCES (PFAS) (March 09, 2023), https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm#footnote.] In 2012, the Centers for Disease Control and Prevention, using data from the National Health and Nutrition Examination Survey ("NHANES"), found PFAS in the blood of 97% of Americans. [FN4: Ryan C. Lewis, Lauren E. Johns, & John D. Meeker, Serum Biomarkers of Exposure to Perfluoroalkyl Substances in Relation to Serum Testosterone and Measures of Thyroid Function among Adults and Adolescents from NHANES 2011–2012, INT'L J. ENV'T RSCH. PUB. HEALTH (2015), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4483690/.] PFAS represent a growing environmental concern because of their widespread presence in the environment and bioaccumulation in humans and other organisms. [FN5: Marco Parolini et al., A review of the bioaccumulation and adverse effects of PFAS in free-living organisms from contaminated sites nearby fluorochemical production plants, WATER EMERGING CONTAMINANTS & NANOPLASTICS (2022), https://www.oaepublish.com/wecn/article/view/5282.] The pervasiveness of PFAS in U.S. public water systems threatens public health [FN6: Xindi C. Hu et al., Detection of poly-and perfluoroalkyl substances (PFASs) in US drinking water linked to industrial sites, military fire training areas, and wastewater treatment plants, ENV'T SCI. & TECH. LETTERS (2016), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5062567/. See also

ENVIRONMENTAL WORKING GROUP, PFAS CONTAMINATION IN THE U.S. INTERACTIVE MAPS (Oct. 4, 2021), https://www.ewg.org/interactive-maps/pfas_contamination/map/.] as this class of chemicals has been linked to many negative health outcomes, including increased cholesterol levels, decreased vaccine response in children, increased risk of high blood pressure or pre-eclampsia in pregnant women, and increased risk of kidney or testicular cancer. [FN7: AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, What are the health effects of PFAS? (Nov. 1, 2022), https://www.atsdr.cdc.gov/pfas/health-effects/index.html] EPA recognizes that PFAS pose significant risks to human health even at extremely low level of exposure. [FN8: U.S. ENV'T PROTECTION AGENCY, Our Current Understanding of the Human Health and Environmental Risks of PFAS (March 16, 2023), https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas.] Therefore, the prompt establishment of a National Primary Drinking Water Regulation ("NPDWR") is essential to protect public health.

Nevertheless, due to the persistent, bioaccumulative, toxic, and pervasive nature of these chemicals, EPA should employ class-based approaches to regulate PFAS in the proposed NPDWR. For example, long-chain PFAS, such as perfluorooctane sulfonate (PFOS) and perfluorooctanoate (PFOA), have been demonstrated to pose an intrinsic threat to human and ecosystem health. [FN9: Grace M Wickham & Thomas E Shriver, Emerging contaminants, coerced ignorance and environmental health concerns: the case of per- and polyfluoroalkyl substances (PFAS), SOCIOLOGY OF HEALTH & ILLNESS (Feb. 26, 2021), https://pubmed.ncbi.nlm.nih.gov/33635569/.] As a result the production of long-chain PFAS has been phased out, and companies have shifted their production to short-chain fluorinated alternatives. [FN10: Gerald T. Ankley et al., Assessing the ecological risks of per- and polyfluoroalkyl substances: current state-of-the science and a proposed path forward, ENV'T TOXICOLOGY & CHEMISTRY (Nov. 6, 2020), https://pubmed.ncbi.nlm.nih.gov/32897586/.]

Not only are these short-chain fluorinated replacements and newly identified PFAS considered emerging compounds, whose environmental presence and potential toxicity are largely unknown, but the chemical structures and properties of alternative, short-chain PFAS are commonly treated as confidential information. [FN11: John W. Washington et al., Nontargeted mass-spectral detection of chloroperfluoropolyether carboxylates in New Jersey soils, SCIENCE (June 5, 2020), https://pubmed.ncbi.nlm.nih.gov/32499438/; Wendy E. Wagner & Steve C. Gold, Legal obstacles to toxic chemical research, SCIENCE (Jan. 14, 2022), https://pubmed.ncbi.nlm.nih.gov/35025638/.] Further, short-chain PFAS are also frequently found in drinking water. In 2019, a study conducted by EPA and the US Geological Survey detected short-chain PFAS such as PFBS, PFHxA, PFPeA, PFHpA, and PFBA in 100%, 100%, 96%, 92%, and 88%, respectively, of tap water collected from twenty-five water treatment plants (all located in different states). [FN12: J. Scott Boone et al., Per- and polyfluoroalkyl substances in source and treated drinking waters of the United States, THE SCIENCE OF THE TOTAL ENVIRONMENT (Feb. 25, 2019), https://pubmed.ncbi.nlm.nih.gov/30412881/.] EPA has identified over 12,000 chemical compounds classified as PFAS, [FN13: U.S. ENV'T PROTECTION AGENCY, PFAS MASTER LIST OF PFAS SUBSTANCES (Aug. 11, 2021),

https://comptox.epa.gov/dashboard/chemical-lists/PFASMASTER.] many of which are associated with industrial processes and consumer products. [FN14: Juliane Glüge et al., An overview of the uses of per- and polyfluoroalkyl substances (PFAS), ENVIRONMENTAL SCIENCE—PROCESSES & IMPACTS (Dec. 1, 2020), https://pubmed.ncbi.nlm.nih.gov/33125022/.] Given the size of this chemical family, it is not feasible to conduct human health risk assessments for each individual PFAS compound. Additionally, the persistence of PFAS makes it impossible to study the long-term health impacts of these chemicals, meaning that the health risks of PFAS may be underestimated. [FN15: See Health risks of widely used chemicals may be underestimated, HARVARD SCH. OF PUB. HEALTH, https://www.hsph.harvard.edu/news/hsph-in-the-news/pfas-health-risks-underestimated/.] The persistency of PFAS in the environment coupled with the sheer number of PFAS compounds requires a class-based approach for effective regulation.

EPA Response: Please see section 2.3 of the EPA response in this *Response to Comments* document, the SDWA regulates contaminants that meet specific regulatory criteria using the best available science as outlined in section 3 of the EPA response in this *Response to Comments* document. At this time, lacking a clear PFAS definition, it does not make sense to regulate all PFAS, as explained in the preambles to the proposed and final rule and elsewhere in these responses to comments. While some PFAS classes may warrant regulation in the future, at the present time this is not supported through the best available science and the SDWA regulatory process.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044903)

Cleveland Water has some concerns with this proposed approach, some of which will be addressed later in these comments, but first and foremost, such a novel approach deserves more thought than a 60-day comment period can convey. Regulating groups or classes of PFAS will set a precedent unlike one seen in the past; therefore, EPA should be consulting with stakeholders on the best way to do so before making Regulatory Determinations and proposing regulations in such a rapid and expedited manner. The SDWA is very clear on not allowing backwards sliding in regulation, so it is paramount that the agency make well-informed decisions that include feedback from stakeholders and use up-to-date data. Additionally, this type of regulations will likely prove difficult for the public to understand. Considerable thought and attention should be given on how this information will be presented and explained in Consumer Confidence Reports.

EPA Response: Please see section 2.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045905)

D. To the extent health advisories are retained by EPA, the science is not reliable to support them

EPA has stated "[a]fter EPA has considered public comments and issues a final NPDWR, EPA will decide whether to update or remove the interim health advisories for PFOA and PFOS and the final health advisories for PFBS and HFPO-DA."[FN140: See EPA Technical Overview Webinar Presentation: Proposed PFAS NPDWR, March 29, 2023, at slide 35, available at: https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas.] As described in the comments above, the science in this proposal is so flawed that, if finalized, it should not be used to support even the existing health advisories for PFOA, PFOS, PFBS, and HFPO-DA chemicals. The compromised SAB review process and the short public comment period provided for this rulemaking do not allow for sufficient robust review of the science underlying this proposal.

For the reasons stated above, the information EPA uses to support its proposed MCLs for PFOA and PFOS do not represent the best available science. Therefore, relying on this information to regulate PFOA and PFOS would be contrary to SDWA requirements.

EPA Response: Please see sections 2.2 and 2.3 of the EPA response in this *Response to Comments* document. The EPA followed all requirements set forth in the SDWA using the best available science to fulfill its mission of protecting people and the environment from exposure to negative PFAS health effects as quickly as feasible. The SAB is addressed in section 14.11.1 of the EPA response in this *Response to Comments* document and the regulatory process is addressed in section 1.1 of the EPA response in this *Response to Comments* document. The best available science that underpins the health advisories is discussed further in section 4 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045951)

AMWA has some concerns with the proposed HI approach, some of which will be addressed later in these comments, but such a novel approach warrants longer than a 60-day comment period. Regulating groups or classes of PFAS will set a precedent unlike one seen in the past; therefore, EPA should be consulting with stakeholders on the best way to do so before making Regulatory Determinations and proposing regulations in such a rapid and expedited manner. SDWA is very clear on not allowing backward sliding in regulation, so it is paramount that the agency make well-informed decisions that include feedback from stakeholders and use up-to-date data.

EPA Response: Please see section 2.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045567)

As further detailed below, unless the issues outline in this letter are addressed, AWWA is concerned that any final rule would be legally vulnerable for not complying with the SDWA and the Administrative Procedure Act (APA).

EPA Response: In this comment, the American Water Works Association (AWWA) outlined the following issues: implementation challenges posed by the proposed three-year timeline to include training laboratory as well as technical operational capacity, determining if there is a problem, performing pilot testing, securing funding, and building; simultaneous compliance with other rules; and primacy agency capacity then suggested that without extension, the implementation timeline would violate the Administrative Procedure Act (APA) as arbitrary and capricious. The EPA is authorizing a two-year capital improvement extension pursuant to SDWA 1412(b)(10). Please see section 12.1 of the EPA response in this *Response to Comments* document for the EPA's discussion on supply chain and labor challenges that may affect the compliance timeline. More information on compliance with statutory and executive orders is in section 14 of the EPA response in this *Response to Comments* document. Laboratory capacity is addressed in section 7, information on treatment technology availability and capacity is addressed in section 10.6. Information on simultaneous compliance is discussed in section 10.4.2. Please see section 2.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045698)

X. THE PROPOSED RULE DOES NOT PERMIT MEANINGFUL NOTICE AND COMMENT IN VIOLATION OF THE SDWA AND THE APA

The APA requires notice-and-comment rulemaking for agency rules, 5 U.S.C. [sec] 553(b)(c). This notice-and-comment process is a "crucial" rulemaking requirement to ensure that "regulations are tested via exposure to diverse public comment" and "affected parties [have] an opportunity to develop evidence in the record to support their objections to the rule and thereby enhance the quality of judicial review." Daimler Trucks N. Am. LLC v. EPA, 737 F.3d 95, 100 (D.C. Cir. 2013); see Miami-Dade Cty. v. EPA, 529 F.3d 1049, 1058 (11th Cir. 2008) (the purposes of notice requirements in notice-and-comment rulemaking under the APA are "(1) to ensure that agency regulations are tested via exposure to diverse public comment, (2) to ensure fairness to affected parties, and (3) to give affected parties an opportunity to develop evidence in the record to support their objections to the rule and thereby enhance the quality of judicial review"), quoting Envtl. Integrity Project v. EPA, 425 F.3d 992, 996 (D.C. Cir. 2005).

The D.C. Circuit has explained that an agency must "allow for meaningful commentary" not only as to the requirements that a proposed rule adopts, but also on the "technical basis for a proposed rule." N. Am.'s Bldg. Trades Unions v. OSHA, 878 F.3d 271, 301 (D.C. Cir. 2017); see also Owner-Operator Indep. Drivers Ass'n v. FMCSA, 494 F.3d 188, 199 (D.C. Cir. 2007) (the notice-and-comment requirement applies not only to the text of a rule but also to the "technical basis for a proposed rule" and the "critical factual material that is used to support the agency's position"). And the methods relied on by the agency must be made "available during the rulemaking." Am. Radio Relay League, Inc. v. FCC, 524 F.3d 227, 237 (D.C. Cir. 2008). An agency cannot withhold key elements of its analysis—methods and data—until the final rule, because that defeats the purpose of the notice and comment process.

Unless the agency promulgates a revised proposal in which it fully discloses the data and methods on which it relies, so that interested parties may comment on them, the public will learn of that "uncommented upon data and calculations," Am. Radio Relay League, Inc. v. FCC, 524

F.3d 227, 237 (D.C. Cir. 2008), only when the "final rule reveal[s]" them. CSX Transp. v. STB, 584 F.3d 1076, 1081 (D.C. Cir. 2009). That is not a permissible way to conduct rulemaking governed by the APA.

Here, basic transparency requirements have been blatantly violated, as demonstrated above. See Scientific Integrity Fast-Track Action Committee (2022), which states, "development of Federal regulations follows strict procedures that support transparency, e.g., through issuance of Notices of Proposed Rulemaking that solicit public input and establishment of regulatory dockets containing related information that are open for public inspection. Continued vigilance is necessary to ensure these procedures are followed and that all underlying documentation—including related scientific information—is made publicly available." The Agency's numerous failures to disclose underlying data and methods for its analysis are described throughout these comments.

3M has been prejudiced by the agency's non-disclosure of these key bases for the Proposed Rule. While it comments here on the errors in EPA's analysis, and on the gaps in the data and methods EPA used, what these comments cannot address is the substance of the missing material. See Horsehead Res. Dev. Co. v. Browner, 16 F.3d 1246, 1268 (D.C. Cir. 1994) ("While we have noted that insightful comments may be reflective of notice and may be adduced as evidence of its adequacy, we have rejected bootstrap arguments predicating notice on public comments alone. Ultimately, notice is the agency's duty because comments by members of the public would not in themselves constitute adequate notice. Under the standards of the APA, notice necessarily must come—if at all—from the Agency"). The only way to cure this serious procedural defect is for the agency to issue a new proposed rule in which it discloses all the data and methodology underlying its conclusions, on which interested parties may then comment.

EPA Response: Please see section 2.3 of the EPA response in this *Response to Comments* document. Contrary to commenter's assertion, key elements of the EPA's analysis were made available for a total of 77 days following the rule announcement to include the significant underlying technical supporting documents, including the *Economic Analysis* and Appendices, *Toxicity Assessment and Proposed MCLG for PFOA* and Appendix, *Toxicity Assessment and Proposed MCLG for PFOS* and Appendix, *Framework for Estimating Noncancer Health Risks Associated with Mixtures of PFAS*, *MCLG Summary Document for a Mixture of Four PFAS*, the *EPA's Response to Science Advisory Board Recommendations on Draft Documents for the Proposed PFAS NPDWR*, the *Best Available Technologies and Small System Compliance Technologies for PFAS in Drinking Water document*, the *Technologies and Costs for Removing Per- and Polyfluoroalkyl Substances from Drinking Water document*, and the Drinking Water Treatability Database, as well as a pre-publication version of the rule.

2.4 Bipartisan Infrastructure Law

Summary of Major Public Comments and EPA Responses

Many commenters stated that removing these six PFAS from drinking water will improve American health, particularly among those with special vulnerabilities. The EPA agrees and has described quantified and non-quantified benefits in the health risk reduction and cost analysis discussed in section 13 of the EPA response in this *Response to Comments* document.

Many commenters pointed out that there is a significant expense associated with this rule and expressed concerns that the costs would be borne by ratepayers. The EPA's final rule represents data-driven drinking water standards that are based on the best available science and meet the requirements of SDWA. Regulation of the PFAS covered by this NPDWR is vital toward protecting public health. The agency accounted for costs in its HRRCA and its evaluation of feasibility for the final MCLs. The agency anticipates that significant health benefits (attributable to reduced PFAS exposure) will be realized after the rule is promulgated. Additionally, the agency expects significant co-removal benefits (related to removal of other contaminants while removing PFAS) as a result of implementing the PFAS NPDWR. After considering both the nonquantifiable and quantifiable costs and benefits of the final PFAS NPDWR, the Administrator is re-affirming that the benefits of the MCL justify its costs. For additional information on the EPA's cost and benefit estimates for the final rule, please see section 13.3 and 13.4 of the EPA response in this *Response to Comments* document, respectively.

When establishing the MCLs, the EPA considered costs of treatment technologies that have been demonstrated under field conditions to be effective at removing the regulated PFAS and determined that the costs of complying with the MCLs are reasonable (please see section 5.1.3 for additional discussion on cost considerations when establishing the final MCLs).

The agency notes that funds are also available as a result of P.L. 117-58, the Infrastructure Investment and Jobs Act (IIJA), also referred to as the BIL, to assist many disadvantaged communities, small systems, and others with the costs of installation of treatment. BIL represents the single largest investment in clean and safe water that the federal government has ever made by providing $50 billion to the EPA, approximately $43 billion of which will flow to states, Tribes, and territories (and ultimately utilities and communities) through the Clean Water and Drinking Water State Revolving Funds (CWSRF and DWSRF). There is $4 billion specifically reserved to address PFAS and emerging contaminants and $5 billion in grants for small or disadvantaged communities. The EPA is working to ensure the funds are available to drinking water systems, especially those within disadvantaged communities.

Many commenters stated that the rule would not be affordable for low-income ratepayers. Some commenters expressed particular concern for ratepayers served by small PWSs. Additionally, a few commenters requested that the EPA consider implementation flexibilities for small and rural water systems and suggested that these types of utilities may not have staff capacity nor expertise to compete for funding to implement the rule. The EPA notes that it is authorizing a two-year

capital improvement extension, applicable to all PWSs subject to this rule, pursuant to SDWA 1412(b)(10). While issues surrounding competition for funding were not the basis for the EPA's decision to extend the compliance date, the agency believes that extending the compliance date will also provide ancillary benefits by giving smaller and rural water utilities more time to apply for funding under BIL. After finalization of the PFAS NPDWR, the EPA also intends to provide support to utilities, primacy agencies, and other interested parties to ensure successful rule implementation. See also section 12.1 of the EPA's response in this *Response to Comments* document for discussion on supply chain and labor challenges that may affect the compliance timeline.

Additionally, the EPA has incorporated flexibilities in the final rule that should alleviate some cost concerns (particularly for small systems) related to the monitoring requirements of the rule. In particular, the final rule includes the flexibility to use previously acquired monitoring data to satisfy some or all the initial monitoring requirements. For those groundwater systems serving 10,000 or fewer people that do not have this data, they will be required to only collect two samples at each entry point to the distribution system (EPTDS) to satisfy initial monitoring requirements.

With respect to cost concerns for small systems, the agency anticipates some increased costs to households served by PWSs, including small systems, that install treatment. However, the agency expects the availability of BIL funds to reduce some of these household costs (for more details, please see the EPA's affordability analysis in chapter 9.13, Tables 9-15 and 9-15 of the final Economic Analysis supporting the NPDWR).

The EPA also notes that there are some strategies that utilities may apply to help particular rate payers, such as the following: variable rate structures, which allow free or low-cost essential-use amounts, then scale for extra use; capping bills for low-income residents as a percent of income; discounts to low-income customers; aiding low-income consumers with correcting plumbing leaks as well as other repairs; consumer assistance programs; and grants or subsidies from the State Revolving Funds (SRFs).

The Financial Capability Assessment Guidance, originally designed for the CWA program, may also prove useful to PWSs, and organizations such as the Natural Resources Defense Council and National Consumer Law Center have provided toolkits on affordability and assistance programs, water efficiency and plumbing repair assistance, and equitable water rates as part of water affordability advocacy toolkits (see, for example, the EPA response to comment Doc. #1723, SBC-044469 in section 2.4 in this *Response to Comments* document).

The EPA's affordability analysis and discussion of small-system compliance technology can be found in sections 10.5 and 13 of the EPA response in this *Response to Comments* document.

In summary, the EPA believes that cost challenges, including those associated with small systems and low-income communities, are manageable using the approaches outlined above in this section essay and discussed elsewhere in the record for this rule.

Many commenters requested permission to use IIJA (BIL) funding for operations and maintenance costs (O&M costs). The EPA cannot offer this flexibility since 40 CFR 35.3520(f) explicitly prohibits DWSRF from being used for operation and maintenance expenses. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

If a water system or particular project cost is not eligible for funding under the DWSRF, it may be eligible under other programs, such as the following: the U.S. Department of Agriculture's Rural Development program; the U.S. Department of Housing and Urban Development's Community Development Block Grant program; the CWSRF; the newly-authorized Water Infrastructure Finance and Innovation Act (WIFIA) funding; or other federal, non-federal or state funding sources.

Initial filters, granular activated carbon, or anion exchange resin used to commission a project or as part of a substantial renovation are eligible for DWSRF money. While ongoing, routine monitoring is an ineligible O&M cost, initial, one-time monitoring associated with newly installed equipment as well as select special-purpose monitoring may be eligible for DWSRF money as set-aside expenses. More information may be found in the *Drinking Water State Revolving Fund Eligibility Handbook*.

Many commenters were concerned that restrictions associated with federal or state funds (e.g., the requirements described in the Build America Buy America Act (BABA)) would drive costs higher. Concurrently with BIL, Congress passed BABA. This domestic-preference program aims to create long-term opportunities for domestic manufacturing and the associated jobs as well as build resilient domestic supply. For SRF recipients, BABA expands existing American Iron and Steel (AIS) requirements that the EPA has implemented since 2014. AIS applies to all SRF projects, while BABA applies only to projects receiving federal dollars. In October 2023, the Office of Management and Budget (OMB) released the final guidance, the 2-CFR-184 and a clarifying memo, M-24-02. The EPA issued implementation guidance for BABA compliance for its federal water infrastructure funding programs. The EPA recognizes this is a new provision, and is working closely with states, Tribes, and territories on technical assistance and training.

The EPA plans to continue to provide detailed information on BABA compliance requirements, flexibilities, and processes; educate funding recipients about their eligibility for waivers; and assist with the waiver process. In accordance with Section 70914(b), there are three kinds of waivers: public interest (where applying the domestic-content procurement preference would be inconsistent with the public interest); non-availability (where materials are not produced in the United States in sufficient and reasonably available quantities or of a satisfactory quality); and unreasonable cost (where BABA requirements will increase overall project cost by more than 25 percent). Not all products are subject to BABA requirements; BABA only applies to items permanently incorporated into an infrastructure project. This means, for example, that temporary equipment and furnishings that are used only during construction or are not incorporated within the finished infrastructure project would be exempt from BABA.

Many commenters stated that PFAS manufacturers and distributors need to be held accountable for the costs of the damage that they have caused (including contamination of drinking water); many commenters recommended outright bans on PFAS as a class. These comments are outside the scope of the current rulemaking, since the SDWA and associated regulations apply to drinking water, and not manufacturing, distribution, and use of chemicals. Related to these concerns, though, see https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024 for discussion of the EPA's *PFAS Strategic Roadmap*. The roadmap describes the EPA's commitment to addressing PFAS contamination using a whole-of-agency approach. As such, the NPDWR must follow the legal requirements of the SDWA and therefore is not the appropriate forum to restrict chemical manufacture. Additionally, it is both the EPA's core mission and its responsibility under the SDWA to ensure that populations served by contaminated drinking water are not exposed to harmful concentrations of PFAS by developing and finalizing this regulation. The SDWA regulates contaminants that meet specific regulatory criteria as outlined in section 3 of the EPA response in this *Response to Comments* document. More information on PFAS as a class is in the summary of major comments for sections 2.2 and 2.3 of the EPA response in this *Response to Comments* document. Through the EPA's *PFAS Strategic Roadmap*, the agency is committed to addressing PFAS contamination, including through the development of the proposed PFAS NPDWR, which is a key action within this whole-of-agency approach (please see section 15 for discussion on the PFAS Roadmap). As outlined in the *PFAS Strategic Roadmap*, the EPA is committed to addressing PFAS, and the NPDWR is one aspect of that plan. The EPA cannot likely solve the problem of "forever chemicals" by tackling one route of exposure or one use at a time and has centered the PFAS approach on considering the full PFAS lifecycle, getting upstream of the problem, holding polluters accountable, ensuring science-based decision making, and prioritizing disadvantaged communities. Key actions for how this will happen can be found at: https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024. Specifically, the Roadmap sets timelines by which the EPA plans to take specific actions and commits to new policies to safeguard public health, protect the environment, and hold polluters accountable. The actions described in the PFAS Strategic Roadmap each represent important and meaningful steps to safeguard communities from PFAS contamination. Cumulatively, these actions should build upon one another and lead to more enduring and protective solutions. In the Roadmap, the EPA notes that the agency "will bring deeper focus to preventing PFAS from entering the environment in the first place—a foundational step to reducing the exposure and potential risks of future PFAS contamination." Additionally, in the Roadmap, the EPA notes that "intervening at the beginning of the PFAS lifecycle—before they have entered the environment—is a foundational element of the EPA's whole-of-agency approach." Manufacture has not continued unabated as several significant new use rules have been enacted on PFAS and the New Chemicals Program continues to review new PFAS before approving commercialization.

With respect to commenter concerns regarding EJ, the agency is committed to ensuring the fair treatment and meaningful involvement of all people with respect to environmental laws,

regulations, and policies. The EPA has conducted an EJ analysis for the final NPDWR, consistent with the EPA's *Technical Guidance for Assessing Environmental Justice in Regulatory Analysis* as well as existing Executive Orders such as EO12898 and EO14096, as described in section 14.10 of the EPA response in this *Response to Comments* document.

Some commenters stated that particular care needed to be taken for disadvantaged communities. A key BIL priority is to ensure that disadvantaged communities benefit equitably from these funds. Additionally, BIL funding prioritizes investment in local communities that are on the frontlines of PFAS contamination and that have few options to finance solutions through traditional programs and help them meet their obligations under this regulation. Disadvantaged communities typically experience, or are at risk of experiencing, disproportionately high exposure to pollution – whether in air, land, or water – and can include those with EJ concerns. The Justice40 initiative aims to ensure that federal agencies deliver at least 40 percent of benefits from certain investments to disadvantaged communities. Additionally, BIL mandates that 49 percent of DWSRF General Supplemental Funding must be provided as grants and forgivable loans to disadvantaged communities. The BIL also requires that not less than 25 percent of funds provided through the DWSRF Emerging Contaminants Funding be provided as grants and forgivable loans to disadvantaged communities or PWSs serving fewer than 25,000 people. For the CWSRF, the BIL mandates that 49 percent of funds provided through the CWSRF General Supplemental Funding must be provided as grants and forgivable loans to municipalities that meet affordability criteria (or municipalities that do not but seek supplemental funding), or entities implementing a process, material, technique, or technology that addresses water or energy efficiency, mitigates runoff, or encourages sustainable project planning, design, and construction.

Additionally, to support BIL implementation, the EPA is offering water technical assistance (WaterTA) to help communities identify water challenges and solutions, build capacity, and develop application materials to access water infrastructure funding (USEPA, 2023k). The EPA anticipates that new and existing EPA WaterTA programs for PWSs, including some aimed at small and/or disadvantaged systems, will be utilized to support effective implementation of the BIL. The EPA anticipates that some of these efforts will focus on identifying and addressing emerging contaminants, including PFAS NPDWR implementation. As stated in the March 2023 memo *Implementation of EPA Water Technical Assistance*, "EPA and technical assistance providers will collaborate to provide direct WaterTA to communities to facilitate access to CWA, SDWA and BIL SRF resources (and other relevant BIL funding opportunities, such as the Emerging Contaminants in Small or Disadvantaged Communities (EC-SDC) grant program), with a focus on disadvantaged and underserved communities, communities that have never accessed SRF funding before, and communities that are not currently receiving an equivalent kind of technical assistance." This focus encompasses many small drinking water systems. The EC-SDC grant program provides grant funding for small or disadvantaged communities, and it supports projects in which the primary purpose is to address the challenges of PFAS in drinking water, whether it is found in the PWS or in source water. There is no cost-share requirement for EC-SDC. Lastly, the EPA also receives approximately $25 million annually for the Small,

Underserved, and Disadvantaged Communities (SUDC) grant program. This is a noncompetitive program administered through the states with the purpose of assisting PWSs comply with the SDWA. This funding is available for a variety of project activities, and all projects must benefit communities that are underserved and small or disadvantaged.

Some commenters stated that the EPA was not working quickly enough or encouraged the EPA to work more quickly. The EPA is working as quickly as possible while maintaining adherence to statutory limits, high quality analysis, and best available science. This rule is a key EPA priority under the *PFAS Strategic Roadmap* and the *PFAS Action Plan*. More information on the SDWA rulemaking process including timelines can be found in section 1.1, the SDWA Rulemaking Process, in this *Response to Comments* document. Some commenters also stated that the EPA must move faster because their primacy agency is not moving quickly enough. The EPA creates a baseline that others may build on. Primacy agencies are welcome to enact rules according to their authorities on their own timeline and are not precluded from enacting stricter or quicker rules than the EPA.

Individual Public Comments

North Penn Water Authority (NPWA) (Doc. #1470, SBC-043292)

Costs

The cost to bring PFAS levels down this low will be exorbitant. Even if some grant money is made available from the federal or state governments, it will not be nearly enough to cover all the costs involved around the country. And this does not even take into account that grant money is a one-time lump sum to assist only with the initial construction and installation of treatment equipment. It does not include the additional cost required if water utilities need to buy into the capacity available from neighboring treatment plants. And there will be no grant money to fund the ongoing, annual costs to continuously operate these systems forever into the future. No government, federal or state, can provide such a continual funding stream that all water systems around the country will need for many years into the future. Certainly not when the federal government is already awash in many trillions of dollars in debt, before these new regulations even go into effect. So it is completely unrealistic to think that federal grant money will be falling freely from the sky like pixie dust, without the cost eventually falling on the shoulders of every American through higher taxes and higher water rates. In the end, this is yet another unfunded mandate. The question remains – is this added cost worth it, in terms of a measurable reduction in risk to human health impacts?

Also related to costs is the problem that the manufacturers and distributors of the PFAS material are not being held accountable for their role in introducing this hazardous material into the environment. Instead, it is the water utilities and their customers, who are on the receiving end of this problem, and are not responsible for the PFAS being found in the water supply, that are having these exorbitant costs imposed on them. This is a gross misapplication of blame and financial responsibility.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Kerri Sullivan-Leger (Doc. #1500, SBC-042569)

Re: Docket ID No, EPA-HQ-OW-2022-0114,

Proposed Per- and Polyfluoroalkyl Substances

National Primary Drinking Water Regulation

To the EPA,

Thank you for providing the opportunity to comment on Environmental Justice Considerations for the Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation under the Safe Drinking Water Act. My name is Kerri Sullivan-Leger, and I am a graduate student in the Masters of Jurisprudence in Environmental Law at Tulane University in New Orleans, Louisiana. As a resident of Louisiana, I am a part of this expansive group of citizens that your rule will target because of the chemicals dumped and seeped into our drinking water supplies. In St. James Parish, we have historically been silenced and denied recourse on environmental matters that pertain to our community's contamination of chemicals in the air and our water. PFAS chemicals have filled our lakes and rivers used as drinking water sources.

I am writing to raise concerns over the failure of local and state regulatory agencies to address chemical exposures in our community. Until we as a country are genuinely committed to reducing forever chemicals and dismantling the industries that profit from them, health problems and other disparities will remain stubbornly intractable. If a state refuses to provide the most basic level of security for its poorest citizens, it has lost any justification for deference to agencies whose job is to protect all citizens. All that is left are empty slogans, well-drawn philosophies, and failed promises.

Recognizing the need for water monitoring stations and access to emergency financial support could provide low-income communities like mine with safe, clean drinking water. Please allow me to give context and foundational information in the following comment.

Highest Regards,

Kerri Sullivan-Leger

Tucked into the lower corner of Louisiana off the banks of the nation's second longest river, The Mississippi, was some of the most cherished lands in the south. Before 1860 Louisiana produced nearly all of the nation's sugar and a large amount of its cotton. Louisiana had approximately 25,000 slaveholders who were considered the wealthiest in the nation. The state was only second to Mississippi in per capita wealth. Sugar, cotton, and slave labor were Louisiana's economy. Pre-Civil War, Louisiana's enslaved population was well over 300,000. The Sugar Plantations

were valued at more than $200,000 during the Antebellum time. The large plantations along the river were recorded as the most expensive land in the country. The United States Census Bureau recorded in 1860 that ten percent of the land in Louisiana produced sugar at a value of $19 million just in agricultural equipment compared to Wisconsin's 70,000 farms that recorded $6 million. The sugar barons dominated south Louisiana. The Sugar Prince, John Burnside, owned a mansion in New Orleans and two plantations on the river, with 753 people on one and 187 in St. James Parish on the other. At the time of his death, he had accumulated nearly $3 million in assets which would be almost $80 million in 2023.

This same 85-mile stretch of land that held my ancestors in slavery is now home to the most carcinogen-ridden locations in America. An astounding 150 petrochemical companies operate in this small manufacturing corridor called "Cancer Alley." St. James Parish is our home, and it is where our ancestors took refuge after slavery ended. They stayed here to build homes and develop communities despite what they had gone through on those plantations. There was a time when fishing, hunting, and farming was typical pastime until the grand ole sugar and cotton plantations began to get raffled off to the highest bidder over 40 years ago. That is when everything changed—the land, air, and water began to make community members sick because of the unaccounted-for pollution. The remnants of once-enslaved populations were experiencing chemical retribution by petrochemical facilities allowed to develop products that could legally poison the air and water.

Louisiana Department of Environmental Quality failed to protect our communities. The politicians who control our parish seat are lobbied so well by the polluters that they ignore our complaints. Our right to water free of PFAS chemicals is not only a legal presumptive but also a human right. The roots of the water contamination and sanitation crisis can be traced to poverty, inequality, and unequal power dynamics exacerbated by socioeconomic challenges and depleting water resources. Yet, we continue to fend off wealthy chemical magnates who can afford teams of lawyers and advisers who tell us to "shut up and be quiet ."Today I ask the EPA what you will do to champion our cause. Will you stand up for communities like ours that are on the precipice of being plundered into extinction?

PFAS left undeterred, accumulates in the bloodstream, tissue, and vital organs. The endocrine system, made up of all the body's different hormones, regulates biological processes in the body from birth through old age, and plays a role in brain development, including nerve chemical transmission, reproductive organs, blood pressure, and sugar levels are disturbed and adversely affected by high levels of PFAS. PFAS chemicals simulate our fatty acids and perform as endocrine-disrupting chemicals (EDCs) in our hormones. A study by The Water Collaborative of Greater New Orleans conducted a study in the summer of 2022 on chemicals flowing in the Mississippi River. Most communities near the river use it as a source of drinking water. High levels of PFAS, the forever chemicals, were found in the water, increasing cancer risks within the community. PFAS levels were 200 to 268 times higher than what EPA, your agency, said was safe for our drinking water. The report emphasized the impact on the lives of African Americans, who are 75 percent more likely than white Americans to live in a community near a

chemical company that produces harmful chemical pollutants. The report also said that cancer deaths and other sicknesses in low-income communities are 12% higher than in communities above the poverty line that are not experiencing targeted, polluting infrastructure.

What could the EPA do to help socioeconomically challenged communities in Louisiana? Commit to the following:

•Require all unnecessary PFAS be eliminated from our drinking water reservoirs

•Enact a national safe PFAS drinking water standard

•Enact strict guidelines covering interstate borders to keep safe surface & groundwater safe from PFAS

•Provide necessary coverage of the SDWA that would include protection from PFAS in bottled water production

•Include recourse for states that decide not to comply with SDWA regulations in protecting all communities from PFAS

•Regulate PFAS as a single chemical class to reduce health risks and contamination and improve clean-up effort

We are all part of an assiduous shame of a chemical-driven discriminatory system that systematically relegates underprivileged communities into islands riddled with sicknesses and neglect. It is because there are those among us who benefit from maintaining these inequalities. This is why the EPA regulations for PFAS-free regulations have to speak for those who cannot. To be clear, clean drinking water is an enthusiastic beginning to correct the many historical injustices that have plagued impoverished communities in America. Maslow's hierarchy of needs reflects five categories that can dictate an individual's behavior. Those needs are physiological needs, the need to feel safe, experience love and community, and be valued, and self-actualization needs. Physiological needs are categorized as the basic requirements of life--food, water, housing, clothing, and rest. Security and protection from harm are second on the list, meaning a safe home, a safe community, and a secure environment are just as important as clean water and food.

It is insidious to pretend that the lingering effects of poverty and discrimination are not intertwined in our culture of classism and segregation that creates marginalized communities held captive by a hostile environment. There are no secrets; history exposes how we got to this point and emphasizes the extraordinary possibilities when charismatic visionary leaders stand up to enact policies that will bring about systemic change.

19th Judicial District Court held that LDEQ “must take special care to consider the impact of climate-driven disasters fueled by greenhouse gases on environmental justice communities and their ability to recover.”

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Information on health effects associated with the six regulated PFAS can be found in section 4. The EPA notes that the Food and Drug Administration (FDA) regulates bottled water as defined in 21 CFR 165.110 through the Federal Food, Drug, and Cosmetic Act (FFDCA); section 410 provides FDA with specific instructions for bottled water in response to developments at the EPA. FDA is required to establish a quality standard or find that such a regulation is not necessary to protect the public health (21 CFR 165.110). The FDA regulation must have the same effective date as the EPA regulation and FDA must publish its regulation no later than 180 days before the effective date (21 CFR 165.110). The EPA notes that this rule prescribes a national standard designed to address PFAS and provide for safe drinking water, as requested by the commenter. All community- and non-transient, non-community PWSs must comply with this SDWA-based regulation.

Kaden Heldt (Doc. #1510, SBC-042589)

One of the issues raised by this decision is cost. The costs of this decision could be damaging to municipalities who cannot afford the technology needed for regulating PFASs. The few technologies available for this process are revevrse osmosis, activated carbon, and ion-exchange resins. (Underferth). All of these processes are very costly, and on top of regular testing and maintenance costs, of the 200 million Americans that have PFASs in their drinking water many municipalities simply won't have the funds to keep up and protect their citizens (Underferth). This also doesn't even begin to cover households with wells, which also can contain PFASs (Underferth). This decision must be made in order to protect people from these harmful chemicals, but the issue surrounding the costs needs to be figured out.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Households with private wells are not subject to SDWA provisions; rather, SDWA-based regulations apply to water systems that provide water for human consumption to at least 15 service connections or that regularly serve at least 25 people.

Jon Raclin (Doc. #1511, SBC-042592)

Our two focused dimensions are in:

https://www.epa.gov/system/files/documents/2023-03/PFAS%20NPDWR%20Public%20Presentation_Overview_3.16.23_508.pdf

1. The proposed actions moving forward (screen 4)

2. The proposed MCL levels (screen 5)

Our two additional resources I found:

a. https://www.pbs.org/newshour/science/4-questions-about-the-epas-proposed-pfas-drinking-water-standard-answered

b. https://www.niehs.nih.gov/health/topics/agents/pfc/index.cfm

Jon's Input :

This new policy change to many water systems in America, would cause the cost of living to go up. This affects the general public of both national and local. PBS states, "It's an important step in the right direction. But it's not over". This policy change was the correct step and first of many. Not only was this the right choice, but it should become the basis for more policies and investigations for our health benefits.

PBS uses the language that this new policy decision is necessary to protect our health as American citizens. I would agree with this perspective as the health of ourselves, and our loved ones, should be the leading reason. We can all benefit or scam, or even just straight up lie in life, but taking any negative health effects to our one life is not worth any price we can think of. This policy is protecting the length and quality we live in.

The restricted level of MCL parts/trilion the forever per- and polyfluoroalkyl substances. PBS added, "The EPA would cap PFOA and PFOS at 4 parts per trillion, essentially the lowest level at which "they can be reliably measured." Four other PFAS — PFNA, PFHxS, PFBS and GenX chemicals — would be

regulated as a mixture, which still tests for each one individually but assesses their risk in combination with one another".

Also another important fact worth adding in the cost of the changes that the EPA now says needs to happen. "To help pay for it, the EPA noted that $2 billion from the Bipartisan Infrastructure

Law was made available last month to "address emerging contaminants, including PFAS, in drinking water across the country."

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on health effects from the six regulated PFAS can be found in section 4 of the EPA response in this *Response to Comments* document.

City of Alexandria, Virginia (Doc. #1523, SBC-042612)

While the proposed regulation details the significant expense required to remove these chemicals from our drinking water, we recognize that such an investment will improve the health and wellness of our residents, particularly those with health vulnerabilities. This investment is particularly timely given the substantial financial commitment to drinking water systems included in the Bipartisan Infrastructure Law.

As such, we urge the EPA to finalize these regulations without delay.

Thank you for the opportunity to provide comment.

Sincerely,

Justin M. Wilson, Mayor

City of Alexandria, Virginia

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Orange Water and Sewer Authority (OWASA) (Doc. #1524, SBC-042615)

• Cost

o Construction

*Rate impact of 1 to 2% depending on the year

*The expected construction cost is approximately 50% of our typical 5 year CIP costs.

*Reductions in other necessary CIP Spending to accommodate PFAS treatment (especially on this timeline).

*Has caused deferral of active projects due to overlap of expected construction and increased spending.

o Annual Operating Expenses

§ An additional $2-3M per year needed – this is an 30-40% increase

§ Laboratory costs for sampling (assume 5-10 samples per month = $50k-70K?

o Funding

§ OWASA has to commit to treatment implementation without full understanding of what funding opportunities will be available to authorities

§ DWSRF has $4B – if we assume everyone will have a similar cost to us (around $50M to implement treatment (and some will have higher or lower costs than this) this funding will only help 80 water systems. However, 25% of this funding is being slated towards disadvantaged communities so there may be more water systems helped – BUT OWASA will not qualify for that portion of the funding. Also the $5B to the EC-SDC grant program will also not be for OWASA since that is geared towards small, disadvantaged rural communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Robert Adamski (Doc. #1530, SBC-043336)

The cost to implement the proposed regulations has been severely underestimated by EPA at $772 million. AWWA puts it at $3.8 billion. EPA estimates the benefit to be around $1 billion which is not cost beneficial. The capacity of the industry i.e. consultants, contractors, manufacturers and operators is not available. Neither is the capacity of the agencies to hire, train and certify the operators and lab technicians to implement this rule. At present localities like Flint, MI the current utility operates with a $9 million annual deficit (not including significant capital expenditure needs) as a result of inadequate water rates and collections.

While EPA says there is money available in current federal programs there is not enough to cover all water related needs. AWWA's 2012 report Buried No Longer estimated the investment gap or needs at a trillion dollars. EPA estimates it at $625 billion over the next 20 years. Lead service line replacement has been estimated to cost $6 billion. There isn't enough money available for all these needs. In addition as the calls for balancing the budget and reducing spending these dollars might disappear.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Treatment technology availability and capacity is addressed in section 10.6 of the EPA response in this *Response to Comments* document.

Greenville Utilities Commission (Doc. #1534, SBC-042639)

Significant capital and annual operating costs will be needed to remove the PFAS compounds to the proposed levels. The costs of the associated strategies to remove PFAS will increase due to the significant increase in demand for these strategies to meet the proposed compliance and goat levels. The water industry is facing an aging infrastructure challenge that will require large investments to ensure clean and safe drinking water is provided to our customers. Funds should not be diverted from infrastructure needs to address contamination from multi-million-dollar companies.

Thank you for your consideration,

David W. Springer, P.E.

Interim Director of Water Resources

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Treatment technology availability and capacity is addressed in section 10.6 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce (Doc. #1537, SBC-042650)

Infrastructure Investment and Jobs Act (IIJA) funding is a solid benchmark to focus limited federal resources. We must have a balanced approach considering that the current resource levels in the IIJA. Setting such low MCL levels are well beyond the potential funding available and the ability of communities to afford. Our report suggests that if the MCL for PFOA and PFOS is set at less than 20 ppt the likelihood of outspending the $10 billion contained in the IIJA is significant. And this does not even contemplate the costs associated with the MCL for the other four PFAS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Alliance of Nurses for Healthy Environments (Doc. #1544, SBC-042672)

While some water utilities have already installed water treatment technology capable of reducing

PFAS, many are not yet equipped to do so. To help communities, Congress passed the Bipartisan Infrastructure Law which provides $9 billion in funding for drinking water treatment upgrades, and an additional $11.7 billion for other necessary drinking water infrastructure needs. This funding will aid utilities in meeting EPA's proposed drinking water standards and improve drinking water safety.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL provided approximately $43 billion to CWSRF and DWSRF. This includes $4 billion specifically reserved to address PFAS and emerging contaminants and $5 billion in grants reserved to small or disadvantaged communities. While $15 billion is reserved for lead service line replacements, the rest can be used for various purposes, which could include installing PFAS treatment or source water protection.

Brooke Young (Doc. #1554, SBC-043969)

Some actions the EPA can do to address these challenges as part of the proposed PFAS drinking water regulation include:

• Ensure funding and incentives for the research and development of advancing technologies to remove PFAS from drinking water successfully.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. As part of the PFAS Strategic Roadmap, the EPA is evaluating and developing technologies for end-of-life materials management. This includes disposal and destruction technologies to further reduce PFAS in the environment in addition to their work on drinking water and wastewater treatment, contaminated site cleanup and remediation, air emission controls, and health effects.

Lecsy Gonzalez (Doc. #1561, SBC-042870)

Environmental health disparities exist across the United States but affect indigenous populations living in tribal nations disproportionally, as they experience a higher burden of disease and a lower life expectancy than non-Native individuals. [REF6: Indian Health Service. 2019. Disparities. https://www.ihs.gov/newsroom/factsheets/disparities/] Tribal drinking water systems already have well-documented issues, including high rates of unsafe inorganic contaminates and nitrates, and indigenous communities have also been historically excluded from PFAS action. [REF7: Mok, K., Salvatore, D., Powers, M., Brown, P., Poehlein, M., Conroy-Ben, O. and Cordner, A., 2022. Federal PFAS testing and tribal public water systems. Environmental health perspectives, 130(12), p.127701.] Indeed, tribal nations' water systems have been overlooked for systematic PFAS testing over the years, generating a large data gap. [REF8: Powers, M., Conroy Ben, O., Salvatore, D., Mok, K., Brown, P. and Cordner, A., 2021, August. PFAS in American Indian and Alaska Native Communities. In ISEE Conference Abstracts (Vol. 2021, No. 1).] Research suggests that even if PFAS was detected in tribal water systems, as per the suggested regulation, there is no current regulation for PFAS treatment and insufficient remediation funding. [REF7: Mok, K., Salvatore, D., Powers, M., Brown, P., Poehlein, M., Conroy-Ben, O. and Cordner, A., 2022. Federal PFAS testing and tribal public water systems. Environmental health perspectives, 130(12), p.127701.] Therefore, it is a primary concern to provide the funds needed not only to determine if PFAS is present in the water but also to correct their presence.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. This rule is a regulation for PFAS as the commenter requests, however, the rule does not proscribe how a water system must meet the rule; this means systems may choose treatment or non-treatment options as site-specific circumstances dictate. Additionally, BIL mandates that 49 percent of DWSRF General Supplemental Funding must be provided as grants and forgivable loans to disadvantaged communities (IIJA P.L. 117-58). The BIL also requires that not less than 25 percent of funds provided through the DWSRF Emerging Contaminants Funding be provided as grants and forgivable loans to disadvantaged communities or PWSs serving fewer than 25,000 people (IIJA P.L. 117-58). For the CWSRF, the BIL mandates that 49 percent of funds provided through the CWSRF General Supplemental Funding must be provided as grants and forgivable loans to municipalities that meet affordability criteria (or municipalities

that do not but seek supplemental funding), or entities implementing a process, material, technique, or technology that addresses water or energy efficiency, mitigates runoff, or encourages sustainable project planning, design, and construction (IIJA P.L. 117-58).

Lecsy Gonzalez (Doc. #1561, SBC-042871)

Many studies call for state and federal support for PFAS monitoring and remediation in tribal nations, as small tribal water sources do not have the financial resources to afront the remediation costs associated with PFAS. [REF7: Mok, K., Salvatore, D., Powers, M., Brown, P., Poehlein, M., Conroy-Ben, O. and Cordner, A., 2022. Federal PFAS testing and tribal public water systems. Environmental health perspectives, 130(12), p.127701] It is important to note that most (over 68%) water sources in tribal nations are considered "small," which compares to the 18.8% of systems serving non-tribal water systems. [REF9: U.S. EPA. 2022. Safe Drinking Water on Tribal Lands: Tribal PFAS Monitoring Results.https://sdwis.epa.gov/ords/sfdw_pub/f?p=SDWIS_FED_REPORTS_PUBLIC:TRIBAL_PFAS] Furthermore, it is important to revisit the 1908 Supreme Court decision in Winters v. United States, where the federal government guaranteed that land established as a reservation would be permanently owned by indigenous tribes. [REF10: Williams SM. 1997. Overview of Indian water rights. J Contemp Water Res Educ107(1):6–8.] This decision also guaranteed tribes the right to adequate amounts of water to meet the needs of the reservation. [REF10: Williams SM. 1997. Overview of Indian water rights. J Contemp Water Res Educ107(1):6–8.] As such, and with emphasis on this Supreme Court ruling, I suggest that "adequate amounts of water to meet the needs of the reservation" could, and should, be applied in the context of this water regulation ruling. If we are to achieve true health equity across the United States, which is the basis of this PFAS regulation, it is necessary for the federal government to provide additional help, in the form of funding, to tribal nations to meet the needs of their residents. In addition, tribal nations have also provided water rights to non-tribal entities, [REF10: Williams SM. 1997. Overview of Indian water rights. J Contemp Water Res Educ107(1):6–8.] which means that if this PFAS regulation passes and places a profound burden on tribal water systems, it will also hurt non-indigenous individuals.

According to this rule, the United States Federal government will not "provide funds necessary to pay direct compliance costs" to enact the PFAS monitoring and regulations in drinking water. [REF3: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027.] However, the Federal government funds the Indian Health Service, which states that one of their primary concerns is "environmental sustainability." [REF11: Indian Health Service. The Federal Health Program for American Indians and Alaska Natives. 2023. https://www.ihs.gov/] As such, and considering the public health impacts of PFAS contamination and the Winters v. United States ruling, it seems like this regulation could be easily edited to provide additional funding or other resources to tribal nations to deal with the monitoring and remediation that would be mandatory once passed. [REF3: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027.] Additionally, funding

tribal nations would not be a massive endeavor, as most water systems are considered to be small, and, therefore, less costly to monitor. [REF3: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027; REF9: U.S. EPA. 2022. Safe Drinking Water on Tribal Lands: Tribal PFAS Monitoring Results.https://sdwis.epa.gov/ords/sfdw_pub/f?p=SDWIS_FED_REPORTS_PUBLIC:TRIBAL_PFAS]

In conclusion, for PFAS contamination as a health issue to be genuinely addressed across the United States, this regulation needs to be reviewed to include additional funds for tribal nations. Most tribal nation water systems do not even have estimates of PFAS values since they have not been monitored, [REF8: Powers, M., Conroy Ben, O., Salvatore, D., Mok, K., Brown, P. and Cordner, A., 2021, August. PFAS in American Indian and Alaska Native Communities. In ISEE Conference Abstracts (Vol. 2021, No. 1).] which already incurs more expending than other state or local water systems. With this in mind, this regulation would be disproportionally more expensive for tribal nations that already have less funding and resources than the states. [REF7: Mok, K., Salvatore, D., Powers, M., Brown, P., Poehlein, M., Conroy-Ben, O. and Cordner, A., 2022. Federal PFAS testing and tribal public water systems. Environmental health perspectives, 130(12), p.127701.] Therefore, this regulation should include additional funds to help offset the difference and allow for a more equitable enactment of PFAS monitoring and removal.

Thank you for the opportunity to comment on this regulation,

Lecsy Gonzalez

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA and BIL place increased investment in disadvantaged communities as a key priority as stated in the memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law." This can also be seen in various EPA initiatives such as Justice40 and the funding allocations to small and disadvantaged communities. More information on EJ can be found in section 14.10 of the EPA response in this *Response to Comments* document.

Michigan Farm Bureau (MFB) (Doc. #1562, SBC-043353)

EPA must also consider and find ways to address the cost of compliance for not only municipal water supplies of all sizes, but also for farms and agricultural product packers and processors who are often classified as public water supplies but who are not generally eligible or high-ranking in applications for state and federal financial support for upgrading testing and treatment systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has carefully considered the cost for all systems that will be affected by the rule and has detailed the agency's assumptions. Please see section 13.3 of the EPA response in this *Response to Comments* document for additional discussion on costs.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042737)

It is also recommended that EPA and primacy states streamline their new technology review process to expedite grant approvals.

EPA Response: Permits for the installation of treatment facilities at water systems are generally addressed by state and local authorities. The EPA has developed supporting documents

such as the *Best Available Technologies and Small System Compliance for Per- and Polyfluoroalkyl Substances (PFAS) in Drinking Water* document (USEPA, 2024d) that can be used to help permitting authorities become more familiar with these technologies. The agency plans to further consider suggestions from states, technical assistance providers, industry associations, and interested stakeholders as it develops technical materials that can assist water systems in complying with the regulations. More information on treatment technologies and permitting may be found in section 10 of the EPA response in this *Response to Comments* document.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042744)

GAC media costs have been increasing steadily as illustrated in the following chart. We are concerned that costs will continue to rise for all PWSs who use GAC for treatment when there is a rush to provide it to systems for PFAS remediation.

EPA states "To help communities on the frontlines of PFAS contamination, the passage of the Infrastructure Investment and Jobs Act, also referred to as the Bipartisan Infrastructure Law (BIL), invests over $11.7 billion in the Drinking Water State Revolving Fund (SRF); $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion to Small, Underserved, and Disadvantaged Communities Grants. These funds will assist many disadvantaged communities, small systems, and others with the costs of installation of treatment when it might otherwise be cost-challenging." While this funding is appreciated, it's not nearly enough for what PWS will need to address PFAS. MWUA strongly encourages EPA to establish and maintain communications with Congress on how to provide more funding to communities facing PFAS contamination. There must be committed attention not only to the initial capital costs that PWS will incur to install treatment, but also ongoing operations and maintenance costs such as for sampling, operation and maintenance of the treatment system, and media replacement. In some situations, the responsible party may pay for the capital costs. In most cases, municipalities will need to front the costs and chase the responsible parties for reimbursement. It is likely that many contaminated water supplies may not have an easily identifiable source or responsible party. Who will be responsible for these ongoing costs? Ratepayers should not have to bear this burden for harm caused by others.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on treatment technology availability and capacity can be found in section 10.6 of the EPA response in this *Response to Comments* document.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042727)

Further, we are concerned that in the interest of rapid implementation of drinking water standards, the burden of paying for treatment will fall to ratepayers when it should be falling to the polluters to remediate the damage they have caused. When the Clean Water Act and the Safe Drinking Water Act were passed in the 1970s, Congress felt it so important to make progress

with regulatory compliance that there were robust grant programs (to the tune of 90% grants) to support the construction of treatment plants and treatment works. That same level of commitment does not exist today. The Biden Administration points to the funding available through the Bipartisan Infrastructure Law to lessen the burden; let us be very clear - it will NOT make a dent in what we anticipate our PWS will need in order to comply with the proposed PFAS rules. We have major backlogs of infrastructure needs which require significant investment to maintain public health. We call on Congress and the Biden Administration to fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the polluters who have caused this problem.

EPA needs to carefully consider implementation challenges for PWS caused by regulatory efforts related to PFAS. MWUA is questioning whether EPA has invested enough time into this effort before moving forward with the proposed drinking water regulations. Without adequate consideration regarding these implementation challenges, public confidence in drinking water could be further jeopardized. EPA must address these challenges before finalizing the rule. We hope that EPA will strongly consider the information we are providing on behalf of Maine PWS and will craft a final rule that is reasonable in its expectations of implementation and schedule.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has provided compliance flexibility through a two-year capital improvements extension of the MCL compliance deadline allowed by Section 1412(b)(10) of SDWA in response to challenges raised by commenters surrounding capital improvement. For additional discussion on supply chain and labor challenges that may affect the compliance timeline, please see section 12 on extensions and exemptions and section 10.6 on treatment technology availability and capacity in this *Response to Comments* document. More information on compliance with related regulatory requirements is located in section 10.4.2 of the EPA response in this *Response to Comments* document.

National Special Districts Coalition (NSDC) (Doc. #1571, SBC-043000)

The capability to detect and treat PFAS in water systems and needed treatment to meet MCL remains as a concern. NSDC encourages the EPA to consider what is reasonable for small- and medium-size special districts and other utilities that already face significant challenges in upgrading infrastructure and implementing treatment technologies. As EPA approaches the primary drinking water standard, NSDC urges the agency offer adequate time and weigh funding considerations to water agencies to explore and implement appropriate treatment methods to meet the new standards. Adequate funding and resources will be necessary to support districts and other agencies' ability to meet these standards.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. SDWA Section 1412(b)(4)(E)(ii) requires the EPA to list technologies that small systems may reasonably use for rule compliance. The results of mandatory analysis may be

found in the *Best Available Technologies and Small System Compliance Technologies for PFAS in Drinking Water* document. Additional information on small system compliance technologies can be found in section 10.5 of the EPA response in this *Response to Comments* document. Additional information on availability and capacity of compliance technologies can be found in section 10.6 of the EPA response in this *Response to Comments* document.

Lakewood Water District (LWD) (Doc. #1574, SBC-042752)

Funding Support Exaggerated

The proposed regulations highlight the $11.7 billion of Drinking Water SRF funding contained in the Bipartisan Infrastructure Law (BIL). $4 billion of this appropriation is set aside for Emerging Contaminants like PFAS. While $4 billion is certainly a lot of money, the implication that this will largely offset the cost of compliance is misleading.

Table 66 shows that the annual cost of compliance with these proposed rules ranges from $705 million (on the optimistic side) to over $1.3 billion (on the more realistic side). At these rates, the BIL support will last at most about five years and, more likely, about three years.

The description of federal dollars fails to mention that this support could often be in the form of loans and is, therefore, not really funding but rather a financing option.

Further, whether federal dollars come in the form of a grant, forgivable loan, or loan, all federal money comes with multiple regulatory strings attached that increase costs (e.g., Buy America Build America requirements, American Iron and Steel requirements, recycled material requirements, disadvantaged business requirements, and more).

In addition to the imposition of additional costs, securing federal dollars takes an exceptionally long time and almost always lengthens the duration of a project, which also increases costs and diminishes the value of federal support.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

COMM Water Department (Doc. #1577, SBC-042436)

There is no where near adequate funding identified to help our PWS like ours address our basic infrastructure needs, never mind comply with these new standards. EPA's most recent estimate for Massachusetts was recently released, the 7th Drinking Water Infrastructure Needs Survey and Assessment [FN1: https://www.epa.gov/system/files/documents/2023-04/Final_FAQ_DWINSA_4.4.23.v1.pdf], and it shows $15 billion in need over the next 20 years to maintain public health protections. This estimate doesn't include any costs associated with complying with the proposed PFAS standards. Congress and the Biden Administration need to fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the generators who have

caused this problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Washington Suburban Sanitary Commission (WSSC Water) (Doc. #1585, SBC-042779)

6. Financial support

Availability of funding assistance:

We suggest that EPA consider expanding the eligibility criteria for various funding opportunities that are currently available to support PFAS mitigation. While the Bipartisan Infrastructure Law (BIL) offers a major funding opportunity to support such efforts, it is important to note that this funding is limited to capital expenditures or related planning and design work. Unfortunately, funding for PFAS research, including synoptic studies, source water assessments, or treatment alternative studies and related pilot tests, remains scarce, and costs for operations and mitigation efforts thus fall on ratepayers.

Furthermore, it is imperative that EPA ensures that the funding allocated to support compliance costs aligns with the accurate cost estimates. Although we acknowledge EPA's pledge to support water systems, particularly those in disadvantaged communities, we note that the amount of funding falls short of the high costs of treatment and waste disposal. This inadequacy is primarily attributed to the inaccurate cost assessments presented in this rulemaking.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Water & Health Advisory Council (Doc. #1590, SBC-042789)

[Figure 1

Geometric Mean PFOS and PFOA Serum Concentrations for the U.S. Population, CDC National Health and Nutrition Examination Survey, 1999 – 2018.

[Figure 1: See Docket ID: EPA-HQ-OW-2022-0114-1590]

About 85 percent of Americans who receive water utility service are served by local governments that face continuous pressure to keep rates low. High PFAS testing, remediation, and/or removal costs are likely to crowd out water system investments that would yield greater public health benefits, such as investment in infrastructure necessary to improve reliability or address contaminants such as arsenic or lead in drinking water. Small water systems and water systems in disadvantaged communities who already struggle with underfunding and understaffing lack the necessary resources to address these proposed regulations. While the EPA

has designated PFAS-specific funds for these communities, the cost of implementation far exceeds the available funding. We must invest in small water systems and disadvantaged communities and not force them to address contaminants at such low levels and uncertain science, when this may not be the highest concern for their communities. The media creates intense concern regarding PFAS, but when it comes to public health, it is important to focus on addressing issues that most improve the safety of our nation's drinking water for the greatest number of people.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document and note that BIL contains a $15 billion dollar allotment to aid with lead service line replacement.

Water & Health Advisory Council (Doc. #1590, SBC-042791)

We urge the U.S. EPA to consider the unintended public health consequences associated with diverting water utility resources towards these low-level contaminants and away from known risks impacting drinking water. Municipal utilities may be forced to fund the compliance costs associated with the PFAS MCLs by cutting back on infrastructure replacement and maintenance, operational resiliency, and reducing other expenditures that would have more benefit to public health and provide better access to clean and safe water.

The Safe Drinking Water Act calls on our nation's leaders to take effective steps towards ensuring a safe, affordable, and reliable drinking water supply for everyone. We ask that you continue to apply a science-based, risk- and cost-benefit analysis when approaching regulating PFAS. Our Council stands ready to provide additional comment, testimony, or other ways that our expertise can be of value to this process. Thank you.

Sincerely,

Water & Health Advisory Council

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that the monthly price increase quoted is significantly higher than the costs that the EPA has published in its analysis and is significantly higher than the EPA figures that are published on table 18 of the *Best Available Technologies and Small System Compliance Technologies for PFAS in Drinking Water* document. More information on cost and affordability analysis can be found in the *Best Available Technologies and Small System Compliance Technologies for PFAS in Drinking Water* and the *Technologies and Costs for Removing Per- and Polyfluoroalkyl Substances from Drinking Water* documents as well as section 13 of the EPA response in this *Response to Comments* document.

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042995)

A significant portion of this federal funding will be required to effectively support public water supply system upgrades, necessary to address the new limits proposed in this NPDWR. PFAS analytical testing alone represents a significant burden for many of our small supplies, especially those non-community water supplies operating as schools and childcare providers. To ultimately address PFAS contamination in source water may require additional challenges be met, including contamination investigation, engineering study, treatment design/permitting, consolidation efforts, or new well construction.

While EPA has taken steps toward providing funding opportunities to meet these challenges, it is likely that the need outweighs the current availability of federal resources. More is needed. It is the hope of EGLE DWEHD that EPA will remain an active partner for all states, in providing support and resources throughout implementation of the NPDWR and beyond.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Lehigh County Authority (LCA) (Doc. #1600, SBC-042825)

In addition, efforts should be made to find avenues to extend the availability of current funding streams so that support is available for utilities when they need it.

EPA Response: Please see section2.4 of the EPA response in this *Response to Comments* document. It is important to note that BIL Appropriations cover through at least FY2026 and the SRFs have successfully stewarded more than $200 billion since 1988 and should continue.

Lehigh County Authority (LCA) (Doc. #1600, SBC-042823)

5. Funding Capacity & Timing – The Infrastructure Investment and Jobs Act (IIJA) may be a vital resource for water utilities in their efforts to achieve compliance with the proposed PFAS rule. However, the $55 billion allotted for water infrastructure is set to expire in 2026, which is before the implementation date of the proposed rule. Further, the process for applying for and receiving IIJA or other funds through the Drinking Water State Revolving Fund (DWSRF) or the Water Infrastructure Finance and Innovation Act (WIFIA) can be time consuming.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042901)

EPA states "To help communities on the frontlines of PFAS contamination, the passage of the Infrastructure Investment and Jobs Act, also referred to as the Bipartisan Infrastructure Law (BIL), invests over $11.7 billion in the Drinking Water State Revolving Fund (SRF); $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion to Small, Underserved, and Disadvantaged Communities Grants. These funds will assist many disadvantaged communities, small systems, and others with the costs of installation of treatment when it might otherwise be cost-challenging." While this funding is appreciated, it's not nearly enough for what PWS will need to address PFAS.

Additionally, the BIL funding has a sunset which will likely occur before many PWS are able to get through the monitoring and design process, preventing them from accessing these monies.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042875)

We are concerned that in the interest of rapid implementation of drinking water standards, the burden of paying for treatment will fall to ratepayers when it should be falling to the polluters to remediate the damage they have caused. When the Clean Water Act and the Safe Drinking Water Act were passed in the 1970's, Congress felt progress toward regulatory compliance was of utmost importance and robust grant programs were established (to the tune of 90% grants) to support the construction of treatment plants and treatment works. That same level of commitment does not exist today. The Biden Administration points to funding available through the Bipartisan Infrastructure Law (BIL) as a means to lessen the burden. However, BIL funding will cover only a small fraction of what we anticipate our PWS will need in order to comply with the proposed PFAS rule. The total allocation of BIL funding proposed for Massachusetts was just $1.2 billion across all programs [FN12: https://www.mass.gov/doc/clean-water-and-drinking-water-state-revolving-funds-and-the-bipartisaninfrastructure-law-presentation/download] including Drinking Water State Revolving Fund Supplemental, Lead, Drinking Water Emerging Contaminants, Clean Water Supplemental, and Clean Water Emerging Contaminants. Lead funding for Massachusetts is now expected to be reduced by almost one-half because of reallocation after the 7th Drinking Water Infrastructure Needs Survey and Assessment.

Further, there are major backlogs of infrastructure needs in Massachusetts and across the country which require significant investment to maintain public health. EPA's most current estimate for Massachusetts was recently released, the 7th Drinking Water Infrastructure Needs Survey and Assessment [FN13: https://www.epa.gov/system/files/documents/2023-04/Final_FAQ_DWINSA_4.4.23.v1.pdf], and this report shows $15 billion is needed over the next 20 years; and this estimate doesn't include any costs associated with complying with the proposed PFAS standards. We will identify costs being incurred by PWS in Massachusetts later in our comments, but we call on Congress and the Biden Administration to fully fund the treatment and ongoing operations and maintenance (O&M) costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the manufacturers who have caused this problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has provided compliance flexibility through a two-year capital improvements extension of the MCL compliance deadline allowed by Section 1412(b)(10) of SDWA in response to challenges raised by commenters surrounding capital improvement. For additional discussion on supply chain and labor challenges that may affect the compliance timeline, please see section 12 on extensions and exemptions and section 10.6 on treatment technology availability and capacity in this *Response to Comments* document. More information on simultaneous compliance with other regulatory efforts is located in section 10.4.2 of the EPA response in this *Response to Comments* document. More information on the health risk reduction

and cost analysis can be found in section 13 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042904)

MWWA strongly encourages EPA to establish and maintain communications with Congress on how to provide more funding to communities facing PFAS contamination. There must be committed attention not only to the initial capital costs that PWS will incur to install treatment, but also ongoing O&M costs such as for sampling, operation and maintenance of the treatment system, and media replacement. In some situations, the responsible party may pay for the capital costs. In most cases, municipalities will need to front the costs and file lawsuits against potentially responsible party(ies) (if any) for reimbursement. It is likely that many contaminated water supplies may not have an easily identifiable source or responsible party. Who will be responsible for these ongoing costs? Ratepayers should not have to bear this burden for harm caused by others. The proposed MCL represents an unfunded federal mandate unlike any other in the past under the SDWA and costs associated with complying with the rule need to be fully funded in perpetuity by the federal government.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042899)

Massachusetts has already committed $209 million in State Revolving Fund (SRF) loans to fund just 24 PFAS treatment projects in the Commonwealth. Over the past year, SRF projects are routinely coming in 30% higher than what was originally committed, and we expect that trend will continue as we are experiencing inflationary pressure, supply chain challenges, and workforce shortages. With the limited public comment period, we do not have sufficient time to survey Massachusetts PWS to quantify private financing which many smaller, non-municipal PWS have had to utilize. MassDEP has also issued $11.8 million in targeted grant funding to assist PWS in their remediation activities. MassDEP recently issued the final Intended Use Plan for 2023 SRF funding and there are 29 communities on that list that have PFAS projects, and the projected 2023 funding is around $308 million. It's important to note that these PWS will still need local approval to enter into loan commitments for these projects to move forward. It is also important to note that several of these are multi-year projects with much higher price tags ($20 million+) which need to be funded over a multi-year period, as our SRF has a $15 million cap for funding given in any one year. As such, the loan commitments to date do not show the full extent of the needed expenditures for PFAS remediation. If all the 2023 projects move forward that will be more than $500 million expended in Massachusetts for just a fraction of systems who have exceeded the MMCL, which as we know is a much higher compliance value than EPA's proposal. It should also be recognized that SRF is primarily a financing mechanism that provides loans to PWS. Unless it is specified that all PFAS remediation projects are to be grant-funded, an SRF loan remains a burden on local ratepayers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the public comment period and the EPA regulatory process can be found in section 2.3 of the EPA response in this *Response to Comments* document. More information on simultaneous compliance with other regulatory efforts is located in section 10.4.2 of the EPA response in this *Response to Comments* document.

Arlington County Virginia (Doc. #1603, SBC-043008)

4. The regulation as proposed inappropriately places the extraordinary financial burden of PFAS on rate payers, who were unwitting consumers of these compounds – the financial burden needs to fall on the companies that profited from the manufacture of these compounds

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Arlington County Virginia (Doc. #1603, SBC-043019)

Cost Burden

It is widely acknowledged that the presence of PFAS in source water systems (and nearly everything else) is a consequence of decades of manufacturing and commercial endeavors. The production of PFAS continues largely unabated today, and they therefore continue to accumulate in the environment. Water utilities bear no responsibility for the prevalence of PFAS, yet the proposed regulations place the entirety of the burden for removal upon water utilities and their customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-044007)

Low-Income Assistance

During the COVID-19 pandemic, Congress recognized that water and wastewater services could not be compromised by a customer's inability to pay their bill. A temporary low-income household water assistance program, or LIHWAP, was created as a stop-gap measure, offering $1.1 billion to customers and households across the U.S.

While this funding meant that the most vulnerable in our communities could continue to drink, bathe, and flush their toilet during the pandemic, it was only a short-term solution. Prior to the proposed PFAS rule, an independent report commissioned by five water sector associations that represent a cross-section of the 315 million Americans who rely on community water systems found the annual need for a federal assistance program to range between $2.4 billion and $7.9 billion in order to balance affordability with the need to accelerate investments in our infrastructure. We anticipate that the needs will only increase when the PFAS rule is finalized.

Therefore, we are calling for Congress and the Biden-Harris Administration to establish and fund a permanent federal low-income household water assistance program as quickly as possible.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-043979)

Treating or removing contaminants in water comes at a cost. To realize the health benefits of such, water utilities must have the financial resources to assure they can sustain the ongoing costs that will arise from constructing, operating, maintaining, and monitoring PFAS treatment systems for the safety and benefit of customers. States should treat these expenditures for regulated utilities as federally mandated requirements that are recoverable in customer rates through expedited means.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Prince William County Service Authority (Doc. #1609, SBC-042847)

6. The cost to implement PFAS treatment will be considerable and will be borne by utility ratepayers – the public. Drinking water affordability is already challenged by other new regulations, replacement of aging infrastructure, and price increases for chemicals, power, and supplies that far outpace overall inflation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For additional discussion on supply chain and labor challenges please see sections 12.1 and 10.6 of the EPA response in this *Response to Comments* document. More information on simultaneous compliance with other regulatory efforts is located in section 10.4.2 of the EPA response in this *Response to Comments* document. More information on the health risk reduction and cost analysis can be found in section 13 of the EPA response in this *Response to Comments* document.

Marlene Ladderbush (Doc. #1612, SBC-042912)

• EPA has very much underestimated the costs to PWSs to comply with the proposed rule.

• There is no where near adequate funding identified to help our PWS or address our basic infrastructure needs, never mind comply with these new standards. EPA's most recent estimate for Massachusetts was recently released, the 7th Drinking Water Infrastructure Needs Survey and Assessment [FN1: https://www.epa.gov/system/files/documents/2023-04/Final_FAQ_DWINSA_4.4.23.v1.pdf], and it shows $15 billion in need over the next 20 years to maintain public health protections. This estimate doesn't include any costs associated with complying with the proposed PFAS standards. Congress and the Biden Administration need to

fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the generators who have caused this problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the health risk reduction and cost analysis can be found in section 13 of the EPA response in this *Response to Comments* document.

Town of Lincoln Water Department (Doc. #1613, SBC-043023)

There is no-where near adequate funding identified to help our PWS like ours address our basic infrastructure needs, never mind comply with these new standards. EPA's most recent estimate for Massachusetts was recently released, the 7th Drinking Water Infrastructure Needs Survey and Assessment [FN1: https://www.epa.gov/system/files/documents/2023-04/Final_FAQ_DWlNSA_4.4.23.v1.pdf], and it shows $15 billion in need over the next 20 years to maintain public health protections. This estimate doesn't include any costs associated with complying with the proposed PFAS standards. Congress and the Biden Administration need to fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the generators who have caused this problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document.

Oakland County Water Resources Commissioner (WRC) (Doc. #1615, SBC-042926)

First, the potential costs and liabilities associated with the proposed regulations, including cost associated with remediation and disposal, would cause a substantial financial burden for many of our customer communities, including the City of Pontiac and the Charter Township of Royal Oak. Water affordability is a top priority for my office. Through a state grant, we recently researched the topic, released a detailed report with our findings, and developed a comprehensive water affordability plan that can be found at www.wrc.com/affordability. A key finding in our report is that water affordability is not just a problem of the poor. As new water quality regulations emerge, the costs of regulatory compliance will be passed on through customer rates which drives up the number of households who struggle to pay for essential water services. This impacts the financial health of public utilities and results in tradeoffs to balance competing needs regarding proper investments in infrastructure, maintaining affordable rates, and long-term fiscal stability of the utility. Unfortunately, these tradeoffs lead to inequities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document. More information on cumulative regulatory as well as disposal burden can be found in section 10.4.2 of the EPA response in this *Response to Comments* document.

Oklahoma Department of Environmental Quality (DEQ) (Doc. #1616, SBC-043048)

The cost to laboratories to obtain the instrumentation needed for analysis is substantial. In addition, there is need för laboratories to purchase redundant instruments to maintain capacity as well as test in matrices other than drinking water. The cost of peripheral equipment and maintenance contracts further adds to the cost of performing PFAS testing. The EPA should mandate that some portion of Bipartisan Infrastructure Law funds should be dedicated to laboratory support.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document. It is important to note that the DWSRF set-asides can be used to obtain test kits/laboratory equipment for systems to test for newly recognized contaminants of concern and training to use that equipment as mentioned in the memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law."

Oklahoma Department of Environmental Quality (DEQ) (Doc. #1616, SBC-043049)

Treatment, Small Systems, and Availability of Qualified Water Operators

DEQ suggests that EPA continue to fund and dedicate resources to technical assistance programs, programs to advance small water systems' technical, managerial, and financial capability, and operator recruitment programs.

Small system compliance with the PFAS MCL's will be challenging. Systems with no alternative source water will be faced with the challenge of installing treatment, and most small groundwater systems currently have minimal treatment installed.

In most cases, treatment for PFAS will require an increase in the level of certification for the water operator. The challenges for small and disadvantaged systems to hire and retain qualified operators will increase as systems install treatment to comply with PFAS MCL's.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The money committed to the SRFs represents continued dedicated assistance programs and those funds contain mandatory reserves for small or otherwise disadvantaged systems. More information on operator capacities can be found in section 10.6 of the EPA response in this *Response to Comments* document.

Aquarion Water Company (Doc. #1617, SBC-043375)

Federal funding, particularly through the Bipartisan Infrastructure Law (BIL), will defray some of these costs, but ratepayers will still bear the burden of much of the cost to construct solutions and all the cost to operate and maintain these solutions.

With these factors in consideration, Aquarion offers the following comment on the EPA's proposed regulation for the six PFAS.

1. EPA estimates the Annualized Quantified National Costs and Benefits of the proposed regulation are approximately $772 million and $1.23 billion, respectively (Table 66 in previously noted Federal Register), which indicates a net benefit of the proposed regulation. However, a recent study conducted by Black & Veatch on behalf of AWWA (WITAF 56 Technical Memorandum – PFAS National Cost Model Report) estimates the annualized national costs to be significantly higher at approximately $3.8 billion. As shown above, we estimate that our annualized capital costs to comply with the proposed regulation is approximately $14 million. Prorating this $14 million from our population served of 700,000 to the 316 million people served by community water systems across the country (see Table 4-4 in EPA's "Economic Analysis for the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation") yields an annualized national capital cost of $6.3 billion to comply with the proposed regulation. We recognize that this is a very rough approach to estimating the national costs of complying with the proposed regulation, and we're merely providing this input to show evidence that EPA should consider further evaluation of its cost estimates while finalizing the regulation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA disagrees with many of the assumptions in AWWA's Black & Veatch's (B&V) report and the report's overall conclusions about the estimated national costs; see section 13.3.3 of the EPA response in this *Response to Comments* document for details.

Aquarion Water Company (Doc. #1617, SBC-043378)

4. To reduce the impact on water rates, we ask that regulatory agencies (and legislative bodies) consider providing more funding in the form of grants and loan principal forgiveness instead of the current approach of providing much of the funding in the form of low or no interest loans. While it's recognized and appreciated that the BIL requires states to distribute PFAS related funding entirely as forgivable loans or grants, in practice it seems that these funds will be spread over many individual loans, resulting in only partial principal forgiveness for the individual loans. The result is that ratepayers will have to cover the large portion of a loan that is not forgiven. More funding in the form of grants and/or increased principal forgiveness would further defray the impact on water rates.

We respectfully request that EPA take our comments under consideration when finalizing the regulation. Thank you for the opportunity to provide our comments.

Sincerely,

Aquarion Water Company

John P. Walsh, P.E.

Vice President, Operations (MA & NH), Water Quality, and Environmental Management

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Beaufort-Jasper Water & Sewer Authority (BJWSA) (Doc. #1618, SBC-042930)

May 26, 2023

U.S Environmental Protection Agency EPA Docket Center

Office of Ground Water and Drinking Water 1200 Pennsylvania Avenue NW Washington, DC 20460

Re:Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

To Whom It May Concern:

Thank you for the opportunity to comment on the USEPA's proposed PFAS National Primary Drinking Water Regulation . Beaufort-Jasper Water & Sewer Authority (BJWSA) is a political subdivision and a special purpose district of the State of South Carolina created by the state's legislature to provide water and wastewater services to residents in Beaufort and Jasper counties. The utility treats and delivers an average of 20 million gallons of drinking water each day to more than 65,000 retail customers, as well as numerous wholesale customers, for a total population served of approximately 150,000.

The major source of water supplying BJWSA's two water treatment plants is the Savannah River. Although this river is a very reliable source of water, it is impacted by low levels of PFAS chemicals. Neither treatment plant is presently equipped with treatment processes which remove these chemicals to levels below the proposed PFAS regulations. As a result, if the current proposal is finalized, BJWSA will be required to install treatment that is estimated to cost $80 million and budget for additional annual costs to operate and maintain the new treatment facilities and dispose of process residuals. This cost estimate is in alignment with that experienced by the Cape Fear, North Carolina Public Water Authority, which recently constructed and began operating a new granular activated carbon (GAC) facility to remove compounds such as PFAS. That project had a timeline of five years from study and pilot testing to facility startup, and annual operating costs for the Cape Fear facility are estimated at $5M in future years.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043067)

Securing Funding is a Slow Process

A crucial step for installing capital improvements is to identify and secure a source of funding. In announcing this rule, EPA highlighted the funds through the Bipartisan Infrastructure Law and more specifically the Drinking Water State Revolving Fund (DWSRF). Funding is also available through the Water Infrastructure Finance and Innovation Act (WIFIA) program. These programs provide an avenue for water systems to fund new treatment facilities; however, these programs can be time consuming and sometimes take several years to acquire approval, in addition to project design time. These programs may also impose additional requirements for funding to be approved that may limit procurement options and costs. Whether a system utilizes the DWSRF, WIFIA, or another program, the process may still be slow and will require financial planning for capital improvements outside of the typical Capital Improvement Program (CIP). Planning through a CIP helps to assure that capital improvements are staged in a way that minimizes water rate impacts.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

WaterPIO (Doc. #1624, SBC-043475)

Nationwide, the financial impacts of the EPA's proposed MCLs and HI will be in the tens of billions of dollars. AWWA commissioned a study on the financial costs of the proposed PFAS MCLs and Hazard Index [Link: https://www.awwa.org/Portals/0/AWWA/Government/2023030756BVFinalTechnicalMemoradum.pdf?ver=2023-03-14-102450-257]. The thorough work by Black and Veatch clearly shows how EPA exponentially underestimated the funding mandates created by these proposed regulations, financial burdens that are guaranteed to be passed on to the American people.

To show how absurd the cost burdens could be on the American people, here's an example using one of our clients. The water and wastewater utility is currently below the proposed MCLs for PFOA and PFOS at around three ppt each, and their main water source is a major river flowing through multiple states.

As we know from our experience with PFAS in North Carolina, PFAS levels jump in waterways during times of drought. When droughts have occurred for our "three ppt" client, their PFOA and PFOS levels have spiked to six, eight, and on occasion, to double-digit parts per trillion levels. This creates a situation where their running annual average could spike above the proposed MCLs of 4.0 ppt or throw them out of compliance with the HI's formula. What will be the result for this utility simply because it experienced a drought? An estimated construction cost of

approximately $1.5 BILLION dollars, with annual operation and maintenance costs in the tens of millions.

Without a definitive polluter on their waterway, guess who will be paying for these BILLION-dollar costs? The utility's customers, leaving many of them to decide if drinking their tap water is worth it anymore, especially since they'll be repeatedly told their water contains cancer-causing compounds while their rates are rising.

Is that really the world the EPA wants to create?

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA disagrees with many of the assumptions in AWWA's B&V report and the report's overall conclusions about the estimated national costs; see section 13.3.3 of the EPA response in this *Response to Comments* document for details. Compliance with this rule is calculated using a running annual average; we expect this to mitigate many of the concerns associated with temporary spikes in regulated PFAS concentration.

WaterPIO (Doc. #1624, SBC-043461)

2. The costs, grossly underestimated by the EPA, for meeting the proposed regulations will be astronomical. The largely unfunded mandates will cost in the tens, or even hundreds, of billions of dollars that water systems do not have.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044114)

ASDWA recommends that EPA continue funding research for the treatment of emerging contaminants in drinking water, especially treatment at small water systems.

Based on costs associated with the BAT, primacy agencies anticipate that small and disadvantaged water systems exceeding the MCL will face financial difficulties implementing any treatment options. While funding under the Bipartisan Infrastructure Law (BIL) may be available for some systems, each of the BAT are costly treatment methods with high operation and maintenance costs. For many systems, these costs will be passed on to ratepayers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document and note that the EPA identified research as a key pillar in the *PFAS Strategic Roadmap.* The agency is funding research into new treatment technologies. More information on small system compliance technologies may be found in section 10.5 of the EPA response in this *Response to Comments* document and more information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044106)

ASDWA strongly recommends that EPA invest funding into evaluations of these technologies by ORD, similar to the arsenic studies completed in the early 2000s or EPA's previously managed Environmental Technology Verification (ETV) program. Investment should particularly focus on treatment technologies at small water systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has invested in evaluating and developing technologies for reducing PFAS in the environment to inform decisions on drinking water and wastewater treatment, contaminated site cleanup and remediation, air emission controls, and end-of-life materials management. Please see sections 10.1 and 10.2 of the EPA response in this *Response to Comments* document. The EPA's Environmental Technology Verification (ETV) Program concluded operations in early 2014 and there are currently no plans to reestablish it. The EPA is supporting the development of alternative technologies through various other programs such as the Innovative Water Technology Grant Program for next generation adsorbents and Small Business Innovation Research grants.

Illinois Farm Bureau (IFB) (Doc. #1630, SBC-043140)

[The most glaringly overlooked and/or underestimated data includes:]

• Infrastructure Investment and Jobs Act (IIJA) funding are limited federal resources. The investment needed to reach these low MCL levels moves well beyond the ability of communities to afford and beyond the potential funding available in the IIJA.

Please refer to more robust comments submitted by the American Farm Bureau Federation for a more detailed review our shared concerns.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Illinois Farm Bureau (IFB) (Doc. #1630, SBC-043142)

It will be infeasible for many rural communities to meet the standards outlined in the short timeframe identified and the exorbitant costs will inevitably be handed down to the water users. While federal funding may be available, our concern is there is not enough money to go around to cover the costs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044146)

Finally, because the financial burdens on small, rural, and tribal communities will be so great, EPA must work with utilities on a regional scale, encouraging partnerships between PWSs to help with compliance and cost-effective solutions.

RCAP thanks EPA for its efforts to protect public health in promulgating this proposed NPDWR and stands ready to assist the Agency with continued feedback and implementation support in the months and years to come.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRA can be found in section 13 of the EPA response in this *Response to Comments* document, and more information on an affordability analysis can be found in section 10.5 of the EPA response in this *Response to Comments* document. Significant amounts of funding are reserved for small, rural, Tribal, or otherwise disadvantaged systems that are being distributed through the SRFs as a result of the EPA's commitment to productive partnerships and to maximize the impact of these funds.

Orange County Water District (OCWD), California (Doc. #1634, SBC-043235)

Securing funding for treatment or other means of compliance (e.g., drilling a new well) via programs such as the Bipartisan Infrastructure Act, Drinking Water State Revolving Fund (DWSRF), and or Water Infrastructure Finance and Innovation Act (WIFIA) requires significant time. It can take several years for funding to be approved through these programs, many of which impose procurement restrictions or reporting requirements which limit flexibility and further slow project progress.

EPA Response: The EPA has provided compliance flexibility by providing a two-year capital improvements extension of the MCL compliance deadline allowed by Section 1412(b)(10) of SDWA. For additional discussion on the compliance timeline, please see section 12 on extensions and exemptions. Please see section 2.4 of the EPA response in this *Response to Comments* document.

Town of Tewksbury, Massachusetts (Doc. #1637, SBC-043242)

There is nowhere near adequate funding identified to help our PWS like ours address our basic infrastructure needs, never mind comply with these new standards. EPA's most recent estimate for Massachusetts was recently released, the 7th Drinking Water Infrastructure Needs Survey and Assessment, and it shows $15 billion in need over the next 20 years to maintain public health protections. This estimate does not include any costs associated with complying with the proposed PFAS standards. Congress and the Biden Administration need to fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the generators who have caused this

problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document.

Citizens Against Ruining the Environment (CARE) (Doc. #1638, SBC-043443)

One impacted Will County community, the City of Joliet, recently signed an agreement to purchase Lake Michigan water from the City of Chicago thirty-five miles away. The agreement will ensure clean drinking water for Joliet residents. Joliet currently uses a groundwater aquifer to supply community drinking water but will build the $1 billion pipeline infrastructure to transport treated Lake Michigan water in the future. [FN2: A.D. Quig, City of Chicago OK's 100-Year Water Deal with Joliet, Chicago Tribune (Apr. 19, 2023), https://www.chicagotribune.com/politics/ct-chicago-water-deal-with-joliet-council-2023-20230419-mpb635xftvgudf54vfw43322eu-story.html.] This is prohibitively expensive and infeasible for other Will County communities which have no choice but to continue using groundwater.

CARE asserts the costs associated with monitoring, reporting, and cleanup of PFAS should be borne by the parties responsible for the contamination, not private well users or water suppliers. CARE asserts that financial assistance for testing and filtration should be made available to middle class homeowners as well as low-income households. C

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document, and more information on an affordability analysis can be found in section 10.5 of the EPA response in this *Response to Comments* document.

California Municipal Utilities Association (CMUA) (Doc. #1639, SBC-043254)

I. CMUA Strongly Urges the EPA to Provide Financial Assistance that can be used in all Communities

Any new regulation comes with additional costs for public water agencies. Costs to monitor, notify, and treat at the proposed maximum contaminant levels (MCLs) for PFOA, PFOS, PFHxS, GenX Chemicals, PFNA, and PFBS may be infeasible for some agencies to bear, especially smaller agencies. Ultimately, those costs are borne by customers.

The proposed MCLs will require substantial investments for public agencies to monitor their water supplies to detect these contaminants at the proposed levels. It is also important to acknowledge the investments that public water agencies have already made in monitoring and detection equipment. The existing equipment may be able to detect at the currently proposed

standard, but if that standard is any lower, the extensive investments will be for naught since that equipment will not detect a lower standard. There is additionally the potential for false negatives or positives for the proposed trigger level of 1.3 parts per trillion for PFOA and PFOS. The lowest concentration that PFOA and PFOS can be reliably quantified within specific limits of precision and accuracy during routine laboratory operating conditions is 4 parts per trillion. Similarly, for some other agencies, past investments made in equipment will be insufficient to comply with the proposed MCLs, making those investments futile.

Thus, the EPA needs to consider ways to financially support public water agencies to comply with the proposed MCLs. Financial assistance must also be able to be accessed by agencies that serve differing populations. Water supplies are not distinguished between economic classes. A single water supply that contains PFAS may be used to deliver water to disadvantaged and non-disadvantaged communities. Providing financial assistance limited to a DAC would be a disservice to the non-DAC portions of a water agency's service territory and will not help the EPA achieve the goal of ridding water supplies of PFAS contaminants.

Therefore, CMUA urges the EPA to offer financial assistance without DAC limitation to public water agencies to comply with the Regulation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document, more information on an affordability analysis can be found in section 10.5 of the EPA response in this *Response to Comments* document. It is important to note that the DWSRF set-asides can be used to obtain test kits/laboratory equipment for systems to test for newly recognized contaminants of concern and training to use that equipment as mentioned in the memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law." More information on analytical methods may be found in section 7 of the EPA response in this *Response to Comments* document. More information on monitoring and compliance requirements may be found in section 8 of the EPA response in this *Response to Comments* document, more information on trigger levels may be found in section 8.8 of the EPA response in this *Response to Comments* document. For concerns related to false negatives or positives, please see section 8.7 of the EPA response in this *Response to Comments* document. For commenter concerns regarding practical quantitation levels (PQLs), including implementation of the MCLs at the PQL, how the PQLs were set for the final NPDWR, or use of sample results below the PQLs to help operators manage their treatment operations, please see section 5.1.2 of the EPA response in this *Response to Comments* document.

National Rural Water Association (NRWA) (Doc. #1641, SBC-043263)

3. Available Funding

The State Revolving Fund (SRF) model has left many small, disadvantaged communities behind. The Infrastructure Investment and Jobs Act of 2021 (IIJA) appropriated $4 billion over 5 years

for projects that are Drinking Water SRF eligible whose primary purpose must be to address emerging contaminants, with a focus on PFAS. 25 percent of this BIL funding is targeted toward disadvantaged communities and/or communities of fewer than 25,000 people. Additionally, EPA recently announced the availability of $5 billion as part of the Emerging Contaminants in Small or Disadvantaged Communities grant program that can be used to reduce PFAS in drinking water in communities facing disproportionate impacts. The goal of the Emerging Contaminants in Small or Disadvantaged Communities grant program is for states to provide grants to public water systems in small or disadvantaged communities to address emerging contaminants, including PFAS. The proposed rule's financial analysis assumes 100% of water systems will receive financial assistance. Although this available funding is a good start, it does not go far enough to address the need. The total cost of capital improvements for all small systems across the United States is unknown. Additionally, most small systems have not begun to sample making it impossible to accurately forecast the cost to implement this rule. Controls must be established to ensure the smallest, and most disadvantaged communities will receive the funds needed. In many states the SRF funding is going directly to large, well-established communities.

Additionally, many states have struggled to spend their allocated SRF money. In a study published by Duke Nicolas Institute for Environmental Policy Solutions and the Environmental Policy Innovation Center, it is stated that "Nationwide there is $9.9 billion in SRF funding that states have not committed to projects." See Report Here [Link: https://nicholasinstitute.duke.edu/publications/uncommitted-state-revolving-funds#:%7E:text=States%20and%20the%20federal%20government,Revolving%20Fund%20(SRF)%20programs.] . There are many reasons why the SRF funding isn't being spent that are not the fault of the state SRF staff: capacity, staffing, resources, and funding. These challenges will be compounded by the influx of new money, further challenging the state staff.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA's national level cost analysis in the HRRCA does not assume 100 percent water systems will receive financial assistance, as was suggested by the commenter. The commenter may be referring to the EPA's supplemental affordability analyses that examined the impact of the rule when accounting for the financial assistance through BIL and other sources that are generally available to small systems. The EPA disagrees with commenters that stated this assumption was flawed; see section 14.11 of the EPA response in this *Response to Comments* document for more information.

National Rural Water Association (NRWA) (Doc. #1641, SBC-043278)

• EPA requests comment on the type of assistance that would help small public water systems identify laboratories that can perform the required monitoring, evaluate treatment technologies and determine the most appropriate way to dispose of PFAS contaminated residuals and waste the systems may generate when implementing the rule.

Response: Small public water systems are going to need technical assistance and funding to identify laboratories to perform monitoring, evaluate the best treatment technologies and determine the most appropriate and cost-effective ways to dispose of treatment residuals and waste. While a great deal of money has been appropriated – the greater challenge will be getting it out to the small systems - and doing so in a timely manner.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For more information on technical assistance for Best Available Technologies, or their evaluation, please see section 10.1 of the EPA response in this *Response to Comments* document. For information on disposal of treatment residuals, please see section 10.4 of the EPA response in this *Response to Comments* document. For information on monitoring, including laboratories, please see section 8 of the EPA response in this *Response to Comments* document.

National Rural Water Association (NRWA) (Doc. #1641, SBC-043280)

Thank you for the opportunity to participate and comment. NRWA is very appreciative of the agencies' many public outreach opportunities. We believe our recommendations will result in a better rule once finalized. PFAS was not caused or created by our small, rural water systems. As such, these systems should not carry the financial burden of detecting, remediating, and monitoring PFAS. These costs will cripple the systems and negatively impact our most distressed communities. NRWA is ready to work with the EPA to responsibly remove concentrations of PFAS from drinking water in a manner that doesn't burden the systems, rate payers, and taxpayers that bear no responsibility in introducing PFAS into the environment.

If you have any questions, please contact NRWA's Senior Executive Policy Director, Charles Stephens (charles@nrwa.org).

Sincerely,

Matthew Holmes

Chief Executive Officer

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Raptor Pharm & Tox, Ltd (Doc. #1644, SBC-043414)

May 30, 2023

Following are public comments submitted by Raptor Pharm & Tox, Ltd. These comments are not on behalf of any other party. These comments are in response to EPA Docket EPA-HQ-OW-2022-0114-0027, the Per-and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. These comments were prepared by our President and CEO, Dr. Lyle Burgoon, ATS. We would be happy to engage with EPA further with respect to our comments.

Raptor Pharm & Tox, Ltd (Raptor) is a North Carolina small business. Part of our expertise is regulatory toxicology. Raptor strives to ensure policies are based on the highest quality science, and has several outreach programs to help inform the public about both good quality and low quality science that is being talked about in the press, or is being used to formulate policy.

Raptor is concerned about the economic impacts of these Primary Drinking Water Standards on small businesses and the poor. Ultimately, these drinking water standards, at the levels being proposed, would significantly drive costs up at the point of water treatment. That means the water bills for America's small businesses and everyone with a tap at their house will significantly increase. At this time, America's small businesses are under immense pressure – from inflation driving our costs up, to inflation driving down spending, and from the Federal Reserve's actions further driving down consumer spending. These have cascading effects that ultimately hit America's small businesses the hardest of all businesses.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Raptor Pharm & Tox, Ltd (Doc. #1644, SBC-043415)

Not only that, but increasing costs for water, will disproportionately impact the poor. Water is necessary for life. Already today, there are poor individuals who have to choose which bill they will pay this month. As costs continue to increase on the poor individuals, including our grandparents, our senior citizens, those who cannot work, and children who have no say in any of this, we will further burden the poor, and further widen the wealth gap.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document, more information on an affordability analysis can be found in section 10.5 and 14.11 of the EPA response in this *Response to Comments* document.

GFL Environmental (Doc. #1648, SBC-043224)

• Funding shortfalls: The Building Infrastructure Law (BIL) provides a total of $10B for Emerging Contaminants, including $5 billion for the Emerging Contaminants in Small or Disadvantaged Communities (EC-SDC) grant program, which focuses on addressing emerging contaminants, such as PFAS in small or disadvantaged communities' drinking or source water. Funding shortfalls are anticipated as the cost to identify the presence, source, and extent in source water alone is substantial and with cost impacts associated with drinking water treatment alone anticipated to be as much as $60 billion, funding is inadequate.

Thank you for your consideration of our comments, and we look forward to continuing to partner with EPA to ensure the safe and effective management of waste streams containing PFAS.

Sincerely,

GFL ENVIRONMENTAL

Selin Hoboy | Vice President - EHS & Compliance 847-456-8889 | shoboy@gflenv.com

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document, particularly the amount of funding available, which the EPA notes is higher than suggested by the commenter.

New England Interstate Water Pollution Control Commission (NEIWPCC) (Doc. #1650, SBC-043146)

Finally, our member states are concerned that the rule will place a disproportionate burden on smaller community water systems. In general, small systems tend to contract with smaller laboratories for services. However, the smaller laboratories are less likely to be certified for PFAS. Those smaller laboratories, therefore, will likely subcontract the PFAS analyses out to other laboratories. As a result, small systems will incur higher cost. Small systems generally have fewer resources and, if privately-owned, may be ineligible for state financial assistance. Our member states anticipate that the financial challenges smaller systems have been experiencing will be compounded by the increased monitoring costs imposed by the rule. It, therefore, is imperative that EPA take into consideration the ability of smaller systems to carry this increased expense.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044196)

6. NCDEQ recommends that EPA continue funding research for the treatment of emerging contaminants in drinking water, especially treatment at small water systems.

Based on costs associated with the BAT, state agencies anticipate that small and disadvantaged water systems that exceed the MCL will face financial difficulties in implementing any of the

treatment options. While funding under the Bipartisan Infrastructure Law may be available for some systems, each of the BAT are costly treatment methods with high operation and maintenance costs. For many systems, these costs will be passed on to ratepayers. North

Carolina has a diverse and robust research community that could support such research needs. NCDEQ is available to work with EPA to develop collaborative partnerships between federal government, states, and academia to maximize the benefits of multiple funding sources.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has invested in evaluating and developing technologies for reducing PFAS in the environment to inform decisions on drinking water and wastewater treatment, contaminated site cleanup and remediation, air emission controls, and end-of-life materials management. Please see sections 10.1 and 10.2 of the EPA response in this *Response to Comments* document.

Virginia Municipal Drinking Water Association (VMDWA) (Doc. #1657, SBC-043170)

Third, the construction project pricing recent experience for VMDWA Members projects is already adversely impacted by the currently high volume of engineering and construction work in the water sector (water, wastewater, stormwater), on road and bridge projects, and on other infrastructure projects. Relatedly, unemployment is low and inflation continues to run very high. Our Members have reported construction bid prices exceeding engineering estimates easily in the range of 2550% and the number of responsive bidders is relatively low compared to historical activity.

Fourth, with ongoing ARPA spending on infrastructure projects (with a 2026 completion deadline presently) and upcoming Bipartisan Infrastructure Law grant and loan projects, this situation is on track to get worse – and that is before adding in thousands of water treatment plants upgrades that EPA expects under this regulation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has provided compliance flexibility through a two-year capital improvements extension of the MCL compliance deadline allowed by Section 1412(b)(10) of SDWA. For additional discussion on supply chain and labor challenges that may affect the compliance timeline, please see section 12 on extensions and exemptions in this *Response to Comments* document. More information on the HRRCA can be found in section 13 of the EPA response in this *Response to Comments* document.

Maryland Association of Municipal Wastewater Agencies (MAMWA) (Doc. #1658, SBC-043405)

Third, the construction project pricing recent experience for utility projects is already adversely impacted by the currently high volume of engineering and construction work in the water sector (water, wastewater, stormwater), on road and bridge projects, and on other infrastructure

projects. Relatedly, unemployment is low, and inflation continues to run very high. Our Members have reported construction bid prices exceeding engineering estimates easily in the range of 25-50% and the number of responsive bidders is relatively low compared to historical activity.

Fourth, with ongoing ARPA spending on infrastructure projects (with a 2026 completion deadline presently) and upcoming Bipartisan Infrastructure Law grant and loan projects, this situation is on track to get worse – and that is before adding in thousands of water treatment plants upgrades that EPA expects under this regulation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document and the EPA response to comment Doc. #1657, SBC-043170 from the Virginia Municipal Drinking Water Association (VMDWA).

National Association of Clean Water Agencies (NACWA) (Doc. #1659, SBC-043154)

EPA continues to point to the 2021 Bipartisan Infrastructure Law's (BIL) $9 billion allotment for drinking water investments to address PFAS and other emerging contaminants as a way to cover the increased costs. While the BIL funding is a historic federal water infrastructure investment—it is a mere drop in the bucket when considering the 66,000 public water systems that will be impacted by this proposed rulemaking. Some utilities are estimating they will need to spend billions of dollars at their facilities alone to treat PFAS over the next several decades. The sheer national scope and financial impact of EPA's proposed rule on public utilities far exceeds the investments provided by the BIL, which will be allocated and exhausted in a few short years.

Around the country, communities and their ratepayers are already facing heightened affordability challenges to cover the rising costs of water, wastewater, and stormwater services. To meet the MCLs proposed by this rulemaking, communities and ratepayers will bear the brunt of the treatment costs—further exacerbating the affordability gap disproportionately affecting low-income customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that significantly more money is available through BIL than suggested by the comments and notes that the estimated number of systems subject to the rule is stated directly in section VI.F of the proposed and final rule preamble at 4,100-6,700. For more information on numbers of systems subject to the rule, please see section 6 of the EPA response in this *Response to Comments* document.

Maine Organic Farmers and Gardeners Association (MOFGA) (Doc. #1660, SBC-043380)

The costs and scope of that taxpayer-funded assistance is taking shape through the Fund to Address PFAS Contamination, and it is proving to be an expensive proposition. Starting with an initial appropriation of $60 million, the PFAS Fund Advisory Committee's draft implementation plan currently estimates nearly $80 million will be needed over the next several years to mitigate

the devastating impact of PFAS on farmers' livelihoods, to purchase contaminated farmland, to pay for PFAS blood testing and health monitoring, to conduct research, and more. [FN3: https://www.maine.gov/dacf/about/commissioners/pfasfund/advisory-committee.shtml]

The $80 million figure is in addition to the millions of dollars the State is already paying to comprehensively investigate PFAS contamination of soils and water and to pay for water filtration for contaminated wells. Nor does this amount account for the cost to municipalities and their residents to properly dispose of PFAS-contaminated wastewater sludge residuals instead of continuing the polluting practice of land application of sludge and sludge-derived compost.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Water Supply District of Acton (Doc. #1662, SBC-043660)

Adequate funding has not yet been identified to help address our basic infrastructure needs, let alone to comply with these new PFAS standards. Our rate payers have already committed $35 million since 2009 to address water treatment upgrades to comply with state and federal requirements. EPA's most recent estimate for Massachusetts was recently released, the 7 th Drinking Water Infrastructure Needs Survey and Assessment [FN1: https://www.epa.gov/system/files/documents/2023-04/Final_FAQ DWINSA_4.4.23.v1.pdf], and it shows $15 billion in need over the next 20 years to maintain public health protections. This estimate doesn't include any costs associated with complying with the proposed PFAS standards. Congress and the Biden Administration need to fully fund the treatment and ongoing operations and maintenance costs necessary to remediate PFAS in our nation's drinking water and seek reimbursement from the generators who have caused this problem. The federal government has far more resources and abilities to pursue legal actions and seek reimbursements from PFAS manufacturers than do individual PWS or groups of PWS. Our actions to treat PFAS are a long-term commitment that will forever change our operating costs; any existing financial assistance available to the District is in the form of capital financing and limited principal forgiveness. EPA must look at the full cost implications of PFAS treatment and establish a fund to assist with the remedial costs in perpetuity.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Santa Clara Valley Water District (Valley Water) (Doc. #1664, SBC-043125)

Comment 1 – Valley Water Urges the EPA to Minimize the Burden on Ratepayers

Valley Water is committed to ensuring safe, clean water for the nearly two million residents of Santa Clara County. We will continue to take all action needed to ensure the treated water we deliver meets or exceeds all drinking water standards and to "aggressively protect groundwater from the threat of contamination" in accordance with our Board of Directors policy. Board

policy also directs us to "promote access to equitable and affordable water supplies" and we take that responsibility seriously.

Despite having no role in the production of PFAS or the release of these "forever chemicals" into the environment, water agencies must now find ways to remove them from local water supplies or identify alternative water supplies. Valley Water supports the EPA's efforts to limit PFAS in drinking water but encourages the EPA to minimize the financial burden on water agencies and ratepayers.

As described in the ACWA comment letter, nationwide water utility costs from the proposed rule will likely far exceed the EPA's cost estimate. While the Bipartisan Infrastructure Law provides much-needed funding, more will be necessary to address PFAS contamination in all communities. Valley Water supports a strong focus on financial support to address PFAS contamination in disadvantaged communities. However, PFAS will impact broad communities nationwide, as water supplies are not distinguished between economic classes, geographical, or demographic boundaries.

Like most other water utilities, Valley Water is already facing significant pressure on rates due to increased capital and operations costs, aging infrastructure, source water quality challenges, and new investments needed for continued water supply reliability. Valley Water encourages the EPA to hold polluters accountable and to consider ways to provide financial assistance to all impacted water agencies such that ratepayers are not unduly burdened with the costs for addressing PFAS contamination.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044395)

Costs to public water systems including funding treatment design and installation, operation and maintenance, availability of certified operators for implementing treatment options, and potential treatment supply chain product availability represent challenges especially to small water systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Inland Empire Utilities Agency (IEUA), California (Doc. #1666, SBC-043388)

Water and wastewater providers do not use PFAS in their process but are passive receivers. EPA's proposed regulation would result in significant cost increases on essential public service providers which would have severe negative impacts on the communities and residents they serve.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

City of Allentown and Lehigh County Authority (LCA), Pennsylvania (Doc. #1667, SBC-043683)

4. Funding Capacity & Timing -- Infrastructure Investment and Jobs Act (IIJA) may be a vital resource for water utilities in their efforts to achieve compliance with the proposed PFAS rule. However, the $55 billion allotted for water infrastructure is set to expire in 2026 which is before the implementation date of the proposed rule. Further, the water process for applying and receiving IIJA or other funds through the Drinking Water State Revolving Fund (DWSRF) or the Water Infrastructure Finance and Innovation Act(WIFIA) can be time consuming.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

City of Allentown and Lehigh County Authority (LCA), Pennsylvania (Doc. #1667, SBC-043685)

In addition, efforts should be made to find avenues to extend the availability of current funding streams so that support is available for utilities when they need it.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

City of Hillsboro, Oregon (Doc. #1668, SBC-043122)

Hillsboro Water greatly encourages EPA to increase the funding availability for infrastructure investments to allow utilities to implement and install the needed advanced treatment technology to ensure their drinking water meets the proposed MCLs and MCLGs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044912)

Cleveland Water supports EPA in protecting public health by ensuring safe, clean drinking water to the public at an affordable rate. This is why it is crucial EPA is using all the resources available to make the decisions that will have profound financial implications on the public. EPA always has the authority to strengthen drinking water standards when new data or science presents itself, but the agency is not able to walk back previously finalized standards if subsequently obtained data demonstrates that the occurrence of a contaminant is not as widespread as had been believed. This means that water system ratepayers would be permanently saddled with monitoring and treatment costs related to these low-occurrence contaminants –

funding that may be put to better use addressing improving infrastructure or addressing widespread contaminants that pose broad threats to public health.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that less occurrence than estimated would decrease estimated treatment costs and there would be more resources available to fewer communities providing treatment. Funding is also included to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to improve infrastructure or address widespread contaminants. Finally, it is important to note that occurrence is one piece of an important puzzle, more information on how the EPA regulates contaminants as well as the regulatory process can be found in sections 2.3 and 3 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies (ACWA) (Doc. #1675, SBC-044931)

EPA points to funding provided in the Bipartisan Infrastructure Law (BIL) as the answer to the impending costs of this proposal. The BIL provides $9 billion to invest in drinking water systems specifically impacted by PFAS and other emerging contaminants through the Drinking Water State Revolving Fund (DWSRF) and Emerging Contaminants in Small or Disadvantaged Communities Grant Program.

ACWA appreciates this foundational funding to address PFAS contamination, however, the anticipated total costs of this proposal, including both capital and operation and maintenance costs, would greatly exceed this additional funding. Accurate cost estimates of proposed drinking water regulations are directly tied to whether the regulation is "feasible" under SDWA. As a result, ACWA believes the proposed rule is not feasible because the anticipated costs of this regulation have not been sufficiently evaluated.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that significantly more funding than suggested by the commenter is available through BIL, as noted in section 2.4 of the EPA response in this *Response to Comments* document. The EPA has published extensive details regarding its economic analysis (EA) as well as feasibility determination, and more information can be found in section 13 of the EPA response in this *Response to Comments* document as well as the rule supporting documents, such as the Best Available Technologies and Small System Compliance Technologies for PFAS in Drinking Water and the Technologies and Costs for Removing Per- and Polyfluoroalkyl Substances from Drinking Water documents.

City of Vancouver Water Utility, Vancouver, WA (Doc. #1684, SBC-044301)

May 30, 2023

Michael S. Regan

Administrator Environmental Protection Agency 1200 Pennsylvania Avenue, N. W.

Mail Code: 4607M Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114 Comments - Draft PFAS Primary Drinking Water Regulation

General Comments:

Thank you for the opportunity to comment. The City of Vancouver Water Utility is in support of the development of a science based Per- and Polyfluoroalkyl Substances (PFAS) Primary Drinking Water Regulation that supports public health. The PFAS rulemaking and the assurance of providing a safe water supply and a safe environment for our residents are extremely important to the City of Vancouver. Protection of our natural resources and ultimately protection of the citizens is of the utmost concern.

However, there are substantial questions with EPA's current proposal. It is critical that EPA gets this right, as the costs that the proposed rule would impose are significant, and significantly underestimated, leading to several challenges to the water utilities. We urge EPA to conduct a more thorough analysis that more accurately captures the costs of compliance and if necessary, the agency collects more data to inform and address the gaps that currently exist. This should be a reasonable request given that the agency caveated its own work in the posting by listing a host of data limitations and uncertainties from a lack of modeling national costs for treatment.

Vancouver is committed to limiting exposure to PFAS and protecting the environment. At the same time, we want to ensure efforts do not impose unintended consequences by unnecessarily directing resources away from other water system priorities like noncompliance with existing pollutant MCLs, the lead service line inventory, cybersecurity, replacement of failing infrastructure, or conservation and resiliency efforts. The reallocation of resources to deal with a PFAS response at the proposed levels will mean deferring on maintenance, which could risk failure of water infrastructure and be ultimately more costly in terms of quality of life in dollars, public health, and the environment.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA's final rule represents data-driven drinking water standards that are based on the best available science, meet the requirements of SDWA, and regulation of the PFAS covered by the NPDWR is vital toward protecting public health by removing these contaminants from our nation's drinking water. Funding is also included to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to improve infrastructure or address widespread contaminants. See section 13.3.3 on the EPA's response to comments on national treatment costs, and section 13.3.2 for the EPA's response to comments on the costs of the Hazard Index, specifically. Further, the EPA notes that it is best practice to identify known data limitations and uncertainties in any scientific or economic analysis, including this one (see e.g., USEPA Guidelines for Economic Analysis for more information). Finally, the EPA modeled national treatment costs of treating for PFOA, PFOS, and PFHxS. System level costs for treating PFNA, Gen X, and PFBS are discussed in detail in section13.3.2 of the EPA response in this *Response to Comments* document.

Massachusetts Coalition for Water Resources Stewardship (MCWRS) (Doc. #1691, SBC-044321)

More specific comments are as follows:

1. EPA's cost estimate for nationwide compliance with the proposed MCLs is significantly lower than estimates prepared by experts in the water profession. EPA's costs analysis suggests annualized compliance costs of up to $1.3 billion based on up to 6,300 water systems exceeding one or more of the proposed MCLs. The American Water Works Association (AWWA) had a cost estimate prepared by an engineering consulting firm experienced in the design of water treatment facilities. The AWWA estimate landed at $40-$55 billion for total compliance costs and annualized costs of $3.8 billion to $5.2 billion. Here in Massachusetts, the most recent Intended Use Plan for the State Revolving Fund found the state financing 24 PFAS drinking water treatment projects for a total of $209 million, or $8.7 million per project. The AWWA analysis and the Massachusetts SRF data suggest EPA's estimated costs are well below the mark. If the costs are underestimated then the cost benefit analysis would also be skewed and the federal funding through the Bipartisan Infrastructure Law (BIL), which is touted as the solution to the cost impact for PFAS compliance, will also be inadequate. Water ratepayers will carry the burden of funding PFAS MCL compliance unless federal grants are increased to cover the costs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA disagrees with many of the assumptions in AWWA's B&V report and the report's overall conclusions about the estimated national costs; see section 13.3.3 of the EPA response in this *Response to Comments* document for details.

New Jersey Department of Environmental Protection (NJDEP) (Doc. #1699, SBC-045011)

New Jersey also notes that the successful implementation of the proposed primary drinking water standards will require a sustained long-term investment in water and waste management infrastructure. While the Bipartisan Infrastructure Law has provided a historic level of investment, New Jersey's analysis of the projected cost of implementing the proposed primary drinking water standards has indicated that significant additional funding will be required. The cost of designing, installing, and maintaining treatment facilities for water systems to comply with the proposed standards, as well as for primacy agency oversight, will be significant, and ongoing and increased support from the federal government is essential to prevent the upfront cost of compliance from being borne solely on the shoulders of residents in the form of increased water bills.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies et al. (Doc. #1701, SBC-043837)

Water systems are responsible for addressing various public health risks while also working to maintain affordable rates for their community. Regulations must not impose excessive financial burdens on ratepayers that drive rates beyond affordable levels for low-income households, as economic hardships can force difficult choices between water bills and essential needs. Our groups acknowledge the funding that the Bipartisan Infrastructure Law provides for PFAS, but given the estimates of organizations signing this letter, we reiterate to EPA and to Congress that this money is nowhere near enough to cover the cost of compliance.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Protecting Our Water, Environment, and Ratepayers (POWER) (Doc. #1714, SBC-045933)

The pass-through cost of implementation is very high and may prevent poor and rural communities from maintaining access to safe drinking water.

EPA's proposed NPDWR acknowledges that, in general, water agencies are able to pass through cost increases to their consumers. As such, it is important to adequately consider the actual costs to consumers to determine the proportionate impact and the feasibility of these changes. As of 2019, the average household spends $876/year on water. Table 22 [FN14: Proposed Rule, 88 Fed. Reg. at 18687.] has been revised to reflect the percent increase of cost for implementing the technologies necessary for PFAS treatment.

[Table 1: See Docket ID EPA-HQ-OW-2022-0114-1714]

GAC=Granular Activated Carbon; IX = Ion Exchange; RO=Reverse Osmosis; NF = Nano-filtration; POU = Point of Use

As shown by the amended table, implementing any of the technologies will substantially increase the average household cost of water with a disproportionate impact on rural communities or lower income families.

POWER! is concerned that many of the communities we serve will find it difficult to afford these pass-through costs for significant investments in new treatment infrastructure and treatment byproduct disposal in just three years. This will require water and wastewater agencies to rely on either limited federal funds to perform the treatment upgrades or take on substantial debt in a very short window. It will also increase water and wastewater agencies' operation and maintenance costs and the public's utility bills in perpetuity. In addition to our duties to serve clean water and wastewater, POWER! members each have a duty to ensure costs are reasonable and affordable for the public we serve.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044763)

12. WDEQ Recommends EPA Provide Additional Training and Funding Opportunities for Small and Rural PWSs Due to the Increased Burden of Training to Implement Best Available Technologies (BATs) for PFAS Treatment of Drinking Water

The BATs presented in the proposed PFAS NPDW rule will require an increase in the PWS operator certification level. Recruitment of qualified operators is already a significant challenge in small and rural communities. The proposed BATs will result in an increased cost to small and rural PWSs by resulting in them needing to offer additional training and appropriate pay for existing operators or employ workers with the required certifications. EPA should provide additional training and funding opportunities for small and rural PWSs to help ensure that communities have available and trained workforces. Without EPA support, the costs will be passed on to consumers, who are already being impacted by cost-of-living increases.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA recommends states use the full DWSRF 2 percent small system technical assistance set-aside and the newly available CWSRF 2 percent technical assistance funds to enhance or build programs that proactively identify, reach out to, and provide assistance to rural, small, and Tribal publicly owned treatment works and drinking water systems, particularly in disadvantaged communities. The programs should be designed to help disadvantaged communities identify needs, develop projects, apply for funding, design and implement projects, build capacity, and create training and career pathways. The agency has been collaborating with states, technical assistance providers, industry associations, and interested stakeholders to provide technical materials that can assist water systems in complying with the regulations, as well as outreach efforts to help develop technical and operator capacities. More information on available operator and technology capacity can be found in section 10.6 of the EPA response in this *Response to Comments* document.

Monte Vista Water District (MVWD) (Doc. #1718, SBC-043529)

The cost to treat PFAS can vary depending on several factors, including the specific treatment method, volume and concentration of PFAS contaminants, the site characteristics, and local regulations. Estimates for PFAS treatment can reach several million dollars, requiring significant funding for such projects. Operational costs associated with compliance testing and disposal of spent media are also significant. Federal and state funding will be required to offset both capital and operational PFAS treatment costs, which would otherwise disproportionately affect the disadvantaged and low-income communities we serve.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA agrees that site-specific factors impact rule compliance cost.

Monte Vista Water District (MVWD) (Doc. #1718, SBC-043535)

The cost to treat PFAS can vary depending on several factors, including the specific treatment method, volume and concentration of PFAS contaminants, the site characteristics, and local regulations. Estimates for PFAS treatment can reach several million dollars, requiring significant funding for such projects. Operational costs associated with compliance testing and disposal of spent media are also significant. Federal and state funding will be required to offset both capital and operational PFAS treatment costs, which would otherwise disproportionately affect the disadvantaged and low-income communities we serve.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Thurston Public Utility District (PUD), WA (Doc. #1729, SBC-043588)

7. On page 18,639, funding should be provided by the EPA to Washington State to provide an effective implementation and data system support to implement the HI if approved.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. States can use a portion of the SRFs for administration of the funds.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045962)

AMWA supports EPA in protecting public health by ensuring safe, clean drinking water to the public at an affordable rate. This is why it is crucial EPA is using all the resources available to make these decisions that will have such profound financial implications for the public. EPA always has the authority to strengthen drinking water standards when new data or science presents itself, but the agency is not able to walk back previously finalized standards if subsequently obtained data demonstrates that the occurrence of a contaminant is not as widespread as had been believed. This means that water system ratepayers would be permanently saddled with monitoring and treatment costs related to these low-occurrence contaminants – funding that may be put to better use addressing improving infrastructure or addressing widespread contaminants that do pose broad threats to public health.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that less occurrence than estimated would decrease estimated treatment costs and there would be more resources available to fewer communities providing treatment. Funding is also included to address leaded pipes and to supplement the DWSRF and CWSRF which may be used to improve infrastructure or address widespread contaminants. Finally, it is important to note that occurrence is one piece of an important puzzle, more information on how the EPA regulates contaminants as well as the regulatory process can be found in sections 2.3 and 3 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045946)

May 30, 3023

Michael S. Regan Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, NW Washington, D.C. 20460

Via electronic submission

Re: Docket ID #: EPA-HQ-OW-2022-0114; PFAS National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan,

The Association of Metropolitan Water Agencies (AMWA), an organization representing the largest publicly owned drinking water utilities in the United States, welcomes the opportunity to provide comments on the proposed National Primary Drinking Water Regulation of PFOA, PFOS, PFBS, HFPO-DA and its ammonium salts (known as GenX), PFNA, and PFHxS. AMWA strongly supports policies that protect public health and economic vitality via safe, affordable, and sustainable drinking water. AMWA appreciates the opportunity to lay out its concerns with elements of the rulemaking – particularly related to costs/affordability and compliance timeline, among many others.

Although AMWA supports regulating PFOA and PFOS in drinking water, AMWA disagrees with EPA's choice to place the lion's share of the financial burden of PFAS removal from drinking water on the American public rather than those producing and manufacturing these chemicals. EPA should be pursuing a polluter pays principle, where polluters are responsible for PFAS pollution prevention and remediation. EPA could mitigate these costs without compromising protection of public health by prioritizing water systems with the highest concentrations of PFAS. By doing so, these systems would gain expedited access to essential project resources including supplies, labor, and funding.

EPA's cost analysis vastly underestimates the real-world costs that this rulemaking will impose on public water systems, and ratepayers will bear those costs. Even worse, those costs will disproportionately affect economically disadvantaged and underserved communities. As EPA continues to work toward addressing environmental justice, the agency should be working to reduce burdens on these communities, not imposing further financial stresses. Given the numerous pressing priorities that public water systems are already grappling with, including challenges posed by aging infrastructure, compliance with various regulations, the impacts of climate change, and the current difficulties stemming from inflation, labor shortages, and disruptions in the supply chain, it is evident that more time than what is proposed in this rulemaking will be necessary for the implementation of PFAS treatment technologies. Projects of this magnitude can rarely be done in three years, but with the certainty of additional time, many water systems will be able to come into compliance by the deadline.

The association was able to provide the following comments to EPA in the short, 60-day comment period that was given for such an intricate and consequential rulemaking. In addition to real-world data and information AMWA collected from members who have explored or are currently exploring PFAS treatment, the association commissioned a report on the additional benefits and disbenefits of this proposed rule. This report can help EPA further explore the costs and benefits of its final rulemaking.

AMWA welcomes the opportunity to engage in continued dialogue regarding the effective implementation of this proposed rulemaking, with the overarching objective of enhancing public health protections in a manner that is financially feasible and accessible to all. If you have any additional questions, please contact Brian Redder (Redder@amwa.net), AMWA's Manager of Regulatory and Scientific Affairs.

Sincerely,

Tom Dobbins

Chief Executive Officer

Comments on Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Docket ID No. EPA-HQ-OW-2022-0114

May 30, 2023

[Table of Contents, see docket ID EPA-HQ-OW-2022-0114-1738]

Section 1: Overarching comments

AMWA continues its strong support of regulation based on sound science that is protective of human health. Due to the significant risks of severe health effects and their persistent nature, AMWA agreed with EPA's 2021 final determination to regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) in drinking water. Public water systems (PWSs) and EPA share the same goal of ensuring the delivery of clean, safe drinking water to the public, and AMWA welcomes continued dialogue with EPA on the best ways to accomplish this goal.

PWSs provide an important and valuable service to the public, and the burdens of pollution remediation should not be solely placed on these systems and their ratepayers. Foremost, EPA

should focus its resources on incentivizing pollution prevention and regulating per- and polyfluoroalkyl substances (PFAS) pollution where it is manufactured and/or used, rather than putting the entirety of burdens on passive receivers. It is much easier and more cost effective to prevent chemical discharges from entering the nation's waterways than trying to remediate pollution downstream. EPA must do more to hold polluters accountable and implement the "polluter pays" principle, where those causing pollution are responsible for the cost of clean-up. Relying solely on PWS ratepayers to finance the removal of contaminants shifts this responsibility to a "community pays" model, where the burdens of pollution removal are unfairly placed on the public.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. In the SRFs, funding is included to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to improve infrastructure or address widespread contaminants. Information on simultaneous compliance with other regulations is provided in section 10.4.2 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045979)

Another concerning aspect of these technologies is that the removal media does not maintain the same level of performance indefinitely and will require routine replacement or reactivation. For AIX, once the resin has been spent, there is no feasible way to reactivate it. GAC can be reactivated but only a finite number of times. With levels proposed at the PQL of 4.0 ppt, water systems that have already implemented one of these technologies for PFAS treatment will face increased costs and must revise treatment plans. To reliably treat down to the proposed level, which is half the level of the lowest state MCL, will require much more frequent replacement of media. In some instances, PWSs have indicated this will cut their media life in half. This will significantly increase operation and maintenance costs and will also require more frequent and distant transport by trucks of spent material to disposal sites or fossil-fuel-operated reactivation facilities, resulting in more contributions of greenhouse gas (GHG) emissions and quickly fill landfills. With only a select few GAC reactivation facilities in the country, significant transport costs, often time across state lines, will be required.

AMWA wants to reiterate that EPA and the association are both working toward the same goal of protecting public health by providing drinking water that is not only clean and safe but also affordable. Many utilities across the U.S. are struggling with the ability to maintain affordable rates in light of routine required capital and regulatory projects. Regulations must not put unnecessary financial burdens on ratepayers. Any economic hardship can cause individuals to have to make difficult choices like choosing between paying water bills and buying groceries. Access to safe, clean drinking water is a necessity, and it is important to develop regulations that do not unnecessarily compromise the abilities of PWSs to provide water access that is affordable and equitable.

While AMWA was and continues to be extremely supportive of the passage of the Bipartisan Infrastructure Law (BIL), the money provided will be insufficient to cover the cost of this rule. Between replacing lead service lines, addressing water scarcity, and upgrading aging infrastructure, there simply are not enough federal funds to offset large increases in water bills. It is difficult for utilities to justify rate increases when federal funds available are presented as grants and a catch-all fix to the affordability issue. EPA should use the momentum of recent federal legislation to highlight projects being done with federal funds but also illustrate the need for funding for projects that still need to be done.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on Best Available Technologies is included in section 10. The EPA notes that while granular activated carbon (GAC) can be reactivated repeatedly, we estimate that roughly 20 percent will need to be replaced each activation cycle. While anion exchange (AIX) resins can be regenerated, the EPA expects that this will be unlikely for drinking water utilities based on our research. SRFs include set asides to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to improve infrastructure or address widespread contaminants. Greenhouse gases and the social cost of carbon were addressed in the economic analysis (EA), as described in section 13 of the EPA response in this *Response to Comments* document.

Del-Co Water Company, Inc. (Doc. #1744, SBC-043621)

Again, taking into account information provided in preceding sections of this document, Del-Co questions whether this funding could be allocated to other priorities (e.g., replacing lead service lines, upgrading cybersecurity, replacing aging infrastructure, and assuring sustainable water supplies) which would provide greater benefit, risk reduction, and public health protection to the ratepayers.

Thank you for the opportunity to provide comments on the proposed PFAS regulations. As mentioned previously, PWSs understand the importance of ensuring drinking water meets all Safe Drinking Water Act requirements and protects public health. Therefore, EPA has an obligation to address all stakeholder comments prior to finalizing the regulations. We look forward to working collaboratively with EPA and the state primacy agencies to ensure our PWSs can meet their mandate of continued protection of public health.

Respectfully,

Jeffrey Kauffman

Compliance Manager

6658 Olentangy River Road

Delaware, OH 43015

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. SRFs include set asides to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to upgrade cybersecurity, replace aging infrastructure, and assuring sustainable water supplies.

City of Thornton, Colorado (Doc. #1748, SBC-044799)

Thank you for considering these comments during the finalization of the PFAS NPDWR. Thornton is supportive of the EPA's efforts to protect consumers but strongly emphasizes that ratepayers should not be responsible for the cost burden of this proposed rule that protects public health from the pollution caused by decades of corporate and industrial malfeasance.

Sincerely,

Caleb Owen

Water Quality Administrator City of Thornton

9500 Civic Center Dr Thornton, CO 80229

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

City of Thornton, Colorado (Doc. #1748, SBC-044782)

In addition, EPA needs to work with Congress to increase funding for PFAS treatment beyond what has currently been established by the Bipartisan Infrastructure Law. EPA also needs to simplify the requirements for receiving these funds. While Thornton generally supports EPA's environmental justice considerations, Thornton also sees advantages to prioritizing funding towards systems that may not qualify as a disadvantaged but will see a greater benefit to public health because that funding will affect a greater number of people or address areas of higher contamination. Likewise, while Thornton as a whole does not meet requirements for a disadvantaged community, the City still contains many neighborhoods that would and also has a significant underrepresented population. Thornton believes it should receive funding from EPA to address PFAS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. States have the flexibility to determine priorities and select projects for grant funding as well as establish a definition of disadvantaged communities that can receive additional subsidization. States may provide additional funds to municipalities that meet the state's affordability criteria, municipalities that do not meet the state's affordability criteria but seek additional subsidization to benefit individual ratepayers in the residential user rate class, or entities that implement a process, material, technique, or technology that addresses water or energy efficiency goals; mitigate stormwater runoff; or encourage sustainable project planning, design, and construction.

Las Cruces Utilities (LCU) (Doc. #1753, SBC-043924)

In response to Section XIII. Health Risk Reduction and Cost Analysis, EPA requests comment on whether factors such as anticipated Federal funding, the structure of PWSs relative to private enterprises, or the nature of the public health benefits should be further explored in the final rule analysis, including as it relates to the estimated range of impacts under the applied discount rates.

• Federal funding needs to be increased to cover implementation costs of this rulemaking, and the uncertainty regarding the availability of this funding should be further explored in the final rule analysis.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045641)

As part of this proposal, EPA proposes preliminary determinations for PFHxS, PFNA, HFPO-DA, and PFBS concurrently with a proposed drinking water standard for these compounds. The preliminary determinations for PFNA, HFPO-DA, and PFBS are not supported by the available occurrence data and the determination for the mixture of these PFAS is similarly lacking in co-occurrence data and is inconsistent with EPA guidance. Furthermore, the proposed regulation of these compounds concurrently with the preliminary determination is beyond EPA's authority under SDWA. EPA should (i) not finalize the preliminary determinations, (ii) evaluate and, if appropriate, re-issue the preliminary determinations following the availability of UCMR 5 data, and (iii) withdraw and re-issue a scientifically sound and adequately supported proposal to regulate the PFAS among these four which EPA can provide a sound basis for a positive determination to regulate.

With respect to the proposed drinking water standards for PFOA and PFOS, the docket does not support finalizing a rule, particularly a rule where attributable benefits outweigh quantifiable costs. The affordability of EPA's rule options is especially questionable for households served by small systems – systems which SDWA requires EPA give particular attention to in crafting a drinking water standard. If EPA moves forward with a final rule, setting MCLs for PFOA and PFOS at 10 ppt is the most appropriate option among the options EPA has analyzed. This option will prioritize water systems with the highest PFAS levels moving forward immediately.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Information on occurrence data is contained in section 6 of the EPA response in this *Response to Comments* document. Section 3 of the EPA response in this *Response to Comments* document contains information on regulatory determinations and section 2.3 contains some information on the regulatory process. More information on how the MCLGs were determined is in section 4, and more information on MCLs is in section 5 of the EPA response in this *Response to Comments* document. The EPA has described its use of the best available science in the particular sections (e.g., section 10 for treatment technology information,

section 6 for occurrence, section 4 for health effects). The EPA determined that 4.0 ng/L is feasible (see section 5) and is as close to the MCLG as is feasible. The EPA accounted for costs in its HRRCA and its evaluation of feasibility for the final MCLs. When establishing the MCLs, the EPA considered costs of treatment technologies that have been demonstrated under field conditions to be effective at removing the regulated PFAS and determined that the cost of complying with the MCLs is reasonable (please see section 5.1.3 for additional discussion on cost considerations when establishing the final MCLs).

American Water Works Association (AWWA) (Doc. #1759, SBC-045555)

The responsibility of the Administrator is to ensure that regulatory actions are implemented in a cohesive manner for the effective protection of the environment and the public. It is imperative that the Administrator begin to advance these actions more meaningfully to minimize the role that communities play in addressing PFAS contamination that they were not responsible for causing. Advancing these actions in a more meaningful, cohesive manner has the potential to curb costly burdens on water system rate payers.

Ensuring Community Resources are Invested in High Priorities

In crafting NPDWRs, it is imperative that the abovementioned guiding principles be followed by the agency to ensure that community resources are invested in high priority risks. In crafting SDWA, Congress recognized the importance of addressing contaminants of greatest concern as part of the development of NPDWRs. EPA must consider the impact this final rule will have on communities as they are managing multiple priories for community investments to protect public health. Important examples include the replacement of lead service lines, enhancing cybersecurity protections, continuing to improve risk reductions related to disinfection byproducts (DBPs), and the continuous efforts to replace and maintain aging infrastructure to avoid the risk of water main breaks and other threats to public health. The benefits and costs of new standards must be carefully, and accurately, weighed to ensure the investments needed to meet new regulatory requirements do not inappropriately lead to reallocating available funds away from public health concerns of higher priority, causing unintended consequences.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. SRFs include set asides to address leaded pipes and to supplement the DWSRF and CWSRF, which may be used to upgrade cybersecurity, replace aging infrastructure, protect against disinfection byproducts (DBPs), and assure sustainable water supplies. The EPA has considered the rule's impact on communities, see sections 13 and 10.5 of the EPA response in this *Response to Comments* document.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044251)

PFAS Treatment Concerns

Complying with most drinking water contaminants can generally be achieved with modern treatment technologies. However, these treatment technologies are becoming increasingly unaffordable for many community water systems, especially those that are considered small and/or disadvantaged. These proposed PFAS regulations may require small and disadvantaged communities to fund and construct expensive advanced treatment systems in order to achieve compliance. Additionally, the overall operation and long-term maintenance of these advanced treatment systems may also require advanced level operations and increased utility rates that many small and disadvantaged communities may not be able to afford. On top of that, many community water systems are already struggling with failing infrastructure and may not have the capacity to fund multiple high dollar projects at the same time. NMED highly recommends that EPA consider a significant amount of easily accessible low cost, or no cost funding options for community water systems that may need advanced treatment or advanced level certified operators.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Eastern Municipal Water District (EMWD) (Doc. #1780, SBC-043825)

In addition to the comments herein, EMWD echos the comments on this Proposed Rule that were submitted by the Western Urban Water Coalition, the Association of California Water Agencies, and the WateReuse Association, and in addition would like to make the following comments. EMWD strongly supports efforts to address PFAS contamination and protect public health, however we feel strongly that water customers should not bear the cost of clean up and compliance.

Thank you for the opportunity to comment, and also for your consideration. If EMWD can be a resource as you evaluate next steps, please contact me at mouawadj@emwd.org.

Sincerely,

Joe Mouawad, P.E.

General Manager

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

National Ground Water Association (NGWA) (Doc. #1804, SBC-045465)

Laboratory Availability/Capacity - Does adequate lab availability to test to the MCL exist (this may apply to other contaminants as well as PFAS)? Actions that EPA should consider to enable more laboratory capacity are:

1. Provide funding to support an aggressive buildout of nationwide laboratory capacity.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. It is important to note that the DWSRF set-asides can be used to obtain test kits/laboratory equipment for systems to test for newly recognized contaminants of concern and training to use that equipment as mentioned in the memorandum from Radhika Fox dated 8 March 2022, titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law."

Florida Rural Water Association (FRWA) (Doc. #1806, SBC-044697)

Existing funding mechanisms will not cover costs such as ongoing sampling, bottled water, treatment system operation and maintenance, and additional operator certifications. Most of these smallest systems do not employ on-site operators and will need to pay increased visits and assistance from contract operations companies.

Zephyrhills, is a Florida community water system impacted by PFAS. Treatment costs are still adding up, but so far, millions have been spent on loss of supply, engineering, treatment, and remediation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Office of Advocacy at the U.S. Small Business Administration (Doc. #1807, SBC-045479)

II. Advocacy's Small Business Concerns

A. Advocacy is concerned that small water systems will not have funding for timely compliance with EPA's proposed rule.

Overwhelming feedback indicates that small water systems do not currently have, nor will they have access to the funding required to comply with this rule, either at all or to ensure timely compliance. Advocacy is concerned that EPA did not adequately consider critical significant alternatives to reduce the significant economic burden on small entities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Regarding the EPA's evaluation of the impacts to small entities as required under the Regulatory Flexibility Act (RFA) / Small Business Regulatory Enforcement Fairness Act (SBREFA), see section 15.3 of the EPA response in this *Response to Comments* document. Additional information on impacts to small water systems can be found in sections 13 and 10.5 of the EPA response in this *Response to Comments* document.

Office of Advocacy at the U.S. Small Business Administration (Doc. #1807, SBC-045484)

b. EPA has overestimated its reliance on federal funding to defray compliance costs for small water systems.

Advocacy is concerned that EPA has overestimated its reliance on federal funding to help small water systems comply with its proposed requirements. EPA relies on anticipated federal funding to defray compliance costs for small water systems citing that "[t]he passage of the Infrastructure Investment and Jobs Act, also referred to as the Bipartisan Infrastructure Law (BIL), invests over $11.7 billion in the Drinking Water State Revolving Fund (SRF); $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion to Small, Underserved, and Disadvantaged Communities Grants."[FN13:88 Fed. Reg. at 18640.] The agency states that "[t]hese funds will assist many disadvantaged communities, small systems, and others with the costs of installation of treatment when it might otherwise be cost-challenging."[FN14: 88 Fed. Reg. at 18640.] EPA further explained that "these funds can also be used to address emerging contaminants like PFAS in drinking water through actions such as technical assistance, water quality testing, and contractor training, which will allow communities supplemental funding to meet their obligations under this proposed regulation and help ensure protection from PFAS contamination of drinking water."[FN15: Id. at 18644-45.] These funding opportunities may be available but there is no guarantee that it will be provided to the small water systems to comply specifically with this proposed rule. Moreover, the funding is likely to be insufficient because it only covers capital costs and will not alleviate the costly burden associated with the operation and maintenance costs (O&M). Finally, even if funding was available to small water systems, it is unlikely that it will be utilized efficiently to ensure timely compliance with the rule.

Federal funding referenced by EPA is not allotted specifically for compliance with this rule. Once that federal funding is dispersed to the states, availability to small public water systems may be limited due to other competing priorities and is often laden with stipulations. For example, during one of EPA's public hearings on the rule, a California stakeholder, who works with small and very small water systems, pointed out that available federal funding often gets encumbered once it gets to the states by being subjected to other priorities. This stakeholder recommended that the funds should be specifically designated for PFAS treatment and should be prohibited from being used for other requirements (e.g., state consolidation). A small entity representative of private primary schools in Wisconsin shared that without access to funding, either tuition will increase, or the school will close. Another commenter from EPA's public hearing, an Arizona water company, expressed that water utilities need additional opportunities to obtain funds to comply with the proposed regulations.

Given EPA's underestimated impacts of the rule (discussed above), the funding EPA relies on to defray the costs will not be sufficient. Especially, due to the number of systems that will likely need to implement treatment to comply with the low levels proposed, the funding sources cited by the agency will not be able to provide the compliance assistance required for the small water systems. In addition, as mentioned above, O&M costs will not be covered by the federal funding EPA references. These costs include labor, materials, energy, residual disposal/treatment, and other technology specific costs including trained personnel.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that significant funding is reserved for small systems.

Groundwater Resources Association of California (Doc. #1831, SBC-047714)

The regulations do highlight funds allocated in the Infrastructure Investment and Jobs Act for the Small, Underserved, and Disadvantaged Communities Grants. However, these funds may not be sufficient or difficult to access by CWS/SCWS. We encourage the EPA to work with local and State agencies to identify programs and funding opportunities for the CWS/SWS entities to comply with the EPA's sampling requirements. These opportunities should be paired with supporting access to affordable PFAS-free sampling materials and other external costs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Pennsylvania Municipal Authorities Association (Doc. #1832, SBC-045781)

[PMAA's specific comments on the Proposal are as follows:]

4. As EPA is aware, many states, including the Commonwealth of Pennsylvania, have enacted various PFAS initiatives in advance of EPA's Proposal. In the case of Pennsylvania, a Safe Drinking Water PFAS MCL Rule was published in January, 2023, with MCLs for PFOA and PFAS less stringent than those proposed by EPA. Moreover, Pennsylvania's regulation contains many provisions that the regulated community are or will soon be required to comply with, including monitoring for the aforementioned PFAS chemicals. EPA's Proposal, when finalized, may require Pennsylvania to revise its program and MCLs to meet what appears to be a more stringent EPA regulation. The practical problem is that PMAA member authorities are or will be required to meet the mandates of Pennsylvania's regulation before EPA's PFAS regulation is finalized and, in so doing, will spend significant money to meet requirements that may no longer be applicable once EPA's PFAS regulation is finalized. Does EPA plan on meeting with representatives of Pennsylvania to address this issue, or is EPA going to allow PMAA member authorities to potentially spend significant ratepayer and taxpayer funds on state regulatory initiatives, some of which may be rendered moot upon the publication of a final PFAS Regulation by EPA.

[PMAA's specific comments on the Proposal are as follows:]

5. A final regulation based upon the Proposal and its associated compliance schedule will likely adversely impact the economic wherewithal of many municipal entities. If EPA enacts a final regulation towards the latter part of 2023, then most municipal entities will have a three-year compliance window under the Safe Drinking Water Act, with monitoring beginning during that three-year period. EPA should be aware that there may be tasks required to be implemented to meet the requirements of the Proposal, with such tasks possibly involving many separate and distinct phases, such as planning, design, budgeting and construction, which taken together would likely exceed the three-year window for compliance. Moreover, the timing of a final PFAS regulation based upon this Proposal will present an even more challenging economic environment for many municipal entities, in part because of concurrent regulatory initiatives,

such as the Lead and Copper Rule (and the Lead and Copper Rule Improvements). Although the federal government has earmarked funds for municipal entities to address PFAS, these funds are likely grossly insufficient to address many of the PFAS mandates, let alone compliance with other concurrent federal and state regulatory initiatives.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Analyses conducted by the agency in support of an NPDWR undergo a significant public engagement and peer review process. The EPA notes that the EA for this rulemaking accounts for existing state standards at the time of analysis. Specifically, to estimate the costs and benefits of the final rule, the EPA assumed that occurrence estimates exceeding state limits are equivalent to the state-enacted limit. For these states, the EPA assumed that the state MCL is the maximum baseline PFAS occurrence value for all EPTDS in the state. Additionally, while states may establish drinking water regulations or guidance values absent federal regulation as they deem appropriate, the presence of state regulations does not preclude the EPA from setting federal regulations under the authority of SDWA that meets that statute's requirements. SRFs include set asides to address leaded pipes. Information on simultaneous compliance with other regulations is provided in section 10.4.2 of the EPA response in this *Response to Comments* document. More information on how the EPA consulted states can be found in section 14 of the EPA response in this *Response to Comments* document.

Corix Infrastructure Inc. (Doc. #1834, SBC-045365)

Likewise, Corix recommends that the EPA develop a residuals management plan that addresses disposal capacity, standardized analytical methodology, and ratification of a CERCLA exemption for drinking water systems before finalizing the rule to ensure additional liability and expense is not incurred by the public and the customers of water systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Commenter's request for the agency to develop a "residuals management plan that addresses disposal capacity, standardized analytical methodology, and ratification of a CERCLA exemption for drinking water systems before finalizing the rule to ensure additional liability and expense is not incurred by the public and the customers of water systems" is beyond the scope of this rulemaking. For more information on how the EPA considered residuals management in context of the PFAS NPDWR, please see section 10.4.2 of the EPA response in this *Response to Comments* document. Analytical methodology is standardized and described in section 7 of the EPA response in this *Response to Comments* document.

New England Water Works Association (Doc. #1836, SBC-045375)

Further, we are concerned that EPA has vastly underestimated the cost of implementation [FN6: American Water Works Association WITAF 56 Technical Memorandum, PFAS National Cost Model Report, 2023]. In the interest of rapid implementation of drinking water standards, the burden of paying for treatment will fall to ratepayers when it should be falling to the polluters to

remediate the damage they have caused. A recent comprehensive study found that per-household costs would range from hundreds to thousands of dollars annually [FN7: American Water Works Association WITAF 56 Technical Memorandum, PFAS National Cost Model Report, 2023]. When the Clean Water Act and the Safe Drinking Water Act were passed in the 1970s, Congress felt it so important to make progress with regulatory compliance that there were robust grant programs (to the tune of 90% grants) to support the construction of treatment plants and treatment works. That same level of commitment does not exist today. The Biden Administration points to the funding available through the Bipartisan Infrastructure Law (BIL) as a means to lessen the burden—let us be very clear—it will NOT make a dent in what we anticipate our PWS will need in order to comply with the proposed PFAS rules. Nor does BIL funding adequately address the major backlogs of infrastructure needs which require significant investment in order to maintain public health. EPA's 7th Drinking Water Infrastructure Needs Survey and Assessment [FN8: https://www.epa.gov/system/files/documents/2023-04/Final_DWINSA%20Public%20Factsheet%204.4.23.pdf] released in April 2023 shows the enormous magnitude of costs facing our PWS before we even begin to address PFAS. These figures represent Drinking Water State Revolving Fund- eligible infrastructure projects that are necessary over the next 20 years for PWS to continue to provide safe drinking water to the public. For our region alone, this amounts to more than $24 billion in need (based on January 2021 dollars):

• Connecticut - $4,910,100,000

• Maine - $1,013,900,000

• Massachusetts- $15,192,800,000

• New Hampshire - $1,363,000,000

• Rhode Island - $1,029,000,000

• Vermont- $888,700,000

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA disagrees with many of the assumptions in AWWA's B&V report and the report's overall conclusions about the estimated national costs. See section 13.3.3 of the EPA response in this *Response to Comments* document.

<u>Washington Association of Sewer and Water Districts (Doc. #1842, SBC-044770)</u>

Significantly Higher Costs than Estimated

The costs to clean up drinking water will be far more than EPA estimates. While hopeful that new technologies for cleanup being developed will lower costs, current technologies are not cheap.

One of our members, Lakewood Water District, has submitted a letter with details of their experience mitigating PFAS contamination from a nearby military base. They, along with other utilities, have experienced real world costs that are three to four times greater than the EPA estimates. These high cost facilities must be built into utility rates. EPA's underestimated costs for capital and operational expenses leads to an inappropriate conclusion about the impact on customers served by these utilities, with the greatest impact on smaller utilities that have fewer customers to share in the expense of the rule implementation and underserved communities who already have a hard time paying utility bills. We recognize that some money from government programs will be available, but Congress needs to know the real impacts to the constituents they represent. Underestimating implementation costs will impact the amount of funds that Congress makes available. Having a definitive MCL is helpful for utilities to know what to plan for, but without adequate funding support from Congress, the results will be unachievable without penalizing consumers who did not create the problem.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Metropolitan Washington Council of Governments (Doc. #1843, SBC-044756)

Third, while significant federal funding has been approved by Congress, additional direct federal funding for local governments and water utilities should be provided to help offset the high capital, operations, and maintenance costs expected at the local level. The cost of compliance is estimated by a recent AWWA study to be significantly higher than cost estimates developed by EPA. These potentially high expenses for PFAS treatment come at a time when local governments and water utilities are facing double and triple digit increases in the prices of essential supplies, equipment, and electricity. On top of that, we are also facing potentially high costs to address regional water security and resilience needs, mitigate climate change impacts, meet Chesapeake Bay TMDL restoration requirements, and more. Ultimately, all these costs will fall on ratepayers who are already facing higher costs for other basic necessities such as food, housing, and transportation.

We thank you for your consideration of these recommendations and look forward to continuing to work together on environmental restoration efforts.

Sincerely,

Maria Mackie

Chair, Chesapeake Bay and Water Resources Policy Committee

Cc: Radhika Fox, Assistant Administrator for Water

Adam Ortiz, EPA Region III Administrator

Catherine A. Libertz, Director, EPA Region III Water Division

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA disagrees with many of the assumptions in AWWA's B&V report and the report's overall conclusions about the estimated national costs; see section 13.3.3 of the EPA response in this *Response to Comments* document for details. SRFs include set asides to supplement the DWSRF and CWSRF, which may be used to upgrade cybersecurity, replace aging infrastructure, protect against DBPs, assure sustainable water supplies, address regional water security and resilience needs, mitigate climate change impacts, meet Chesapeake Bay Total Maximum Daily Load (TMDL) restoration requirements, and more.

Amelia Davis (Doc. #1929, SBC-047448)

When looking at the issue at hand it is clear that continuing to unregulated these forever chemicals can only cause further harm and damage to the living things throughout the world. Regulation of these PFAs is something that needs to be done to protect our environment and our health for generations to come. Understandably figuring out a way to regulate these chemicals becomes difficult and while I believe you are going in the right direction; I think that there is more to be done in order to protect our livelihood. The first two steps of the plan to first measure and monitor PFAs in public water systems and to make this information is the right first step in combating this issue. It's with the third step that issues arise.

Reducing the amount if PFAs in our water is known to be a difficult task and one that will cost a lot of money. At the moment the proposed rule change would have ratepayers in charge of paying for this filtering of water (Water Environment Foundations). This is something that should not become the burden of the citizens as they didn't have the knowledge necessary, and they are already responsible for other payments to clean water in other ways, like the Clean Water Act and the Safe Drinking Water Act. Having taxpayers provide funds to clean up a mess that was knowingly created can create issues for the common citizen, as an increase in taxes seems like an easy solution. The Water Environment Foundation also mentions that fact that money may be diverted from other clean water acts, which leads to an ineffective clean water system. It seems like the solution that would allow citizens to get clean water and to keep more of their income is to have the companies that knowingly put these PFAs in the water to pay for the reduction of their chemicals in the water. The amount of money that they have made from manufacturing these chemicals is more than enough to provide safe drinking water through the public water system. While this solution may cause economic issues for these businesses, it forces them to be held accountable and provide incitive to work on creating products that don't cause damage to the entire world.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the health impacts of these six regulated PFAS may be found in section 4 of the EPA response in this *Response to Comments* document. More information on monitoring and compliance may be found in section 8 of the EPA response in this *Response to Comments* document. More information on the regulatory process can be found in section 3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1944, SBC-047323)

The idea of having risk free drinking water is one that is seen to be unachievable due to the extreme cost of testing and cleaning the water. The cost of clean water will fall on those that the pollution most greatly affects in taxpayer dollars (Isaacs-Thomas, 2023). So why aren't the ones making the mess not picking up the mess? When corporations are linked to a mass amount of pollution, they are only forced to pay for part of the clean up, the rest is on us, the ones who are negatively affected by the pollution and had no say (Faye, 2021). When pollution cannot be linked to a corporation, instead of forcing corporations that only pay 21% of taxes in America and make 2.77 trillion dollars every year, the people are forced to pay for it (Faye, 2021). This is why just setting a bare minimum is not enough. There is a better option, it is attainable, we are just skirting around it making shortcut propositions like this. Go after the agencies, fund education, fund science, think about the future, if there is going to be one at this rate, and how they will historically look at this proposition. Would they think you guys went far enough for them or would they laugh, me personally, I'd laugh.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the rule making process can be found in section 3 of the EPA response in this *Response to Comments* document. More information on the health effects can be found in section 4 of the EPA response in this *Response to Comments* document. More information on feasibility can be found in section 5 of the EPA response in this *Response to Comments* document.

Anya Mulvaney (Doc. #1965, SBC-047450)

The EPA's Proposed National Primary Drinking Water Regulation of PFASs Policy attempts to establish legally enforceable levels for six PFAS in drinking water and it would "require [state and city] public water systems to (a) monitor for these PFAS; (b) notify the public of the levels of these PFAS; [and] (c) reduce the levels of these PFAS in drinking water if they exceed the proposed standards." This policy has both various positives and negatives. It could be damaging in some [or many] ways. State or local governments would pay for testing and potential clean-up or remediation, and this would show up in local taxes for citizens. While there is this financial cost, most citizens want to trust their water is safe, so arguably the benefit outweighs the cost. But the issue with this policy is who the cost and responsibility fall on. The question is if the responsibility should fall on the corporations that are disposing of these chemicals into the water, instead of responsibility falling onto the local government and therefore the citizens. This raises the question of how we charge the cost back to the corporations responsible. This issue is a complex one that is about more than what is legal or efficient, but also what is ethically and just.

What we know is 99% of humans have PFASs in their system. High concentrations have been connected to drinking water and have led to sickness. We don't necessarily know in what other ways we are being exposed to it due to the fact that PFASs are in so much of our environment. There are several stakeholders in this matter. Citizens are involved due to health risk; chemicals

companies hold a stake because if the tests proved their processes and products were dangerous it would turn back on them and could have major costs on them; and lastly, the local governments are stakeholders because the cost of testing and clean upfalls on them. The options for action are to test the water or do nothing. Within this, there are different creative ways to fund it. The way this policy has it set up is the local government pays. This would likely be through citizen taxes. Another option would be to hold the chemical companies responsible which could look like special taxes that hit companies or industries that rely on PFASs most. There are possible externalities, such as an increase in taxes and the potential increase in the cost of products containing chemicals.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Lance Freeman (Doc. #2132, SBC-047427)

There is also the issue of money, assuming there is a technology or method that can remove PFAS to the required level it is likely to be very expensive. While few would deny that making drinking water safer is a good use for taxpayer dollars there is the issue of those areas with a smaller population of people/a smaller economy might not have enough taxpayer dollars to afford it; The EPA talked about this themselves. Unless there is a way to help those smaller areas meet the cost criteria such as taking a certain amount out of every area's tax revenue and using any excess from larger economies to help the smaller areas, or maybe an exemption for smaller areas.

While there are likely other issues that I am missing or don't understand the significance of these two are my main concerns and if these two issues are addressed then I trust that the EPA will work out the smaller details sufficiently and they have my personal approval.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on treatment technologies can be found in section 10 of the EPA response in this *Response to Comments* document.

Julia Wolny (Doc. #2313, SBC-047453)

While it is necessary to understand the dire need for federally regulating PFAS in drinking water, it is equally important to discuss how the regulation will be implemented and enforced. The primary feature of the NPDWR is to monitor the level of PFAS in drinking water to ensure they meet appropriate levels. Yet this raises many questions in regard to how violations will be dealt with in a way that holds appropriate parties responsible. Further, the EPA's proposal raises questions about what actions will be taken if PFAS exceeds permissible levels in drinking water. Although the proposal requires notifying the public of PFAS in drinking water if they exceed the proposed standards, it is unclear whether water treatment facilities will be entirely responsible for reducing PFAS in drinking water or if the responsibility will be placed on citizens. If notifying the public is not followed by swift action to reduce PFAS in drinking water, the burden

will inevitably fall upon citizens. This could have detrimental effects as home filters may not be affordable to all citizens and are often ineffective at reducing PFAS depending on the contamination levels. This leads me to echo the comments and concerns proposed by the Association of Metropolitan Water Agencies (AMWA) which calls for the EPA to consider how regulatory actions will affect water affordability for disadvantaged communities.

Once again, I would like to emphasize my support for the EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. Yet I would also like to call attention to the need for a comprehensive analysis of how the regulation will be implemented in a manner that prioritizes all citizens' health and well-being. Logistics such as economic factors and access to resources must be taken into consideration. Failure to complete such examinations will likely decrease the effectiveness of the proposed regulation and disadvantage certain populations.

Sincerely,

Julia Wolny

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on treatment technologies, specifically the use of filters, can be found in section 10 of the EPA response in this *Response to Comments* document. More information on monitoring and compliance can be found in section 8, and section 9 describes public notification requirements of the EPA response in this *Response to Comments* document.

Peter Ayres (Doc. #2679, SBC-047416)

I am concerned that many municipalities might not have the tech, infrastructure and money to implement the requirements that would be needed to meet the rules that are put in place. I know from a small town in Iowa where we have a house they are already trying to update sewer and water lines that are 100 years old at great cost and meet the rules and regs for water quality that are in place now So adding these rules is a good thing, but needs to be evaluated as to how realistic is it for water treatment plants thru out the nation to be able to comply or even afford to update again their filtration systems. I think of Dubuque Iowa's plant that deals with changes in quality of water sometimes every 15 minutes.

I hope something can be implemented.

Thanks

Peter Ayres

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on feasibility can be found in section 5 of the EPA response in this *Response to Comments* document.

Westport Harbor Water Association (Doc. #2855, SBC-047294)

I am President of a rural water supply in Westport, MA. The Westport Harbor Water Association has currently 50 connections. Our PFAS/PFOS levels have been found to be less than 10 parts per trillion. We meet the regulatory limits as set by the Mass DEP but under the proposed rules will not meet the limits. The estimated cost for meeting the new rules would we over $50,000 in capital cost and the estimated yearly maintenance costs are estimated at $40,000. The rules will bankrupt the company and we may not be able to provide water to our members going forward. The State of Massachuesetts has indicated there is little money to help small systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Arizona Water Company (Doc. #3072-11, SBC-047363)

Good morning. My name is Andy Haas. I am the Vice President of Engineering with the Arizona Water Company, and we are a water utility that provides service to over 100,000 customers throughout the state of Arizona. I want to thank you for the opportunity to provide comments this morning. We rely on the EPA for their research and expertise to identify contaminants in drinking water and develop MCLs. We thank EPA for its aggressive stance to mitigate the effects of forever chemicals on the public through drinking water and other forms of exposure. The PFAS research, laboratory testing, and treatment technologies change quickly and frequently, so water utilities are doing their best to keep up. With concentrations this small, there is no room for human error in field sampling and laboratory testing. Many water utilities we have spoken with only sampled for PFAS chemicals under UCMR 3 about 10 years ago, and at the time, laboratory technologies did not have the ability to report results down to the levels in the proposed regulation now and if they're similar to us, we've sampled 10 years ago and had no water sources impacted by PFAS chemicals, but since then, we've continued to sample and may have more than 20 impacted sources. So, we believe other utilities may be similarly affected. As a result, EPA's estimates the number of affected water utilities, water supplies, and the construction and O&M costs may be significantly underestimated, and we expect the results of the UCMR 5 sampling to show a significant increase in the number of affected utilities. As a result, we request that there's additional funding opportunities made available for regulated utilities, not just municipal utilities, as water utilities will need sufficient funding opportunities and opportunities to timely recover their investment costs, while mitigating significant increases to customer water bills, so we can continue to provide safe, reliable, and adequate water supplies to our customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on occurrence in water systems may be found in section 6 of the EPA response in this *Response to Comments* document. Information on analytical methods may be found in section 7, and information on monitoring requirements may be found in section 8 of the EPA response in this *Response to Comments* document.

West Virginia Rivers Coalition (Doc. #3072-21, SBC-047371)

For far too long, residents of the Ohio River Valley have unjustly beared the burden of health impacts from industries manufacturing and using these chemicals. These health impacts include the cost of care for PFAS-related diseases, as well as premature death. West Virginians already pay some of the highest rates for public drinking water in the country. There is simply not capacity for consumers to take on additional rate or tax burdens to clean up the mess of corporations that have benefited from their pollution for decades. Additionally, there is concern about paths for funding making its way into the communities that are most impacted. As we have seen with other federal funding recently made available to upgrade technology and infrastructure, many West Virginian communities do not have the capacity to secure and implement grant funding. Many grants are simply passing West Virginians by. This reality needs to be acknowledged as we explore best practices and work together to ensure that the citizens that are the most impacted by toxic pollution are first in line to receive funding to protect human health. The health of all people who depend on the Ohio River for their primary drinking water source deserve our best efforts to protect them. Thank you.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on health effects can be found in section 4 of the EPA response in this *Response to Comments* document.

California Association of Mutual Water Companies (Doc. #3072-25, SBC-047373)

Secondly, we wanted to call your attention to the fact that even though the EPA is making funds available for this and having grants that are particularly targeted to small and disadvantaged communities, once they get to the state, they often get encumbered in other state priorities. And so if there is a way to make this allocation to California in a way that says this funding has to be separately available just for treatment for PFAS, and it can't be held hostage to a requirement to consolidate or other kinds of state priorities, that would be very helpful because what we're finding is that much of the EPA money that's in the State Revolving Fund right now is only accessible if our small systems are willing to agree to consolidation, and that's not reasonable. Thank you.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Zone 7 Water Agency (Doc. #3072-29, SBC-047377)

Second, I'd like to raise, again, the issue of funding. Although the U.S. EPA can only be part of the funding picture, I will take this moment to remind everyone that the roughly $50 million required to build a PFAS treatment system for just our agency is only part of the picture. The O&M costs in the subsequent decades as well as disposal costs will be significant. Also, one of the cities in our Tri-Valley area expects to incur similar amounts to either build their own system

and/or to pipeline into a nearby system so residents will get hit twice with rate hikes. Something needs to be done to help mitigate this. Although the Bipartisan Infrastructure Bill will help, it does not appear to be nearly enough to cover the capital costs nor the millions of dollars that our area will spend annually. I would ask the EPA to remind the administration and Congress that more robust funding will be needed to truly match the coming expenses. Further, I'd also ask that those that have started the process aren't penalized when funding becomes available, rather that there's retrospective funding. Thanks again for all your work on this issue. We're very happy to see these regulations at last and we hope the funding will follow through to make this available, and so we can finish the job that we started. Thank you and have a good day.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Massachusetts Water Resources Authority (Doc. #3072-49, SBC-047379)

This fails that test. EPA should be doing substantially more to eliminate these chemicals from production and use. Water systems should not be forced to pay to deal with contaminants they have nothing to do with. I agree with other commenters on the potential futility of trying to resolve the PFAS problem with a whack-a-mole approach, and believe the appropriate resolution is to keep those things out of our source waters. Speaking of cost, EPA's cost estimates are wildly too low based on what we've already seen here in New England. And while I'm sure water systems are grateful for the current additional federal funding, it's only a down payment, not nearly enough to meet these standards at a reasonable impact on our customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Raymond Choma (Doc. #3072-59, SBC-047391)

Furthermore, we have the technology necessary to remove PFAS from our drinking water. What we need is the political willpower to enact it at scale without putting the burden on individual households. I'm glad to know that the Bipartisan Infrastructure Law invests funds that will assist many disadvantaged communities, small systems, and others with the cost of installation of treatment when it might otherwise be cost challenging. In conclusion, safe drinking water is a fundamental human right that every American deserves. The new water filtering technologies will reduce cases of heart attacks, strokes, kidney cancer, and bladder cancer. I hope the EPA will finalize the PFAS National Primary Drinking Water Regulation quickly so we can have a healthier tomorrow. Thank you for listening. May the fourth be with you.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Steve Liska (Doc. #2355, SBC-047497)

Plus, the cost of containing this contamination is mounting. I just heard this morning that the Federal Government is going to spend 10 billion dollars to help "filter" some of these chemicals out of drinking water. Seems like it would be better to prevent the drinking water from being contaminated in the first place, as this is another tax-payer expense that could be better allocated.

I'm tired of billion dollar companies dictating policy that allows them to say what's important. It usually ends up being that they get record profits, and the consumer suffers health consequences.

Capitalists are ruining Capitalism. We need good government to put it right.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Steve Liska

Chicago, IL 60625

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

National Center for Health Research (Doc. #3072-73, SBC-047402)

And fourth and last, we appreciate the law that provides funding for these efforts, but it's time to start shifting the costs to the companies that have made these chemicals. When companies are held financially responsible, they'll be less likely to inundate us with PFAS in products. Taxpayers are already stuck with the health risks. It's not fair for municipalities and taxpayers to get stuck with the work and the cost. Thank you very much for the opportunity to speak today.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

San Gabriel Valley Water Association (Doc. #3072-87, SBC-047404)

Additionally, the identified best available technologies may prove costly and inadequate if California and other states decide to adopt more stringent standards. Hazardous waste disposal, which may require transportation across state lines are also not included in the primary economic

analysis and can potentially double the total cost of meeting the MCL requirements. Although the BIL provides billions of dollars to assist water providers, it doesn't cover the ongoing cost of operating and maintaining water treatment systems. These expenses will have to compete with other EPA mandates, such as a Lead and Copper Rule Revisions and the newly introduced cybersecurity measures. We fear that this could lead to disparities between communities that can afford treatment methods and those that cannot. Thank you again for the opportunity to address you here today.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has estimated that cost increases associated with managing drinking water treatment residuals as hazardous waste cost would be approximately $99M at the 2 percent discount rate as described in Appendix N.2 of the EA for the final rule. This represents 7 percent of the total estimated treatment costs of the rule. SRFs include set asides to address leaded pipes and augmentations to the SRFs can be used on cybersecurity measures. Information on simultaneous compliance with other regulations is provided in section 10.4.2 of the EPA response in this *Response to Comments* document. For more information on the EPA modeled costs, please see section 13 of the EPA response in this *Response to Comments* document.

Liliana Salcido (Doc. #1509, SBC-042586)

When it comes to the cost-benefit analysis, the cost of regulation may seem big now, but in the future, people will be healthy and not be hospitalized due to cancer or other diseases caused by PFAS. The American Water Works Association has expressed its concerns regarding consumers paying more for better water saying, "Advanced drinking water treatment systems for PFAS will require communities to make significant investment" (Isaacs-Thomas, 2023). However, it should not be a matter of "if," rather a matter of "when" citizens will pay more for their own well being and that of their neighbors. Decades have passed with countless cancer rates and deaths. Human beings can contribute to society if they are happy and healthy. Public health should be prioritized, especially if taxpayers will have to pick up most of the cost for these regulations.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on how the EPA considered potential costs relative to potential health and other benefits may be found in section 13 of the EPA response in this *Response to Comments* document.

Southern Methodist University Dedman School of Law (Doc. #1512, SBC-042598)

(2) The EPA must take measures to ensure that adequate funding is available to all water utilities needing to improve their filtration equipment to meet new NPDWR standards.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Southern Methodist University Dedman School of Law (Doc. #1512, SBC-042600)

2. Funding for PFAS Reduction Efforts

An additional concern I have with the proposed NPDWR rulemaking has to do with the amount of funding available to local water utilities for necessary equipment upgrades. While I realize the Bipartisan Infrastructure Law has funding dedicated to PFAS reduction efforts, further economic analysis needs to be done to determine the financial impact the new rules may have on communities. Estimates need to be made to determine exactly how much it will cost to reach the Maximum Contaminant Levels (MCLs) dictated by the new regulation.

The reduction of PFAS has the potential to lessen costs incurred due to health problems and deaths caused by long term PFAS exposure. However, PFAS most severely impact poor and minority communities who may struggle to pay for upgraded water treatment equipment. [FN7: Udasin, supra, n.3] It would be inequitable for these communities to struggle to meet a MCL they cannot afford to reach. Therefore, I would like to see assurances that enough funding is in place to meet the MCL goals before the proposed NPDWR rules take effect.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. These requested analyses are part of the EA and affordability analyses; please see sections 13 and 10.5 of the EPA response in this *Response to Comments* document.

Cayro Bustos (Doc. #1517, SBC-042718)

Understandably, the government must consider cost and technological feasibility when considering undergoing any policy decision. New water treatment systems will be required for filtering PFAS from our water, and that will undoubtedly impact some communities more adversely than others. However, in February 2023 the EPA announced the availability of $2 billion from President Biden's Bipartisan Infrastructure Law to address emerging contaminants, including PFAS, in drinking water across the country. Future legislation like this will undoubtedly garner support if the public is educated and aware of the problems of PFAS contamination in their drinking water; many individuals have no idea what PFAS is, let alone its negative health effects. Cheryl Hogue, Why limiting PFAS in drinking water is a challenge in the US, Chemical & Engineering News (Jul. 13, 2020), https://cen.acs.org/environment/persistent-pollutants/limiting-PFAS-drinking-water-challenge/98/i27. Congress never seems to fail to find the budget necessary for what is politically popular; this is not only popular, but necessary for the health of our country.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that significantly more funding than that described by the commenter was made available.

Lecsy Gonzalez (Doc. #1561, SBC-042868)

Although the proposed water regulation would make great strides toward health equity for the general United States population, it places an additional burden on indigenous populations due to a lack of funding to implement these changes. [REF3: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027.] Due to this, I highly encourage to review the budget for this regulation and increase the funding for tribal nations.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Water Works Board of the City of Birmingham (BWWB) (Doc. #1602, SBC-043627)

Date: May 26, 2023

To: Michael Regan Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Mail Code: 1309

Washington, DC 20004

RE: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking – Docket No. EPA-HQ-OW-2022-0114

Dear Administrator Regan,

First and foremost, the Water Works Board of the City of Birmingham (BWWB) would like to thank the USEPA for the opportunity to provide comments on the proposed PFAS National Primary Drinking Water Regulation (published on March 29, 2023) (i.e., the "PFAS Rule"). As the largest drinking water system in the State of Alabama, serving more than 15 percent of the population of the State, and employing more than 600 water professionals, we appreciate the chance to voice our perspective on this proposed regulation.

BWWB owns and operates four water filtration plants within the Birmingham metropolitan area namely: Shades Mountain Filter Plant, Western Filter Plant, Carson Filter Plant, and Putnam Filter Plant. Combined, these filtration plants delivered more than 111 MGD of drinking water to our customers in 2022. Each plant has received a series of awards from AWPCA, CDC, USEPA, and the Alabama Department of Environmental Management (ADEM) in recognition of treatment excellence and safe drinking water quality. As an innovative water leader in our state and nationally, BWWB prioritizes efficient operations, water quality, as well as environmental and community stewardship. In preparation of these comments, we assembled a team of internal

experts (licensed engineers and scientists) as well as our external independent engineer Arcadis US, Inc, and financial experts Raftelis.

Arcadis is a global company leading delivery of sustainable design, engineering, and consultancy solutions for built and natural assets. Arcadis has engaged several experienced national experts in drinking water regulation and water quality planning who have participated in the development of these comments—including their Director of Applied Research and several National Discipline Leaders.

Raftelis is a leading national financial and rate consulting firm that has contributed to major industry affordability research efforts, including completing an assessment of the Federal Low-Income Water Customer Assistance Program (LIWCAP) that was recently implemented by the federal government to help customers afford essential water and wastewater services, and to industry publications, including "Developing a New Framework for Household Affordability and Financial Capability Assessment in the Water Sector" prepared for AWWA, WEF, and NACWA, "Improving the Evaluation of Household-Level Affordability in SDWA Rulemaking: New Approaches" prepared for AWWA, and Affordability of Wastewater Service, a reference book published by WEF. In addition, Raftelis regularly provides affordability analysis and support to water utilities nationwide.

A brief summary highlighting BWWB's key points/concerns is provided within this letter. In support of the positions outlined in this summary, we have attached a series of appendices, detailed at the bottom of this letter.

Overall, BWWB believes that USEPA's proposed maximum limits for PFAS contaminants are the most stringent regulatory limits ever proposed for drinking water utilities. We also believe the proposed limits have not been demonstrated to be cost beneficial, and, if enforced, will have significant impacts on the affordability of drinking water for our customers and throughout the United States. Specifically, a significant portion of our customer base is already burdened with water bills equal to more than 2% of their household income. If implemented, this regulation is expected to push approximately 13,000 more Alabamans beyond this affordability threshold. A brief summary of BWWB's concerns is provided below:

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA's final rule represents data-driven drinking water standards that are based on the best available science, meet the requirements of SDWA, and regulation of the PFAS covered by the NPDWR is vital toward protecting public health by removing these contaminants from our nation's drinking water. The agency accounted for costs in its HRRCA and its evaluation of feasibility for the final MCLs. After considering both the nonquantifiable and quantifiable costs and benefits of the final PFAS NPDWR, the Administrator is re-affirming the determination made at proposal that the nonquantifiable and quantifiable benefits of the MCL justify its nonquantifiable and quantifiable costs. For additional information on the EPA's cost and benefit estimates for the final rule, please see sections 13.3 and 13.4 of the EPA response in this *Response to Comments* document.

Water Works Board of the City of Birmingham (BWWB) (Doc. #1602, SBC-043643)

B. USEPA model considered costs in a vacuum without addressing the impact of other compliance and infrastructure needs (e.g., LCRR compliance, non-revenue water control, risk reduction and aging infrastructure).

Based on the existing utility challenges with aging infrastructure and other regulatory driven investments, the combined capital cost impact on BWWB for the next 10 years is estimated to be $180 million.

Please refer to Appendix B and Appendix C for BWWB's detailed impact analysis under a variety of regulatory scenarios; this analysis helps illustrate the likely impacts on BWWB capital and O&M expenses, as well as rate impacts on customers.

In summary, addressing the existing and emerging challenges facing BWWB over the next five years, excluding PFAS, could yield an average bill percentage of 2.74% of LQI and place a staggering 38.0% of households below the affordability threshold. When considering PFAS as well, the average water bill would represent 3.17% of the LQI and 40.0% of BWWB's customers would be below the affordability threshold by 2028.

It is recommended that USEPA reconsider the cost implications of the proposed PFAS rule on rate payers, particularly those in low-income communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The factors described by the commenter were considered in the EA and affordability analyses. Please see sections 13 for the cost analysis, 10.5 for an affordability analysis, and section 10.4.2 for simultaneous compliance concerns in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044070)

These increases in primacy agency responsibilities should be supported by a corresponding increase in the Public Water System Supervision (PWSS) Grant Program, recognizing EPA's limited ability to influence Congressional PWSS appropriations. Without additional PWSS funding, primacy agencies will have to make tough decisions on prioritizing support to existing programs. Limitations on primacy agency resources will result in fewer opportunities to work individually with water systems to improve compliance and protect public health.

On behalf of ASDWA's 57 members, we thank EPA for the opportunity to provide insightful comments on this critical rulemaking. ASDWA looks forward to further engagement with the Agency as we work together to implement this rule. Please feel free to reach out to me if you have any questions about these comments.

Sincerely Yours

J. Alan Roberson, P.E.

ASDWA Executive Director

Alex Lan - EPA OGWDW

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The implementation memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law" notes that states may use a portion of the SRF for administration of the funds from each funding stream in BIL.

Texas Commission on Environmental Quality (TCEQ) (Doc. #1632, SBC-044131)

State Program Funding

In state fiscal year 2023, Texas' Base Capitalization grant experienced a new loss of $31 million due to congressional earmarking. Although there is funding currently available through the Bipartisan Infrastructure Law, this funding is limited and will not remain available in perpetuity. Therefore, it is important to protect the long-term viability of the Drinking Water State Revolving Fund (DWSRF) base program funding for the additional resources needed to implement the PFAS NPDWR, and other newly promulgated federal regulations, and to ensure equitable funding access to all eligible public water systems and safeguard the intended self-sustaining nature of the DWSRF.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that $15,000,000,000 was set aside for Lead Service Line Replacement.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044144)

Funding and Other Issues for Congress

While RCAP understands that it is the responsibility of Congress, not EPA, to fund the testing, compliance, enforcement, and technical assistance programs mentioned above, we would be remiss not to emphasize that more funding is needed for technical assistance, testing, and compliance, particularly for small, rural, and tribal systems. RCAP agrees with EPA that the Bipartisan Infrastructure Law (BIL) provides substantial funding for public water systems impacted by the proposed NPDWRs, and RCAP applauds this historic funding. Unfortunately, by the time the rule is implemented and enforced, around 2027, much of the BIL funding and time to access it will have already run out and will no longer be available for systems that need to install new treatment technologies.

We urge the President to work with Congress to increase federal investment in drinking water for small public water systems to comply with proposed PFAS NPDWRs and existing regulations under the Safe Drinking Water Act.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

American Farm Bureau Federation et al. (Doc. #1642, SBC-043487)

[They have identified the following areas of concern regarding the agency's development of this rule:]

• Infrastructure Investment and Jobs Act (IIJA) funding will be insufficient to cover the costs of compliance. The investment needed to reach these low MCL levels moves well beyond the ability of communities to afford and beyond the potential funding available in the IIJA. Simply put, the likelihood of outspending the billions of dollars contained in the IIJA is significant because the compliance costs are so high.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The factors described by the commenter were considered in the EA and affordability analyses. Please see sections 13 for the cost analysis and 10.5 for an affordability analysis.

American Farm Bureau Federation et al. (Doc. #1642, SBC-043501)

Federal Funding Is Limited

While the EPA touts the various federal funding streams that are available for drinking water utilities to adapt to this rule, they fail to recognize the difficulties that small, rural communities face in obtaining these monies. At a Small Business Environmental Roundtable on May 11, 2023, EPA staff highlighted the following funding opportunities that were authorized through the IIJA:

• $11.7 billion to the Drinking Water State Revolving Fund (SRF)

• $4 billion in SRF for emerging contaminants

• $5 billion to Water Infrastructure Improvements for the Nation (WIIN) Grants to address emerging contaminants

It is encouraging to see this level of investment in protecting our drinking water and addressing emerging contaminants, like PFAS chemicals. But, as previously mentioned, there is not enough money to go around to cover the costs of this rule for every water utility, and these resources are often devoted to projects that benefit large population areas. We have heard directly from rural

water communities who have expressed the challenges of accessing these federal dollars. The agency needs to ensure that these areas are not forgotten but rather prioritized, as they will experience the greatest challenges in meeting this proposed standard.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Water Supply District of Acton (Doc. #1662, SBC-043667)

Finally, the District wishes to acknowledge that the proposed PFAS regulations will impact other aspects of our community. The funding for our PFAS response is currently the sole responsibility of our rate payers. If utility bills continue to rise due to inflation, energy costs, and further regulation, we may see unintended consequences. The community may not support funding requests for PFAS treatment. Other priority projects in the community such as roadway safety improvements may garner support instead. The current model of local users paying the costs for a global PFAS issue is unreasonable and must be fully addressed in EPA's regulatory response and the federal government's financial assistance model.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

National Association of Water Companies (NAWC) (Doc. #1670, SBC-044160)

3. EPA must fully explain its approach to affordability to ensure that funding will be available to achieve the aims of the regulation.

EPA must do more in this rulemaking to assure that communities across the U.S. that are struggling to maintain affordable rates already due to currently planned and required capital and regulatory projects, have access to funds the communities and water systems can use to carry out the requirements of this rulemaking. As noted above, the costs of upgrading treatment systems to achieve reductions in the presence of PFAS chemicals in the water supply will be substantial and will significantly impact ratepayers. NAWC encourages EPA to maximize the opportunities for states and municipalities to spend funds from the Bipartisan Infrastructure Law (BIL) in a way that delivers the most benefit for communities, especially those with high levels of PFAS substances in their water supplies. NAWC again urges EPA to recognize with respect to affordability issues and funding that is provided, it is important that these rules and policies apply equally to all community water systems and wastewater treatment systems regardless of whether the systems are publicly or privately owned or operated.

Additionally, in setting the appropriate MCL levels EPA must recognize that the resources available from the Infrastructure Investment and Jobs Act (IIJA) are limited to $10 billion and that the lower the MCL is set, the more likely those funds will be insufficient to cover increased costs. In fact, reports provided to OMB by other organizations addressing this rulemaking point

out that if the MCL for PFOA and PFOS is set at less than 20 ppt, the likelihood of outspending the $10 billion contained in the IIJA is significant.

Access to safe, clean drinking water is a necessity and this action by EPA must ensure that this access is affordable and equitable.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044448)

4. We urge EPA to make technical and engineering resources available to public water systems so that the financial burden of removing PFAS does not unfairly fall on ratepayers and customers.

In the PFAS Rule, EPA examined the treatment options to achieve compliance with the proposed standards. EPA identified BATs, or Best Available Technologies, based on their high removal efficiency, history of successful use, general applicability, reasonable cost, compatibility with other water treatment processes, and the ability to bring all the water in a system into compliance. The proposed BATs for PFAS removal from drinking water are GAC, AIX, and high-pressure membranes such as RO and NF. [FN40: PFAS National Primary Drinking Water Regulation Rulemaking, 88 FR 18638-01 at 18684 to 18689.]

GAC and AIX are sorptive processes, which means that they involve substances attaching to other substances. Sorptive processes work by passing water through a vessel filled with a sorbent, which removes the contaminants. [FN41: Id. at 18684-85] High- pressure membranes are a separation process where water is split into two streams across a membrane. One stream has fewer contaminants, known as permeate, and the other stream contains concentrated contaminants, known as concentrate or retentate. The effectiveness of membrane systems is measured by flux, which is the amount of permeate produced per surface area and time. [FN42: Id. at 18685-86.]

Regardless of whether a water provider opts for sorptive processes or high- pressure membranes, the cost to build, operate and maintain the treatment will be substantial. [FN43: Id. at 18687-88 (analyzing costs of GAC, AIX, RO, and NF based on system size).] Even if the costs are very substantial, the benefits associated with the anticipated drinking water improvements justify such expenditures. EPA should nevertheless acknowledge and reflect in its rulemaking that the costs imposed on providers and their ratepayers are high.

The costs of installing additional treatment technologies should not fall to state and local governments and taxpayers. Further, the proposed regulation may create significant burdens on State regulatory agencies, and it is essential that EPA secure sufficient resources for states to be able to successfully implement and enforce the new MCLs. As some of our States have alleged in pending lawsuits, certain chemical manufacturers have broken the law in their manufacture, sale and distribution of PFAS and caused much of the contamination in our drinking water

supplies. For these reasons, we urge EPA to (1) provide substantial technical and engineering resources to water providers (including model plans); and (2) work with Congress to obtain and distribute federal funding for treatment, especially in underserved communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The implementation memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law" notes that states may use SRF funds to administer funding stream in BIL. As is typical after any rule promulgation, the EPA plans to provide support to utilities, primacy agencies, and other interested parties to ensure successful implementation of this PFAS rule. The agency notes that PFAS treatment will very likely often depend on site-specific factors; more information on this topic may be found in section 10 of the EPA response in this *Response to Comments* document.

Austin Water (AW), Austin, TX (Doc. #1688, SBC-044455)

The affordability of drinking water is a critically important factor in considering the proposed PFAS NPDWR. AW strives to maintain affordable rates for all customers as we conduct and complete necessary capital and other regulatory projects. Future regulatory actions should include ample time and easily accessible means to review, understand, and provide meaningful feedback on cost models used to estimate financial impacts on the community. They should not put unnecessary or significant financial burdens on ratepayers. Access to safe, clean drinking water is a necessity, and regulatory efforts moving forward should prioritize making this access affordable and equitable. Public water systems and their customers are the receivers of potential PFAS pollution, not the creators of these substances. More time should be given to allow for a careful evaluation of the cost burden on customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the EPA's rule development timeline can be found in section 2.3 and more information on the regulatory process can be found in section 3.1 of the EPA response in this *Response to Comments* document.

New Hampshire Department of Environmental Services (NHDES) (Doc. #1690, SBC-044333)

May 30, 2023

Michael S. Regan, Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Subject: NHDES Comments for the Proposed PFAS National Primary Drinking Water Regulation Rulemaking Docket ID No. EPA-HQ-OW-2022-0114, Published March 29, 2023, Pages 18638-18754

Dear Administrator Regan:

We are writing to provide our comments on the United States Environmental Protection Agency's (US EPA) proposed Maximum Contaminant Levels (MCLs) for per- and polyfluoroalkyl substances (PFAS). As the primary environmental regulatory agency in our state, the New Hampshire Department of Environmental Services (NHDES) understands well the importance of protecting public health and the environment from PFAS contaminants. We have served as the principal responders to several drinking water contamination events, dating back to the 2014 discovery of PFAS contamination of a major public water supply well at the former Pease Air Force Base in Portsmouth, NH, and the 2016 discovery of widespread impacts in southern New Hampshire to both public and private drinking water wells from airborne emissions of PFAS from two manufacturing facilities. We have witnessed first-hand the impacts of PFAS contamination on our communities and the need for action to address this issue. Our agency and public water systems across our state continue to commit substantial financial and personnel resources to this problem each and every day. Sampling for PFAS in the state started in 2016 and has been conducted at over 1,400 public water system sources and over 10,000 private wells.

New Hampshire (NH) has had enforceable state MCLs for perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA) and perfluorohexane sulfonic acid (PFHxS) since October 1, 2019. Community and non-transient, non-community public water systems have been required by NH administrative rule to complete compliance sampling for these four PFAS compounds since the fourth quarter of 2019. Based on the sampling results to-date, PFAS has been detected at approximately 30% of the public water system sources that have been sampled. However, exceedances of NH PFAS drinking water standards have only occurred at about 7% of those sources.

Since the initial discovery of PFAS contamination in our state, more than $300 million has been spent responding to this crisis. Much of that burden has been borne by state and local government, requiring significant reprogramming of and increases to capital and operating budgets in both sectors. As just one example of state-level impacts, in response to promulgating the state MCLs, in 2020 the NH legislature instituted the PFAS Remediation Grant & Loan Fund program that aids community water systems; non-profit, non-transient, non-community water systems; and municipalities with funding to remediate PFAS in drinking water that exceeds the state standards. The program was established offering $50 million in loan funds and $35 million in grant funding that are primarily funded with State monies. At this time, the grant funding is exhausted and approximately half the loan funding has been awarded to 33 projects at an anticipated cost of $55 million. Even with anticipated targeted federal funding, the need will outstrip available resources.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information about occurrence can be found in section 6 of the EPA response in this *Response to Comments* document.

Massachusetts Coalition for Water Resources Stewardship (MCWRS) (Doc. #1691, SBC-044323)

3. If EPA moves forward to implement the proposed MCLs then it is imperative that all capital and operational compliance costs be borne by the federal government. If the federal government cannot or will not provide full funding to public water systems then compliance with the MCL should not be mandated.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Ontario International Airport Authority (OIAA), California (Doc. #1693, SBC-043505)

Although the proposed MCL and the monitoring, treatment, and remediation regulations are aimed primarily at public water systems (PWSs), it is clear that the affected PWSs will not be able to feasibly afford the infrastructure required to treat the subject PFAS contamination to the concentration levels required under the proposed rule. Even those PWSs with advanced, state-of-the-art treatment facilities will be overwhelmed by the monitoring and disposal costs associated with PFAS removal from public water supplies. It is equally clear that the amount of federal assistance contemplated to assist PWSs in their compliance efforts will fall well short of what is needed, leaving the PWSs with no choice but to offset their costs by seeking to shifting liability toward those persons and entities which use PFAS-containing products – including large, public airports such as the Ontario International Airport (ONT).

Since 1988, the Federal Aviation Administration has required public airports such as ONT to maintain, store, and use Aqueous Film Forming Foam (AFFF) for purposes of fire suppression. Specifically, larger public airports like ONT (often referred to as "FAA Part 139 airports") are required to use AFFF with the molecular composition known as MIL-PRF-24385, which contains PFAS chemicals. For this reason, the proposed rule will make airports an easy target for any PWS seeking to deflect and reallocate costs it has incurred, or will incur, to comply with the 4 ng/L PFAS MCL that EPA now seeks to implement. Given that public airports were and remain required by federal regulation to use the very AFFF that results in potential discharges of PFAS into the environment, it would be prudent to exempt or otherwise shield such airports from liability under the proposed rule (or any other rule that EPA may propose on this topic). In short, it makes no sense hold public airports liable for a contaminant they were forced to use by federal regulation.

This is not to say that the OIAA is unsympathetic to PWSs striving to comply with the proposed rule. The costs of such compliance will be extraordinary. Further, they will be disproportionate to the operating and capital budgets of many of the affected PWSs, especially the smaller ones in rural areas. The cost-benefit analysis set forth in the proposed rule is deficient from a host of angles and provides little meaningful information on which to base a decision. For example, many of the cost items are deemed "unknown" or "uncertain", which means they were not factored into the analysis. This skews the results and hides the true costs of compliance. In

addition, the benefits of the proposed rule – and there are many – will be dispersed among the entire population, whereas the costs – and these are staggering – will be borne by a small number of public entities that already struggle to maintain balanced budgets. This disparity between who benefits and who pays undermines the proposed rule's cost-benefit analysis and renders it a complete fiction.

This defect in the proposed rule could be forgiven if the federal government were to provide an adequate pool of money to fund all necessary compliance efforts, thereby minimizing the economic pain felt by PWSs and, by extension, those third parties to whom PWSs may seek to shift liability. Unfortunately, this is not the case. The federal monies identified for this purpose in the proposed rule will not even come close to meeting what the PWSs will need. Again, this is what concerns the OIAA and other public airport operators. We do not wish to become the default funding source for PWSs seeking to comply with the proposed rule.

In light of these concerns, the OIAA recommends that EPA slow down and fully examine whether the proposed rule, including its rigorous (some might say draconian) MCLs for PFOA and PFOS, can feasibly and economically be implemented by the many and varied PWSs in the country. The OIAA also recommends that EPA exempt from liability any and all public entities which, by federal regulation, have been (or continue to be) required to use PFAS-containing substances, such as AFFF. Without such an exemption, public airports such as ONT may be forced to litigate with PWSs seeking to recoup costs incurred during their PFAS remediation efforts, leading to an unfortunate clash of public agencies and an unnecessary loss of local and federal public dollars.

Sincerely,

David P. Hubbard, Partner Gatzke Dillon & Ballance, LLP Counsel for the

Ontario International Airport Authority

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document, information on the health risk reduction and cost analysis can be found in section 13. Whereas the commenter suggests that the benefits of the rule will be distributed nationally while the costs are focused on those PWSs required to address elevated PFAS in their water, the benefits will very likely be seen specifically by those served by such PWSs. Regarding the consideration of uncertainty in the EA, the EPA provided a comprehensive uncertainty analysis in the PFAS NPDWR EA (see USEPA 2024b and the HRRCA section XII of the FRN for this action). Moreover, the EPA assessed all major sources of uncertainty in the EA using both quantitative and qualitative approaches, which is consistent with the OMB Circular A-4 guidance recommending that important uncertainties be analyzed and presented. For more information on the cost analysis, see section13.3 of the EPA response in this *Response to Comments* document. For more information on the EPA's uncertainty analysis and characterization, see section 13.9 of the EPA response in this *Response to Comments* document. The EPA makes CERCLA response decisions based on site-specific information, which includes evaluating the nature, extent, and risk to human health and/or the environment from the release.

Hazardous substance designations do not automatically result in CERCLA liability for any specific release. Whether an entity may be subject to litigation or held liable under CERCLA are site-specific and fact-dependent inquiries. Please see section 10.4.2 of the EPA response in this *Response to Comments* document for more information on how other statutes may interact with this rule.

City of Cottage Grove, Minnesota (Doc. #1696, SBC-044457)

May 30, 2023

Office of Water

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue NW Washington DC, 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking (Docket EPA-HQ-OW-2022-0114)

To Whom It May Concern:

Thank you for the opportunity to comment on the US EPA's proposed PFAS National Primary Drinking Water Regulation . The City of Cottage Grove is located in the eastern Minneapolis-St. Paul Metropolitan Area (East Metro), which has a long history in dealing with PFAS groundwater contamination. The residents of Cottage Grove have been impacted by PFAS since its first detection in the City's municipal drinking water supply wells in the mid 2000's. Since that time, ever changing drinking water standards and guidance levels have continuously challenged the ability to meet the water supply needs of our community. Cottage Grove supports this proposed rulemaking to provide consistent, nationwide standards for PFAS.

Cottage Grove and its neighboring communities have been fortunate to be able to fund temporary PFAS treatment measures through the 2007 3M Consent Order, in addition to the upcoming construction of permanent treatment plants through 2018 3M Settlement Agreement. Having worked through the planning process and costs related to PFAS water treatment, Cottage Grove has firsthand experience with the magnitude of this endeavor. While communities in the East Metro have the funding to provide for water treatment, along with operations and maintenance for a period of time, these "forever chemicals" will impact all aspects of our water supply operations in perpetuity. The nationwide costs to meet these standards will be significant, and Cottage Grove supports new federal funding opportunities to assist public water suppliers as they take on this challenge.

Finally, the City of Cottage Grove supports the comments from the Minnesota Department of Health in their letter dated May 25, 2023, and the Minnesota Pollution Control Agency. These two agencies have been instrumental in addressing both PFAS contamination and fighting for clean drinking water in the State of Minnesota.

The·City of Cottage Grove appreciates the opportunity to submit these comments. Please contact Ryan Burfeind, Public Works Director, at 651-458-2899 or rburfeind@cottagegrovemn.gov should you have any questions or wish to discuss our comments in greater detail.

Sincerely,

Jennifer Levitt

City Administrator

City of Cottage Grove

C: Mayor and City Council

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045727)

2. The Costs of Implementing the Proposed MCLs will Come Down With Time

Commenters also write to remind the Agency that the costs of compliance with the Proposed Rule will drop swiftly as technological advancements enter the market. With the Proposed Rule, EPA will require nearly 150,000 public water systems to monitor, test, and, potentially, take action to remediate PFAS contamination from the water supply. The sheer volume of water systems that will be required to engage in PFAS-related testing and action will invite resources into the market, which will spur innovation and drive costs down in the future.

The HRRCA requires EPA to analyze Quantifiable and nonquantifiable costs for which there is a factual basis in the rulemaking record to conclude that such costs are likely to occur solely as a result of compliance with the maximum contaminant level, including monitoring, treatment, and other costs and excluding costs resulting from compliance with other proposed or promulgated regulations. [FN43: 42 U.S.C. § 300g-1(b)(3)(C)(i)(III). Importantly, this statute means that EPA must not consider "costs associated with compliance with regulatory regimes other than the SWDA itself." City of Waukesha v. E.P.A., 320 F.3d 228, 243 (D.C. Cir. 2003). Thus, any comments complaining about alleged costs of compliance with the MCLs for purposes other than the SDWA—such as CERCLA, RCRA, or another statutory scheme—hold no weight.]

To meet this obligation, "EPA estimated costs associated with engineering, installing, operating, and maintaining PFAS removal treatment technologies, including treatment media replacement and spent media destruction." [FN44: PFAS National Primary Drinking Water Regulation Rulemaking, supra note 34, at 18692.] But absent from this calculation is any expected drop in engineering, installation, operating, or maintenance costs caused by advancements in technology or science that ease the financial burden for public water systems to comply with the Proposed Rule. Minnesota, for example, has already deployed PFAS removal technologies that, as of a few years ago, seemed like a pie-in-the-sky invention from the distant-future. [FN45: MPCA Brings

Cutting-Edge Technology to Minnesota to Remove PFAS from Water, Minn. Pollution Control Agency (Oct. 31, 2022), available at https://www.pca.state.mn.us/news-and-stories/mpca-brings-cutting-edgetechnology-to-minnesota-to-remove-pfas-from-water.] As public and private dollars are pumped into the PFAS space, innovation will follow, driving costs of compliance down. While the benefits of clean water and avoided public health outcomes will remain high, the costs of ensuring our public water supplies are not serving water laced with toxic levels of PFAS will drop substantially in the coming years. The Agency's conclusion that the ends justify the means is on sound footing.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA agrees with the commenter that costs of compliance may be reduced by advancements in treatment technologies in the future, though future costs are unknown. The EPA anticipates approximately 4,100-6,700 water systems would need to take action to come into compliance with the MCL and the entities regulated by this action are community water systems and non-transient non-community water systems , of which there are approximately 67,000. This rule does not affect the approximately 78,000 transient non-community water systems.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045736)

4. Despite historic infrastructure funding, it is still a possibility that customers will bear the cost of PFAS clean-up.

PWD applauds Congress for passing the historic Infrastructure Investment and Jobs Act (IIJA) and Drinking Water and Wastewater Infrastructure Act – known as the Bipartisan Infrastructure Law (BIL) – to invest more than $50 billion to improve the nation's water, wastewater, and stormwater infrastructure. PWD appreciates acknowledgement of the challenges that emerging contaminants, such as PFAS, pose to the water industry through the availability of $4 billion to the Drinking Water State Revolving Fund (SRF), with an additional $5 billion to support these efforts in small and disadvantaged communities. However, this funding will not be sufficient to cover the costs that will be incurred because of this proposed NPDWR. While these investments are unprecedented and commended by PWD, the proposed NPDWR may necessitate the nation's largest water infrastructure investment to date, requiring additional funding from either PWSs, state governments, or the federal government to close the anticipated funding gap.

Unfortunately, at this time, Philadelphia does not qualify for grant funding or principal forgiveness through Pennsylvania's SRF due to the size of our system, PWD's financial structure, and the applied affordability methodology. For Philadelphia and other communities impacted by these eligibility limitations, this translates to repaying the loans provided through BIL funding with the revenue generated from rate increases. In other words, PWD customers ultimately bear the cost of the treatment upgrades needed to remove PFAS from drinking water.

Like many major cities, citizens in Philadelphia have a higher poverty rate (22.8%, per the 2020 US Census) than the United States as a whole (11.4%, per the 2020 US Census). While PWD has

made great efforts to ease the financial burden on its most vulnerable ratepayers with the implementation of senior discounts and the tiered assistance program (TAP), [Link: https://water.phila.gov/cap/] the majority of the financial burden for implementing PFAS treatment technologies as proposed by the NPDWR will fall on ratepayers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. States have flexibility in determining priorities and selected projects for grant funding as well as setting interest rates and repayment terms.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045754)

Conclusion

PWD applauds EPA for making strides to better protect residents across the country from exposure to PFAS. PWD fully supports the EPA's efforts to develop drinking water regulations for PFAS, however, PWD believes that further evaluation of the costs, benefits, and feasibility of reducing PFAS to concentrations less than the proposed maximum contaminant levels is needed. Like many systems across the country, PWD may have to make significant changes to its water treatment systems to comply with the proposed MCLs. Funding to implement the upgrades required must be made more financially accessible to ensure that PWD and water systems across the country have the same ability to treat or remove PFAS from drinking water. Given the challenges PWD has faced in acquiring federal infrastructure funding, PWD requests that EPA prioritizes providing clear and consistent funding guidelines to state revolving funds to ensure low-income communities can receive BIL funds regardless of their size.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. States have flexibility in determining priorities and selected projects for grant funding as well as setting interest rates and repayment terms for SRFs. For information on the feasibility analysis, please see section 5 of the EPA response in this *Response to Comments* document.

HRSD (Doc. #1719, SBC-043539)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Submitted electronically to EPA-HQ-OW-2022-0114

RE: PFAS National Primary Drinking Water Regulation Rulemaking Dear Sir/Madam:

HRSD, a regional wastewater treatment provider serving southeast Virginia and approximately 1.9 million Virginians, appreciates the opportunity to provide comment on the proposed National Primary Drinking Water Regulation Rulemaking for PFOA, PFOS and for PFHxS, PFNA, PFBS, and HFPO-DA and its ammonium salt. What follows are specific comments from HRSD though we also support the comments of the Virginia Municipal Drinking Water Association (VMDWA).

HRSD is proud to offer One Water solutions to meet the growing water challenges faced by the communities we serve, implementing water management practices that prioritize investment in the programs and projects that provide the greatest environmental and public health benefits. This One Water management approach includes HRSD's Sustainable Water Initiative for Tomorrow (SWIFT), a managed aquifer recharge program which offers a sustainable supply of groundwater while reducing nutrient loading to the Chesapeake Bay. This program delivers multiple environmental and public health benefits, supporting a more affordable approach to meeting the compliance objectives of the Chesapeake Bay restoration plan for the region's wastewater and stormwater sectors. This allows local governments to prioritize investment in resiliency efforts to meet the increasing challenges of relative sea level rise throughout our region.

A One Water strategy necessitates the management of water quality and quantity to meet the varied water interests of the community. The SWIFT program, permitted through EPA Region 3's Underground Injection Control (UIC) program, recharges a potable groundwater source. As such, the program is required to meet the Safe Drinking Water Act's (SDWA) Primary Maximum Contaminant Levels (PMCLs) for all SWIFT Water™ that is recharged to the aquifer. The SWIFT Advanced Water Treatment (AWT) process includes Granular Activated Carbon (GAC) and is well positioned to meet the proposed MCLs for PFOA and PFOS as well as the MCL proposed for the combined effects of PFHxS, PFNA, PFBS, and HFPO-DA.

While HRSD is supportive of EPA's efforts to regulate PFAS in drinking water supplies, the costs and impacts to communities are not inconsequential, requiring a thoughtful, strategic approach to regulation that relies on the strength of science and leverages on-going federal and state efforts to reduce or eliminate PFAS at their source. While EPA has offered cost projections, those costs appear to be woefully underestimated, and communities already struggling with water challenges will be heavily burdened by the costs of controlling these chemical contaminants. Though oft repeated within our sector and by EPA itself, it is worth noting again that neither water/wastewater utilities nor the communities they serve manufactured these chemicals or profited from their use. It is critical, therefore, that the "Polluter Pays" model for clean-up of these contaminants serves as the basis for minimizing costs to communities.

Recognizing the importance of public health protection while minimizing economic burden to communities, we implore EPA to approach the PFAS drinking water regulation in a measured way, focusing on the strategies that provide that largest benefit to communities with the lowest cost burden.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045415)

EPA's proposed MCLs are affordable.

The EPA correctly determine that the benefits of the proposed rule outweigh the costs, even though SDWA does not explicitly require EPA to make that finding. While SDWA analysis of feasibility "tak[es] costs into consideration,"[FN58: 42 U.S.C. [sec] 300g–1(b)(4)(D).] it does not give more weight to cost over public health benefits or a finding that the benefits of outweigh the costs. [FN59: See S. Rep. No. 104-69 at 33 (Nov. 7, 1995) ("The Administrator is not precluded from … set[ting] a maximum contaminant level as close to the maximum contaminant level goal as feasible, even if the Administrator determines that the benefits of the MCL at this level do not justify the costs."); see also 42 U.S.C. [sec] 300g-1(b)(3)(C)(i) (requiring EPA to consider "nonquantifiable health risk reduction benefits" when establishing MCLs); City of Portland, Oregon v. E.P.A., 507 F.3d 706, 712 (D.C. Cir. 2007). See also Earthjustice et al., supra note 7, at 9.]

The costs of implementing the proposed rule are achievable. As explained above, there are off the shelf technologies which have been available for years. Many systems likely already have GAC installed, reducing the upfront costs of meeting the MCL. In fact, EPA's survey of drinking water infrastructure found an estimated $625 billion is needed over 20 years for water systems to continue providing safe drinking water to the public. [FN60: Env't Prot. Agency, Fact Sheet: 7th Drinking Water Infrastructure Needs Survey and Assessment (April 2023), https://www.epa.gov/system/files/documents/2023-04/Final_DWINSA%20Public%20Factsheet%204.4.23.pdf.] However, the proposal to regulate PFAS in drinking water would account for only approximately 2-3 percent of the total 20-year infrastructure investment need.

Additionally, unprecedented amounts of funding are already available to help systems meet the costs of upgrading. The Bipartisan Infrastructure Investment and Jobs Act, which was signed into law on November 15th, 2021, included $10 billion dollars to address pollution from emerging contaminants, including PFAS, through Safe Drinking Water Act and Clean Water Act grant programs. [FN61: The Infrastructure Investment and Jobs Act, H.R. 3684, 117th Cong. (1st Sess. 2021).]

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Natural Resources Defense Council (NDRC) et al. (Doc. #1723, SBC-044469)

Yet, many water systems have opposed the proposed MCLs based on the cost of compliance, which they say may make water bills unaffordable, especially for low-income customers. The

unavoidable implication is that communities experiencing PFAS contamination should resign themselves to drinking unsafe water if low-income residents cannot afford to pay higher water bills. This approach would only perpetuate existing inequities in access to safe drinking water—inequities that the Safe Drinking Water Act is meant to remedy. And it is based on a faulty premise that compliance with protective PFAS standards must come with the expense of unaffordable water bills.

First, opponents of the proposed standards often over-state the likely costs, as some of our organizations explain in separate comments submitted to the rulemaking docket. Second, as discussed further below, they often overlook steps that water systems, states, and EPA can take to fund compliance costs without relying exclusively on ratepayers, and without imposing unaffordable burdens on low-income residents.

In recent guidance under the Clean Water Act, EPA took a firm stand that communities must not be left with water that harms their health and the environment if their most vulnerable residents cannot afford increased water bills. EPA should take the same strong stand here, under the Safe Drinking Water Act.

Specifically, in the February 2023 Clean Water Act Financial Capability Assessment Guidance ("FCA Guidance"), EPA refused to accede to persistent utility demands to weaken standards whenever utilities raise concerns about affordability for low-income households. [FN1: See EPA, Clean Water Act Financial Capability Assessment Guidance (Feb. 2023), https://www.epa.gov/system/files/documents/2023-01/cwa-financial-capability-assessment-guidance.pdf.] Instead, EPA's guidance pushes utilities to pursue "strategies for lowering costs and reducing impacts on low-income households"[FN2: https://www.epa.gov/system/files/documents/2023-02/cwa-fca-questions-and-answers.pdf.] using tools that "ensure that a financial strategy is in place to support needed infrastructure upgrades without overburdening their most vulnerable ratepayers."[FN3:https://www.epa.gov/newsreleases/epa-announces-financial-capability-guidance-support-communities-and-ensureclean.] The guidance identifies "strategies for communities to support affordable utility rates while planning investments in water infrastructure that are essential to protecting clean water….Tools such as variable rate structures, consumer assistance programs, and grants or subsidies from the…State Revolving Fund are some of the tools outlined in the guidance."[FN4: https://www.epa.gov/system/files/documents/2023-02/cwa-fca-fact-sheet.pdf.] In releasing the guidance, EPA emphasized its commitment to work closely with state and utilities to deploy these strategies.

EPA should apply the same principles when adopting Safe Drinking Water Act standards for PFAS: adopt strong standards that are needed to protect human health and help water systems meet those standards without making bills unaffordable for low-income households.

In connection with adopting a final rule, EPA should highlight funding and financing strategies that water systems can use to achieve these objectives. EPA, the states, and water systems must all work to implement these strategies. We describe below several key strategies, including

maximizing use of available federal funding, especially for disadvantaged communities; holding polluters accountable for water systems' compliance costs; and adopting equitable rate structures and other programs that can increase rate revenues without burdening low-income customers.

1. Maximize the use of available federal funding, especially for disadvantaged communities.

To help communities meet new PFAS standards, Congress passed the Bipartisan Infrastructure Law (BIL). On top of federal and state funds available through "base" Drinking Water State Revolving Fund program, the BIL provides $9 billion in grants for water systems to address emerging contaminants such as PFAS, of which $5 billion is specifically for small, underserved, and disadvantaged communities, and of which $4 billion of which is only available as forgivable loans and grants to "eligible recipients," meaning disadvantaged communities [FN5: Pub. L. No, 117–58, 135 Stat. 429, 1402-03 (Nov. 15, 2021).]. The BIL also includes an additional $11.7 billion for drinking water infrastructure needs generally, of which 49% is for grants or principal forgiveness to disadvantaged communities. This funding will aid utilities in meeting EPA's proposed PFAS drinking water standards and improve drinking water safety.

Other BIL funding, though not eligible to be used for PFAS-related costs, indirectly supports water systems' ability to pay for PFAS compliance by reducing the need to rely on ratepayer funds for capital improvements. This includes $15 billion for drinking water systems for lead service line replacement. For water systems that function as combined water and wastewater utilities, the BIL's $12.7 billion in clean water infrastructure funds also offset capital improvement costs for wastewater and stormwater management, which would otherwise be passed on to ratepayers on their combined water and sewer bills. In addition, of course, there is funding available under the State Revolving Funds that have been federally capitalized and matched by state funds over the past two and a half decades, which continue to receive annual appropriations of about $1 billion or more. A significant portion of those funds also is reserved for grants and forgivable loans for disadvantaged communities.

Additionally, forty states have collectively dedicated almost $19 billion dollars in American Rescue Plan Act State Fiscal Recovery Fund monies towards water infrastructure, much of which is available to municipal water (and/or wastewater) systems [FN6: National Council of State Legislatures, ARPA State Fiscal Recovery Fund Database, https://www.ncsl.org/fiscal/arpa-state-fiscal-recovery-fund-allocations (last visited May 22, 2023).].

EPA should continue to bolster its technical assistance efforts to ensure that eligible communities can access all available grants and subsidized loans. Likewise, EPA should bolster its oversight of states' implementation of BIL funds, to ensure that funds designated for disadvantaged communities reach water systems with the greatest affordability challenges. EPA should closely track distribution of BIL funds (and other federal funds) and continue efforts to identify gaps in funding needs that can be identified for Congressional appropriators.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. After finalization of the PFAS NPDWR, the EPA also intends to provide

support to utilities, primacy agencies, and other interested parties to ensure successful rule implementation.

Natural Resources Defense Council (NDRC) et al. (Doc. #1723, SBC-044471)

3. Adopt equitable rate structures and other programs to increase utility revenue without burdening low-income customers.

As stated above, EPA's FCA Guidance provides a toolkit of approaches that utilities can use to increase investment in water infrastructure without making bills unaffordable for low-income customers. In addition to securing grants and subsidized loans, which reduce the costs of capital improvements for all ratepayers, the guidance identifies many steps that utilities can take to reduce costs for low-income customers specifically. These include:

• capping bills for low-income residents at a percentage of income;

• adopting "lifeline" rates with a low charge for an initial amount of usage sufficient to meet each household's essential needs;

• offering bill discounts specifically to low-income customers;

• helping low-income customers repair plumbing leaks and replace old, water-guzzling toilets, which can both reduce utilities' water supply costs and provide ongoing bill reductions for low-income households.

There are water systems around the country using each of these approaches, to varying degrees. In addition to examples cited in the FCA Guidance, many of the best examples are collected in an extensive water affordability "toolkit" published last year by Natural Resources Defense Council and National Consumer Law Center [FN18: Natural Resources Defense Council and National Consumer Law Center, Water Affordability Advocacy Toolkit (June 2022), https://www.nrdc.org/resources/water-affordability-advocacy-toolkit. Three of the most relevant chapters of from this publication, entitled "Equitable Water Rates," "Affordability and Assistance Programs," and "Water Efficiency and Plumbing Repair Assistance," are submitted to the rulemaking docket as separate PDF files accompanying this letter.]. That toolkit also provides detailed recommendations on best practices and factors to consider when implementing these strategies.

The FCA Guidance states that technical assistance is available through EPA concerning these approaches. We urge EPA to ramp up its technical assistance offerings on these topics.

Additionally, we urge EPA to expeditiously complete the "needs assessment for nationwide rural and urban low-income community water assistance" required by the BIL, in which EPA is required to provide Congress with "recommendations of the Administrator regarding the best methods to reduce the prevalence of a lack of affordable access to water services."[FN19: Pub. L. No, 117–58, 135 Stat. 429, 50108 (Nov. 15, 2021)]

* * *

Thank you for your consideration of these comments. We look forward to a final rule from EPA, coupled with supporting resources, that will protect communities from toxic PFAS contamination while helping water systems achieve affordable bills for their customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA acknowledges the Financial Capacity Assessment (FCA) guidance recommended by the commenter and agrees that these strategies may be helpful for utilities to reduce costs for low-income customers. The "needs assessment for nationwide rural and urban low-income community water assistance" under BIL and providing Congress with "recommendations of the Administrator regarding the best methods to reduce the prevalence of a lack of affordable access to water services" are beyond the scope of the current rulemaking.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-046003)

While EPA and AMWA have been extremely supportive of the Bipartisan Infrastructure Law (BIL) funds that are dedicated to addressing PFAS and other emerging contaminants, AMWA cautions EPA in using messaging that implies the dollars available are enough to cover the cost of this rulemaking. Such messaging creates a difficult situation for water systems and local officials who are forced to raise water rates to implement treatment in compliance with this proposed rule when the public is receiving messaging that available federal funding will fully cover PFAS treatment. The reality is that federal funding to date will be far from enough, and ratepayers will be the primary financiers of this proposed rule. Water systems need EPA's help to simultaneously acknowledge and applaud the BIL investment in drinking water while also urging for more, as the nation's water problems will need significant improvements in the coming years as our comments and assessment of costs (Attachment 1) indicate. EPA's most recent Drinking Water Infrastructure Needs and Assessment (DWINA) estimates that drinking water utilities will need more than $31 billion per year for the next twenty years for infrastructure to support drinking water regulatory compliance. AMWA therefore urges EPA to refrain from communicating to the public that federal investments alone will cover the costs of this proposed rulemaking.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-046026)

2. Federal Funding Analysis

The Drinking Water State Revolving Fund (DWSRF) is a federal-state program that provides funding and financing to CWSs drinking water infrastructure projects [FN133: U.S. Environmental Protection Agency, "Clean Water and Drinking Water State Revolving Funds and the Bipartisan Infrastructure Law," n.d.]. The Infrastructure Investment and Jobs Act (IIJA) provides $4 billion in funding to address emerging contaminants over five years (FY22- FY26). Eligible recipients include public and private community water systems serving at least 15 service connections used by year-round residents or regularly serving at least 25 year-round residents. Nonprofit non-community water systems including schools, publicly owned campgrounds, parks, and churches are also able to receive funding. Comparing the annual treatment cost to available federal funding is important because, while IIJA provides historic investment in PFAS treatment, the proposed rule's estimated costs far exceed this funding.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045959)

Section 3.3: Simultaneous compliance

A major issue facing PWSs is simultaneous compliance. Water treatment is an extremely delicate process, and even the slightest change in the treatment train can have dramatic effects on water quality. Water utility managers are facing many challenges unique to their PWSs and are the most qualified individuals to make decisions on what is a priority for that system. Water systems must balance risk-risk tradeoffs to ensure maximum compliance and minimum risks of health effects.

PFAS is just one of many concerns water systems must navigate. PWSs are also addressing lead service line replacement requirements, where some are running into issues with funding and costs both on the public and private side of the service lines. Utilities across the country are working to prioritize the repair and replacement of aging infrastructure. The nation's headlines have shown the consequences of ignored infrastructure maintenance, and with limited resources, many projects must be put on the backburner to ensure compliance with regulations like the one proposed in this NPDWR. Many PWSs are extremely concerned about water scarcity and climate change impacts, which will require new and creative solutions that will likely come at high costs. These examples do not diminish the impact PFAS can have on public health but highlight the demand for resources and difficult decisions water systems must weigh to keep water both affordable and safe.

Water systems also must comply with the many current and future regulations. Even the smallest change in treatment can have negative impacts on other regulated and unregulated contaminants. The type and concentration of a contaminant to be treated with a new technology is extremely important information to have before designing and implementing a new treatment process as

these variables affect the size and components of the new system. Therefore, a treatment technique may be applicable to many contaminants, but the effectiveness of removing each of the contaminants can be dependent on how the process was developed. As EPA continues to revise or create new rules, water systems will have to make adjustments that could require more labor and increased costs than EPA originally assumed while drafting NPDWRs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The agency acknowledges the concerns raised by the commenter on potential compliance challenges with the final NPDWR and other drinking water priorities in light of limited resources. As discussed further in section 13.4 of this *Response to Comments* document, the agency expects significant quantifiable and non-quantifiable health risk reduction benefits to be realized from implementing the PFAS NPDWR. To the extent that implementation overlaps with other rules, the EPA cannot evaluate costs that result from compliance with other regulations. Specifically, the agency notes that SDWA Section 1412(b)(3)(C)(i)(III) requires that the EPA include quantifiable and non-quantifiable costs that are likely to occur solely as a result of compliance with the rule at issue, including monitoring, treatment, and other costs, and excluding costs resulting from compliance with other proposed or promulgated regulations. Nonetheless, while operational adjustments may be necessary, the EPA has not identified any other drinking water regulations or requirements that will inhibit compliance with this regulation, nor should this regulation significantly impair compliance with other regulations, such as the lead and copper rules.

Environmental Council of the States (ECOS) (Doc. #1752, SBC-044503)

State Funding Needs

States will need additional funding for state capacity building to implement the final PFAS rule. ECOS has emphasized the need for EPA to provide states with funding and the flexibility to use it to manage PFAS. ECOS also acknowledges EPA's work to distribute funds from the Bipartisan Infrastructure Law to drinking water systems impacted by PFAS and other emerging contaminants.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Environmental Council of the States (ECOS) (Doc. #1752, SBC-044505)

ECOS members have also called on Congress to provide significantly more funding for state capacity building and infrastructure to implement and enforce

PFAS-related regulations that can protect and sustain our communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

El Paso Water (Doc. #1757, SBC-044523)

Ratepayers will bear the burden for cost increases. Our water sector trade associations are concerned that EPA has significantly underestimated the costs to PWSs and ratepayers for this testing. If a regulatory action will have a demonstrable health benefit, the return on investment is understood and can be communicated. However, in this case, costs to ratepayers will escalate with unreliable outcomes.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has carefully considered the costs for all systems that will be affected by the rule and has detailed the agency's assumptions. Please see section 13.3 of the EPA response in this *Response to Comments* document for additional discussion on the rule costs.

El Paso Water (Doc. #1757, SBC-044527)

The EPA also should consider creating national fund that would assist PWSs in standing up these new treatment processes and not unfairly burden communities with these high costs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Arizona Water Company (Doc. #1758, SBC-044534)

In the EPA's March 16, 2023 "General Overview Webinar on the Proposed PFAS NPDWR," the EPA mentions that nearly $21 Billion in Infrastructure Law and BIL DWSRF funding is available for drinking water systems specifically impacted by PFAS and other emerging contaminants. The Company, along with numerous other drinking water systems around the country, will apply for and use this funding to construct PFAS removal facilities. The Company recommends the EPA provide instruction on when and how utilities will be able to apply for this funding. The Company recommends providing funding options to all water providers, including private water utilities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. After finalization of the PFAS NPDWR, the EPA also intends to provide support to utilities, primacy agencies, and other interested parties to ensure successful rule implementation.

American Water Works Association (AWWA) (Doc. #1759, SBC-045570)

Securing Financing is a Slow Process

A crucial step for installing capital improvement projects is to identify and secure a source of financing. In announcing this rule, EPA highlighted the funds through the Bipartisan

Infrastructure Law (BIL) and the Drinking Water State Revolving Fund (DWSRF). Financing is also available through the Water Infrastructure Finance and Innovation Act (WIFIA) program. These programs provide an avenue for water systems to finance new treatment facilities, but these programs are known be time consuming and sometimes take several years to acquire approval, which is in addition to the time to get to a project design that can be reviewed. These programs may also impose additional requirements for funding to be approved that may limit procurement options and costs. Whether a system utilizes the DWSRF, WIFIA, or through the market, the process may still be slow and will be independent of the typical financial planning process of developing a Capital Improvements Program. Planning through this program helps to assure that capital improvements are staged in a way that minimizes water rate impacts by staggering major investments within a community's water infrastructure.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Riverside Public Utilities, Riverside, CA (Doc. #1762, SBC-044229)

[The following comments are submitted for consideration in the proposed EPA rulemaking:]

Expand and Facilitate Funding

City staff looks for the U.S EPA and other State and Federal funding programs to expand and facilitate the process of accessing funding to allow utilities to cost-effectively achieve the benefits of the proposed regulations.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044249)

State Staffing Resources and Overall Burden

Grants to states across EPA's portfolio should include additional funding to address known and unknown PFAS, PFOA and PFOS impacts and associated costs for compliance with the proposed regulation. EPA must meet the potential widespread prevalence of these compounds with appropriate funding increases and not simply pass these costs to states and communities.

Many states, including New Mexico rely heavily on federal grant dollars to help implement our state drinking water regulatory programs, specifically, the federal Public Water System Supervision (PWSS). Between 2015 and 2021, the last year for which award amounts are finalized, NMED's PWSS grant increased by 7% (from $2,055,000 to $2,192,000), lagging well behind inflation of nearly 12% in the same period. Beyond inflation, grant dollars are being stretched more thinly with increasingly complex and demanding workloads resulting from implemented regulations such as the Revised Total Coliform Rule, Disinfection Byproduct rules, Lead and Copper Rule Revisions, proposed Consumer Confidence Rule revisions and now PFAS

regulatory determinations. The overall resources required to effectively implement these rules have increased over the years; however, the federal grant dollars have not kept pace with those resource requirements.

Additionally, in New Mexico, almost 80% of our community water systems serve populations of less than 1,000 people. These small community water systems are often disadvantaged and underserved and require a significant amount of assistance from our drinking water program to achieve and maintain compliance with increasingly stringent drinking water regulations. Lastly, states are managing a significant increase in overall workloads due to additional factors such as the Bipartisan Infrastructure Law funding through the State Revolving Fund programs while facing retirements of technical staff and trained operators, putting states in the unreasonable and unsustainable position of being forced to do more with less.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. States have the flexibility to use a portion of the SRF funds to administer the SRF program.

Council of State and Territorial Epidemiologists (CSTE) (Doc. #1770, SBC-044262)

4. Funding Considerations: CSTE applauds the recognition by EPA that the passage of the Infrastructure Investment and Jobs Act, also referred to as the BIL, invests over $11.7 billion in the Drinking Water SRF; $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion to Small, Underserved, and Disadvantaged Communities Grants. These funds will assist many disadvantaged communities, small systems, and others with the costs of installation of treatment when it might otherwise be cost-challenging. These funds can also be used to address emerging contaminants like PFAS in drinking water through actions such as technical assistance, water quality testing, and contractor training, which will allow communities supplemental funding to meet their obligations under this proposed regulation and help ensure protection from PFAS contamination of drinking water. Despite these dollars, updating water infrastructure will likely exceed available funds. In addition, funding should be made available to private well owners. Funding will also need to be expanded to promote health equity in disadvantaged communities to comply with the updated regulation and avoid increases in water delivery costs for consumers or provide alternative water solutions as upgrades are made. CSTE recommends EPA further work with government partners including establishment of resource assessment teams to ensure that all funding needs are included in the prospective resources to support the regulation including needs associated with applied public health epidemiologists staffing and needs associated with conducting epidemiologic assessments and studies.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. As discussed in the section essay, the agency agrees that funding through BIL should help communities meet their obligations under the final NPDWR. After finalization of the PFAS NPDWR, the EPA also intends to provide support to utilities, primacy agencies, and other interested parties to ensure successful rule implementation. The EPA further notes that BIL

funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that funds are intended to help utilities comply with the SDWA. Funding for "staffing and needs associated with conducting epidemiologic assessments and studies" are generally beyond the scope of BIL funding.

Uttara Jhaveri (Doc. #1778, SBC-045448)

The EPA must consider the costs of installation and operation of the proposed technologies by public water utilities. The high costs may be deemed "arbitrary" and not "economically feasible" under SDWA by stakeholders. [FN25: THE SAFE DRINKING WATER ACT, supra note 19.] Moreover, the costs may attract dissent from stakeholders and the public, especially because the entity bearing the burden of the costs is unclear from the proposed rulemaking. [FN26: Joseph J. Rolling & David P. Ruetz, EPA Proposes Regulatory Limits for PFAS in Drinking Water, NATIONAL LAW REVIEW, May 1, 2023, https://www.natlawreview.com/article/epa-proposes-regulatory-limits-pfas-drinking-water.] Therefore, the installation and operational costs must be properly justified, and the burden of said costs should be shifted to the polluters under the "Polluter Pays Principle" [FN27: OSPAR Commission, Polluter Pays Principle, https://www.ospar.org/convention/principles/polluter-pays-principle.] instead of the taxpayers or public entities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA has considered cost to PWSs and primacy agencies in the agency's feasibility analysis of the final MCLs. Specifically, the agency considered the costs associated with implementation (e.g., costs for labor, materials, and construction of capital improvements) and compliance (e.g., costs to monitor) with the final MCLs. The EPA also considered costs of treatment technologies that have been demonstrated under field conditions to be effective at removing PFAS regulated under this NPDWR and determined that the cost of complying with the rule is reasonable. For additional discussion on the EPA's cost analysis, please see section 13.3 (methods for estimating cost) of the EPA response in this *Response to Comments* document.

Ohio Water Utility Council (OWUC), Ohio American Water Works Association (OAWWA) (Doc. #1782, SBC-044722)

These proposed drinking water standards are just one of the many current and upcoming regulatory rules where compliance is required or will be required for many PWSs in Ohio. The funding availability for these treatment and operational changes will only go so far, leaving a large cost to the water utility rate payers of Ohio. These funds will continue to be spread thin as more PWSs become aware of PFAS contaminants in their systems through the UCMR5 monitoring program. OWUC urges the EPA to thoroughly review the estimated costs and what funding will be made available to water systems as we tackle the treatment and removal of PFAS substances.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

National Ground Water Association (NGWA) (Doc. #1804, SBC-045453)

The National Ground Water Association submits its comments on Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking, EPA-HQ-OW-2022-0114, in the attached file. We appreciate the opportunity to review the proposed rule and submit these comments.

NATIONAL GROUND WATER ASSOCIATION COMMENTS ON: ENVIRONMENTAL PROTECTION AGENCY Proposed Rule: PFAS National Primary Drinking Water Regulation Rulemaking

Published: March 29, 2023

Document Citation: 88 FR 18638

Code of Federal Regulations: 40 CFR Parts 141 and 142

Docket/Agency Numbers: EPA-HQ-OW-2022-0114; FRL 8543-01-OW

Comments Due: May 30, 2023

Summary:

On March 29, 2021, EPA proposed a National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for regulating specific Per- and Polyfluoroalkyl Substances (PFAS): perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) as contaminants with maximum contaminant levels and perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS as contaminants with hazard indicies under Safe Drinking Water Act (SDWA). EPA proposed to set the health-based value, the maximum contaminant level goal (MCLG), for PFOA and PFOS at zero. Considering feasibility, including currently available analytical methods to measure and treat these chemicals in drinking water, EPA proposed individual MCLs of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt) for PFOA and PFOS. EPA proposed to use a Hazard Index (HI) approach to protecting public health from mixtures of PFHxS, HFPO-DA and its ammonium salt, PFNA, and PFBS because of their known and additive toxic effects and occurrence and likely co-occurrence in drinking water. EPA proposed an HI of 1.0 as the MCLGs for these four PFAS and any mixture containing one or more of them because it represents a level at which no known or anticipated adverse effects on the health of persons are expected to occur and which allows for an adequate margin of safety.

EPA has determined it is also feasible to set the MCLs for these four PFAS and for a mixture containing one or more of PFHxS, HFPO-DA and its ammonium salt, PFNA, PFBS as an HI of unitless 1.0.

National Ground Water Association Comments

Overarching Comments

Based on Environmental Protection Agency data, small public water systems are most significantly affected by PFAS compared to other system sizes. Additionally, small water systems may be least able to respond technically, financially and managerially to a complex rule requiring expensive treatment technology. [FN1: U.S. Environmental Protection Agency (USEPA). 2021. 18th Annual EPA Drinking Water Workshop: Small System Challenges and Solutions. Dr. Christopher Frey, EPA Deputy Assistant Administrator for Science Policy, message delivered to Session 1, Plenary, August 30, 2021. https://www.youtube.com/watch?v=ycVa5uG7izg (Accessed April 19, 2023).] This circumstance is also applicable to privately-owned household water systems that may be located near small water systems. NGWA is very concerned that Guelfo and Adamson (2018) [FN2: Guelfo, J.L. and D.T. Adamson. 2018. Evaluation of a national data set for insights into sources, composition, and concentrations of per- and polyfluoroalkyl substances (PFASs) in U.S. drinking water. Environmental Pollution vol. 236 (May), pp.505-513. Cited in U.S. Environmental Protection Agency, Regulatory Determination 4 Support Document; EPA 815-R-19-006, December 2019, p. 3-38.] examined PFAS results from the EPA's Unregulated Contaminant Monitoring Rule (UCMR) 3 program in detail and found that approximately 50 percent of samples with reportable levels of one or more PFAS detections contained at least two PFAS and 72 percent of detections occurred in groundwater. When detected, median total PFAS concentrations were higher in small public water systems (PWS) serving 10,000 or fewer persons (0.12 µg/L) than in large PWSs (0.053 µg/L). This PFAS level in small water systems is 30 times the proposed MCL of 4 ppt. This concern is highlighted by the fact that 76 percent (37,914) of all community water systems are primarily ground-supplied, and 96 percent of those groundwater-supplied systems are small water systems serving 10,000 or fewer people and have fewer resources to manage their water systems. Ninety-seven (97) percent (99,666) of nontransient and transient noncommunity water systems are groundwater-supplied. [FN3: U.S. Environmental Protection Agency. 2023. Drinking Water Government Performance Reporting Act Tool.

https://obipublic.epa.gov/analytics/saw.dll?PortalPages&PortalPath=/shared/SFDW/_portal/Public.]

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The commenter provides a summary of reportable detections referenced in Guelfo and Adamson (2018). The EPA notes that this study examined the third Unregulated

Contaminant Monitoring Rule (UCMR 3), which includes a PFAS compound that is not regulated under this final NPDWR (i.e., perfluoroheptanoic acid [PFHpA]). The agency also notes that detections do not necessarily equal MCL violations. In the final NPDWR, violations are assessed by running annual average and individual detections may not cause a system to be out of compliance (please see section 8.2 of the EPA response in this *Response to Comments* document for more information on PWS compliance and violations). Specifically in section 2.4 of the EPA response in this *Response to Comments* document, the EPA is finalizing flexibilities that should alleviate some cost concerns related to the monitoring requirements of the rule, including the flexibilities to use previously acquired monitoring data to satisfy some or all of the initial monitoring requirements and, for those groundwater systems serving 10,000 or fewer people that do not have this data, that they be required to only collect two samples at each EPTDS to satisfy initial monitoring requirements. With respect to PFAS occurrence, the EPA relied on multiple data sources, including UCMR 3 and state finished water data, to evaluate the occurrence of PFOA, PFOS, PFHxS, PFNA, and HFPO-DA, and probability of co-occurrence of these PFAS and PFBS. The EPA also incorporated both the UCMR 3 and some state data into a Bayesian hierarchical model, which supported exposure estimates for select PFAS at lower levels than were measured under UCMR 3. These results are discussed in more detail in section VI of the final rule preamble and section 6 of this *Response to Comments* document.

Florida Rural Water Association (FRWA) (Doc. #1806, SBC-044693)

RE: Comments on PFAS National Primary Drinking Water Regulation

As a representative of Florida's drinking water systems, the Florida Rural Water Association is providing feedback to EPA regarding PFAS regulation. We are proud that Florida is a national leader in protecting public health by regulating contaminants in drinking water. However, the financial impact of addressing contaminants on water utilities also poses a threat to public health. This is especially the case for our small, rural system members.

In particular, proposed regulations of PFAS place an undue burden on the resources of utilities that are impacted. Collecting the PFAS water sample requires extensive training or hiring a contractor. Sample analysis is expensive, especially since there are few labs within the state certified to perform EPA Methods 537 or 537.1. Those systems found to have PFAS levels exceeding the MCL will spend large amounts on engineering services and remediation in addition to the social consequences of issuing a Do Not Drink, public notice or messaging on "forever chemicals" in the water order to their customers. The consequences of the regulation will cause water rates to rise, which will often harm our most vulnerable populations.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For laboratory and other analytic considerations in the agency's evaluation of feasibility for the final MCLs, please see section 5.1.2 of the EPA response in this *Response to Comments* document.

Environmental Working Group et al. (Doc. #1810, SBC-044691)

While some water utilities have already installed water treatment technology capable of reducing PFAS, many are not yet equipped to do so. To help communities, Congress passed the Bipartisan Infrastructure Law which provides $9 billion in funding for drinking water treatment upgrades, and an additional $11.7 billion for other necessary drinking water infrastructure needs. This funding will aid utilities in meeting EPA's proposed drinking water standards and improve drinking water safety.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

West Virginia Municipal Water Quality Association (Doc. #1816, SBC-044680)

VI. Federal Funding Impacts

EPA appears to assert that the BIL will solve all implementation issues. However, little of that funding over the first two years has been provided to the 6,000 community water systems that will have to install PFAS barrier technologies. The reality is that BIL money, with its competitive nature and limited grant percentage, is far from adequate to cover the unprecedented cost of PFAS barrier technology installations at thousands of water systems. Moreover, the States have already programmed a good bit of future BIL funding for supplemental projects unrelated to PFAS. Moreover, even if the BIL were adequate to cover PFAS costs, EPA and the States could not dedicate all (or even a major portion) of it to the exclusion of other significant public health-related drinking water and wastewater needs. For example, PFAS is taking away critical resources that could be used for lead service line replacements at the public water systems that need to continue to fund and implement removal of lead pipes from their systems.

The reality is that many affected water systems cannot afford to design and install PFAS barrier technology and even if they could, they cannot afford the significant operation and maintenance costs, especially if PFAS bearing residuals (such as spent GAC media) must be disposed of as hazardous waste. BIL funding does not address whatsoever these enormous annual operation and maintenance costs.

So even if EPA could cannibalize all other public infrastructure needs, it is highly unlikely that water systems can afford to implement and maintain current PFAS barrier technologies. That reality must be factored into EPA's feasibility analysis and further supports our proposed phased/tiered implementation approach.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule. With respect to a phased implementation approach and compliance timeframes, please see the section 12 of the EPA response in this *Response to Comments* document.

Association of Missouri Cleanwater Agencies (Doc. #1817, SBC-044658)

VI. Federal Funding Impacts

EPA appears to assert that the BIL will solve all implementation issues. However, little of that funding over the first two years has been provided to the 6,000 community water systems that will have to install PFAS barrier technologies. The reality is that BIL money, with its competitive nature and limited grant percentage, is far from adequate to cover the unprecedented cost of PFAS barrier technology installations at thousands of water systems. Moreover, the States have already programmed a good bit of future BIL funding for supplemental projects unrelated to PFAS. Moreover, even if the BIL were adequate to cover PFAS costs, EPA and the States could not dedicate all (or even a major portion) of it to the exclusion of other significant public health-related drinking water and wastewater needs. For example, PFAS is taking away critical resources that could be used for lead service line replacements at the public water systems that need to continue to fund and implement removal of lead pipes from their systems.

The reality is that many affected water systems cannot afford to design and install PFAS barrier technology and even if they could, they cannot afford the significant operation and maintenance costs, especially if PFAS bearing residuals (such as spent GAC media) must be disposed of as hazardous waste. BIL funding does not address whatsoever these enormous annual operation and maintenance costs.

So even if EPA could cannibalize all other public infrastructure needs, it is highly unlikely that water systems can afford to implement and maintain current PFAS barrier technologies. That reality must be factored into EPA's feasibility analysis and further supports our proposed phased/tiered implementation approach.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Arkansas Department of Health (Doc. #1821, SBC-044573)

May 30, 2023

U.S. Environmental Protection Agency EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

Re: Comments on the Proposed PFAS National Primary Drinking Water Regulation Rule Docket EPA-HQ-OW-2022-0114

Thank you for the opportunity to comment on the Proposed PFAS National Primary Drinking Water Regulation. The Engineering Section of the Arkansas Department of Health (ADH) is the primacy agency in Arkansas. As such, we work to ensure compliance with federal and state drinking water standards under the Safe Drinking Water Act. We support the proposal to regulate levels of PFAS chemicals in the National Primary Drinking Water Standards under the Safe Drinking Water Act. The proposed monitoring and corrective actions to identify and reduce PFAS exposure in drinking water will provide additional protections to public health.

The Association of State Drinking Water Administrators (ASDWA) provided comprehensive comments for this proposed Rule on behalf of all member Drinking Water Primacy Agencies. The Arkansas drinking water program fully supports the comments provided by ASDWA. It is imperative that the final Rule provides clear and achievable requirements for PFAS levels in drinking water without being overly burdensome on public water systems and the users they serve. We offer the following comments regarding the proposed Rule in addition to those provided by ASDWA.

We recommend that further evaluation be conducted regarding the costs and potential adverse impacts with compliance with other existing drinking water requirements and water system viability, especially for small water systems. In Arkansas, 94.3% of our 703 public water systems subject to this proposed Rule serve fewer than 10,000 people, with half of those systems serving communities with fewer than 1,100 people. These small water systems currently use minimal or conventional treatment processes and struggle to find properly qualified water treatment operators and adequate funding for their operations.

The capital and operation costs of installing treatment for PFAS are very high compared to the conventional water treatment processes currently being used. Additional treatment processes will require additional electrical and labor resources to operate properly compared to conventional treatment. In addition, these processes will require proper disposal of waste streams that contain concentrated levels of PFAS and other chemicals. The financial capacity of these water systems will be at significant risk to address the financial burden related to the installation of special

treatment equipment, increased costs of labor, power, and waste disposal for operation of the treatment.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA further notes that states can use the DWSRF set-asides to support operator certification programs. Set-asides are different than the loan portion of the program in that the funds do not go directly to the utility but are supporting the overall goals of the DWSRF. The set-asides can assist the state in ensuring that water systems have properly trained operators to operate and maintain drinking water infrastructure to supply safe water to consumers. This set-aside can, for example, fund state operator certification staff and the development of operator certification databases and data management programs to track operators' certification status. For more information, please visit: https://www.epa.gov/dwcapacity/about-drinking-water-state-revolving-fund-dwsrf-set-asides#overview

Neuse Regional Water and Sewer Authority (Doc. #1822, SBC-044568)

NRWASA'S STRUCTURE AND CONTEXT FOR CONCERNS

NRWASA supplies water to its eight member entities in Lenoir County and Pitt County, North Carolina. Our members are: Town of Ayden, Bell Arthur Water Corporation, Deep Run Water Corporation, Eastern Pines Water Corporation, Town of Grifton, City of Kinston, and North Lenoir Water Corporation. [FN1: Each member corporation is a North Carolina non-profit entity and the other members are municipalities.] As of July 2022, NRWASA's member entities supplied 41,127 active metered accounts serving approximately 125,000 people. NRWASA's smallest member serves 354 customers and its largest member serves 11,365 customers.

Each member manages its own water system and customer base independent of NRWASA and the other NRWASA members. In addition, each of the member entities draws water from the Central Coastal Plain Capacity Use Area ("CCPCUA") aquifer and treats such water at their respective plants. NRWASA draws its water from the Neuse River and treats that water at NRWASA's plant. The NRWASA water is then distributed to the member entities.

NRWASA was formed as regional public entity in response to the decreasing yields of well water in the CCPCUA. As a result of the decreasing well water, the State of North Carolina stepped in to regulate the allowable rate of groundwater withdrawals. The goal of these regulations is to limit groundwater withdrawals to a sustainable rate.

In 2000, NRWASA identified a solution to meeting this challenge. The plan was to continue to use a reasonable amount of groundwater in conjunction with a new water supply, the Neuse River, that NRWASA collects, treats, and distributes.

The NRWASA water treatment plant was completed in 2008 and can produce up to 15 million gallons of water per day. In addition, over 78 miles of water transmission mains were constructed across Lenoir and Pitt Counties to carry treated water to each member entity's water distribution system.

The NRWASA surface water supply project cost at least $146.4 million to complete. Design and construction work of the project was funded through grants and low-interest loans from the USDA, State of North Carolina, EPA, the North Carolina Rural Center, the Goldenleaf Tobacco Trust Fund, member entities, and other local sources. The bulk of the funding was through loans, and NRWASA has carefully budgeted expenditures around servicing the debt.

In addition, some members have undertaken extensive efforts to reduce their use of the aquifer by approximately 90% through reliance on NRWASA water, but all members use some groundwater. Member entities have paid increased rates over the exclusive use of well water (an average of 100%), in order to bring significant replenishment benefits to the CCPCUA aquifer.

Unfortunately, the relatively recent expenditure of such large sums of public funds did not predict the potentially devastating financial consequences of the Proposed Rulemaking.

NRWASA capital costs to comply with the Proposed Rulemaking to exceed $30 million if it is implemented as published, and NRWASA's operating costs will increase considerably to implement the Proposed Rulemaking. The PFOS annual operating cost could eventually exceed all of NRWASA's other routine annual operating costs. This will impose tremendous unbudgeted costs and could threaten the ability of NRWASA to fulfill its mission.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that the comment lacks sufficient detail (such as specifying whether these costs are capital or O&M) to compare the commenter's cost estimates to the results of the EPA's Work Breakdown Structure (WBS) models. See section 13.3.3 of the EPA response in this *Response to Comments* document for more information.

Neuse Regional Water and Sewer Authority (Doc. #1822, SBC-044572)

4. EPA's final rule should address regional public water systems serving economically distressed counties. Such systems should have access to federal funds for capital upgrades required by the Proposed Rulemaking and the rule should not penalize those water utilities for their inability to finance massive upgrades.

The Proposed Rulemaking references billions of dollars the federal government has set aside to assist disadvantaged communities and small systems in reducing PFAS contamination [FN9: EPA, PFAS National Primary Drinking Water Regulation Rulemaking, Federal Register Vol. 88, No. 60 page 18640.]. However, NRWASA itself does not qualify for much of this assistance because it is an independent governmental entity, despite North Carolina receiving a large share of the Bipartisan Infrastructure Law funds [FN10: See, e.g., EPA, Region 4 News Releases, https://www.epa.gov/newsreleases/biden-harris-administration-announces-61715000-bipartisan-infrastructure-law-funding-0, https://www.epa.gov/newsreleases/biden-harris-administration-announces-41876000-clean-water-infrastructure-upgrades#:~:text=RALEIGH%2C%20NC%20(Feb.,State%20Revolving%20Fund%20(CWSRF), and https://www.epa.gov/newsreleases/biden-harris-administration-announces-65-billion-

drinking-water-infrastructure-6.]. NRWASA requests EPA to delay the effective date of the Proposed Rulemaking until such funds are available for NRWASA and similarly situated entities.

NRWASA's customers live in Pitt and Lenoir Counties – both of which are in the North Carolina Department of Commerce's top tier of the most economically distressed counties in the state [FN11: N.C. Department of Commerce, County Distress Rankings (Tiers), https://www.commerce.nc.gov/grants- incentives/county-distress-rankings-tiers#AdditionalReferenceCountyAverageWages-497. These rankings compare counties by their average unemployment rate, median household income, percentage growth in population, and adjusted property tax base per capita.]. The Proposed Rulemaking estimates the total annual cost per household for a system serving between 3,301-10,000 people to be, at best, $133 to $235 a year [FN12: EPA, PFAS National Primary Drinking Water Regulation Rulemaking, Federal Register Vol. 88, No. 60 Table 22.]. NRWASA's analysis suggests the costs will be even higher for households, and the practical impact on economically distressed households will be far worse than for more urban, higher-income regions. Placing such compliance costs squarely on NRWASA and its members' customers will likely aggravate the challenging economic conditions this region of North Carolina already faces. NRWASA and its member systems will have to pass those costs down to consumers who are already living in economically challenged areas.

NRWASA respectfully requests EPA accept NRWASA's four recommendations for the Proposed Rulemaking. Incorporating each of these strategies into the Proposed Rulemaking will improve the regulation and help NRWASA eliminate PFAS substances from its water supply. EPA should ensure that the regulation is protective of public health and that it does not place an untenable burden on water utilities.

Sincerely,

Barry Sutton

Chair of the Board of Directors

Harold Herring

Executive Director

ND:4871-2574-3460, v. 1

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Plymouth Village Water & Sewer District (Doc. #1827, SBC-044556)

NH House Bill 1264 (HB1264), effective June 30, 2020, enacted RSA 485-H, which codified NHDES enforceable standards or Maximum Contaminant Level's (MCL's) for PFOA (12 parts

per trillion; ppt), PFOS (15 ppt), PFNA (11 ppt), and PFHxS (18 ppt), and provided for up to $50 million in loans for public water systems and wastewater facilities to address PFAS substances, including residential well owners. Based on existing state law NH requires NHDES to also adopt rules to establish Ambient Groundwater Quality Standards (AGQS's) that are the same as any MCL's established, impacting municipalities, businesses, and residents everyday essential needs; handling and recycling of solid waste and wastewater.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Plymouth Village Water & Sewer District (Doc. #1827, SBC-044558)

Please carefully consider the following points to help inform the pending rulemaking on this class of pervasive and persistent PFAS chemicals:

• With several thousand systems impacted by the proposed MCLs and roughly three-quarters of them serving 10,000 customers or less, the proposed MCLs will disproportionately affect small systems. Many smaller systems lack the financial, staff and management resources to implement the proposed rules. Today approx. 150 public water systems and every wastewater system in New Hampshire are impacted by PFAS above NH's regulatory levels, where approximately 200 additional public water systems will be impacted, the estimated capital costs of ~$170 million and annual O&M costs of $44 million do not account for inflation, manufacturing and supply chain issues, or professional labor shortages. In February 2023 the Biden-Harris Administration announced that $18,914,000 in BIL funding would go to NH for addressing PFAS contamination. As capital costs continue to increase, these funds will fall short. In addition, ongoing operation and maintenance (O&M) costs are large, growing, and of long (decades) duration. Even with proposed federal support, funds for PFAS treatment at current NHDES drinking water standards are inadequate.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

The District of Columbia Water and Sewer Authority (Doc. #1829, SBC-045764)

As a customer of the Aqueduct, DC Water has little control over treatment of our water, but ultimately bears 75% of the costs of compliance - both Capital and Operational. We support reasonable drinking water regulations and EPA's mission to protect and ensure the quality of drinking water in the U.S. The Proposal will place undue and unwarranted costs on our limited base of customers who are already struggling under the burden of having to pay for a $3 billion unfunded Consent Decree mandated program to alleviate combined sewer overflows to the District's waterbodies.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Pennsylvania Municipal Authorities Association (Doc. #1832, SBC-045783)

[PMAA's specific comments on the Proposal are as follows:]

7. Drinking water facilities, including PMAA member authorities, will need to know with certainty the costs to implement the requirements in the Proposal (and, ultimately, any promulgated PFAS regulation) in order to effectively budget for what appears to be a very significant expenditure. It is inevitable that PMAA members will need to spend an enormous amount of money to meet the requirements of the Proposal, even if such requirements can technically be met. Therefore, EPA and the federal government need to ensure that adequate funding is allocated, preferably through grants, to meet the economic expenditures required to meet the requirements of any promulgated EPA PFAS regulation. PMAA understands that certain monies may be available (e.g., Bipartisan Infrastructure Law), but these monies appear to be wholly insufficient, especially in light of other existing or prospective regulatory initiatives (e.g., EPA Lead and Copper Rule) that drinking water facilities in Pennsylvania must address.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Pennsylvania Municipal Authorities Association (Doc. #1832, SBC-045785)

[PMAA's specific comments on the Proposal are as follows:]

9. Municipal entities will certainly require capital improvements and/or other expenditures to meet the mandates of the Proposal. The costs associated with the Proposal may actually increase in the near future due to other EPA regulatory proposals (e.g. designation of certain PFAS as CERCLA hazardous substances). EPA has acknowledged the possibility that such costs could increase by $30 million to $61 million per year if water systems are required to dispose of PFAS treatment as hazardous waste. (EPA PowerPoint from May 4, 2023 public hearing, slide 9). Municipal entities and their ratepayers should not be required to bear the burden of these costs, which will likely be a hardship for many municipal entities, and which expenditure by such municipal entities is wholly consistent with the "Polluter Pays" principle of EPA's PFAS Strategic Roadmap.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Columbia Water (Doc. #1833, SBC-045794)

By Electronic Submission: Docket EPA–HQ–OW–2022–0114

U.S. Environmental Protection Agency

May 30, 2023

EPA Docket Center

PFAS: PFOA and PFOS National Primary Drinking Water Regulation Rulemaking, Mail Code 28221T

1200 Pennsylvania Avenue NW

Washington, DC 20460

Dear Sir/Madam:

The City of Columbia, South Carolina (dba Columbia Water) appreciates the opportunity to comment on the USEPA's proposed National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for PFOA and PFOS, as well as PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS and their mixtures.

Columbia Water has been in the business of protecting the public health of the citizens of Columbia and the surrounding area for over 120 years. We take our responsibilities regarding the safety of the public water supply very seriously, and have an excellent record of compliance with all Federal and State drinking water regulations.

EPA's proposed MCLs for PFAS have the potential to impose the greatest compliance costs in the history of the Safe Drinking Water Act for our utility, both from a capital as well as ongoing operation and maintenance cost perspective. These costs will have to borne by the Columbia Water customers who are already dealing with the affordability challenges associated with meeting existing regulations, inflationary pressures, and aging infrastructure replacement. Such massive and far-reaching regulatory impacts are particularly unprecedented given that thousands of water plants will be impacted and affected utilities will have to plan, design, and construct newly developing PFAS barrier technologies at an unprecedented speed, all while PFAS blood serum levels in Americans have been dropping dramatically and are poised to plummet even farther due to the legislative, regulatory, and litigation pressure around these chemicals.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. More information on the EA can be found in section 13 of the EPA response in this *Response to Comments* document. The EPA has carefully considered the costs of all systems that will be affected by the rule and has detailed the agency's assumptions in section 13 of the EPA response in this *Response to Comments* document.

Corix Infrastructure Inc. (Doc. #1834, SBC-045361)

Corix works on a daily basis to protect our customers and communities by providing high quality drinking water that is compliant with the Safe Drinking Water Act. Corix respectfully submits the following comments in response to the EPA's request in addition to a request to review and revise elements of the proposed rulemaking to ensure the rule is feasible for all water providers. It is important that EPA carefully tailors its approach to reducing the levels of PFAS chemicals in water supplies without imposing unnecessary costs and restrictions because the costs and the impacts of reducing the presence of these chemicals in the water supply at the levels under consideration will be substantial and will place a heavy burden on communities, households and customers.

Corix urges the EPA to recognize in this rulemaking and in other actions related to removing PFAS chemicals from the water supply that EPA should ensure that all water and wastewater systems be treated equally regardless of whether the systems are publicly or privately owned or operated. All water and wastewater providers should have equal access to any and all federal and state funding related to treating PFAS chemicals.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that this rule applies to community- and non-transient, non-community PWSs across the country. It does not set regulatory requirements for wastewater systems nor private wells.

Little Hocking Water Association (Doc. #1835, SBC-045507)

PFASs are not naturally occurring and there are only a few companies (less than 10) responsible for the manufacture of PFAS in the United States. All costs of compliance with this proposed rule will be passed on to ratepayers. In the proposed rule, EPA recognizes that for communities of color, the costs of compliance with the proposed MCLs will be a burden and will compound burdens those communities already face, but concludes that these costs outweigh the benefits of reduced PFAS exposure. This ignores that water supplies in the United States were contaminated for decades while industry knew (and profited from delayed regulation of) the scope of the PFAS contamination and the public health risks of exposure. Accordingly, it is wholly inequitable and improper for individual households to pay to clean up the water they drink. EPA recognizes that federal funding is available under the Infrastructure Investment and Jobs Act. However, this funding is temporary and as EPA recognizes is only for installation costs, not operation. Considering that PFAS persists for thousands of years once in the environment, the operational cost burden likely exceeds the installation cost burden. Further, there is also no indication that there is enough funding for all environmental justice or low income communities to install PFAS water treatment. For these reasons, beyond the temporary federal funding, EPA needs to require the few manufacturers who made billions of dollars on PFAS to pay for any water treatment necessary for water suppliers to comply with the proposed MCLs in this rulemaking.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA reiterates its determination that the benefits of the rule justify its costs. The commenter mistakenly quoted the agency as suggesting the opposite. Please see section 13.8 of the EPA response in this *Response to Comments* document for additional discussion on the comparison of costs and benefits of the rule.

New England Water Works Association (Doc. #1836, SBC-047707)

EPA states "To help communities on the frontlines of PFAS contamination, the passage of the Infrastructure Investment and Jobs Act, also referred to as the Bipartisan Infrastructure Law (BIL), invests over $11.7 billion in the Drinking Water State Revolving Fund (SRF); $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion to Small, Underserved, and Disadvantaged Communities Grants. These funds will assist many disadvantaged communities, small systems, and others with the costs of installation of treatment when it might otherwise be cost-challenging." While this funding is appreciated, it's not nearly enough for what PWS will need to address PFAS.

NEWWA strongly encourages EPA to establish and maintain communications with Congress on how to provide more funding to communities facing PFAS contamination. There must be committed attention not only to the initial capital costs that PWS will incur to install treatment, but also ongoing O&M costs such as sampling, operation, and maintenance of the treatment system, and media replacement. In some situations, the responsible party may pay for the capital costs. In most cases, municipalities will need to front the costs and chase the responsible part(ies) for reimbursement. It is likely that many contaminated water supplies may not have an easily identifiable source or responsible party. Who will be responsible for these ongoing costs? Ratepayers should not have to bear this burden for harm caused by others.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

WASHINGTON STATE BOARD OF HEALTH (Doc. #1837, SBC-044265)

Early experience implementing the state's Group A rules for PFAS drinking water contamination suggests that agencies, water systems, communities, elected officials, and other interests will need significant technical and financial assistance navigating this complex, long-term public health crisis. Please couple action on this rulemaking with follow up on these diverse needs.

We encourage you to work with Congress and other interests to help marshal the needed resources to manage and, to the extent feasible, mitigate the public health effects and concerns associated with PFAS drinking water contamination.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Oklahoma Department of Environmental Quality (Doc. #3072-1, SBC-046340)

Hello everyone, I'm Shellie Chard. I'm the Water Quality Division Director for the Oklahoma Department of Environmental Quality (OK DEQ). Thank you, EPA, for allowing us to have this opportunity to provide comments. I think something that's really important that we all remember is that it's not the setting of standards that protects public health. We have to make sure our communities and water systems can implement and comply with these standards. In that vein, I think it's really important for EPA to provide as much guidance and guidance documents not only for water systems, but also to the primacy agencies, in order to assist our water systems in meeting these new regulations. It's fantastic that we have this huge influx of funding into our drinking water systems through the ARPA funding and BIL funding, but something important that we have to remember is that those are capital costs that are provided by that funding. We need to be thinking about how particularly small systems are going to secure funding for the continued capital or for the operation and maintenance costs and for paying appropriately trained operators to run this advanced technology that is going to be needed. We've touched a little bit on treatment technologies; I think it's important to highlight that we do have disposal costs of those wastes, and we need to be careful that we're not just moving PFAS from one media to the next, from drinking water into our landfill leachate which may then end up back in our wastewater treatment facilities, which we may then have PFAS going back into our surface waters which many times are source waters for drinking water. So, we need to keep those things in mind. I also think it's really important – the discussion of point-of-use filters for in-home or on-property use – that creates an issue where the current owner may be willing to operate and maintain those systems, but when the property is sold, or in the case of a landlord and tenant, sometimes those can be a little bit tricky. I know I'm at the end of my time. Thank you very much for allowing this opportunity to comment. The State of Oklahoma will be submitting to the docket more detailed written questions and comments. Thank you.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule. The EPA considered small system compliance technologies in the cost analysis, including point of use filters, and more discussion can be found in section 10.5 of the EPA response in this *Response to Comments* document. For additional guidance on training and implementation tools, please see section 1.2 of the EPA response in this *Response to Comments* document. For disposal concerns, please see section 10.4.2 of the EPA response in this *Response to Comments* document.

Bob Johnson (Doc. #3072-24, SBC-046353)

Hi, my name is Bob Johnson, and I live in Anson County, North Carolina. I am a clean water and clean air activist. I was born and have lived in this county for 75 years. At present, we are a Tier 1 County in North Carolina. Our water and sewage system has reached its maximum life. Our county does not have money to repair or replace it so my question is, how could we go about

meeting the specifications of the EPA, of refining our water test, and filtering the water system when we have zero funds to do so? I know we're not the only county in the United States in that situation. I would hope that EPA takes into consideration that counties such as Anson requires federal grants and federal engineers, federal labs to test our water system and to make sure that it falls within the EPA guidelines. So, we are at this point at a standstill. We do not have the funds to even test our water on a regular basis, so I would like EPA to look into a special consideration for Tier 1 counties. We are in desperate need of clean water; we are in desperate need of clean air and we also host a regional landfill here in Anson County. Thank you for your time, and I appreciate this opportunity.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Piedmont Triad Water Authority (Doc. #3072-26, SBC-046354)

Hello, my name is Greg Flory. I'm the executive director of the Piedmont Triad Water Authority. We are a 14.7 million gallon a day surface water treatment plant on the Deep River in the Greensboro area of North Carolina. I just wanted to speak to the economic estimates in this proposal. We are currently in the midst of planning for PFAS treatment removal, and we have cost estimates for our facility as we expand to 26.7 million gallons. The cost of treatment will be around $100 million just for our facility and the ongoing cost for the maintenance of that system will be $2.5 million a year. It does appear that there is not adequate allocation of the funding requirements for this rule in EPA's funding formula, and I would request that they reevaluate that and prioritize funding to municipalities so that ratepayers aren't having to sustain these costs. That sums up my comments. Thank you.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the PFAS NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Great Lakes Water Authority (GLWA) (Doc. #1558, SBC-042547)

EPA requested comment on all aspects of its Environmental Justice analysis. GLWA has concerns that our progress towards affordability gained through the WRAP and other measures could be diminished or even eliminated given the potential impact of capital and legacy costs related to this proposed regulation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Great Lakes Water Authority (GLWA) (Doc. #1558, SBC-042546)

Financial Implications

This proposed rule would impact many of GLWA's operations including water sampling, treatment and disposal. The potential costs and liabilities associated with the proposed rule is a significant concern to GLWA and its members and users of its water system.

GLWA has significant concerns about the potentially significant costs and liabilities that EPA's proposed rule will place onto water systems and subsequently local communities. GLWA has been steadfast in addressing issues of affordability. Toward that end, GLWA implemented the Water Residential Assistance Program (WRAP). This program provides income-based assistance for residential customers.

Based on our historical sampling results, GLWA is not expected to require capital improvements for additional water treatment processes to meet the proposed regulation. However, if PFAS concentrations emerge as a problem for us, the cost of treatment would not be confined to a single capital improvement investment. The legacy costs required by disposal or regeneration of the treatment waste streams would be systemic and are currently unknown due to other pending PFAS regulations (I.e., CERCLA and RCRA) regarding solids disposal. Public water utilities did not produce, regulate or discharge PFAS, but will be asked to continually contend with the cost of their disposal. GLWA strongly supports a "polluter pays" model where those who produced PFAS pollution bear the liability and costs of its remediation – not the public.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule. Please see section 13.3 of the EPA response in this *Response to Comments* document for the EPA's discussion on the agency's analysis of costs associated with the final NPDWR. For additional discussion on the EPA's affordability analysis, please see section 13.10 of the EPA response in this *Response to Comments* document. As outlined in the PFAS Strategic Roadmap, the EPA is committed to addressing PFAS and the NPDWR is one aspect of that plan. The EPA has centered the PFAS approach on considering the full PFAS lifecycle, getting upstream of the problem, holding polluters accountable, ensuring science-based decision making, and prioritizing disadvantaged communities. Key actions for how this will happen can be found at https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024. For additional discussion on the Roadmap, please see section 15.1 of the EPA response in this *Response to Comments* document.

Missouri Department of Natural Resources (Doc. #1563, SBC-042513)

With the increased cost for state agencies associated with this new rule, EPA should seek additional funding from Congress through the Public Water System Supervision Performance Partnership Grant to help offset the burden. The cost of the rule for Missouri will be significant. For the state, implementing this rule will require additional staff, equipment, laboratory capacity, and new tools for tracking and reporting all of the required elements included in the rule. In

addition, EPA is also adding to the state burden through other regulatory actions such as the Lead and Copper Rule Revisions, the soon to be proposed Lead and Copper Rule Improvements, the proposed Consumer Confidence Report Rule, and the establishing of additional requirements for states to assess cybersecurity as part of sanitary surveys. The burden that EPA is adding to states through these many regulatory actions is significant. States are ultimately responsible for the implementation of these requirements and will struggle to implement all of these new regulations, while continuing to implement existing requirements, without additional resources from EPA.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

San Antonio Water System (SAWS) (Doc. #1570, SBC-042482)

Small systems are highlighted in this rule and given exceptions. They are given easier sampling schedules and are more likely to receive funding. A PWS is supported by their rate payers regardless of size. A large system has more assets, more staff, and more problems to solve. Our rate payers do not want, nor are they more able to pay for the costs associated with compliance under this rule than anyone else. The EPA fails to acknowledge the practical impact of the rule and the fact that our budgets may be larger than a small system, but so are our costs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA is finalizing a flexibility for all systems to use previously acquired monitoring data to satisfy some or all the initial monitoring requirements. This flexibility allows the use of data from the fifth UCMR (UCMR 5), which is being collected by all community water systems and non-transient non-community water systems serving 3,300 people or more, as well as a subset of smaller systems. The flexibility also allows the use of state-led or other appropriate monitoring data.

City of Wilmington, Ohio (Doc. #1572, SBC-042466)

Billions of dollars have been set aside by Congress to address PFAS and other infrastructure needs. More communities will become aware of PFAS problems as UCMR5 results become available. The money will not go far enough.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Sammamish Plateau Water and Sewer District (Doc. #1573, SBC-042460)

The District notes that water utilities throughout the country are not the responsible parties for causing PFAS to enter the environment and contaminate drinking water. Rather, water utilities

and their customers, are the unfortunate recipients of the adverse impacts of PFAS contaminants in our water resources found through UCMR or independent proactive testing for PFAS. The proposed rules should orient towards supporting water utilities in a facilitative approach as they address potential health impacts and PFAS mitigation in drinking water. Rules that mandate PFAS reduction, and/or removal, should carry appropriate corresponding federal funding to offset capital expenditures mandated to reduce or remove PFAS from drinking water. Funding should be provided on an equal basis to all impacted water utilities regardless of demographics or economics.

Given that "EPA anticipates that if fully implemented the rule will prevent tens of thousands of PFAS-attributable illnesses or deaths", Federal appropriations should be administered in a manner which brings efficient access to funds so PFAS reduction can be implemented in an efficient and timely manner, absent of unnecessary red tape. As an example, in March 2022, our District was awarded a $1.585 million congressionally directed appropriation through Representative Schrier's office to assist in funding an $18.0-$20.0 million PFAS removal treatment plant. Efforts to access the funding have been frustrating to say the least. To date, we have not been able to access the appropriation, and it appears USEPA will be applying its requisites to the entire project, not just the elements funded by the appropriation. This has delayed our ability to build treatment. The $1.585 million is now controlling the entire project, and USEPA BABA, and AIS standards may increase the entire project cost by more than the appropriation.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Sammamish Plateau Water and Sewer District (Doc. #1573, SBC-042464)

Last, the rule states that for an exceedance of the proposed MCL, agencies may implement alternative water sources in lieu of treatment. Due to state regulation and water rights administration, alternative water sources will not exist or be available, thus defaulting in the need for treatment. Federal funding for treatment, available to all impacted water utilities, is an essential element of a holistic approach to PFAS management.

Thank you for the opportunity to comment and contribute in the rulemaking process.

Sincerely,

John C. Krauss

General Manager

cc: Sammamish Plateau Water Board of Commissioners

Judi Gladstone, Washington Association of Sewer and Water Districts

Ray Hoffman, Cascade Water Alliance

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

San Gabriel Valley Water Association (SGVWA) (Doc. #1580, SBC-042421)

Need to Help Small Systems and DACs: Despite efforts by the EPA and other agencies to improve access to government funding programs, small water systems and those serving disadvantaged communities still face challenges in applying for grants, managing reporting requirements, and completing projects. Even if successful in building a treatment system, many small and poorer systems cannot afford to maintain and operate them, as seen in past implementations of arsenic and nitrate standards where treatment systems stand idle.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

San Gabriel Valley Water Association (SGVWA) (Doc. #1580, SBC-042418)

Federal Funding Gaps: Although the Bipartisan Infrastructure Law provides billions of dollars to assist water providers, it does not cover all the expenses associated with the construction, operation, and maintenance of treatment systems. The proposed MCLs will require significant rate increases for most affected systems. Additionally, these expenses will compete with other EPA regulations that require funding, including the Lead and Copper Rule Revisions and the newly announced cybersecurity measures.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document, and note that BIL includes a specific set-aside of funds for lead service line replacements. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Missouri River Public Water Supplies Association (MRPWSA) (Doc. #1581, SBC-042413)

Funding — To realize the health benefits of this proposed rule, water utilities must have the financial resources to assure they can sustain the ongoing costs that will arise from constructing, operating, maintaining, and monitoring PFAS treatment systems for the safety and benefit of customers. Low-income assistance must also be provided.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Center for American Progress (CAP) (Doc. #1586, SBC-042387)

The benefits of reducing forever chemicals in the water greatly outweigh the costs of its removal and to prevent future contamination. The EPA estimates bringing the nearly 66,000 water systems that will be subject to regulation into compliance will cost between $772 million to $1.20 billion, but the savings that the rule will generate in terms of avoided adverse health effects are greater, with estimates ranging from $908 million to $1.23 billion [FN6: United States Environmental Protection Agency, "Addressing PFAS in Drinking Water with the Drinking Water State Revolving Fund" (Washington, DC: 2019), available at https://www.epa.gov/sites/default/files/2019-03/documents/pfas_fact_sheet_and_case_studies_final.pdf]. Critically, local water systems will not shoulder the financial burden of coming into compliance alone, since the Biden Administration is making billions of dollars available to help them monitor and remove PFAS from the drinking water. Between the Drinking Water State Revolving Fund (DWSRF) and the Emerging Contaminants in Small or Disadvantaged Communities (EC-SDC) Grant Program, President Biden has made over $9 billion dollars available to state, local, and tribal governments.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Cape Fear Public Utility Authority (CFPUA) (Doc. #1588, SBC-042381)

Capital and operating costs vs. available funding

EPA has acknowledged federal funding assistance will be needed by public water systems to add treatment required to meet the proposed regulations. EPA points to billions of dollars available through the Bipartisan Infrastructure Law enacted in 2021, including $12 billion in Drinking Water State Revolving Funds (SRFs). CFPUA defers to comments from industry groups such as the American Water Works Association regarding EPA's overall cost estimates and the adequacy of available funding. We do believe our own experience provides useful context.

As noted above, the cost to design and construct CFPUA's new GAC filters needed to treat PFAS in our community's source water was approximately $46 million. Earlier this year, CFPUA shared this cost with members of the North Carolina Water Infrastructure Authority, which administers the State's SRF program. Shadi Eskaf, Authority member and director of the State's Division of Water Infrastructure, remarked that the cost just for CFPUA's GAC treatment exceeded the total amount of SRF funds available to public water systems statewide. In CFPUA's case, the cost to design and build the filters – and the estimated $5 million in recurring annual operating costs – continue to be borne entirely by CFPUA's customers. While federal and state funding may fully or partially offset costs to comply with the proposed NPDWR for some utilities, for many or even most water systems this burden will fall on their customers, who will be left to pay higher water bills to address a problem they did not create. We believe federal funding assistance will be woefully inadequate in offsetting this cost burden.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042360)

Do not leave homeowners and rate payers responsible for the costs to remove, maintain, and dispose of PFAS in their drinking water. The number of contaminated drinking water sources in King County is unclear. UCMR 3 (2013-2015) testing revealed one major drinking water source was contaminated in King County. An expensive filtration system was installed to maintain the city's drinking water quality. Ongoing maintenance of the filtration system is expensive as is disposal of the PFAS that are removed by the filters. In 2021, the state of Washington developed State Action Levels (SALs) for 5 PFAS, and the Washington State Department of Health received funding to encourage water utilities to being testing prior to the 2025 date when testing is required. Many utilities are waiting for UCMR 5 to conduct their testing. Early testing revealed that at least 2 drinking water utilities exceed the state SALs, and we expect that additional utilities will be identified following UCMR 5 and when the EPA's drinking water standards are required. Some utilities that tested above the EPA health advisory or the WA SALs took their contaminated wells offline as they identify affordable ways to remove the PFAS contamination. Although EPA received a large amount of money to cover many costs to utilities for testing and remediation, the majority of costs for ongoing testing, remediation and hazardous waste removal will ultimately be passed on to the customers, as will the health costs associated with PFAS exposures.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For additional discussion on disposal concerns for PFAS treatment, please see section 10.4.2 of the EPA response in this *Response to Comments* document. For additional discussion on monitoring costs, please see section 13.3.4 of the EPA response in this *Response to Comments* document. While remediation is beyond the scope for this NPDWR, please see section 15 of the EPA response in this *Response to Comments* document for related discussion.

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042363)

Prioritize low-income and communities of color that are most impacted by contaminated drinking water and other stressors for federal assistance with testing, remediating, and maintaining healthy drinking water. EPA should identify ways to help low-income residents (both homeowners and low-income renters/landlords) to test and remediate PFAS contaminated private drinking water wells or group wells through technical and financial assistance, and should invest in research that will accelerate the development of methods that could be used to remove PFAS from private and small group drinking water wells.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For PFAS contamination in private wells, please see section 15 of the EPA response in this *Response to Comments* document and note that private wells are not within the scope of the PFAS NPDWR.

National Tribal Water Council-Tribal PFAS Working Group (NTWCTPWG) (Doc. #1598, SBC-042337)

Similarly, funding is needed for PFAS monitoring of numerous small water systems in Indian Country not covered by the proposed regulation. We recommend that EPA at least speak to this in the regulation and identify possible strategies to alleviate this challenge going forward.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. All community- and non-transient, non-community PWSs are subject to this rule.

Water Works Board of the City of Birmingham (BWWB) (Doc. #1602, SBC-043641)

B. Federal funding is expected to defray many such PWS costs-- the available resources are listed below. However, reports of $10B available for PFAS treatment are misleading. The actual federal support available to local utilities can be considerably limited, as projects focusing on other contaminants are also eligible for the same funding. Some examples are provided below:

• Clean Water State Revolving Fund (CWSRF)

o $1 billon (over 5 years FY2022 – FY2026) allocation for PFAS and/or other emerging contaminants

o Eligible projects: wastewater, reuse, and stormwater

• Drinking Water State Revolving Fund (DWSRF)

- $4 billon allocation for PFAS and/or contaminants on the Contaminant Candidate List (CCL)

o Eligible projects: drinking water

• Emerging Contaminants in Small or Disadvantaged Communities Grant Program

o $5 billion allocation for PFAS and/or other contaminants

o Eligible projects: drinking water

It is recommended that significant additional federal funding (exclusively dedicated to PFAS Rule compliance) be provided to utilities to help address the gap between the likely national compliance cost and the available funding.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-044006)

Treating or removing contaminants in the water comes at a cost. To realize the health benefits of such, water utilities must have the financial resources to assure they can sustain the ongoing costs that will arise from constructing, operating, maintaining, and monitoring PFAS treatment systems for the safety and benefit of customers. States should treat these expenditures for regulated utilities as federally mandated requirements that are recoverable in customer rates through expedited means.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044139)

Small, Rural Community Water Challenges

Central to RCAP's mission is the recognition that the availability of high-quality, affordable, and resilient water and sewer service is a key foundational building block necessary to spur economic development in rural communities. Of the approximately 150,000 public water systems across the country, 97 percent serve communities of 10,000 or less, and 72 percent serve communities of 500 or less. The average population of the communities RCAP has served in recent years is roughly 1,500, with a Median Household Income of half the national average. Each year, we have served more than 40 percent of America's persistent poverty counties, and roughly 300,000 individuals from indigenous communities.

The primary challenge for these small communities is spreading out the ever-increasing costs of operations over a smaller, and sometimes decreasing, base of customers. The price tag of necessary system upgrades, which may have minimal impact on a mid-sized or large community, can have a staggering effect on a system that serves only a couple hundred customers. Further, many small systems have very limited staffing. In a 2020 survey of the public water systems we serve, RCAP found that 43% had either 1 or 0 full-time employees, and instead supplement operations with part-time or volunteer staff.

It is of critical importance for EPA to recognize these cost and capability limitations for small, rural systems as it seeks to protect public health through implementation of the proposed NPDWR.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Aurora Water, City of Aurora, Colorado (Doc. #1669, SBC-043723)

Currently, EPA is considering the Bipartisan Infrastructure Law (BIL) funding to be sufficient for water systems' needs. However, BIL funds for emerging contaminants are not limited to PFAS. The available funding cannot cover the lengthy list of all the emerging contaminants

water systems are currently facing. Not only is there not enough available funding, but the process to be awarded any funding is also very complicated and lengthy. For water systems facing numerous complicated challenges, it is extremely straining for employees applying for funding opportunities. Aurora Water suggests EPA increases the available funding for emerging contaminants and simplifies the application process.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

National Association of Water Companies (NAWC) (Doc. #1670, SBC-044156)

NAWC members work on a daily basis to protect families and communities across the nation from the dangers posed by PFAS chemicals. While NAWC supports a rulemaking imposing limits on PFAS substances in drinking water, NAWC believes that EPA needs to revise and alter this proposed rulemaking in several respects outlined below to achieve a workable final rule that will be feasible and achievable. It is important that EPA carefully tailors its approach to reducing the levels of PFAS chemicals in water supplies without imposing unnecessary costs and restrictions because the costs and the impacts of reducing the presence of these chemicals in the water supply at the levels under consideration will be substantial and will place a heavy burden on communities, households and ratepayers.

NAWC urges EPA to recognize in this rulemaking and in other actions related to removing PFAS chemicals from the water supply, that EPA should ensure that all water and wastewater systems be treated equally regardless of whether the systems are publicly or privately owned or operated. All water and wastewater providers should have equal access to any and all federal and state funding related to treating PFAS chemicals.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that this NPDWR applies to all community- and non-transient, non-community PWSs across the country and does not set regulatory requirements for wastewater systems nor private wells.

North Jersey District Water Supply Commission (NJDWSC) (Doc. #1673, SBC-044202)

The recently proposed PFAS rules will require NJDWSC to make significant capital and long-term O&M investments that will ultimately result in onerous rate increases for its member communities. NJDWSC's current monitoring program has shown that PFOS and PFNA results are below the proposed MCLs, however PFOA is currently exceeding the proposed rules by a small margin, as sample results range from 2.28 - 5.08 ppt. Therefore, the member municipalities will incur this immense rate increase, but actually realize very minimal gain in water quality.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

California Association of Mutual Water Companies (Doc. #1676, SBC-043776)

2. Unreasonable Conditions on State Funding

CalMutuals additionally requests the EPA allocate or identify funding to support PFAS testing requirements and treatment in a manner that ensures that the funds are readily accessible to very small systems without unreasonable conditions, such as requiring involuntary consolidations. The State Board has in some situations denied much needed funding through the Drinking Water State Revolving Fund to small water systems which have been put on a list of systems to be consolidated – without any due process or determination as to the feasibility of such a consolidation. Further, the California SAFER program, which the State Board administers, has no plan for how to carry out consolidations in a methodical manner that includes identification of financial resources, public input, and process for implementation. The consequences of this policy are that small systems that do not wish to consolidate (including those that are well run but may face struggles with increasing regulation, increasing expenses and a small customer base) and those where consolidation is not feasible are being denied access to resources to address new regulations and are further penalized and stuck in a limbo of non-compliance without recourse.

In addition, it would be very helpful if access to any federal funding can be streamlined and facilitated without the need for engineering studies or grant writers, which in and of themselves are beyond the reach of most very small water systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

New York City Department of Environmental Protection (NYCDEP) (Doc. #1679, SBC-044210)

Cost Estimate

EPA has estimated the total annualized costs would range from $772 million to $1.2 billion, while the economic benefits would range from $908 million to $1.2 billion. However, a study conducted by Black and Veatch on behalf of the American Water Works Association found that the proposal would exceed $3.8 billion annually. Given that the cost of compliance will exceed any additional funding provided by the 2021 Bipartisan Infrastructure Law, costs associated with treatment, monitoring and public notifications will be passed on to ratepayers and communities rather than primary and secondary manufacturers and industrial users. Additionally, there are cost issues associated with lab capacity as discussed below.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-

quantifiable health benefits realized from implementing the rule. For additional discussion regarding lab capability and capacity for the final MCLs, please see section 5.1.2 of the EPA response in this *Response to Comments* document.

City of Vancouver Water Utility, Vancouver, WA (Doc. #1684, SBC-044304)

The proposed MCLs may imperil the financial sustainability and affordability of some water systems, which will warrant greater assistance in terms of funding. To not clarify the extent of these costs now would be a grievous mistake as water systems and governments across all levels budget for the future and may be forced into competing for limited federal dollars.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Clean Water Action/Clean Water Fund (Doc. #1697, SBC-045004)

Decisive Actions to Address Burdens on Regulated Public Water Systems, State Primacy Agencies, and the Public

When EPA's proposed drinking water limits are final, communities around the country will need to invest in treatment and staff to comply with the regulations. While costs and effort will be higher where PFAS chemicals are found, all community water systems and non-transient noncommunity water systems will need to monitor for PFAS. New federal funding available as a result of the bipartisan Infrastructure Investment and Jobs Act and the Drinking Water State Revolving Fund will help, and water systems and communities should continue to seek to hold PFAS polluters accountable for contaminating drinking water wherever possible. Nonetheless, water systems and local governments will incur additional costs, people's water bills will often go up, state primacy agencies responsible for implementation will also incur new costs, and ongoing exposure to PFAS chemicals through food, air, and other routes of exposure will continue to pose public health risk.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

National Wildlife Federation et al. (Doc. #1702, SBC-043515)

As the Administration continues to address the PFAS crisis, it is critical that assistance for low-income communities and communities of color is prioritized, particularly since history shows us that vulnerable communities are often too under-resourced to quickly and comprehensively address toxic pollution. We must build on the investments made through the Infrastructure Investment and Jobs Act to provide additional assistance to communities that may be disproportionately impacted by PFAS and ensure that changing or implementing federal regulations do not negatively impact ratepayers or vulnerable communities by involving these communities in the decision-making process.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

The City of Columbus, Department of Public Utilities (Doc. #1703, SBC-045056)

Even with a historically high level of federal funding reaching billions of dollars, the proposed rule's estimated costs will far exceed available funding. NACWA's benefit-cost report projected that water utilities and their ratepayers will pay six times the amount allocated, plus operation and maintenance costs [FN5: Federal Funding Analysis, at page 67 of the Black and Veatch Study attached to NACWA's comment letter.]. While the federal funding will provide much needed assistance, it will not offset the necessary expenditure enough to prevent adverse outcomes for water utilities and ratepayers.

Utilities are struggling with maintaining affordable rates as they face an onslaught of mandated capital and regulatory projects [FN6: Impending regulatory challenges for water utilities are the Lead and Copper Rule Revision, Lead and Copper Rule Improvements, and CERCLA designation of PFAS. Additionally, water utilities are struggling with replacing aging infrastructure and meeting the challenges of climate change, including reducing greenhouse gas emissions while simultaneously preparing for its effects.]. Public water utilities are stewards of public funds and must choose how to best protect human health with limited resources. To accommodate the costs of new treatment, public water utilities will either have to devote fewer resources to ongoing operations, infrastructure repairs, and responses to other health priorities, or they will have to raise rates. Ratepayers—especially in our environmental justice communities—will feel the burden of higher utility bills. Regulating without proper consideration of cost will affect affordability and could result in negative outcomes in disadvantaged communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

California Farm Bureau Federation (Doc. #1704, SBC-045081)

Costs to Rural Households

Individual households will also experience financial impacts from this proposed rule. While financial impacts to individual households will vary by specific PFAS levels, system size, and other factors, we are specifically concerned about the impacts on rural households. As illustrated in the graph below, meeting the 4ppt standard would be significantly more expensive for public water systems that service less populated areas. AWWA estimates the annual costs of the proposed rule on communities with populations of less than 100 will cost between $10,000 and $11,000 per household, a significant increase for these households.

[Table 2: See Docket ID EPA-HQ-OW-2022-0114-1704]

Federal Funding is Limited

The agency has claimed that various federal funding streams are available for drinking water utilities to adapt to this rule. However, there remains a failure to recognize the difficulties that small, rural communities face in competing for and obtaining these monies. In a May 11th Small Business Environmental Roundtable, EPA staff highlighted the following funding opportunities that were authorized through the IIJA:

• $11.7 billion to the Drinking Water State Revolving Fund (SRF)

• $4 billion in SRF for emerging contaminants

• $5 billion to Water Infrastructure Improvements for the Nation (WIIN) Grants to address emerging contaminants.

While it is encouraging to see this level of federal investment in protecting our drinking water and addressing emerging contaminants like PFAS chemicals, there is not sufficient financial resources to cover the costs of this rule for every water utility. Additionally, these resources are often devoted to projects that benefit large population areas.

Conclusion

California Farm Bureau encourages EPA to reevaluate the proposed MCLs for these six PFAS chemicals so that the final rule includes an achievable standard that is not disproportionally burdensome to rural communities. If there are questions about these comments, please contact Kari Fisher at kfisher@cfbf.com.

Sincerely,

Jamie Johansson President

California Farm Bureau

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document for concerns regarding rate payers and small public water utilities. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule. The EPA disagrees with many of the assumptions in AWWA's B&V report and the report's overall conclusions about the estimated national costs. See section 13.3.3 of the EPA response in this *Response to Comments* document.

California Farm Bureau Federation (Doc. #1704, SBC-045071)

For example, the U.S. Chamber analysis highlights the following:

• Infrastructure Investment and Jobs Act (IIJA) funding will be insufficient to cover the costs of compliance. The investment needed to reach proposed MCL levels moves well beyond the

ability of communities to afford and beyond the potential funding available in the IIJA. Simply put, the compliance costs are too high.

There are a number of other issues associated with the proposed MCLs that deserve in-depth discussion, including the benefits identified by the agency, the health end points, and the possible conflict between other Administration policies. We hope that the EPA will consider all of these factors before finalizing this proposed rule.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

State of Vermont Agency of Natural Resources and Department of Health (Doc. #1708, SBC-045095)

e. SRF eligibility for O&M expenses:

While there is funding currently available it does not cover all needs, all possible systems, and does not cover Operation and Maintenance (O&M) expenses. Initial designing, permitting, and construction is just the beginning, the on-going expenses are crippling and require the user base to cover increasingly expensive costs of disposal and replacement of media. Without loan or grant eligibility or other funding, these systems may become financially unstable. Additionally, there may be private schools or other for-profit Non- Community drinking water systems that are not eligible for funding but may have considerable expenses incurred.

EPA should establish a dedicated funding source for O&M expenses for small water systems who are disproportionately impacted by PFAS contamination.

EPA Response: With respect to BIL funding for operations and maintenance costs, please see the section 2.4 of the EPA response in this *Response to Comments* document.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045738)

5. In assessing the benefits and costs analysis for this rule, the EPA evaluated cumulative benefits on other regulatory programs but not the cumulative cost impacts resulting from this regulation on other ongoing regulatory activity, such as LCRR/LCRI implementation and compliance.

Currently, PWSs are facing simultaneous compliance issues for various ongoing regulatory changes at the EPA level such as the Lead and Copper Rule Revisions, revisions to National Pollutant Discharge Elimination System (NPDES) permit requirements for ammonia discharges, and combined sewar overflow discharge limits. Together, these current and upcoming regulations, in addition to the numerous other regulatory requirements to which PWSs are subject, represent a significant allocation of resources in the coming years. Given PWD's

inability to access SRF grant funding, as mentioned above, these burdens will be shouldered by our ratepayers. With the significant costs associated with the proposed PFAS NPDWR and other ongoing regulatory requirements, EPA should not be assessing the cost of this rulemaking in a vacuum. Rather, EPA's Economic Evaluation should be re- evaluated to consider the cost of this proposed rulemaking in the context of other ongoing regulatory requirements and the financial capabilities of utilities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. To the extent that implementation overlaps with other rules, the EPA cannot consider costs that result from compliance with other regulations. Specifically, the agency notes that SDWA Section 1412(b)(3)(C)(i)(III) requires that the EPA include quantifiable and non-quantifiable costs that are likely to occur solely as a result of compliance with the rule at issue (including monitoring, treatment and other costs) and exclude costs resulting from compliance with other proposed or promulgated regulations. While operational adjustments may be necessary, the EPA has not identified any other drinking water regulations or requirements that will inhibit compliance with this regulation, nor does the agency expect this regulation to impair compliance with other regulations, such as the lead and copper rules.

Citizens Campaign for the Environment (CCE) (Doc. #1710, SBC-045127)

Now is the time to act. With unprecedented investment in clean water infrastructure from the federal government, through the Bipartisan Infrastructure Law, and from states such as New York, through the Clean Water Infrastructure Act, which has invested $5 billion since 2017, including $500 million in the state's recently adopted SFY 2023-24 budget, communities now have resources to install treatment technology needed to protect drinking water from emerging contaminants, including PFAS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Citizens Campaign for the Environment (CCE) (Doc. #1710, SBC-045139)

• EPA should develop a grant program for low-income communities. Water suppliers that serve low to moderate income communities may need to obtain treatment technology for PFAS contamination. Low to moderate income communities would benefit from an EPA grant program so that clean, safe drinking water is available and affordable.

Thank you for your consideration of our comments.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045917)

E. EPA's reliance on other federal funding will not alleviate costs

EPA indicates that federal funding from the Bipartisan Infrastructure Law as a way to defray a small portion of the potential costs of installation and treatment when it "otherwise [might] be cost-challenging."[FN168: 88 Fed. Reg. at 18640.] However, its reliance on temporary federal funding to address a long-term unfunded mandate is flawed in several respects. First, because EPA underestimates costs, the amount of funding available to address PFAS treatment is a much lower percentage, making the "cost-challenging" comment highly relevant, as indicated in the Chamber's modeling. Second, EPA's reliance on available federal funding does not alleviate costs for water systems in the long term, or to cover O&M costs. The obligations of public water systems will far outlast the short- term funding available. Once funding through the Bipartisan Infrastructure Law runs out, public water systems will need a new source of revenue to continue operating the PFAS treatment, most likely by raising rates. Further, federal funding is certainly not guaranteed for every impacted public water system [FN169: The $11.7 billion funds are for investment in the Drinking Water State Revolving Fund (SRF), $4 billion to the Drinking Water SRF for Emerging Contaminants, and $5 billion for the Small, Underserved, and Disadvantaged Communities Grants. EPA details the process for water systems to be eligible and apply for these funds, which are administered by states: https://www.epa.gov/dwsrf/how-drinking-water-state-revolving-fund-works#tab-1.]. Water systems will have to apply for funding while, in the meantime, incurring compliance costs if and until federal funding is received. Also, the funding available will likely be competing for other important priorities like the lead pipe replacement requirements in the lead and copper rule revision, which could negatively affect environmental justice communities by slowing lead pipe replacement. Further, the fact that public water systems may not, in some circumstances, have to directly bear a portion of the cost does not mean it is not a cost at all. Additional public spending to address a regulatory mandate is a cost to taxpayers and the economy. Finally, the Bipartisan Infrastructure Law specified allocations of funding for certain purposes and did not specify that all of the funds must be used towards addressing PFAS [FN170: See "Bipartisan Infrastructure Law: A Historic Investment in Water," U.S. EPA: https://www.epa.gov/system/files/documents/2021-11/e-ow-bid-fact-sheet-final.508.pdf.]. \

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule. Finally, please also see section XIII.D of the final rule preamble for discussion on the EPA's consultation and analyses under current statutory and Executive Orders, including the Unfunded Mandates Reform Act (UMRA) in support of the final rulemaking.

Clean Air Council, et al. (Doc. #1731, SBC-043879)

Additionally, it should be noted that federal funding is available to help Public Water

Systems treat PFAS contamination. Indeed, $75 million of President Biden's Bipartisan Infrastructure Law was already allocated in February 2023 to Pennsylvania to address emerging contaminants—in particular PFAS—in drinking water [FN30: EPA, Biden-Harris Administration Announces $75 Million in Bipartisan Infrastructure Law Funding to Address Emerging Contaminants like PFAS in Drinking Water in Pennsylvania, https://www.epa.gov/newsreleases/biden-harris-administration-announces-75-million-bipartisan-infrastructure-law-funding (Feb. 14, 2023).]. Such funding would enable mitigation of costs, particularly in water systems serving economically disadvantaged communities.

In summary, enacting the proposed PFAS NPDWR in the Commonwealth of Pennsylvania is feasible both technically and economically. The existing, less stringent, Pennsylvania PFAS drinking water MCL will give PWSs in the Commonwealth a longer period of time to prepare and plan.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

U.S Conference of Mayors, National League of Cities and National Association of Counties (Doc. #1733, SBC-043900)

Conclusion

In conclusion, we urge EPA to adhere to the polluter pay model and to move forward in a way that will not shift the cost burden of this regulation onto local governments, water utilities or ratepayers. In developing this regulation, EPA should adequately examine emerging data in an effort to further scientific consensus regarding PFAS. Further, should EPA move forward on this regulation, we urge the Agency to establish a higher MCL for PFOA and PFOS and to provide local governments with maximum flexibility, longer compliance timeframes, and additional direct funding.

On behalf of the nation's mayors, cities and counties, thank you for considering the local government perspective on this important issue. If you have any questions, please contact us: Judy Sheahan (USCM) at 202-861-6775 or jsheahan@usmayors.org; Carolyn Berndt (NLC) at 202-626-3101 or Berndt@nlc.org; or Sarah Gimont (NACo) at 202-942-4254 or sgimont@naco.org.

Sincerely,

Tom Cochran

CEO and Executive Director

The U.S. Conference of Mayors

Clarence E. Anthony

CEO and Executive Director

National League of Cities

Matthew D. Chase

CEO and Executive Director

National Association of Counties

EPA Response: For funding concerns, please see section 2.4 of the EPA response in this *Response to Comments* document. For additional discussion on regulatory alternatives, please see section 5.1.3 of the EPA response in this *Response to Comments* document. For additional discussion on the compliance timeline, please see section 12 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-046005)

ECONOMIC IMPACTS

These social costs will fall heavily on low-income households and households served by small public water systems. Despite EPA's claims, recently enacted federal support for water utilities is insufficient to pay for even the capital costs of the proposal's requirements. As a result, ratepayers may pay a significant portion of the compliance costs of the rulemaking. Certain ratepayers are projected to pay hundreds of dollars per household per year due to this rulemaking.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs associated with implementing the NPDWR and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Defend Our Health (Doc. #1741, SBC-045197)

We would also like to urge the EPA to refrain from weakening the proposed standards due to arguments by water districts and others that this rule will cause an increase in water costs for taxpayers. Water districts across the country are making the argument that the draft MCLs, if implemented, will make water bills unaffordable, particularly for low-income residents. While we are sympathetic to increased costs for rate payers, water districts do have other options to fund compliance other than raising rates. Water districts also frequently overestimate the likely cost of compliance. The health impacts of PFAS are too great to allow communities to continue to be exposed. The EPA must resist attempts to weaken the draft MCLs.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

LSP Association (LSPA) (Doc. #1742, SBC-043609)

Slide 33: Bipartisan Infrastructure Law Funding for PFAS

• MassDEP data shows that 170 Public Water Suppliers (PWS) have detected PFAS above the state health standards, which is 20 ppt for the sum of six PFAS. That number is predicted to triple if USEPA's MCL is adopted. See the MWWA May 26, 2023 comment letter (pp. 6-7 and Graphic 3).

• The LSPA believes that USEPA is overestimating the ability of the Bipartisan Infrastructure Law (BIL) to fund the significant, ongoing costs of implementing this proposed rule. As the May 26, 2023 MWWA letter notes, "While this funding is appreciated, it's not nearly enough" for what is needed to address the PWS PFAS challenges. Pages 15 – 17 of the MWWA letter present more specific information.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover the costs of the rule and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Connecticut Department of Public Health (CT DPH) (Doc. #1745, SBC-045241)

3. Capital improvements and workforce development will present considerable challenges, especially for small systems. CT DPH is already seeing increased demand for its Drinking Water State Revolving Fund (DWSRF). CT DPH is appreciative of the financial support the Biden Administration has already allotted through the BIL, the Emerging Contaminants DWSRF Award and the Emerging Contaminants in Small or Disadvantaged Communities Grant Program. CT DPH anticipates the need will grow and sustain well into the future as more PWS test for PFAS. In fact, applications to the DWSRF for funding assistance for projects to address PFAS already exceed CT DPH's FFY2022 BIL allotment for the Emerging Contaminants Capitalization Grant.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover the costs of the rule and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045252)

More funding is needed for rule implementation, particularly for small systems.

EPA has noted that passage of the Infrastructure Investment and Jobs Act (also referred to as BIL), invests over $11.7 billion in the Drinking Water State Revolving Fund (DW SRF), $4 billion to the DW SRF for Emerging Contaminants, and $5 billion to Small, Underserved, and Disadvantaged Communities Grants (SUDC). It is critical that EPA build on these investments to provide additional assistance to communities that may be disproportionately impacted by PFAS and ensure that changing or implementing federal regulations do not negatively impact ratepayers or vulnerable communities. Federal funding should cover all capital costs for treatment technologies, and strategies for operation and maintenance costs clearly communicated to states and water systems.

In West Virginia, even basic drinking water infrastructure investments are still gravely needed. Additional costs to install treatment technologies that remove PFAS will require even more funding, particularly because West Virginia is a hot spot for PFAS contamination from industry and military installations [FN4: https://www.ewg.org/interactive-maps/pfas_contamination/map/]. In FY 22, West Virginia was allotted $7.5 million in DW SRF for Emerging Contaminants. The entirety of this funding was used for one project, to upgrade the water treatment plant in Parkersburg, WV to remove PFAS from the source water, which was primarily contaminated by the Chemours Washington Works facility. Moreover, finished water data from 37 water systems show that 19 systems are in violation of the draft MCLs [FN5: https://dhhr.wv.gov/News/2023/Pages/DHHR-and-DEP-Announce-Drinking-Water-Test-Results.aspx]. Source water data from water systems across the state indicate that the total number of systems in violation of the draft MCLs is likely much higher. It is doubtful that West Virginia's allotment of BIL DW SRF and SUDC is sufficient to cover the hundreds of millions needed in capital costs to upgrade water systems, as well as basic infrastructure upgrades to ensure all West Virginians have access to safe drinking water.

Furthermore, it is imperative that ratepayers do not bear the burden of capital costs, nor the operation and maintenance costs. In tandem with the publication of a final rule, EPA should highlight funding and financing strategies water systems can use to ensure they can implement the final rule without making bills unaffordable, particularly for low-income customers. Strategies include maximizing use of available federal funding, especially for disadvantaged communities; holding polluters accountable for water systems' compliance costs; and adopting equitable rate structures and other programs that can increase rate revenues without burdening low-income customers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully cover all capital costs for treatment technologies, and strategies for operation and maintenance costs and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Riverside Public Utilities, Riverside, CA (Doc. #1762, SBC-044226)

May 30, 2023

The Honorable Michael Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, D.C. 20460

Dr. Jennifer McLain

Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1201 Pennsylvania Avenue NW

Washington, D.C. 20004

Re: Comment Letter PFAS National Primary Drinking Water Regulation Rulemaking; EPA–HQ– OW–2022–0114; FRL 8543–01– OW

Dear Administrator Regan and Dr. McLain:

The City of Riverside (City) staff appreciates the opportunity to provide comments on the Environmental Protection Agency's (EPA) proposed PFAS National Primary Drinking Water Regulation (NPDWR). City staff strongly supports drinking water standards for PFAS that are based on sound science and robust analysis. This process will result in a landmark decision for water agencies. The U.S EPA's willingness to consider feedback from water agencies and stakeholders across the nation is greatly appreciated prior to the official rulemaking.

The City is the county seat of Riverside County with its own water, wastewater and electric utilities. The City provides high quality services to a population of more than 300,000. Approximately 34% of Riverside's population falls below 200% of the 2020 Federal Poverty Level. The City is committed to providing the highest quality water at affordable water rates to benefit the community and believes that future regulations must consider the financial burden on ratepayers.

The City's current treatment systems and blending capacity are reducing PFAS concentrations below the State's current notification levels; however, our initial analysis indicates that more advanced water treatment will be required to meet the proposed Federal regulations announced on March 14, 2023. Complying with the lower Federal PFAS limits will be more difficult, particularly during the high water demand summer period. During this time, water treated by the City's existing systems will likely exceed the proposed PFAS Federal limits, unless the City installs additional treatment, or resorts to turning off wells with high PFAS concentrations. Shutting down wells during peak summer water demand will reduce groundwater supplies and

may require the City to purchase more expensive imported water from the Metropolitan Water District of Southern California via Western Municipal Water District in order to meet the needs of its ratepayers.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Northwest Biosolids Association et al. (Doc. #1783, SBC-043800)

In addition, drinking water utilities will need federal funding and assistance to implement technologies capable of meeting any new limits for PFAS. Without federal assistance, the rate payers will suffer the burden of paying for the clean-up of upstream sources of PFAS.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Fairfax Water (Doc. #1789, SBC-045316)

6. The cost to implement PFAS treatment will be considerable and will be borne by utility ratepayers - the public. Placing the entire burden of PFAS removal on the drinking water public exacerbates the affordability issues many utilities face as we address new (Lead and Copper Rule Revisions) and future (Microbial and Disinfection Byproduct Rules) regulations, replace aging infrastructure, and address climate related resilience. Affordability is further challenged by cost increases for chemicals, power, and supplies that far outpace the overall rate of inflation. EPA should re-evaluate the costs of rule implementation to ensure the current realities of utility input costs and supply chain limitations are accurately reflected in its analysis.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that topics related to "new (Lead and Copper Rule Revisions) and future (Microbial and Disinfection Byproduct Rules) regulations, replac[ing] aging infrastructure, and address[ing] climate related resilience" are beyond the scope of the current rulemaking. To the extent that implementation overlaps with other rules, the EPA notes that it is not permitted to consider costs that result from compliance with other regulations per SDWA section 1412(b)(3)(C)(i)(III); please see section 12 of the EPA response in this *Response to Comments* document for additional information.

Fairfax Water (Doc. #1789, SBC-045307)

EPA frequently cites the funding made available for PFAS treatment in the Bipartisan Infrastructure Law (BIL), but those funds represent a fraction of what will be required to implement PFAS treatment at water utilities nationwide and many utilities are not eligible to receive those funds.

While infrastructure costs for PFAS treatment would be financed over time, the increase in annual operating expenses falls directly to the cost per gallon to customers. There is no federal funding to support ongoing operational expenses, nor is there any certainty that funding for the Low Income Household Water Assistance Program (LIHWAP) will continue.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL funds are not meant to fully fund "PFAS treatment at water utilities nationwide" and that there are significant quantifiable and non-quantifiable health benefits realized from implementing the rule.

Metropolitan Washington Council of Governments (COG) (Doc. #1791, SBC-043774)

Third, while significant federal funding has been approved by Congress, additional direct federal funding for local governments and water utilities should be provided to help offset the high capital, operations, and maintenance costs expected at the local level. The cost of compliance is estimated by a recent AWWA study to be significantly higher than cost estimates developed by EPA. These potentially high expenses for PFAS treatment come at a time when local governments and water utilities are facing double and triple digit increases in the prices of essential supplies, equipment, and electricity. On top of that, we are also facing potentially high costs to address regional water security and resilience needs, mitigate climate change impacts, meet Chesapeake Bay TMDL restoration requirements, and more. Ultimately, all these costs will fall on ratepayers who are already facing higher costs for other basic necessities such as food, housing, and transportation.

We thank you for your consideration of these recommendations and look forward to continuing to work together on environmental restoration efforts.

Sincerely,

Maria Mackie

Chair, Chesapeake Bay and Water Resources Policy Committee

Cc: Radhika Fox, Assistant Administrator for Water Adam Ortiz, EPA Region III Administrator

Catherine A. Libertz, Director, EPA Region III Water Division

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The agency notes that concerns regarding, "regional water security and resilience needs, mitigate[ing] climate change impacts, meet[ing] Chesapeake Bay TMDL restoration requirements" are beyond the scope of the current rulemaking.

Ohio Environmental Council (Doc. #1794, SBC-045327)

While some water utilities have already installed water treatment technology capable of reducing PFAS, many are not yet equipped to do so. To help communities, Congress passed the Bipartisan

Infrastructure Law which provides $9 billion in funding for drinking water treatment upgrades, and an additional $11.7 billion for other necessary drinking water infrastructure needs. This funding will aid utilities in meeting EPA's proposed drinking water standards and improve drinking water safety.

EPA Response: The EPA agrees that BIL funding can "aid utilities in meeting the EPA's proposed drinking water standards and improve drinking water safety." Please see section 2.4 of the EPA response in this *Response to Comments* document for additional discussion on BIL funding.

Vermont Rural Water Association (Doc. #1798, SBC-045332)

Existing funding mechanisms will not cover costs such as ongoing sampling, bottled water, treatment system operation and maintenance, and additional operator certifications. In Vermont, the sixteen systems with PFAS exceeding the state MCL include schools, fire districts, and small businesses in every corner of the state. Most of these systems do not employ on-site operators and must pay for increased visits and assistance from contract operations companies.

EPA Response: With respect to BIL funding for operations and maintenance costs, please see section 2.4 of the EPA response in this *Response to Comments* document.

Rural Water…supporting water and wastewater systems in Vermont since 1982.

Date: May 30, 2023

To: US EPA

RE: Comments on Proposed PFAS National Primary Drinking Water Regulation

Docket ID: EPA-HQ-OW-2022-0114

As representatives of Vermont's small drinking water systems, the Vermont Rural Water Association is providing feedback to EPA regarding proposed PFAS regulation. We are proud that Vermont is a national leader in protecting public health by regulating contaminants in drinking water. However, the financial integrity of water utilities is also a threat to public health. This is especially the case for our small, rural system members.

Vermont's current PFAS regulations, established by Act 21, have already caused financial and technical burdens for over 600 public water systems in Vermont. Collecting the water sample requires training or hiring a contractor. Sample analysis is expensive, especially since there are no labs within the state certified to perform EPA Methods 537 or 537.1. Those systems found to have PFAS levels exceeding the state MCL have spent large amounts on engineering services and remediation in addition to the social consequences of issuing a Do Not Drink order to their customers. Additional regulations will likely cause water rates to rise, which will harm our most vulnerable populations.

EPA Response: With respect to funding concerns for disadvantaged communities, please see section 2.4 of the EPA response in this *Response to Comments* document.

Massachusetts Municipal Association (MMA) (Doc. #1800, SBC-043760)

Existing Regulatory Landscape in Massachusetts

In 2020, the Massachusetts Department of Environmental Protection (MassDEP) established an enforceable state maximum contaminant level (MCL) of 20 parts per trillion (ppt) for the sum of six PFAS compounds. These include perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), perfluorohexane sulfonic acid (PFHxS), perfluoroheptanoic acid (PFHpA), and perfluorodecanoic acid (PFDA). This regulatory standard was much more stringent than the EPA's health advisories for PFOA and PFOS at the time.

The Massachusetts MCL for PFOA, PFOS, PFNA, PFHxS, PFHpA, and PFDA, commonly referred to as "PFAS6," required our members to test, monitor, and remediate PFAS contamination in drinking water before a national enforceable regulation was proposed. 170 PWS in Massachusetts were impacted by this MCL and found detections above 20 ppt. To date, $209 million has been committed for just 24 projects to treat PFAS6 through State Revolving Fund (SRF) loans. Funding corrective actions and securing loans has been and will continue to be a complex system for municipalities to navigate.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For additional discussion on existing state drinking water standards, please see section 5.1.5 of the EPA response in this *Response to Comments* document.

Massachusetts Municipal Association (MMA) (Doc. #1800, SBC-043763)

Communities in Massachusetts will face rising water rates as a result of this new regulatory standard, and it will be critical for the federal government to provide additional funding opportunities to support communities through this significant challenge. Investments through the Bipartisan Infrastructure Law (BIL) will assist in this process, but will not be sufficient alone to bear the financial burden this proposal creates for public water systems who are committed to providing safe, reliable service.

MassDEP estimates that 198 PWS across Massachusetts will be impacted should this proposal be finalized. The MMA has been in close communication with our member communities about the impact of this proposal, including many municipalities that have already been involved with significant remediation efforts to deal with PFAS contamination within the existing state standard.

EPA Response: For discussion on funding available to assist in the implementation of the PFAS NPDWR through the BIL, please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL is not intended to solely "bear the financial burden" of this NPDWR and that significant quantifiable and non-quantifiable health benefits are expected to be realized after implementing the rule.

Massachusetts Municipal Association (MMA) (Doc. #1800, SBC-043769)

Summary

The requirements to comply with the EPA's National Primary Drinking Water Regulation proposal go beyond the normal operating budgets of our cities and towns. Because of the tax-limited environment [Link: https://www.mass.gov/service-details/proposition-2-12-and-tax-rate-process] in Massachusetts cities and towns, many communities would be forced to consider an override to increase local property tax burdens, or be compelled to reduce funding for existing programs and services. That is the simple reality caused by unfunded mandates.

Public water systems are devoted to the provision of safe drinking water and will do what is necessary to ensure public trust and confidence in this resource. However, without supplemental funding and a practical timeline for this necessary work, municipalities will struggle to finance and implement corrective action, and this new burden will weaken the delivery of other vitally important services.

We welcome opportunities to work collaboratively with the EPA and EPA Region 1 staff as the regulatory process continues to ensure that municipal concerns and realities are taken into full consideration.

Thank you for considering our comments on the proposed National Primary Drinking Water Regulation. If you have any questions or desire further information, please do not hesitate to

have your office contact me or MMA Legislative Analyst Josie Ahlberg at jahlberg@mma.org at any time.

Sincerely,

Geoffrey C. Beckwith

Executive Director & CEO, MMA

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The agency also notes that individual state or local tax laws are outside the scope of the current rulemaking. Finally, please also see section XIII.D of the final rule preamble for discussion on the EPA's consultation and analyses under current statutory and Executive Orders, including UMRA, in support of the final rulemaking.

Safe Drinking Water Branch, Hawaii Department of Hawaii (Doc. #1801, SBC-043750)

Comment on the proposed PFSA Rule from Safe Drinking Water Branch, Hawaii Department of Hawaii

financial Burden

The cost of test, the construction and operation of the pilot treatment plant, the construction, the operation and maintenance costs of the treatment plant, the disposal cost of spent media will be a heavy financial burden to the water systems, especially those in the disadvantage community. How will EPA provide enough financial support for water purveyors in a long run?

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL provided approximately $43 billion to the CWSRF and DWSRF, with $4 billion specifically reserved to address PFAS and emerging contaminants and $5 billion in grants to small or disadvantaged communities. While $15 billion is reserved for lead service line replacements, the rest can be used for various purposes, which could include installing PFAS treatment or source water protection.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045835)

EPA notes the availability of billions of dollars in federal funds through the BIL to help defray the compliance costs of the proposed rule. The availability of these funds is important context for the proposed rule and should not be ignored. In Wisconsin, around $13,000,000 in funding per year is available—through 2026—via the Safe Drinking Water Loan Program for Emerging Contaminants (SDWLP-EC) alone. [FN35: Wisconsin Department of Natural Resources, Bipartisan Infrastructure Law Funding: Clean Water and Drinking Water State Revolving Fund Programs, https://dnr.wisconsin.gov/aid/BILfunding] These funding sources allows water systems to lower their cost of capital and, thus, the estimated compliance cost forecasted with a 7% discount rate is overstated.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA notes that BIL provided approximately $43 billion to the CWSRF and DWSRF, with $4 billion specifically reserved to address PFAS and emerging contaminants and $5 billion in grants to small or disadvantaged communities. While $15 billion is reserved for lead service line replacements, the rest can be used for various purposes, which could include installing PFAS treatment or source water protection.

Calie Mallory (Doc. #1935, SBC-046606)

It is unquestionable that we as a nation need to do something about the PFAS that are contaminating so much of our water and making so many sick. There is undoubtedly nothing bad that can come of addressing this issue, it would benefit the health of everyone in the long run and even the environment hopefully. Acting can only bring good in providing the EPA the necessary data to cause improvement. The recent Bipartisan Infrastructure Law Funding Grant and requiring PFA manufacturers to better provide toxicity data in broken down categories may be exactly what is necessary to address this issue. While it may seem like an incredibly great amount of money, $2 billion is an important investment for the E.P.A. to make to regulate the amount of PFAs that are seen in the water that is being supplied to citizens all over the country.1 Providing this to small and disadvantaged communities would be essential in taking initiative for this problem since it would start by directly targeting those that are most impacted by the presence of PFAS. Such as small farming communities that may not have much intervention in regulating their water toxicity for them and their farm animals, or disadvantaged communities that are not given the resources to keep their drinking water healthy. Disadvantaged communities such as Flint, Michigan. The people that would most be affected by this Bipartisan Funding is the taxpayers who are, in theory, providing the money for these grants. Some taxpayers may be upset that this is what their money is going to, but this should not be taken too harshly since helping them fund the grants will hopefully benefit them and their health in the future. Also, these taxpayers should feel confident that the money is being allocated appropriately by states and territories since they are going to have to actively collaborate with the E.P.A. regional offices in what they are doing to act. Looking at the Bipartisan Funding, it seems it will bring little harm and more benefit to everyone. Another action being proposed that may be effective in addressing PFAS and their regulation in water, is the new stricter data reporting that is being proposed.2 The proposed idea of all PFA manufacturers having to better provide toxicity data could be incredibly helpful in trying to produce solutions. Especially when it comes to getting very specific in the different PFA categories and breaking them down into smaller and more specific sub-groups that can allow better monitoring of health effects and possible solutions to regulating them. However, while this would be helpful and effective, it may not be very realistic since it will be hard for the E.P.A. to get all manufacturers of PFAS to accurately report their toxicity data. It may be possible that some manufacturers, when their toxicity data is not positive, may alter their numbers to look better which would not help in regulating that specific company or monitoring that PFA. If this is to be a method used in acting, there needs to be more specified details as to how PFA manufacturers are to be truly held accountable. When it comes to finding immediate

solutions and benefitting everyone, the Bipartisan Funding is the most beneficial and best option as of right now, the E.P.A manufacturer regulation may not be the most refined as it may need to be to properly taking effect.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. For additional discussion on the agency's plan for reducing PFAS exposure through the *PFAS Strategic Roadmap*, please see section 15 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2533, SBC-046303)

While I am all for banning, or at least severely regulating, PFAS chemicals because of their negative impacts on our health and the environment, I am wondering if the EPA has considered other relevant components to this proposal, such as its impact on the economy. PFAS are used in many consumer products from things like cleaning supplies to shampoo to life jackets. Regulating these chemicals will surely create an economic burden that will be shoved onto us as consumes of these products. Our health should obviously be our top priority, however, I think it should be considered that this economic burden could potentially make it difficult for those who are disadvantaged to pay for other serious health complications.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Information on health effects associated with the six PFAS can be found in section 4 of the EPA response in this *Response to Comments* document, and economic impact is addressed in section 13 of the EPA response in this *Response to Comments* document under the health risk reduction and cost analysis. Regulation of consumer products is beyond the scope of this PFAS NPDWR.

Reid Biggs (Doc. #2565, SBC-046277)

Great work, thankyou. Please insist on the help of those that have manufactured, and profited from, items that have contributed to the PFAS buildup in our environment throughout this, and the last century. Please, don't let the blame and financial responsibility fall solely on the consumer. Maybe they should subsidize water filtration methods required to keep providing our descendants with plenty of clean, free, fresh, & safe drinking water.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. As part of the *PFAS Strategic Roadmap*, the EPA is committed to addressing PFAS contamination and the PFAS NPDWR is one key part of that strategy. For additional discussion on the *PFAS Strategic Roadmap*, please see section 15 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2311, SBC-047301)

Although there is Federal funding for infrastructure development, why is there no funding for operations and maintenance for rural/native communities, or otherwise economically and technically disadvantaged communities? Alaska has multiple rural communities that still lack running water and sewer service. They drink from rain catchment from their roofs, snow melt, rivers, or lakes and use 5-gallon buckets (aka "Honey buckets") as toilets. Millions of dollars have been spent to develop state of the art water treatment and sanitation facilities only for them to fall in disrepair because there is no funding to support operation and maintenance.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA and BIL place increased investment in disadvantaged communities as a key priority as stated in the memorandum from Radhika Fox dated 8 March 2022 titled "Implementation of the Clean Water and Drinking Water State Revolving Fund Provisions of the Bipartisan Infrastructure Law." This can also be seen in various EPA initiatives such as Justice40 and the funding allocations to small and disadvantaged communities. More information on EJ can be found in section 14.10 of the EPA response in this *Response to Comments* document.

Beaufort-Jasper Water & Sewer Authority (BJWSA) (Doc. #1618, SBC-042934)

The impact on customer rates will be substantial, especially when considering the national need to address aging water infrastructure coupled with the substantial increase in construction costs. Without additional federal funding to support PFAS treatment technology implementation and increased regulations on the polluters to decrease source water PFAS levels, water utility customers will b left paying the bill. In an attempt to try to keep water rate increases to feasible levels, utilities will need to delay other planned capital projects and defer necessary infrastructure repair and rehabilitation, which increases utility risk and could have severe public health consequences.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

California Association of Mutual Water Companies (Doc. #1676, SBC-043787)

5. Incentives for Larger Systems Helping Smaller Systems

CalMutuals recently has become the fiscal sponsor of an alliance of small to medium sized special districts that serve disadvantaged communities and have been advancing regional solutions to small-system challenges. We encourage the EPA to incentivize States to allocate a portion of the technical assistance set-aside within the State Revolving Funds to support and encourage larger systems in proximity to share technology and expertise to assist their smaller system neighbors as we work together to provide safe water to our shared communities.

Thank you for your consideration of CalMutuals comments.

Karina Cervantez

Managing Director

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Susan Gorman-Chang (Doc. #1705, SBC-045085)

6. Please add a statement that, pending future legislation to this effect, the costs of adherence to these regulations will be paid for, in whole or in part, by the chemical corporations that created these dangerous chemicals, those being DuPont, 3M, Chemours, Daikin, Arkea and Solvay. DuPont alone made this much money in the sales of its products in these years. Yes, that is TRILLIONs of dollars:

$25,000,000,000 in 1999

$28,200,000,000 in 2000

$27,000,000,000 in 2001

$24,700,000,000 in 2002

$24,000,000,000 in 2003

It is relevant to go even further back in time, since these products were developed in 1947-1949 so the above number reflect only SOME of the profits made off of the PFAS by DuPont.

In 2014 DuPont created a new corporation, Chemours, and here are the Net Sales per their 10-K for more recent years:

$6,345,000,000 in 2021

$4,696,000,000 in 2020

$5,526,000,000 in 2019

Plus, there are the additional corporations I mentioned at the beginning of this paragraph 6.

7. Please note that these sales figures, above, dwarf any figures of costs that will be borne by our federal government, by our local governments, and local water district which, of course means, it is born by we the taxpayers. Why should we the people pay for the poisons these corporations unleashed without conscience into OUR environment? These corporations have more than enough assets and income to pay for the cleanup of the poisons they released into the world. We even have a legal precedent for such a procedure with the Asbestos Trust Fund for past, present and future victims of exposure to asbestos. In these EPA Regulations, please include and require a PFAS Trust Fund be set up for the past, present and future health impacts of those exposed to

PFAS, with such trust fund paid for entirely by the above mentioned corporations. Additionally or alternatively, the PFAS Trust Fund could be used to help state and local water districts comply with their infrastructure requirements to filter and contain and dispose of the PFAs in their water systems.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

Louisville Water Company (Doc. #1720, SBC-043551)

In that regard, we are providing the following comments on key issues that we think require consideration.

1. Louisville Water's urges EPA to focus its resources at preventing PFAS pollution at the source using the various tools the agency has available and its relationships with other federal and state agencies. We recommend EPA take actions that make it easier to identify sources of PFAS contamination in the environment and work to limit or eliminate these sources. Given the persistent nature of these chemicals in natural systems, the agency should prioritize prevention, as treatment costs are high and the long-term options regarding disposal are uncertain. We appreciate efforts already being made such as the addition of certain PFAS to the Toxics Release Inventory but urge the agency to do more to track and reduce PFAS discharges. Knowing the sources of PFAS will allow EPA and water utilities to work to address PFAS pollution at the source and hold those polluters accountable. Public water utilities provide an invaluable service to the public, but the burdens of pollution remediation should not be placed solely on water systems. We also recognize that the regulation of PFAS via a National Primary Drinking Water Rule establishes its own Environmental Justice dilemma. The proposed rule shifts the responsibility of remediating PFAS in drinking water to the water utilities and their rate payers; the poorest of our rate payers will be burdened the most significantly.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document. Topics related to assigning liability for PFAS pollution or addressing sources of PFAS contamination are beyond the scope of this rulemaking (please see section 15 of the EPA response in this *Response to Comments* document for additional discussion).

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044253)

NMED highly recommends that EPA consider providing specific funding to community water systems and state primacy agencies to recruit, train, and retain a new generation of water and wastewater utility operators that will lead the effort in providing a safe and sustainable supply of drinking water for their communities.

EPA Response: Please see section 2.4 of the EPA response in this *Response to Comments* document.

3 Preliminary Regulatory Determinations

3.1 EPA's Preliminary Regulatory Determinations Summary for PFHxS, PFNA, HFPO-DA, and PFBS

Summary of Major Public Comments and EPA Responses

Many commenters expressed support for the EPA's preliminary regulatory determinations for PFHxS, PFNA, HFPO-DA, and PFBS, including that the EPA has appropriately determined that the three statutory criteria for regulation have been met for all four contaminants using the best available information. Many other commenters did not agree that the agency presented sufficient information to make a preliminary determination to regulate PFHxS, PFNA, HFPO-DA, and PFBS with some commenters recommending that that the agency withdraw the portion of the proposed rule associated with these four PFAS because in their view there is insufficient health effects and/or occurrence data at this time to support the EPA's action or there is a need to wait for future information, such as data from the fifth Unregulated Contaminant Monitoring Rule (UCMR 5), to become available to make a regulatory determination. For only some of the four contaminants, a few commenters stated that the EPA has not met the statutory criteria for regulation or that data suggests a determination not to regulate is more appropriate.

The Safe Drinking Water Act (SDWA) Section 1412(b)(B)(ii)(II) states, "A determination to regulate a contaminant shall be based on findings that the criteria of clauses (i),(ii), and (iii) of subparagraph (A) are satisfied. Such findings shall be based on the best available public health information, including the occurrence data base under section 1445(g)." The statute allows the EPA to determine the "best available public health information" for purposes of this provision and recognizes that the occurrence data may come from sources other than the database discussed in section 1445(g). Regarding PFHxS, PFNA, and HFPO-DA, the EPA disagrees with these commenters because there is this best available public health information to support individual regulation of PFHxS, PFNA, and HFPO-DA, based on the three statutory criteria as detailed in the EPA's responses within sections 3.1.1, 3.1.2, and 3.1.3 of this document and as demonstrated through's the EPA's evaluation of the best available information in sections III.B, C, and D of the final rule preamble. While the EPA recognizes there will be additional health, occurrence, or other relevant information for these PFAS and others in the future, the EPA has determined that there is sufficient information to make a positive regulatory determination in this action and the agency concludes that these three PFAS currently meet all of the statutory criteria for individual regulatory determination.

For the individual PFBS regulatory determination, after consideration of all the public comments on this issue, the agency is deferring the determination to individually regulate PFBS for further evaluation under the statutory criteria; consequently, the agency is also not promulgating an individual Maximum Contaminant Level Goal (MCLG) or National Primary Drinking Water Regulation (NPDWR) for PFBS in this action. This determination is informed by public comments suggesting that the three statutory criteria for individual regulation of PFBS,

particularly related to the occurrence criterion have not been met. The EPA will continue to consider other available occurrence information, including from UCMR 5, to determine whether the information supports a finding that there is a substantial likelihood that PFBS will individually occur in PWSs and at a level of public health concern. However, the record demonstrates that exposure to a mixture with PFBS may cause adverse health effects; that there is a substantial likelihood that PFBS co-occurs in mixtures with PFHxS, PFNA, and/or HFPO-DA in public water systems (PWSs) with a frequency and at levels of public health concern; and that, in the sole judgment of the Administrator, regulation of PFBS in mixtures with PFHxS, PFNA, and/or HFPO-DA presents a meaningful opportunity for health risk reduction for persons served by PWSs. Please see section III.A. of the final rule preamble for additional information.

A couple of commenters questioned the EPA's rationale for selecting PFHxS, PFNA, HFPO-DA, and PFBS for regulation, with some stating the EPA should not develop regulations that differ from state-developed regulations. The agency's process is allowable under SDWA and, as described within the section III of the final rule preamble, there is available health, occurrence, and other meaningful opportunity information for three PFAS (PFHxS, PFNA, and HFPO-DA) to meet the SDWA statutory criteria for regulation individually and four PFAS (PFHxS, PFNA, HFPO-DA, and PFBS) as a mixture. The EPA disagrees with commenters who suggested that the agency should not develop national regulations that differ from state-led actions. While states may establish drinking water standards for systems in their jurisdiction prior to regulation under SDWA, once an NPDWR is in place, SDWA 1413(a)(1) requires that states or Tribes adopt standards that are no less stringent than the NPDWR to maintain primacy. Moreover, the agency further notes that all four PFAS the EPA is regulating individually or as a mixture are currently regulated by multiple states as shown in table 4-17 of USEPA (2024a).

Individual Public Comments

Missouri River Public Water Supplies Association (MRPWSA) (Doc. #1581, SBC-042409)

Preliminary Determination to Regulate PFHxS, HFPO-DA, PFNA» and PFBS MRPWSA does not agree that U.S. EPA has sufficient information to make preliminary determinations on PFHxS, HFPO-DA, PFNA, and PFBS and recommends that the Agency withdraw the portion of the proposed rule associated with these four PFAS until such time as the data to support such action is available for one or more separate National Primary Drinking Water Regulations.

EPA Response: The EPA disagrees with the commenter. Please see section 3.1 of the EPA response in this *Response to Comments* document.

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042971)

A. EPA Preliminary Regulatory Determination for Additional PFAS

Having reviewed Section III of the proposed NPDWR, EGLE DWEHD agrees with EPA's findings that four additional PFAS compounds (HFPO-DA, PFBS, PFNA, and PFHxS) meet the statutory requirements for regulatory determination as established by the Safe Drinking Water Act. Furthermore, the inclusion of these four additional PFAS compounds is consistent with the regulatory determination established by the State of Michigan during the establishment of its own MCLs in 2020.

EPA Response: The EPA acknowledges commenter's agreement that HFPO-DA, PFNA, and PFHxS meet the statutory requirements for determinations to regulate. Please see section 3.1 of the EPA response in this *Response to Comments* document.

Consumer Reports (Doc. #1656, SBC-043183)

To summarize, we agree that EPA has met the criteria laid out in Sections 1412(b)(1)(A) and 1412(b)(1)(B) of the SDWA to make a preliminary regulatory determination that PFHxS, GenX chemicals, PFNA, and PFBS, and their mixtures are contaminants to be regulated as part of this proposed NPDWR.

EPA Response: The EPA acknowledges commenter's agreement that HFPO-DA, PFNA, PFHxS, and mixtures of these three PFAS and PFBS meet the statutory requirements for determinations to regulate. Please section 3.1 of the EPA response in this *Response to Comments* document.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044402)

Page 18729. Section III – Regulatory Determinations for Additional PFAS.

EPA requests comment on its preliminary regulatory determination for PFHxS and its evaluation of the statutory criteria that supports the finding. EPA also requests comment on if there are additional data or studies EPA should consider that support or do not support the Agency's preliminary regulatory determination for PFHxS, including additional health information and occurrence data.

• DOH supports the regulatory determination to regulate PFHxS. This PFAS co-occurs at very high levels with PFOS in drinking water supplies in Washington State. Impacted areas are mostly near fire training areas and military bases that used Aqueous Fire Fighting Foam (AFFF). The multistate ATSDR PFAS Exposure Assessment showed that a community in Washington State near Fairchild Airforce base had higher average serum levels of PFHxS than seven other sites included in the study. After PFOA and PFOS, PFHxS is the most common PFAS to occur above our state action levels in drinking water.

EPA Response: The EPA acknowledges commenter's support for the EPA's determination to regulate PFHxS. Please see section 3.1 of the EPA response in this *Response to Comments* document.

Horsham Water & Sewer Authority (HWSA) (Doc. #1686, SBC-043823)

An occurrence study performed in Pennsylvania, showed a maximum PFBS level found in drinking water of 13.0 ppt (well below the proposed health-based water concentration of 2,000 ppt) and a maximum PFNA concentration of 14 ppt (slightly above the proposed health-based water concentration of 10 ppt). Our experience is that PFHxS is among the PFAS compounds found in waters exposed to AFFF firefighting foam but that its occurrence level is always about half that of PFOA/PFOS and will be adequately covered by the PFOA and PFOS MCLs, as would PFNA if present as well as these are both long-chained PFAS compounds with similar performance to PFOA and PFOS when using GAC or Anion Exchange. GenX is a site-specific contaminant emanating from discreet sources that it is our understanding are already being regulated by EPA. Moving forward to regulate compounds without sufficient justification, especially when there may be little to no additional benefits that result, is not supportable.

Once again, thank you for the opportunity to comment on the Proposed Rule for Per- and

Polyfluoroalkyl Substances National Primary Drinking Water Regulation and if you have any questions regarding these comments, please contact Mike Pickel at (215) 672-8011 or at mpickel@horshamwatersewer.com.

For the Horsham Water & Sewer Authority,

Michael J. Pickel, P.E.

Director, Compliance & Regulatory Affairs

EPA Response: Please see EPA's response 3.1. The EPA disagrees that regulation of only PFOA and PFOS will fully protect against PFHxS or PFNA drinking water exposure, as well as exposure to HFPO-DA and PFBS. While PFHxS, PFNA, HFPO-DA, and PFBS have been demonstrated to often co-occur with PFOA and/or PFOS, in water systems where PFOA and PFOS are not present at elevated levels but PFHxS, PFNA, HFPO-DA, and/or PFBS are present, the EPA estimates in the final rule preamble that 100-300 PWSs will exceed the Hazard Index Maximum Contaminant Level (MCL) or PFHxS MCL without exceeding the PFOA or PFOS MCL. For persons served by those water systems, if the EPA were to rely solely upon regulation of PFOA and PFOS to reduce exposure, those consumers would continuously be exposed to potentially harmful levels of these other PFAS. Furthermore, the EPA agrees that the drinking water treatments used to remove PFOA and PFOS will have co-benefits for removal of PFHxS, PFNA, HFPO-DA, PFBS, and other PFAS, however those treatment systems must be designed and optimized for all of the contaminants that are present, accounting for site specific circumstances. Only designing a treatment system for PFOA and PFOS removal, rather than for the other PFAS which may be present in varying concentrations, may not be as effective for the

other PFAS or adequately public health protective. For comments and the EPA response to treatment co-removal, please see section 10.3 in this *Response to Comments* document.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044442)

Comments

1. EPA has authority to set PFAS drinking water standards because PFAS have known adverse health effects, are likely to occur in public water systems, and such regulation provides a meaningful opportunity for reducing risks to human health.

EPA is required to set enforceable drinking water standards if the EPA Administrator determines that a contaminant meets the following criteria: (a) it may have adverse human health effects; (b) it is known to occur or is substantially likely to occur in public water systems with a frequency and at levels of public health concern; and (c) its regulation presents a meaningful opportunity to reduce health risks for those served by public water systems. [FN10: 42 U.S.C. § 300g-1(b)(1)(A).] These criteria are met here.

EPA Response: The EPA acknowledges commenter's agreement of the EPA's decision that HFPO-DA, PFNA, PFHxS, and mixtures of these three PFAS and PFBS meet the statutory requirements for determinations to regulate. Please see section 3.1 of the EPA response in this *Response to Comments* document.

Clean Water Action/Clean Water Fund (Doc. #1697, SBC-045000)

The Preliminary Regulatory Determination and Proposed NPDWR for PFHxS, GenX, PFBA, and PFNS are consistent with EPA's Final Regulatory Determination for CCL 4

In the March 2021 Final Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List, EPA noted that commenters on the preliminary Regulatory Determination urged the agency to develop regulations for more PFAS chemicals and/or for PFAS chemicals as a class and stated:

EPA notes that although SDWA does not require the Agency to complete regulatory determinations for the contaminants on the fifth CCL until 2026, because of the significant progress related to developing new high-quality PFAS information, combined with the Agency's commitment in the PFAS Action Plan to assist states and communities with PFAS contaminated drinking water, EPA will continue to prioritize regulatory determinations of additional PFAS in drinking water. The Agency is committing to making regulatory determinations in advance of the next SDWA deadline for additional PFAS for which the Agency has a peer reviewed health assessment, has nationally representative occurrence data in finished drinking water, and has sufficient information to determine whether there is a meaningful opportunity for health risk reduction for persons served by public water systems. [FN3: Announcement of Final Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List,

Federal Register / Vol. 86, No. 40 / Wednesday, March 3, 2021 / Rules and Regulations, p. 12278-79]

EPA's proposal of preliminary Regulatory Determinations and proposed regulations for four PFAS chemicals is consistent with this statement of intention to move forward on additional PFAS chemicals if sufficient health effects and occurrence information became available.

EPA Response: Please see section 3.1 of the EPA response in this *Response to Comments* document. For the EPA's response related to the concurrent preliminary regulatory determination and proposed NPDWR actions, please see section 3.3 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045407)

The regulatory determinations for GenX, PFBS, PFHxS, and PFNA are necessary and appropriate.

Section 1412(b)(1)(A) of SDWA creates a three-part test for a determination to regulate a contaminant in drinking water. The EPA shall "publish a maximum contaminant level goal and promulgate national primary drinking water regulation for a contaminant" when:

(a) the contaminant may have an adverse effect on the health of persons;

(b) the contaminant is known to occur or there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern; and

(c) in the sole judgment of the administrator, regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems. [FN19: 42 U.S.C. [sec] 300g-1(b)(1)(A).]

All six PFAS covered by the proposed rule meet these criteria. The EPA made the final regulatory determination for PFOA and PFOS in March 2021 under section 1412(b)(1)(B)(ii)(I), which requires that EPA make a regulatory determination for certain chemicals on the contaminant candidate list, or CCL, every five years. [FN20: 42 U.S.C. [sec] 300g-1(b)(1)(B)(ii)(I).] For the other four PFAS, the EPA is making the regulatory determination concurrent with the proposed maximum contaminant level goal and MCL.

EPA Response: The EPA acknowledges commenter's agreement that PFOA and PFOS and HFPO-DA, PFNA, PFHxS, and mixtures of HFPO-DA, PFNA, PFHxS, and PFBS meet the statutory requirements for determinations to regulate. Please see section 3.1 of the EPA response in this *Response to Comments* document.

PFAS Regulatory Coalition (Doc. #1761, SBC-046069)

3. EPA provides no rationale for why it is making regulatory determinations for the four additional PFAS.

It is not clear in the Proposal why EPA is making a regulatory determination for the four additional PFAS. EPA has recently issued health advisory levels (HALs) for PFBS and HFPO-DA, but the Agency has never issued HALs for PFNA or PFHxS. Additionally, EPA's targeting of these four PFAS is not correlated with state actions. Of the states that have issued MCLs, some have included some of these four PFAS in the state regulations, but we are not aware of any states that have singled out only these four substances for regulatory action. Looking to other EPA programs, this list also does not align with the longer list of PFAS compounds for which EPA is soliciting information as to possible designation as CERCLA hazardous substances. Advance Notice of Proposed Rulemaking, Addressing PFAS in the Environment, 88 Fed. Reg. 22399 (April 13, 2023) (the "CERCLA ANPRM"). EPA has provided no justification for why these four additional PFAS compounds have been targeted in this rulemaking. Understanding why EPA is focusing on these four compounds is also important for understanding how EPA has chosen to regulate them using a Hazard Index approach, as discussed further in Section C below.

EPA Response: The commenter is incorrect: EPA provides a rationale for why HFPO-DA, PFNA, PFHxS, and mixtures of HFPO-DA, PFNA, PFHxS and PFBS meet the statutory requirements for determinations to regulate. Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. Additionally, Health Advisories (HAs) are not a pre-requisite for an NPDWR under SDWA and there is nothing in the statute or the EPA's historical regulatory practice that suggests that the agency must or should delay regulation of a contaminant in order to develop an HA first. Furthermore, while beyond the scope of the rulemaking, through its PFAS Strategic Roadmap and associated actions, the agency is working expeditiously to address PFAS contamination in the environment and reduce human health PFAS exposure through all pathways using all of its available statutes. Nevertheless, the EPA disagrees that the contaminants the agency is proceeding with regulating under the SDWA are required to align with those under other EPA actions or statutes.

<u>San Diego County Water Authority, CA (Doc. #1779, SBC-045286)</u>

Preliminary Determination and Hazard Index

EPA is requesting comment on its preliminary determinations to regulate PFHxS, PFNA, PFBS, and GenX chemicals. The Water Authority supports EPA's preliminary determinations to regulate PFHXs, PFNA, PFBS, and GenX chemicals.

EPA Response: The EPA acknowledges commenter's support of the EPA's decision to regulate HFPO-DA, PFNA, PFHxS. Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document.

<u>Midwest Environmental Advocates +more (Doc. #1846, SBC-045819)</u>

Pursuant to Section 1412 of the SDWA, EPA is required to regulate contaminants that (1) may have an adverse effect on the health of persons; (2) are known to occur or there is a substantial likelihood that they will occur in public water systems with a frequency and at levels of public

health concern; and (3) for which regulation presents a meaningful opportunity for health risk reduction in the sole judgement of the Agency. [FN3: 42 U.S.C. § 300g-1(b)(1)(A)] Here, due to the overwhelming evidence on the toxicity and occurrence of these six PFAS, EPA exercised its expert judgment to determine that these contaminants must be regulated to meaningfully reduce public health risks nationwide.

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document.

J.R. Simplot Company (Doc. #1661, SBC-044148)

Overview of Comments: EPA's Determination to Regulate PFNA, PFHxS, PFBS, and GenX Chemicals Is Pre-Mature

EPA proposes significantly lower, almost zero levels of these six PFAS in drinking water and employs a novel approach to setting an MCL for the mixture of four of the six PFAS without having gone through the required scientific, legal, or procedural requirements to justify the proposed rule. The shortcomings of skipping procedural requirements is that the necessary understanding of background conditions, analytical methods, critical review of health data (and benefits) and costs is not achieved. Examples include the following:

I. Available Occurrence and Health Data Do Not Support a Decision to

Regulate

Background/Occurrence

This rulemaking is on six specifics per- and polyfluoralkyl (PFAS) substances. However, as a broad group, PFAS substances are ubiquitous in the environment. As an example, recent data on PFAS concentration in rainfall has shown that PFAS concentrations range from approximately 0.9 to 13 nanograms per liter (ng/L). [FN1: Cousins, I.T., J.H. Johansson, M.E. Salter, B. Sha and M. Scheringer. 2022. Environmental Science and Technology. Outside the Safe Operating Space of a New Planetary Boundary for Per- and Polyfluoroalkyl Substances (PFAS). Vol. 56, p. 11172-11179.] Data for rainfall in the United States shows PFAS concentrations of approximately of 2-9 ng/L. EPA's proposed rule fails to discuss the widespread nature of these chemicals and how it relates to the MCL goals, health risks and benefits.

Health Risk Determination

EPA's preliminary determination is inconsistent with statutory criteria under Safe Drinking Water Act (SDWA) because the available health data and occurrence data do not support a decision to regulate, and the data does not demonstrate that this rulemaking is a "meaningful opportunity" for health risk reduction. EPA must ensure that its regulations are based on robust scientific evaluations and meet statutory criteria, which this proposal fails to do. A fundamental flaw is that EPA's preliminary determination to regulate rests on predictions of future occurrence and not actual data.

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. For the EPA's response related to the concurrent preliminary regulatory determination and proposed NPDWR actions, please see section 3.3 of the EPA response in this *Response to Comments* document. For the EPA's response related to the regulatory determination statutory criterion on occurrence, please see sections 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document. For the EPA's response related to the regulatory determination statutory criterion on meaningful opportunity, including other routes of PFAS human health exposure and sources of PFAS in the environment, please see sections 3.1.3 and 3.2.3 of the EPA response in this *Response to Comments* document. Related to this, while NPDWRs are intended to reduce the risks from contaminants specifically in drinking water, the EPA disagrees that the proposed rule failed to discuss the physical and chemical characteristics and widespread nature of these PFAS as this information was provided in section II.C of the preamble. Nonetheless, even if these PFAS are found in other media that does not preclude the EPA from implementing the SDWA and developing a drinking water regulation to reduce human health exposure from this particular source.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045245)

The regulatory determination for additional PFAS is well supported and the use of a hazard index approach is warranted.

The EPA's preliminary determination that perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) and their mixtures have adverse human health effects; there is substantial likelihood that PFHxS, HFPO-DA, PFNA, PFBS and mixtures of these PFAS, will occur and co-occur in PWSs with a frequency and at levels of public health concern; and regulation of PFHxS, HFPO-DA, PFNA, and PFBS, and their mixtures, presents a meaningful opportunity for health risk reductions for persons served by public water systems (PWSs) is well supported. In West Virginia, there is substantial evidence that PFHxS, HFPO-DA, PFNA, and PFBS occur and co-occur in PWSs with a frequency and at levels of public health concern, and we request these data be considered in EPA's preliminary regulatory determination.

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. For the EPA's response related to the regulatory determination statutory criterion on occurrence, please sections 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document.

The Chemours Company FC, LLC (Doc. #1845, SBC-046057)

IV. Conclusion

For the foregoing reasons, and those set forth in the attached technical comments and materials incorporated herein by reference, Chemours requests that EPA withdraw its proposed regulation

of HFPO-DA under the SDWA. Chemours also reserves its ability to raise any additional issues with respect to the rulemaking, particularly given the size of EPA's rulemaking docket and the limited time period provided for public comment. Chemours would welcome the opportunity to meet with EPA to discuss its concerns with the rulemaking and answer any questions EPA may have. Please feel free to contact me to arrange such a meeting.

Sincerely,

Brian D. Israel

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. For the EPA response related to the public notice comment period for the preliminary regulatory determination, please see section 17.1 in this *Response to Comments* document.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044403)

EPA requests comments on its preliminary regulatory determination for PFNA and its evaluation of the statutory criteria that support the finding. EPA also requests comment on if there are additional data or studies EPA should consider that support or do not support the Agency's preliminary regulatory determination for PFNA, including additional health information and occurrence data.

• DOH supports the regulatory determination to regulate PFNA and PFBS. Both occur in Washington State drinking water supplies. PFNA has been occasionally found at high levels in our state around firefighting facilities.

EPA Response: The EPA acknowledges commenter's support for the determination to individually regulate PFNA and to regulate PFBS as part of mixtures with PFNA, HFPO-DA, and PFHxS. Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044404)

EPA requests comment on its preliminary regulatory determination for PFBS and its evaluation of the statutory criteria that supports the finding. EPA also requests comment on if there are additional data or studies EPA should consider that support or does not support the Agency's preliminary regulatory determination for PFBS, including additional health information and occurrence data.

• DOH supports the regulatory determination to regulate PFNA and PFBS. Both occur in Washington State drinking water supplies. PFNA has been occasionally found at high levels in our state around firefighting facilities.

EPA Response: The EPA acknowledges commenter's support for the determination to individually regulate PFNA and to regulate PFBS as part of mixtures with PFNA, HFPO-DA, and PFHxS. Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-043982)

Preliminary Determination to Regulate PFHxS, HFPO-DA, PFNA, and PFBS – American Water does not agree that the U.S. EPA has sufficient information to make preliminary determinations on PFHxS, HFPO-DA, PFNA, and PFBS and recommends that the U.S. EPA withdraw the portion of the proposed rule associated with these four PFAS until the data to support such action is available for one or more separate National Primary Drinking Water Regulations, using an MCL approach.

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-043989)

Preliminary Determination to Regulate PFHxS, HFPO-DA, PFNA, and PFBS

American Water does not agree that the U.S. EPA has sufficient information to make preliminary determinations on PFHxS, HFPO-DA, PFNA, and PFBS and recommends that the U.S. EPA withdraw the portion of the proposed rule associated with these four PFAS until the data to support such action is available for one or more separate National Primary Drinking Water Regulations, using an MCL approach.

In the preamble to the rule, the U.S. EPA cites occurrence data and potential impact on public health as key criteria for making a regulatory determination. American Water does not believe that adequate information exists to support positive regulatory determinations on the four PFAS included in the proposal, specifically:

• The majority of public health protection from this proposed rule comes from PFOA and PFOS. EPA should review the co-occurrence between the two analytes with proposed MCLs (PFOA and PFOS) and the four analytes proposed to be regulated under the Hazard Index (PFHxS, HFPODA, PFNA, and PFBS) and clearly articulate the additional protection being provided once systems anticipated to be impacted by PFOA and PFOS are removed from the calculation. This needs to be extended to cost estimates and into the cost-benefit analysis.

• The U.S. EPA needs to complete the toxicity assessments for PFHxS or PFNA before determining appropriate levels of concern in drinking water.

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. For the EPA's response related to the toxicity assessments for PFHxS and PFNA, please see section 4.3.3 in this *Response to Comments* document. For the EPA's response regarding the regulatory determination statutory criterion on occurrence, please see sections 3.1.2 and 3.2.2 in this *Response to Comments* document. For the EPA's response pertaining to the cost estimates for the Hazard Index MCL regulation, please see section 13.3 in this *Response to Comments* document. Additionally, while PFHxS, PFNA, HFPO-DA, and PFBS have been demonstrated to often co-occur with PFOA and/or PFOS, in water systems where PFOA and PFOS are not present at elevated levels but PFHxS, PFNA, HFPO-DA, and/or PFBS are present, the EPA estimates in the final rule preamble that 100-300 PWSs will exceed the Hazard Index MCL or PFHxS MCL without exceeding the PFOA or PFOS MCL. For persons served by those water systems, if the EPA were to rely solely upon regulation of PFOA and PFOS to reduce exposure, those consumers would continuously be exposed to potentially harmful levels of these other PFAS. Furthermore, the EPA recognizes that drinking water treatments used to remove PFOA and PFOS will have co-benefits for removal of PFHxS, PFNA, HFPO-DA, PFBS, and other PFAS, however those treatment systems must be designed and optimized for all of the contaminants that are present, accounting for site specific circumstances. Only designing a treatment system for PFOA and PFOS removal, rather than for the other PFAS which may be present in varying concentrations, may not be as effective for the other PFAS or adequately

public health protective. For the EPA's response on treatment co-removal, please see section 10.3 in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045875)

II. EPA's Preliminary Determination To Regulate PFNA, PFHxS, PFBS, and HFPO- DA (and Mixtures of these PFAS) Is Inconsistent with the Requirements Under SDWA

In the proposed rule, EPA is issuing a preliminary regulatory determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS as contaminants under SDWA.

As described in the final regulatory determination for PFOA and PFOS, EPA follows a three-phase process in making regulatory determinations: (1) data availability, (2) data evaluation, and regulatory determination [FN5: 86 Fed. Reg. 12272, 12274 (Mar. 3, 2021).]. In the first phase, the Agency applies criteria to screen out contaminants that "clearly do not have sufficient data to support a regulatory determination."[FN6: Id.] If sufficient data are available to characterize the potential health effects and likely occurrence in drinking water, then EPA determines whether the contaminant meets three statutory criteria for regulation:

1. The contaminant may have an adverse effect on the health of persons;

2. The contaminant is known to occur or there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern; and

3. In the sole judgment of the Administrator, regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems [FN7: 42 U.S.C. [sec] 300g-1(b)(1)(A).].

Findings under these criteria must be based on the best available public health information, including the occurrence database [FN8: 42 U.S.C. [sec] 300g-1(b)(1)(B)(ii)(II).]. If EPA determines a contaminant meets the three statutory criteria (determination to regulate), EPA must publish a MCLG and promulgate a NPDWR for the contaminant.

As discussed below, EPA does not demonstrate that PFNA, PFHxS, PFBS, and HFPO-DA meet the three statutory criteria regulation under Section 1412(b)(1)(A) of SDWA. Therefore, EPA's preliminary determination to regulate these four PFAS is improper. The human health and occurrence data do not support a determination to regulate PFNA, PFHxS, PFBS, and HFPO-DA or their mixtures at this time. In fact, had EPA followed its typical process, these contaminants should have been screened out in the Office of Water's first phase of regulatory determination work as not having sufficient data. While the Chamber and the coalition continue to support the appropriate and science-based regulation of PFAS chemicals, EPA must ensure that its regulations are based on robust scientific evaluations and meet statutory criteria, which this

proposal fails to do. A fundamental flaw is that EPA's preliminary determination to regulate rests on potentially flawed predictions of future occurrence and not actual data, which does not meet SDWA requirements. In addition, the underlying science has not undergone the required review by the EPA Science Advisory Board (SAB).

EPA Response: Please see section 3.1 of the EPA response in this *Response to Comments* document. The EPA disagrees that it did not follow the required regulatory determination process under SDWA or that PFNA, PFHxS, HFPO-DA, and mixtures of these three PFAS and PFBS do not have sufficient information to meet the three regulatory determination statutory criteria. Please see sections 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document regarding the health effects criterion, sections 3.1.2 and 3.2.2 regarding the occurrence criterion, and sections 3.1.3 and 3.2.3 regarding the meaningful opportunity criterion. Additionally, the EPA disagrees that it did not undertake the required review by the EPA Science Advisory Board (SAB) as described in sections 4.3.2 and 14.11.1 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045550)

2. The agency's preliminary determinations for PFNA, HFPO-DA, and PFBS and the mixture of PFHxS, PFNA, HFPO-DA, and PFBS are not sufficiently supported by the available data. Moreover the available data currently suggests a negative determination for these PFAS is appropriate. The agency should re-issue these preliminary determinations following the availability of national monitoring data currently being collected, as part of the Fifth Unregulated Contaminant Monitoring Rule (UCMR 5).

EPA Response: Please **s**ee section 3.1 of the EPA response in this *Response to Comments* document. Regarding the EPA's determination for mixtures of PFHxS, PFNA, HFPO-DA, and PFBS, please see section 3.2 of the EPA response in this *Response to Comments* document. Concerning UCMR 5, please see sections 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document.

3.1.1 EPA's Preliminary Regulatory Determinations for PFHxS, PFNA, HFPO-DA, and PFBS – Statutory Criterion #1 Adverse Health Effects

Summary of Major Public Comments and EPA Responses

Many commenters expressed support for the EPA's determination that PFHxS, PFNA, HFPO-DA, and PFBS meet the statutory criterion for adverse health effects. Many commenters also supported the EPA's use of best available peer-reviewed science, specifically the use of the final, most recently published Agency for Toxic Substances and Disease Registry (ATSDR) minimal risk levels for PFHxS and PFNA as chronic toxicity reference values. Other commenters criticized the EPA for using ATSDR minimal risk levels and stated that they are inappropriate for SDWA rulemaking.

As discussed further in section 4.3.3 of the EPA response in this *Response to Comments* document, the EPA finds that the ATSDR minimal risk levels for PFHxS and PFNA currently represent the best available, peer-reviewed science for these chemicals. SDWA specifies that agency actions that are based on science must rely on "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices." At this time, the 2021 ATSDR Toxicological Profile for Perfluoroalkyls, which covers 10 PFAS including PFHxS and PFNA, represents the best available peer-reviewed scientific information on the human health effects of PFHxS and PFNA. ATSDR minimal risk levels for PFHxS and PFNA are appropriate for use under SDWA because ATSDR uses scientifically credible approaches, its work is internally and externally peer-reviewed and undergoes public comment, and its work represents the current best available science for these two chemicals. The 2021 ATSDR Toxicological Profile for Perfluoroalkyls underwent intra- and interagency review and subsequent external peer review by seven experts with knowledge of toxicology, chemistry, and/or health effects.

Some commenters questioned the EPA's external peer-review process for the four underlying final toxicity assessments used to calculate the Health Reference Levels (HRLs)/Health-Based Water Concentrations (HBWCs)[1] and for the HBWCs themselves. Some commenters noted that the EPA does not yet have completed Integrated Risk Information System (IRIS) assessments for PFHxS and PFNA, questioning the EPA's use of non-EPA assessments (see above). As discussed further in section 4.3.3 of the EPA response in this *Response to Comments* document, all four toxicity assessments containing the toxicity reference values (reference dose (RfD) or minimal risk level) used to calculate the HRLs/HBWCs underwent rigorous, external peer review (ATSDR, 2021; USEPA, 2021a; USEPA, 2021b). The EPA is not required under SDWA to exclusively use EPA assessments to support an NPDWR, and in fact, SDWA's clear direction in Section 1412(b)(3)(A)(i) is to use the best available, peer-reviewed science when developing NPDWRs. Final EPA assessments for PFHxS and PFNA are under development but are not currently available; final, peer-reviewed ATSDR assessments are available.

Other commenters offered critical comments on the HRLs/HBWCs for PFHxS, PFNA, HFPO-DA, and PFBS and raised technical and process concerns with the underlying human health assessments. Some commenters asserted that the human health toxicity values (EPA RfDs, ATSDR minimal risk levels) upon which the HRLs/HBWCs are based have too much uncertainty and are therefore inadequate to support a SDWA regulatory determination. The EPA disagrees with these comments. As discussed further in section 4.3.3 of the EPA response in this *Response to Comments* document, the HRLs/HBWCs are data-driven values based on toxicity reference values that incorporate uncertainty factors (UFs) based on the EPA guidance.

[1] The agency developed HRLs for PFHxS, PFNA, HFPO-DA, and PFBS as part of its regulatory determinations effort to identify the adverse effects each contaminant may have on the health of persons. In this instance, the EPA identified the HRL as the level below which adverse health effects over a lifetime of exposure are not expected to occur, including for sensitive populations and life stages, and allowing for an adequate margin of safety. The HRLs are also used as HBWCs in the calculation of the Hazard Index MCLG.

Individual Public Comments

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043435)

In addition to the comments set forth above, SSP and RCAP fully endorse the comments submitted by the United States Chamber of Commerce on behalf of several trade organizations, including SSP and RCAP. SSP and RCAP will not fully repeat those comments but emphasize three points.

First, EPA's lack of health and occurrence data and failure to adequately consider costs calls into question EPA's preliminary determination to regulate PFNA, PFHxS, PFBS and GenX. [FN59: See 42 U.S.C. § 300g-1(b).]

• EPA has not demonstrated that these substances may have an adverse effect on human health. EPA did not complete human health assessments for PFHxS and PFNA. EPA's assessments for PFBS and GenX were not subject to review by SAB or otherwise subject to adequate peer-review. Significant uncertainty factors and overly conservative assumptions in the face of a lack of data are inadequate to support a regulatory determination.

EPA Response: The EPA disagrees with these comments. See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document, and section III.B.6, section IV.B.1.b, and section IV.B.2.b of the preamble.

Consumer Reports (Doc. #1656, SBC-043180)

Section III: Preliminary Regulatory Determinations for Additional PFAS

Under the provisions of Sections 1412(b)(1)(A) and 1412(b)(1)(B) of the SDWA, the EPA can regulate substances/chemicals as a contaminant in drinking water if the contaminant(s) can meet three criteria: i) that it may have an adverse effect on the health of a person, ii) that it is known to occur or there is a substantial likelihood that it will occur in public water systems (PWS) and iii) the EPA Administrator determines that regulation of the contaminant presents a meaningful opportunity for health risk reduction for persons served by PWS.

EPA's review of the scientific literature clearly demonstrates that oral exposure to PFHxS, HFPO-DA, PFNA and PFBS may individually, and in mixture, each result in an adverse health effect, including disrupting multiple biological pathways that result in adverse effects a number of biological systems, including the endocrine, cardiovascular, developmental, immune, and hepatic systems1 [FN1: USEPA. 2023a. Maximum Contaminant Level Goal (MCLG) Summary Document for a Mixture of Four Per- and Polyfluoroalkyl Substances (PFAS): GenX Chemicals, PFBS, PFNA and PFHxS. EPA-822-P-23-004. At: https://www.epa.gov/system/files/documents/2023-03/PFAS%20HI%20MCLG%20Public%20Review%20Draft%20 09%20March%202023.pdf].

For each of the 4 PFAS, EPA has calculated a health-based water concentration (HBWC) which it defines as the "level protective of health effects over a lifetime of exposure, including sensitive populations." The EPA determined, based on the available science, that the HBWCs for PFHxS, GenX chemicals, PFNA and PFBS are 9 ppt, 10 ppt, 10 ppt and 2,000 ppt, respectively. We agree with EPA on the HBWCs for these four PFAS. For the Preliminary Regulatory Determination, the HBWCs were used as the Health Reference Level (HRL).

EPA Response: See section 3.1.1 of the EPA response in this *Response to Comments* document. In regard to calculating the HBWCs, please see section 4.3.3 of the EPA response in this *Response to Comments* document.

New York City Department of Environmental Protection (NYCDEP) (Doc. #1679, SBC-044208)

Toxicity

Two of the four chemicals included in the HI (PFNA and PFHxS) lack completed health assessments under the Integrated Risk Information System (IRIS) Program (p. 18664).

EPA Response: See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045879)

2. High uncertainty in the human health assessments for PFHxS, HFPO- DA, and PFBS makes them inadequate to support a determination to regulate

Even if the scientific assessments for PFHxS, HFPO-DA, and PFBS had been appropriately reviewed, all three of these assessments are low confidence. The three assessments each have an aggregate uncertainty factor (UF) value of 3000 assigned to the underlying Reference Dose (RfD). This is the maximum allowable aggregate UF value. Above this point, EPA guidance recommends, consistent with current EPA practice, that reference values not be derived [FN16: U.S. EPA, 2002. A review of the reference dose and reference concentration process, at page xviii and 4-41 where EPA states: "The Technical Panel recommends limiting the total UF applied for any particular chemical to no more than 3000 and avoiding the derivation of a reference value that involves application of the full 10-fold UF in four or more areas of extrapolation," available at: https://www.epa.gov/sites/production/files/2014-12/documents/rfd-final.pdf.]. The values derived for these three contaminants meet the criteria for low confidence. "Low confidence indicates the judgment that the data supporting the [Reference Dose] RfD may be of limited quality and/or quantity and that additional information could result in a change in the RfD."[FN17: See EPA Reference Dose (RfD): Description and Use in Health Risk Assessments, available at: https://www.epa.gov/iris/reference-dose-rfd-description-and-use-health-risk-assessments.]

EPA Response: The EPA disagrees with these comments. See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6, section IV.B.1.b, and section IV.B.2.b of the preamble.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045884)

4. In addition, the flaws in the individual toxicity assessments make a regulatory determination for a mixture of the four contaminants inappropriate at this time

For the reasons described above, EPA has not met the statutory or scientific requirements to make a positive regulatory determination for PFHxS, HFPO-DA, PFNA, or PFBS. EPA has not demonstrated that these PFAS may cause adverse health effects at the levels that EPA believes may occur, and EPA has not conducted the requisite SAB review. As such, a determination to regulate a mixture of the four contaminants is also not supported.

EPA Response: The EPA disagrees with these comments. See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.2 and 4.3.3 of the EPA response in this *Response to Comments* document, and section III.B.6, section IV.B.1.b, and section IV.B.2.b of the preamble.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045881)

For PFHxS and HFPO-DA, while the assessments are lacking the typical statement about the confidence in the value, due to the UFs of 3000 applied in both assessments, it is not possible to characterize these assessments as anything but low confidence.

EPA Response: The EPA disagrees. See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document, and section III.B.6 of the preamble.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044774)

1. EPA should wait to propose a NPDW rule for PFNA and PFHxS until Health Advisories are finalized for these compounds. EPA Should Complete the Human Health Toxicity Assessment/or PFHxS and PFNA

In the March 2023 Maximum Contaminant Level Goal (MCLG) Summary Document for a Mixture of Four Per- and Polyfluoroalkvl Substances (PFAS): HFPO-DA and its Ammonium Salt (also known as GenX Chemicals). PFBS, PFNA, and PFHxS. EPA states that there is no published EPA human health toxicity assessment for PFNA or PFHxS; however, EPA's Integrated Risk Information System program is developing a human health toxicity assessment for PFNA and PFHxS, which is expected to undergo public comment and external peer review in Fiscal Year 2023. Given the implementation costs of the proposed PFAS NPDW rule and how

quickly the human health toxicity assessments are expected to be released, EPA should first finalize the toxicity assessments, review and incorporate public comment, and use this as the basis to issue final Health Advisories for PFNA and PFHxS, prior to finalizing the PFAS NPDW rule for these compounds. This is particularly important given that the proposed PFAS NPDW rule for these compounds may change as a result of the human health toxicity assessment.

EPA Response: The EPA disagrees. See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble. Also, HAs are not a pre-requisite for an NPDWR under the SDWA. There is nothing in the statute or the EPA's historical regulatory practice that suggests that the agency should delay regulation of a contaminant in order to develop an HA first.

HRSD (Doc. #1719, SBC-043541)

For PFNA and PFHxS, EPA has not yet completed its human health toxicity assessment. Further, the information that is available to derive the Health Based Water Concentration (HBWC) for these four PFAS utilizes uncertainty factors ranging from 300x – 3000x, resulting in compounding conservatism in the HI calculation. Occurrence data must be gathered, the EPA human toxicity assessment must be completed, and this new approach must be fully vetted before it is adopted as a regulation. The imposition of a regulation without fully understanding the need for or impacts of such a regulation has the potential to impose economic burden on communities without commensurate public health benefits.

EPA Response: See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble.

3M Company (Doc. #1774, SBC-045666)

i. EPA's selection of reference values for the four PFAS for which it seeks to issue preliminary regulatory determinations (PFHxS, HFPO-DA, PFNA, and PFBS) is erroneous.

Putting aside EPA's violations of SDWA-mandated processes for public notice and peer review, the proposed standards for the HI PFAS are not consistent with EPA processes designed to ensure reliability and sound scientific practices. EPA relies on ATSDR for the PFHxS and PFNA reference values, and there is no evidence that EPA conducted an independent systematic review of the evidence base or assessed study quality for these compounds as recommended by the IRIS Handbook. Furthermore, because these four PFAS are considered together under the HI, EPA has not sufficiently discussed, as recommended in EPA's own RfD process recommendations (USEPA 2002), the implications of the collective uncertainty underlying all four reference values.

PFHxS. EPA's proposed reference value of 0.000002 mg/kg/day for PFHxS is based on ATSDR's (2021) Minimum Risk Level (MRL) [FN39: An MRL is a screening value used to identify potential environmental risk and is not a regulatory standard.], which is derived from Butenhoff et al. (2009). Butenhoff et al. (2009) observed that adult male rats exposed to PFHxS at 3 mg/kg-day exhibited thyroid follicular cell hyperplasia that may have been due to increased liver hypertrophy and induction of liver enzymes, which could in turn impact thyroid hormone metabolism. However, the authors did not measure thyroid hormones; therefore, the clinical significance of thyroid cell hyperplasia is unclear. Furthermore, in contrast to Butenhoff et al.'s (2009) findings, ATSDR (2021) concluded that liver effects in mice after exposure to PFHxS were not adverse. Had EPA evaluated Butenhoff et al. (2009) per systematic review guidance, that lack of adversity may have been identified and the study excluded.

In contrast, Chang et al. (2018), did measure thyroid stimulating hormone (TSH), and observed changes in neither TSH levels nor thyroid histopathology in mice at doses up to 3 mg/kg-day. Had EPA conducted an appropriate systematic review and assessed study quality per its IRIS Handbook, it may have considered this study, which is more reliable than Butenhoff et al. (2009) because it measured relevant endpoints. In other words, if EPA had conducted a truly independent systematic review of PFHxS toxicity studies, rather than rely on ATSDR's (2021) evaluation, it likely would have selected a different critical effect for PFHxS and therefore derived a different HBWC.

EPA also failed to comply with its guidance related to the application of uncertainty factors (USEPA 2002; USEPA ORD 2022). To derive the reference value for PFHxS, EPA applied a 10-fold uncertainty factor to ATSDR's MRL of 0.00002 mg/kg/day to extrapolate from subchronic to chronic exposure. This 10-fold uncertainty factor is in addition to the 30-fold uncertainty factor and 10-fold modifying factor that ATSDR applied its derivation of the MRL. The resultant combined uncertainty factor is 3,000, which highlights the substantial uncertainty of the evidence for the reference value. EPA's IRIS Handbook and EPA's recommendations on the RfD process (USEPA 2002) recommends that any composite uncertainty factor greater than 3,000 represents "excessive uncertainty" and should not be relied upon.

EPA Response: See section 3.1.1 of the EPA response in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble. Additionally, in response to the comment that if the EPA had conducted an independent systematic review of PFHxS toxicity studies instead of relying on ATSDR's evaluation, it likely would have selected a different critical effect for PFHxS—the EPA disagrees. As noted in section 4.3.3 of the EPA response in this *Response to Comments* document, at this time the 2021 ATSDR toxicological profile represents the best available peer-reviewed scientific information regarding the human health effects of PFHxS. ATSDR uses scientifically credible approaches and its work is internally and externally peer reviewed and undergoes public comment (the ATSDR toxicological profile underwent intra- and interagency review and external peer review by seven experts with knowledge of toxicology, chemistry, and/or health effects).

3M Company (Doc. #1774, SBC-045651)

The Proposed Rule is also based on profound uncertainty and assumptions, which EPA did not properly quantify and explain in its rulemaking documents. EPA defines "uncertainty" as "a lack of knowledge about factors affecting exposure or risk" (USEPA 2019, p. 1-7).. "Uncertainty factors" are "used in noncancer risk assessments when insufficient data are available to support the use of chemical-specific and species-specific extrapolation factors" (OEHHA 2008). Because uncertainty factors are used to address a lack of data, the higher the total uncertainty factors, the lower the confidence in the accuracy of the analysis. For its evaluations of HFPO-DA and PFHxS, EPA has assigned "uncertainty factors" totaling 3,000— the maximum that could be considered as the basis of a reference value according to EPA's IRIS Handbook. Had the uncertainty factors been any higher, EPA's own guidance would have precluded it from setting a reference value for those substances. In adopting a total uncertainty factor of 3,000, EPA implicitly acknowledges that its proposed RfDs for those substances are, at best, on the very edge of acceptability. This is important because "uncertainty factors" only account for specific sources of uncertainty in the Proposed Rule. They do not account for significant additional uncertainties, including uncertainties resulting from EPA's poor systematic review, inconsistent and non-transparent study quality evaluations, lack of an independent verification of underlying analyses of the selected points of departure, and the absence of peer review of the proposed hazard index MCLG. Accordingly, EPA's uncertainty factor of 3,000— already at the margins of acceptability—significantly understates the actual uncertainties inherent in EPA's proposal for those substances.

EPA Response: See section 3.1.1 of the EPA response in this *Response to Comments* document and section 4.3.3 of the EPA response in this *Response to Comments* document, as well as section III.B.6 of the preamble.

3M Company (Doc. #1774, SBC-045668)

PFNA. EPA's reference value for PFNA is based on ATSDR's (2021) intermediate MRL of 0.000003 mg/kg-day and is overly conservative as a result of EPA's improper data review processes. ATSDR's (2021) MRL is derived from Das et al. (2015), in which mouse pups exposed to PFNA at 3 mg/kg-day were observed to have decreased body weight and delays in development. Importantly, most of the PFNA-induced effects, including developmental effects, are directly linked to the PPARα pathway (Rosen et al. 2017; Wolf et al. 2010). As demonstrated in Wolf et al. (2010), there is a clear association between PPARα and delayed eye opening and decreased body weight in exposed mouse pups. Because the PPARα has limited relevance to humans, the selection of Das et al. (2015) as the primary basis of the MRL is improper.

Additionally, ATSDR's (2021) application of an uncertainty factor of 3 for interspecies differences was overly conservative and in violation of EPA's own guidance. As previously discussed, the limited application of PPARα to humans indicates that mice are the more sensitive species to the observed effects in Das et al. (2015) (i.e., PPARα is less active in humans than it is

in mice), such that an interspecies uncertainty factor of 1 would be consistent with guidance in EPA's IRIS handbook that allows for lower uncertainty factors considering differences in cross-species toxicokinetics and toxicodynamics are accounted for. Prior to the application of an interspecies uncertainty factor, the MRL was amply protective of human health. EPA (USEPA 2023l) also acknowledges that both ATSDR and EPA are reassessing the toxicity of PFNA via a revised MRL or new IRIS assessment, respectively. This further highlights the uncertainty in the reference value and lack of basis in the most up-to-date and systematically reviewed science.

Finally, another example of poor quality assurance in this proposed rulemaking, is in Section III.B.3 of the Federal Register Notice (USEPA 2023f), where EPA incorrectly refers to the HBWC for PFNA as both 100 ppt and 10.0 ppt.

EPA Response: For the EPA's response to comments related to uncertainty factors and human relevance of the critical effects, see section 3.1.1 in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble. Additionally, the agency has corrected the HBWC in the NPDWR. The correct HBWC for PFNA is 10 ng/L (ppt).

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042357)

Lower the health-based water concentration (HBWC) used for PFBS to account for thyroid hormone disruption during early development. Washington and other states have selected lower values for PFBS to determine when action is needed to protect health. For example, the Washington State Action Level for PFBS is 345 ng/L whereas EPA's proposed HBWC (or health advisory level) is 2000 ng/L. Because thyroid hormone plays a critical role in early brain and skeletal development, PHSKC recommends that EPA lower the health advisory level set for PFBS to better protect pregnant women, infants and children.

EPA Response: The EPA disagrees. Washington State used the same RfD (3E-04 mg/kg-d) but a higher Drinking Water Intake Bodyweight-Adjusted (DWI-BW) to develop its Action Level for PFBS as compared to the EPA's HBWC (Washington State used the 95th percentile DWI-BW of 0.174 L/kg/day for infants, whereas the EPA selected the 90th percentile DWI-BW of 0.0354 L/kg/day for women of child-bearing age). The EPA disagrees that the infant DWI-BW is more appropriate for HBWC calculation. The EPA selected the thyroid hormone outcome (decreased serum total thyroxine in newborn mice seen in a developmental toxicity study) as the critical effect in its PFBS human health toxicity assessment (USEPA, 2021a). The RfD derived from this critical effect included application of a 10X uncertainty factor to account for lifestage-specific susceptibility (UF_H). To select an appropriate DWI-BW for use in deriving the HBWC for PFBS, the EPA followed its established approach of considering the PFBS exposure interval used in the developmental toxicity study that was the basis for chronic RfD derivation. In this study, pregnant mice were exposed throughout gestation, which is relevant to two human adult life stages: women of child-bearing age who may be or become pregnant, and pregnant women and their developing embryos or fetuses (Table 3-63 in USEPA,

2019). To be clear, the critical study exposed mice to PFBS only during pregnancy and not during postnatal development; newborn mice in early postnatal development, which would correspond to the human infancy life stage, were not exposed to PFBS. Of the two relevant adult stages, the EPA selected the 90th percentile DWI-BW for women of child-bearing age (0.0354 L/kg/day) to derive the HBWC for PFBS because it is the higher of the two, and therefore more health-protective. Please see additional information related to DWI-BW selection in section 4.3.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045880)

The PFBS assessment is very clear in stating that "[t]he overall confidence in the chronic RfD for thyroid effects is low,"[FN18: U.S. EPA Human Health Toxicity Values for Perfluorobutane Sulfonic Acid (CASRN 375-73-5) and Related Compound Potassium Perfluorobutane Sulfonate (CASRN 29420-49-3), at page 4, available at: https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=350888.] yet EPA relies on this endpoint and value for the health-based water concentrations (HBWC).

EPA Response: The EPA disagrees with this comment. Please see section 4.3.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045882)

It is worth noting that during the review of the PFBS assessment, one peer reviewer questioned why a single study could serve as the basis of U.S. national regulation. EPA responded that the "PFBS assessment is not a regulatory action but rather may in part inform risk remediation activities."[FN19: U.S. EPA, Response to Peer Review Comments on the Draft Human Health Toxicity Values for Perfluorobutane Sulfonic Acid (CASRN 375-73-5) and Related Compound Potassium Perfluorobutane Sulfonate (CASRN 29420- 49-3) October 2020, at page 16, available at: https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=350888.] Notwithstanding that earlier caveat, the single study in the PFBS assessment is indeed a critical driver in EPA's proposed regulation to regulate PFBS.

EPA Response: See the section 4.3.3 of the EPA response in this *Response to Comments* document, as well as section III.B.6 of the preamble. The EPA's 2021 PFBS Human Health Assessment included a systematic literature search and evidence mapping that resulted in identification of several human epidemiological and experimental animal studies. This landscape of hazard and dose-response information, associated primarily with oral exposures to PFBS, revealed a number of health outcomes of potential concern in several target organs or systems (e.g., thyroid, developmental, and the kidney). From among the candidate critical studies and critical health effects, a single study and effect were expertly identified by the assessment authors, consistent with the EPA human health risk assessment guidance and practice. In the derivation of a toxicity value, the identification of a single best study is necessary to qualitatively and quantitatively evaluate health effect dose –response. This is typically related to greatest

degree of confidence in the study/data. Importantly, this does not mean that other information from other studies were not considered for derivation purposes. Additionally, the commenter quotes only a small part of an EPA response to a peer-review comment on the PFBS toxicity assessment. The full EPA response states that the single study in question is a robust, high-confidence study that reports health outcomes consistent with a broader body of evidence demonstrating an exposure-effect relationship between oral PFBS and thyroid hormone perturbations. The identification of decreased thyroid hormone seen in this study as the critical effect is based on the entirety of the relevant study landscape (i.e., across rats and mice, different sexes, different exposure durations and lifestages); from amongst this body of evidence, the selected publication provided the highest confidence dose-response dataset on which to base identification of a point of departure (POD) for RfD derivation.

3M Company (Doc. #1774, SBC-045669)

PFBS. EPA relies on its RfD of 0.0003 mg/kg/day (USEPA 2021a) as the basis of the HBWC. EPA again failed to follow processes that would have ensured its RfD was properly supported. EPA relied on Feng et al. (2017), in which mouse pups exposed to PFBS were observed to have decreased serum thyroid hormone (thyroxine [T4]) levels compared to unexposed pups. The study's authors, however, expressed uncertainty as to whether the decreased serum T4 levels were toxicologically relevant; they further state that the decreased levels were not specifically related to development (Feng et al. 2017). A proper systematic review would have taken that uncertainty into account.

The selection of thyroid hormone changes in mice as the critical effect by EPA (USEPA 2021a) in and of itself is overly conservative but is further compounded by EPA's application of an uncertainty factor of 3 for interspecies differences. Multiple studies have shown that rodents are more sensitive to alterations in thyroid hormone compared to humans (NRC 2005; Bartsch et al. 2018; Parker and York 2014; Brown-Grant 1963). In other words, without the uncertainty factor, EPA's RfD may be protective of human health, but is made unduly conservative with it.

EPA Response: The EPA disagrees with these comments. Please see section 4.3.3 of the EPA response in this *Response to Comments* document,.

The EPA disagrees with the commenter regarding the application of the uncertainty factor for interspecies differences (UF_A). As noted in the EPA's toxicity assessment for PFBS (USEPA, 2021a), a UF_A of 3 was applied to account for uncertainty in characterizing toxicokinetic and toxicodynamic differences between mice and humans following oral K+PFBS/PFBS exposure (specifically, uncertainty in the relative cross-species sensitivity in toxicodynamics (e.g., thyroid signaling)). In the absence of chemical-specific data to quantify this uncertainty, the EPA's guidance recommends the use of a UF_A of 3.

Colorado Water Utility Council (CWUC) (Doc. #1622, SBC-044055)

33. EPA requests comments on the approaches we used to estimate each of the health impacts of exposure to the PFAS chemicals covered in this proposed rule, including the transparency of the assumptions we made and the impact of these assumptions on the magnitude of the risks avoided by the proposed regulatory action.

a. CWUC does not think the health impacts explained can be reliably linked to specific impacts of exposure to PFAS chemicals alone. There are many reasons a person could experience the health impacts discussed and they cannot be reliably linked to PFAS chemicals alone. Further, drinking water is typically only a very small exposure pathway of PFAS to an average person. Exposures are much greater to a typical individual from cosmetics and PCP, clothing, cookware, food wrappers, and many more products consumers use everyday.

EPA Response: The EPA disagrees with this comment. For the EPA's response to comments about approaches used to estimate health impacts of exposure to PFAS, please see sections 4.3.1, 4.3.2, and 4.3.3 of the EPA response in this *Response to Comments* document. Please also see the EPA's PFAS website (https://www.epa.gov/pfas) for links to resources and information about the established associations between PFAS exposure and adverse health effects. Additionally, please see section 4.3.3 of the EPA response in this *Response to Comments* document for information about relative source contribution (RSC) derivation, which takes into account potential PFAS exposure via non-drinking water routes.

U.S. Chamber of Commerce (Doc. #1537, SBC-042648)

There is limited understanding of risk at these levels. EPA's Reference Dose for PFNA, GenX Chemicals, PFHxS, and PFBS is based entirely on laboratory animal studies, even though EPA itself advises "Adequate human data are the most relevant for assessing risks to humans." There is significant uncertainty regarding the health risks at the proposed MCL levels for all six PFAS. WHO's recent study on potential guidelines for water quality, for example, proposed 100 ppt based on the most relevant public health data and seems to be consistent with known risk.

EPA Response: With respect to the use of animal studies, SDWA requires that the EPA use "the best available, peer reviewed science" to inform decision making on drinking water regulations. The HBWCs are based on the best available science—peer-reviewed, publicly available assessments for HFPO-DA (USEPA, 2021b), PFBS (USEPA, 2021a), PFNA (ATSDR, 2021), and PFHxS (ATSDR, 2021) provide the oral toxicity values (i.e., RfD or Minimal Risk Level) used to calculate the HBWCs; the DWI-BW selected for each of the four PFAS takes into account the relevant sensitive population(s) or life stage(s); and RSCs are determined based on a literature review of potential exposure sources of the four PFAS (USEPA, 2000a). Additionally, as noted in the EPA's *Staff Handbook for Developing IRIS Assessments* (USEPA, 2022) and *A Review of the Reference Dose and Reference Concentration Process* (USEPA, 2002), animal studies can provide the basis for toxicity reference values when adequate human studies are not available.

For the EPA's response to comments related to uncertainty factors, see section 3.1.1 in this *Response to Comments* document, as well as section 4.3.3 of the EPA response in this *Response to Comments* document and section III.B.6 of the preamble.

3.1.2 EPA's Preliminary Regulatory Determinations for PFHxS, PFNA, HFPO-DA, and PFBS – Statutory Criterion #2 Occurrence

Summary of Major Public Comments and EPA Responses

The EPA received many comments on the agency's evaluation of the second statutory criterion under Section 1412(b)(1)(A) of SDWA that the contaminant is known to occur or there is a substantial likelihood that the contaminant will occur at a frequency and level of public health concern. The EPA notes that some comments discussing occurrence information are also contained within section 6 of this *Response to Comments* document. Many commenters supported the EPA's preliminary determination that PFHxS, PFNA, HFPO-DA, and PFBS meet the second statutory occurrence criterion under SDWA citing that the agency has used the best available information to determine that these PFAS are known to occur or there is a substantial likelihood that these PFAS will occur at a frequency and level of public health concern. Conversely, many other commenters did not agree that the agency presented sufficient occurrence information to make a preliminary determination to regulate PFHxS, PFNA, HFPO-DA, and PFBS at this time or that a determination not to regulate (i.e., negative determination) these four PFAS is more appropriate given the information provided by the EPA or a lack of available information. Other commenters stated that the EPA has not met the statutory criteria for regulation for only some of the four contaminants, primarily HFPO-DA, PFBS, and PFNA, while it has met the statutory criteria for others (e.g., PFHxS). Regarding PFHxS, PFNA, and HFPO-DA, the EPA disagrees with commenters that claim the EPA did not present sufficient occurrence information to satisfy the second statutory criterion or that a negative determination is more appropriate for these three PFAS. Within section III.C. of the final rule preamble, the EPA presents the best available information, consisting of both UCMR 3 and extensive state drinking water data, which documents the measured occurrence of PFHxS, PFNA, and HFPO-DA above their HRLs as well as other information to support the EPA's determination that there is a substantial likelihood that these contaminants will occur with a frequency and level of public health concern.

A couple of commenters claimed that the EPA does not have a robust understanding of available occurrence data that supports any of the regulatory determinations for the four PFAS in this rule. Additionally, some commenters suggested that the preliminary determinations were "rushed" and "non-scientific," and that the agency should wait until some or all of the UCMR 5 data is available and considered. The EPA disagrees because while the EPA recognizes there will be additional occurrence or other relevant information for these and other PFAS in the future, the agency has determined that there is more than sufficient occurrence information to establish a substantial likelihood of occurrence at frequencies and levels of health concern satisfying the statutory criterion to regulate PFNA, PFHxS, and HFPO-DA. Per the intent of the statute, the

agency used the best available data in an expeditious manner, which was also a very large dataset consisting of tens of thousands of samples and representing one of the most robust occurrence datasets ever used to inform development of a drinking water regulation of a previously unregulated contaminant. The agency also disagrees that the occurrence analyses undertaken and available in the proposed rule preamble as well as the technical support document for occurrence were non-scientific. Based on the publicly available information within the state data, the EPA verified that the very large majority of samples (at least 97 percent) were collected using EPA-approved methods; the slight percentage the agency was unable to verify would not result in different agency conclusions. Additionally, the EPA notes that the aggregated data were assessed using precedented statistical metrics and analyses. In addition, the Cadwallader et al. (2022) model uses a robust, widely accepted Bayesian statistical approach for modeling contaminant occurrence. Based on these analyses, the EPA has a clear understanding of the occurrence of the modeled contaminants. As discussed in the final rule preamble section III.C and USEPA (2024b), the EPA also has sufficient state data which consist of a greater number of total systems and samples than that included within the monitoring under UCMR 3, to confidently establish that there is a substantial likelihood of occurrence at frequencies and levels of public health concern. As discussed in section III of the final rule preamble and previously stated, the agency believes that the best currently available occurrence data demonstrate substantial likelihood of occurrence for the chemicals included in the final rule as they are demonstrated at frequencies and levels of public health concern. UCMR 5 data are being reported to the EPA while this final rule is being prepared. See section VI.G. of the final rule for more information on the preliminary results. While these data are too preliminary to provide the basis for the regulatory determination, these preliminary UCMR 5 results appear to confirm state data and model results.

Commenters both agreed and disagreed with the EPA's individual preliminary determination for PFBS. While PFBS occurs at significant frequency, in the final rule preamble, the EPA is making a final determination to regulate PFBS in mixtures with PFHxS, PFNA, and/or HFPO-DA, but is deferring the final individual regulatory determination for PFBS so that the agency can continue to evaluate this contaminant relative to the SDWA criteria for regulation, particularly related to its individual known or likely occurrence. However, the EPA maintains that there is a substantial likelihood that PFBS co-occurs in mixtures with PFHxS, PFNA, and/or HFPO-DA in PWSs with a frequency and at levels of public health concern, also meeting the other two statutory criteria and is finalizing regulation of PFBS as part of a mixture with PFHxS, PFNA, and HFPO-DA.

Several commenters requested that the EPA evaluate additional state occurrence data for PFHxS, PFNA, HFPO-DA, and PFBS to further inform its analysis for the preliminary regulatory determinations. In response to public comments on the proposal, the EPA evaluated updated and new state occurrence data available through May 2023. These additional occurrence data further confirm that the SDWA second criterion for regulation have been met for PFHxS, PFNA, and HFPO-DA as individual contaminants. The agency has included updated information in its occurrence analyses as described in section VI.B of the final rule preamble.

Several commenters disagreed that the available occurrence information supports a preliminary determination specifically for HFPO-DA, with a few citing limited or a lack of nationally representative data (such as through UCMR 3) and suggesting a delay until UCMR 5 data is collected. The EPA disagrees with these comments, as the extensive state monitoring data detailed in section III.C. of the final rule preamble and consisting of approximately 36,000 samples within 10,000 systems representing multiple geographic locations, demonstrates HFPO-DA occurrence in 13 geographically diverse states, including at 75 systems serving at least 2.5 million people, and at least 13 systems in 5 states within different geographic regions of the country serving a population of 227,000 people with reported concentrations above the HRL of 10 ng/L. Additionally, when evaluating only a subset of the available state data representing non-targeted monitoring, HFPO-DA was reported in approximately 0.48 percent of monitored systems; if these results were extrapolated to the nation and those system subject to the final rule requirements, the agency estimates that HFPO-DA would be detectable in over 320 PWSs serving 9.9 million people. If those results were further compared to the HRL for HFPO-DA (10 ng/L), HFPO-DA would be detected above the HRL in 42 systems with at least 495,000 people exposed. Moreover, there is no SDWA or other requirement that a contaminant must be monitored for under UCMR in order to make a determination to regulate and non-national datasets, particularly those of such size currently available through recent state data, may serve to demonstrate occurrence of a contaminant to warrant a positive determination and subsequent development of an NPDWR.

One commenter specifically stated that a regulatory determination for PFNA was unnecessary as they do not believe it occurred with frequency under UCMR 3 monitoring, and a couple of other commenters suggested that a negative determination was appropriate for PFNA citing occurrence levels. The EPA disagrees that a negative determination is appropriate for PFNA as discussed in section III.C. of the final rule preamble where the EPA's evaluation of the best available information demonstrated it to occur under UCMR 3 in approximately 0.28 percent of systems, serving 526,000 people in 7 states, Tribes, and U.S. territories, using a minimum reporting level of 20 ng/L. As this reporting level is two times greater than the health-based HRL of 10 ng/L, the EPA expects there is even greater occurrence and exposed population in the range between 10 and 20 ng/L. Additionally, through analysis of the extensive amount of state data, the agency found in occurred above the HRL of 10 ng/L in at least 52 water systems across 12 states. Furthermore, evaluating only a subset of the available state data representing non-targeted monitoring, PFNA was reported in approximately 3.6 percent of monitored systems and if those results were extrapolated across the country, PFNA would be detectable at any concentration in over 2,300 PWSs serving24.9 million people and detectable above the HRL of 10 ng/L in 228 systems serving 830,000 people.

Further supporting the final determinations for PFNA and HFPO-DA (as well as PFHxS), these PFAS are very stable and persistent in the environment. While PFNA has generally been phased out in the U.S. there are still detections as demonstrated through the EPA's evaluation of the best available information and legacy stocks may still be used, as well as products containing PFNA may still be produced internationally and imported to the U.S. (ATSDR, 2021). In the case of

HFPO-DA, however, it continues to be actively produced and used within the country and is generally considered to have replaced the production of PFOA. Since PFNA and HFPO-DA are both environmentally persistent, products containing PFNA are still in use and may be imported into the U.S., and HFPO-DA is still being actively produced and used, there is a substantial likelihood that environmental contamination of sources of drinking water will continue from the PFAS. To illustrate this point further, PFOA and PFOS, two of the most extensively sampled PFAS, are also very environmentally persistent and have been phased out in the U.S. for many years, though these two contaminants continue to often be found at levels of public health concern as discussed in section VI of the final rule preamble. Therefore, in consideration of factors relating to the environmental persistence of PFNA and HFPO-DA, their current and legacy production and use in commerce, and the observed occurrence of PFOA and PFOS as an indicator of likely future occurrence of PFNA and HFPO-DA, the EPA finds that there is a substantial likelihood PFNA and HFPO-DA occur or will co-occur at a frequency and level of public health concern.

A few commenters provided feedback on occurrence thresholds the agency should consider when evaluating the second statutory criterion for regulatory determinations. Particularly, these commenters recommended that the EPA should define a threshold for frequency and level of public health concern that warrants a specific regulatory determination. A few commenters cited other previous regulatory determinations where the agency made a determination not to regulate contaminants with similar or lower levels of occurrence suggesting that this should be the same for some or all of these four PFAS. Furthermore, some of these commenters stated that it would be arbitrary and capricious and conflict with the SDWA if the EPA did not use the level of adverse health effect (i.e., HRL) to represent the level at which a contaminant is considered a public health concern.

The EPA disagrees with these commenters and as demonstrated in the proposal and described in section III of the final rule preamble, for this regulatory determination, as well as past determinations, the agency did compare available occurrence data relative to the contaminant HRL as a factor in informing the occurrence level of public health concern. However, the level of public health concern for purposes of the second criterion is a contaminant-specific analysis that includes consideration of the HRL, as well as other factors and not solely based on the direct comparison to the HRL. There is not just one simple threshold used for public health concern for all contaminants. In the case of PFAS, this is particularly relevant given the dose additivity of mixtures. Furthermore, the EPA's evaluation of the second statutory criterion for regulation of PFHxS, PFNA, and HFPO-DA individually and regulation of combinations of these PFAS and PFBS in mixtures follows a similar process to previous rounds of regulatory determinations including the written Protocol developed under Regulatory Determination 3 (USEPA, 2014) and also described in detail in the Preliminary Regulatory Determination 4 (USEPA, 2020). Using the Protocol, and as conducted for the regulatory determinations in this action, the agency compares available occurrence data relative to the contaminant HRL as a preliminary factor in informing the level of public health concern. Consistent with the Protocol and similar to all past regulatory determinations, these regulatory determinations are also based on other factors, some

of which include the level at which the contaminant is found in drinking water, the frequency at which the contaminant is found and at which it co-occurs with other contaminants, whether there is an sustained upward trend that these contaminant will occur at a frequency and at levels of public health concern, the geographic distribution (national, regional, or local occurrence), the impacted population, health effect(s), the potency of the contaminant, other possible sources of exposure, and potential impacts on sensitive populations or lifestages" (USEPA, 2023a). It also includes consideration of production and use trends and environmental fate and transport parameters which may indicate that the contaminant would persist and/or be mobile in water. Appropriately, the EPA has considered these relevant factors in its evaluation that there is a substantial likelihood that PFHxS, PFNA, and HFPO-DA will individually occur and combinations of these three PFAS and PFBS will co-occur in mixtures in PWSs with a frequency and at levels of public health concern.

The EPA also disagrees with these commenters as SDWA does not define the occurrence level of public health concern for contaminants, nor does it prescribe the level of adverse health effects that must be used for a regulatory determination. In previous EPA regulatory determinations, the agency has considered the occurrence criteria unique to the contaminant it is evaluating and has made decisions not to regulate contaminants both where there was substantial likelihood of occurrence at frequency and/or at levels of public health concern and where there was limited or no substantial likelihood of occurrence at frequency and/or at levels of public health concern. Ultimately, the overall decision to regulate a contaminant considers all three statutory criteria, including the comprehensive assessment of meaningful opportunity which is in the Administrator's sole discretion. Moreover, consistent with this past regulatory history and the Administrator's authority under the terms of the statute, the decision considers all three criteria and cannot be determined in the exact same manner for different contaminants. While the EPA may have made negative determinations for other contaminants demonstrating occurrence at different frequencies and levels of public health concern, the basis for those decisions was specific to those contaminants and does not apply to these PFAS or any other future contaminants for which the EPA would make regulatory determinations. Therefore, the statute does not require, and the EPA does not use a minimum or one-size-fits-all occurrence thresholds (for either frequency or precise level) for regulatory determinations.

Individual Public Comments

American Water Works Association (AWWA) (Doc. #1759, SBC-045558)

The agency's preliminary determinations for PFNA, HFPO-DA, and PFBS are not sufficiently supported by the supporting documentation. The information included in the proposed rule docket does not suggest that there is a substantial likelihood of PFNA, HFPO-DA, and PFBS occurrence in drinking water with a frequency and at levels of public health concern. Instead, the available evidence indicates that a negative determination is appropriate. Similarly, the information on co-occurrence and overall occurrence of PFHxS, PFNA, HFPO-DA, and PFBS as a mixture also indicates that the agency only has supporting information for a negative

determination. Preliminary determinations for these compounds and their mixture should be re-issued following completion of the Fifth Unregulated Contaminant Monitoring Rule (UCMR 5).

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. For the EPA's response related to the second statutory criterion for the regulatory determination of mixtures of PFHxS, PFNA, HFPO-DA, and PFBS, please see section 3.2.2 in this *Response to Comments* document. Concerning UCMR 5, please also see section 6.8 of the EPA response in this *Response to Comments* document.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043097)

As part of this Proposal, EPA proposes preliminary determinations for PFHxS, PFNA, HFPO-DA, and PFBS concurrently with a proposed drinking water standard for these compounds. The determinations for PFNA, HFPO-DA, and PFBS are not supported by the available occurrence data.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

American Farm Bureau Federation et al. (Doc. #1642, SBC-043482)

They have identified the following areas of concern regarding the agency's development of this rule:

• Lack of occurrence data at the proposed MCL level. EPA does not have a robust understanding of occurrence levels at the proposed MCL levels for PFOA and PFOS or the other four PFAS. This lack of occurrence data for a preliminary regulatory determination requires more thoughtful and thorough analysis.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. See section 6.2 of the EPA response in this *Response to Comments* document regarding state data used to inform PFOA and PFOS occurrence at MCL levels. Additionally, see PFOA and PFOS occurrence data results which are presented in section VI of the final rule preamble and the *Occurrence Technical Support Document* (USEPA, 2024b).

Consumer Reports (Doc. #1656, SBC-043181)

In terms of the occurrence of these four PFAS in drinking water, EPA analyzed data from the Unregulated Contaminant Monitoring Rule (UCMR) 3 sampling, which took place from 2013-2015, and from more recent data collected by states. The UCMR 3 study had 36,972 samples from 4,920 PWS that were analyzed for levels of PFHxS, PFNA and PFBS, but not GenX chemicals. The more recent data consisted of drinking water samples from 23 states that were also tested for PFHxS, PFNA, PFBS and GenX chemicals. The state data on detection frequency

and concentration results that EPA presents for PFHxS, GenX, PFNA, and PFBS vary widely between the four PFAS and across states.

That said, EPA notes that if you review the state data representing non-targeted monitoring, one or more of PFHxS, GenX chemicals, PFNA, and PFBS were reported in about 14% of the monitored systems. However, EPA also presents data to show that these four PFAS generally co-occur with each other, as well as with PFOA and PFOS. The state data also showed that for PFHxS, PFNA, PFBS, the levels found in drinking water often exceeded the HRLs of 9 ppt, 10 ppt, and 10 ppt, respectively. EPA made a determination that there is sufficient evidence of occurrence to support a preliminary determination that there is a substantial likelihood that PFHxS, GenX chemicals, PFNA, and PFBS will occur at frequencies and levels of public health concern. We agree with this assessment.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044444)

b. EPA's proposed PFAS drinking water contaminant levels are known to occur or substantially likely to occur in public water systems with a frequency and at levels of public health concern.

EPA appropriately determined that "there is a substantial likelihood that the [PFAS] contaminants [subject to the PFAS Rule] will occur and co-occur with a frequency and at levels of public health concern in [public water systems] based on EPA's evaluation of the best available occurrence information." [FN24: 88 Fed. Reg at 18647.] To reach this determination, EPA considered data collected under the Third Unregulated Contaminant Monitoring Rule (UCMR3) program as well as data collected by states. The state data, using newer analytical methods that have lower reporting limits than those under UCMR3, show "widespread occurrence of PFOA, PFOS, PFHxS, PFNA, and PFBS in multiple geographic locations." [FN25:Id. at 18648] State sampling demonstrated that millions of people drink water contaminated by the subject four PFAS. [FN26:Id. at 18651.] For example, Massachusetts data disclosed PFHxS in over 31 percent of finished water samples, South Carolina found PFBS in over 38 percent of finished water samples, and Kentucky found HFPO-DA in 13 percent of finished water samples. [FN27: Id. at 18949-50] The data show that PFHxS, HFPO-DA, PFNA, and PFBS, and mixtures of these PFAS, occur and co-occur at levels of public health concern as they are measured at concentrations above their respective individual health reference levels (HRLs) or, when considering their dose additive impacts, exceed these levels. [FN28: Id. Concentrations of PFBS, taken alone, did not exceed the HRL. But EPA determined that there is a substantial likelihood of its occurrence with a frequency and at levels of public health concern because of dose additivity with other PFAS found in mixtures and the elevated frequency with which PFBS occurrence has been observed over time. Id. at 18650.]

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

California Farm Bureau Federation (Doc. #1704, SBC-045066)

For example, the U.S. Chamber analysis highlights the following:

• Lack of occurrence data at the proposed MCL level. EPA does not have a robust understanding of occurrence levels at the proposed MCL levels for PFOA and PFOS or the other four PFAS. This lack of occurrence data for a preliminary regulatory determination requires more thoughtful and thorough analysis.

EPA Response: The EPA disagrees that the agency lacks occurrence data. In fact, the agency has tens of thousands of monitoring results for these six PFAS, many of which have reporting limits at or below the MCLs and many of which are for the PFAS EPA is making final regulatory determinations in this action. Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. See section 6.2 of the EPA response in this *Response to Comments* document regarding state data used to inform PFOA and PFOS occurrence at MCL levels. Additionally, see PFOA and PFOS occurrence data results which are presented in section VI. of the final rule preamble and the *Occurrence Technical Support Document* (USEPA, 2024b). In short, the EPA has a robust understanding of the occurrence of these PFAS and it is more than sufficient to determine that PFNA, PFHxS, and HFPO-DA and PFBS as part of a mixture with PFHxS, PFNA, and HFPO-DA are likely to occur with a frequency and at levels of public health concern.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045893)

5. EPA does not explain how it applied criteria to determine whether these four PFAS meet the occurrence factor

In the proposed rule, EPA fails to explain how it applied criteria in determining that the four PFAS meet the occurrence factor—the statutory finding that the contaminants are "known to occur or there is a substantial likelihood that the contaminants will occur in public water systems with a frequency and at levels of public health concern." EPA acknowledges that it does not have a "bright line" threshold for occurrence in drinking water that triggers whether a contaminant is of public health concern; rather, this determination is based on various factors. The considerations include: the level at which the contaminant is found in drinking water; the frequency at which the contaminant is found and at which it co-occurs with other contaminants; whether there is an sustained upward trend that these contaminant will occur at a frequency and at levels of public health concern; geographic distribution; the impacted population; health effects; the potency of the contaminant; other possible sources of exposure; and potential impacts on sensitive populations or life stages [FN50: 88 Fed. Reg. at 18647.].

EPA fails to explain why the data it relies on meets these factors for occurrence at levels and frequency of concern. EPA bases its determination for the occurrence factor on UCMR 3 data for PFNA, PFBS, and PFHxS (no data were monitored for HFPO-DA in UCMR 3) and recent PFAS drinking water data collected by 11 states, which are not representative [FN51: Id.]. The UCMR

data found that only 233 out of 36,972 samples had reported detections greater than or equal to the minimum reporting levels of at least one of the three PFAS. The percentage of systems where PFAS were found ranged from 0.1 to 56%. EPA does not explain why this data, which shows significant occurrence variability, and in some cases virtually no instances of occurrence, reflects a sufficient level of occurrence for all four PFAS to warrant regulation.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, in the proposed rule preamble and the proposed rule *Occurrence Technical Support Document* (USEPA, 2023b), the EPA evaluated recent PFAS drinking water monitoring data from 23 states, not 11 states as incorrectly cited by the commenter. These datasets are representative of multiple geographic locations across the country and can be used to inform regulatory determinations. Based on public comment, for the final rule occurrence analyses, the EPA further updated this dataset to include new state occurrence data available through May 2023. These data include a very large dataset consisting of tens of thousands of samples from 32 states and representing one of the most robust occurrence datasets ever used to inform development of a drinking water regulation of a previously unregulated contaminant and further confirm that the SDWA second criterion for regulation have been met for PFHxS, PFNA, and HFPO-DA as individual contaminants. These updated state data are confirmatory of the data the EPA considered and discussed extensively during the rule proposal.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045246)

In a 2022 study of raw-water samples at 279 public water systems across West Virginia, PFHxS was detected in 21% of samples with concentrations ranging from 0.8 to 81.4 ppt; HFPO-DA was detected in 10% of samples with concentrations ranging from 1.3 to 9.5 ppt; PFNA was detected in 3% of samples with concentrations ranging from 1.6 to 8.0 ppt; and PFBS was detected in 28% of samples with concentrations ranging from 0.49 to 24.5 ppt [FN1:https://www.sciencebase.gov/catalog/item/60db3fe9d34e596d2ba5c8f7]. Additionally, mixtures of these PFAS (at least two or more detections of PFHxS, HFPO-DA, PFNA, or PFBS) were found in 20% of samples. While these data are for pre-treated source water, it is likely that the frequencies and concentrations are generally reflective of finished water across the state as most public water systems only employ conventional treatment technologies, which are unable to remove PFAS to levels protective of public health.

In response to the above results, a follow up study was conducted to test for PFAS in the finished water at 37 public water systems identified to have PFOA and PFOS above laboratory reporting levels. These data show that PFHxS was detected in the finished water of 38% of systems with concentrations ranging from 1.94 to 22 ppt; HFPO-DA was detected in the finished water of 1 system with a concentration of 34 ppt; PFNA was detected in the finished water of 8% of systems with concentrations ranging from 3.9 to 6.51 ppt; and PFBS was detected in the finished water of 41% of systems with concentrations ranging from 2.09 and 8.49 ppt [FN2: https://www.sciencebase.gov/catalog/item/6401ff0dd34e6929881229c1]. Additionally, mixtures of these PFAS (at least two or more detections of PFHxS, HFPO-DA, PFNA, or PFBS) were

found in 32% of samples. Though these data are from targeted monitoring efforts and may not be representative of all PWSs in the state, we request that they be included in EPA's preliminary regulatory determination for PFHxS, HFPO-DA, PFNA, and PFBS.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045583)

Occurrence data for PFHxS is available not only through the UCMR 3 program but also as part of numerous state monitoring programs. Data is also currently being collected through the UCMR 5 program by 3,500 systems this year and more than 10,000 systems by the end of 2025 (EPA, 2021c). In review of the UCMR 3 data that is currently available, approximately 1.1% of water systems detected PFHxS at 30 ppt, more than 3 times higher than the proposed HBWC of 9.0 ppt. Additionally, data from California, Colorado, Pennsylvania, Vermont and Ohio show a similar trend of occurrence at levels above the proposed HBWCs (California Water Boards, 2023; CDPHE, 2023; Ohio EPA, 2023; PADEP, 2023; VTDEC, 2023). In review of the available occurrence data in comparison with the EPA's proposed HBWC, AWWA agrees that there is evidence that PFHxS occurs in drinking water at potential levels of concern.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. See section 6.2 of the EPA response in this *Response to Comments* document regarding the use of state datasets to support the final rule.

American Water Works Association (AWWA) (Doc. #1759, SBC-045581)

5. Preliminary Regulatory Determinations

The proposal includes preliminary regulatory determinations for four PFAS (and their mixture) concurrently with a proposed drinking water regulation of these compounds. AWWA supports the agency's interest in looking at PFAS beyond PFOA and PFOS for potential action and has previously recommended that the agency do so by applying adequate resources to fill data gaps (AWWA, 2020b).

Under the SDWA, EPA may only issue a NPDWR for a contaminant that is known to occur or there is a substantial likelihood that it will occur in public water systems at a level of public health concern. [FN15: 42 U.S.C. § 300g–1 (b)(1)(A)(ii).] In the preamble to the proposal, the agency notes that there is not a "bright-line threshold for occurrence in drinking water that triggers whether a contaminant is of public health concern". AWWA agrees that SDWA does not define a "bright-line threshold" that would define that a contaminant is of public health concern but given the statutory focus on the "adverse effect on the health of persons"16 [FN16: 42 U.S.C. § 300g–1 (b)(1)(A)(i).] it would be arbitrary and capricious and conflict with the SDWA if EPA did not use the level of adverse health effect to represent the level at which a contaminant starts to be considered a public health concern. AWWA also notes that EPA should consider its past

practices for determining whether a contaminant reaches a level of public health concern and ensure that its approach in any final rule is consistent with past practice or that it provides a reasoned explanation for any deviation from past practice. AWWA offers recommendations for each of these options, with this and other aspects in consideration. AWWA further notes that the best available health information indicates that a negative determination is appropriate for PFNA, HFPO-DA, and PFBS at this time.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

San Antonio Water System (SAWS) (Doc. #1570, SBC-042475)

While it is problematic that there is such minimal data available for those PFAS substances tested for through UCMR3, the inclusion of GenX is wholly unsupported by any nationwide dataset since it was not a part of UCMR3.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. See section 6.2 of the EPA response in this *Response to Comments* document regarding the use of state datasets to support the final rule.

Alameda County Water District (ACWD) (Doc. #1595, SBC-042351)

3. Establishment of a standard for HFPO-DA prior to the collection of national level occurrence data

Monitoring for HFPO-DA was not conducted during the UCMR-3 monitoring and data is currently being collected as part of the UCMR-5 monitoring. UCMR 3 monitoring occurred between 2013 and 2015 and is currently the best available national dataset for any PFAS.

The occurrence of HFPO-DA is based on a limited data set from various state monitoring results. Using state monitoring results may not provide an accurate indication of occurrence data nationwide. As described above, UCMR-3 did not include sampling for HFPO-DA, and state monitoring orders may not have captured systems with HFPO-DA in source waters at all, nor systems with HFPO-DA at levels contemplated by the proposed MCL. EPA should allow for the completion of UCMR-5 monitoring to determine occurrence data for HFPO-DA prior to establishment of a standard, via the Hazard Index, for HFPO-DA.

We appreciate the opportunity to participate in the rule-making process. Should you have any questions about these comments, please feel free to contact Mike Wickham at (510) 668-6516, by email mike.wickham@acwd.com, or via U.S. mail at the letterhead address.

Thank you for your consideration.

Sincerely,

Ed Stevenson

General Manager

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. See section 6.2 of the EPA response in this *Response to Comments* document regarding the use of state datasets to support the final rule.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043057)

2. The proposed positive regulatory determinations for perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA), and perfluorobutanesulfonic acid (PFBS) is not supported by national occurrence data. EPA should either make a negative determination or re-propose the rule based on available occurrence data from Fifth Unregulated Contaminant Monitoring Rule (UCMR 5).

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045741)

Similarly, PWD is not aware of a national dataset for HFPO-DA, and it was not a required analyte of the UCMR3 sampling program. While EPA has used state-level data, this information is regionally focused and includes an inconsistent suite of PFAS species for each state. It is unclear how EPA made a preliminary regulatory determination for this contaminant without having an indication as to its occurrence in public water systems across the country.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045744)

8. EPA should clearly define what threshold constitutes the determination that there is a "substantial likelihood that the contaminants will occur or co-occur with a frequency and at levels of public health concern".

Throughout section III.C and in the preamble for rulemaking reference USEPA 2023e ("Per- and Polyfluoroalkyl Substances (PFAS) Occurrence and Contaminant Background Support Document"), EPA states that the four HI compounds being discussed are found to have a "substantial likelihood [to occur] with a frequency and at levels of public health concern in drinking water systems across the United States". However, it is unclear what threshold was used to make this determination. For two of the HI compounds (PFNA and HFPO-DA), the percent of samples and systems with detects from most states was less than 10%. For all four of these compounds most states and systems had under 30-40% detections. PWD requests that EPA define what threshold it used to determine that each of these compounds have a "substantial likelihood" for occurrence.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045887)

2. UCMR 3 data and state data do not support a positive regulatory determination for HFPO-DA, PFNA, and PFBS

The existing data do not support a finding that the four contaminants of concern are occurring in drinking water with a frequency and at levels of public health concern. Furthermore, the detection levels used in UCMR 3 are significantly higher than the derived HBWCs, making data interpretation difficult.

There is no nationally representative data for HFPO-DA. In the past, EPA has determined not to regulate contaminants based on the lack of nationally representative occurrence data [FN33: 67 Fed. Reg. 38222, 38231 (Jun. 3, 2022) and 68 Fed. Reg. 42897, 42903 (Jul. 18, 2003). EPA determined not to regulate Acanthamoeba under the SDWA because EPA had no national monitoring data for Acanthamoeba occurrence in PWSs.]. While there is some non-representative state data (which likely suffers from self-selection bias), the majority of state samples detected HFPO-DA at occurrence levels below prior EPA determinations to regulate. Only three states had a percentage of detection that was above 0.5%, and the majority of states analyzed had detections below 0.3%. [FN34: 88 Fed. Reg. at 18649.] The statutory standard is simply not met based on the limited HFPO-DA occurrence data.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Regarding quality assurance steps the EPA took to evaluate the available state PFAS data which are reported at levels significantly below UCMR 3 reporting limits, please see section 6.2 of the EPA response in this *Response to Comments* document. The EPA disagrees with the commenters assertion that the agency cannot make a determination to regulate a contaminant without UCMR or that SDWA requires a contaminant to be monitored for under UCMR to make a regulatory determination or establish an NPDWR assuming that the agency does have other non-national finished water datasets of sufficient size and scope to inform the determination to regulate. In addition, the EPA disagrees with the commenter's assertion that in the past the EPA has determined not to regulate contaminants based on the lack of nationally representative occurrence data. Specifically, in the case of acanthamoeba provided by the commenter, the agency further disagrees, because while there was no monitoring data for acanthamoeba to indicate occurrence in drinking water under UCMR or any other program, the EPA made the determination not to regulate acanthamoeba with an NPDWR since regulation would not present a meaningful opportunity for health risk reduction for persons served by PWSs. Moreover, as noted in the EPA's preliminary determination and affirmed in the final determination for acanthamoeba, "EPA finds that the disease incidence for acanthamoeba is extremely low and that exposure to acanthamoeba-related infections are not typically produced by ingestion of drinking water, inhalation during showering, or other standard uses of drinking

water. Rather, acanthamoeba related infections are typically associated with poor hygiene practices among contact lens wearers. Thus, the EPA finds that regulation of acanthamoeba does not present a meaningful opportunity for health risk reduction for persons served by PWSs" (67 FR 38232 and 68 FR 42903). In contrast, HFPO-DA does have a substantial amount of recently available state monitoring data covering a range of geographic locations demonstrating the substantial likelihood that it will occur at a frequency and level of public health concern and drinking water is known to be a significant route of human exposure.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045890)

The levels of detection from the best available sampling data simply do not support a listing for HFPO-DA, PFNA, and PFBS.

EPA has determined not to regulate the following substances at a national level on the basis that they did not occur at a frequency or level of public health concern:

• Nitrobenzene: UCMR 1 collected 33,576 finished water samples from 3,861 PWSs (serving ~226 million people) for nitrobenzene, and it was detected in only a small number of those samples (0.01%) above the HRL (10 μg/L), which is the same as the minimum reporting level (10 μg/L) [FN41: 86 Fed. Reg. at 12285.].

• RDX: UCMR 2 collected 32,150 finished water samples from 4,139 PWSs (serving ~229 million people) for RDX, and it was detected in only a small number of those samples (0.01%) at or above the minimum reporting level [FN42: Id. at 12286.].

In the above examples where EPA determined not to regulate the contaminants, the percentage of samples with detections were close to the percentage detection occurrence levels found for the four PFAS.

Further, in 2003, EPA made a determination that aldrin, a more hazardous substance than PFAS, did not occur at a frequency and a level of public health concern despite nationally representative data showing occurrence of aldrin above the health risk level in 0.2% of water systems [FN43: 85 Fed. Reg. at 43996.]. In that case, over one million people were being served by the water systems that had detections above the health risk level. The representative occurrence data for HFPO-DA (state data varied, some as low as 0%), PFNA (0.28%), and PFBS (0.16%) are similar or less than the percentage of detections in PWS for aldrin.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. As discussed previously, all regulatory determinations are a contaminant-specific decision and there is no one-size-fits-all determination. Regarding the comments provided on the EPA's regulatory determination for aldrin, in the EPA's preliminary regulatory determination, the EPA did find that aldrin occurred in PWSs at a very low frequency and at low levels, therefore regulation would not present a meaningful opportunity. Those levels, under Round 2 of Unregulated Contaminant Monitoring (UCM) indicated 0.02 percent of reporting PWSs had detections of greater than the HRL affecting 8,600 people, not 0.2 percent and over

one million people as incorrectly provided by the commenter. Further specific factors in the regulatory determination and consideration of meaningful opportunity for aldrin included that it was not considered to occur widespread nationally and the chemical was banned by the EPA for most uses nearly 30 years prior (i.e., 1974) to the EPA's regulatory determination. Thus, in consideration of these factors, and others, "It is likely that there will be so few people exposed to aldrin and dieldrin in their drinking water that a national regulation to control these two pesticides in drinking water would not provide a meaningful opportunity to reduce risk" (67 FR 38232). In contrast, HFPO-DA and PFNA have been demonstrated to occur or that there is a substantial likelihood that they will occur nationally with a much greater population exposure. Moreover, products containing PFNA and HFPO-DA are either still being actively produced and used or may be used through legacy products or imports into the U.S.

For the EPA's regulatory determinations on nitrobenzene and Royal Demolition Explosive (RDX), the agency again notes that these are contaminant specific determinations, and the EPA disagrees that these should serve as occurrence threshold examples for the regulatory determinations for HFPO-DA and PFNA or any other regulatory determinations. Further, the agency notes that for the nitrobenzene and RDX regulatory determinations, their occurrence was not geographically widespread as indicated by their UCMR 1 and UCMR 2 sampling results, respectively. RDX was not detected under UCMR 2 above its non-cancer HRL, and detected in only three systems nationwide above the Minimum Reporting Level (MRL) (which was higher than the cancer-derived HRL). Nitrobenzene was detected under UCMR 1 above its HRL in only two PWSs. Furthermore, as provided in the EPA's regulatory determination for nitrobenzene, "The EPA does not anticipate nitrobenzene occurrence meaningfully changing from the UCMR 1 monitoring period given that reported releases to surface water have generally decreased over time and detections of nitrobenzene in ambient waters and Six-Year Review monitoring data are at low levels" (85 CFR 14098). Therefore, in comparison to the occurrence data for HFPO-DA and PFNA demonstrated in section III.C. of the final rule preamble and the *Occurrence Technical Support Document* (USEPA, 2024b) which demonstrates many more than two or three PWSs with levels above the EPA's HRLs for HFPO-DA and PFNA, as well as the substantial likelihood of the continued or increasing occurrence of HFPO-DA and PFNA, regulation of RDX and nitrobenzene on a national scale would not have presented a meaningful opportunity for health risk reduction.

American Water Works Association (AWWA) (Doc. #1759, SBC-045584)

HFPO-DA

The UCMR 3 program did not include monitoring for HFPO-DA. Therefore, EPA is not able to determine the national occurrence of the chemical. While some states have conducted monitoring for HFPO-DA, these states provide only a limited understanding of national occurrence.

In review of the EPA's analysis, HFPO-DA monitoring was conducted in only 16 states and the data does not provide sufficient evidence that there is national occurrence of HFPO-DA. In two

states, North Carolina and Alabama, sampling data was available, but the extent of the program was unknown and so statewide occurrence levels can not be determined. In eight states, HFPO-DA was not detected in any systems and in another three states there was less than 0.2% of systems with detections of HFPO-DA, let at levels above the EPA's lifetime health advisory level of 10 ppt (EPA, 2022f).

The only state with a significant number of detections of HFPO-DA at systems was Kentucky. A total of 81 systems were sampled across the state. Of these 81 systems, eleven detected HFPO-DA. An in-depth review of this data shows that all of these systems, except one, rely on the Ohio River as a water supply source. The last system relies on the Ohio River Alluvium. This data suggests that HFPO-DA contamination in Kentucky is not widespread but rather linked directly to recent releases directly to the Ohio River. Specifically, it is anticipated that the Ohio River, and these systems, have been impacted by discharges of HFPO-DA from the Washington Works PFAS manufacturing plant in Parkersburg, West Virginia.

The Washington Works plant has long been a center for discussions on PFAS contamination. However, the EPA recently took landmark action against this plant for violations of the Clean Water Act related to discharges of HFPO-DA to the Ohio River (EPA, 2023c). With this action, it is anticipated that HFPO-DA levels in the Ohio River will drop, which will lead to a reduction in contamination of affected systems. Similar action has been taken by the North Carolina Department of Environmental Quality (NCDEQ) against the Fayetteville Works facility along the Cape Fear River. In 2019 NCDEQ issued a consent order that required the facility to begin taking mitigative measures against the release and contamination of HFPO-DA in the area surrounding the facility. Following EPA's publication of the lifetime health advisory level in 2022, this consent order was updated and now will limit discharges to a maximum of 10 ppt HFPO-DA. This action will reduce HFPO-DA contamination in the Cape Fear River.

Data is available on the production, use, and release of HFPO-DA from the EPA's supporting documentation and shows that HFPO-DA was released by five facilities in five states. According to the most recent TRI program data for HFPO-DA, 72% of the total HFPO-DA and its ammonium salt released was from the Fayetteville Works facility in North Carolina; the Washington Works facility in West Virginia accounted for 5.7% to the total releases (EPA, 2023d). Given that both of these facilities are reducing releases, as discussed above, this will reduce the total release of PFAS by as much as 77.7% from these two facilities alone. Further reductions are anticipated following the promulgation of the ELGs for manufacturers and metal finishers under the CWA, which has been identified by EPA as a part of the Effluent Guidelines Program Plan 15 (EPA, 2021b). Similar reductions may be anticipated as EPA and states work towards addressing PFAS as part of the National Pollutant Discharge Elimination System (NPDES), as directed by the agency in April and December of 2022 (EPA, 2022d; EPA, 2022e).

Overall, UCMR data is not currently available for HFPO-DA and the available state data is not sufficient to determine the national occurrence of HFPO-DA in drinking water. Furthermore, the limited occurrence observed by state monitoring programs and the limited extent of production shown by information from the TRI program data is not suggestive of a substantial likely of

HFPO-DA occurrence in drinking water with a frequency and at levels of public health concern. Instead, the available evidence indicates that a negative determination is appropriate for HFPO-DA.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. As shown in the final rule preamble section III.C. as well as the *Occurrence Technical Support Document* (USEPA, 2024b), the EPA disagrees that the state monitoring results demonstrate this is a local or regional issue only, given the documented drinking water occurrence both for detections at any concentrations and at levels above the HRL in 13 and 5 states, respectively, which is much more than the two states specifically documented by the commenter. Additionally, while the agency is taking appropriate actions to hold polluters of HFPO-DA accountable as detailed in this comment, and does show drinking water occurrence in some locations where the EPA has taken these actions due to known contamination, the EPA does not agree that these locations are the only areas where there is a substantial likelihood HFPO-DA will occur at a frequency and level of public health concern, nor that the agency should not take additional actions, such as the development of an NPDWR, when the statutory criteria are met. Furthermore, HFPO-DA continues to be actively produced and used throughout the U.S and is very stable and persistent in the environment; therefore, even if releases are reduced from certain facilities, the EPA anticipates that drinking water occurrence levels will continue to be found at least to the levels described in the final rule preamble.

Metropolitan Water District of Southern California (Doc. #1777, SBC-045430)

In addition, based on the California State Water Resources Control Board's GeoTracker PFAS database (2016-2023 data), there are insufficient occurrence data in California wells to support EPA's preliminary determination to regulate three of these contaminants (GenX chemicals, PFNA, and PFBS). While 558 wells statewide would be impacted by PFOA, 681 wells by PFOS, and 320 wells by PFHxS proposed MCLs, only 14 wells statewide would be impacted by PFNA above its health-based water concentration (HBWC). In addition, no wells are impacted by PFBS and HFPO (GenX) statewide. Accordingly, Metropolitan recommends EPA consider updated drinking water occurrence data that states have collected to inform its regulatory decision-making process.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, as often observed, specific contaminant occurrence can be site-dependent, and while a contaminant may not occur as the same levels in all localities and states, the EPA has demonstrated that PFHxS, PFNA, and HFPO-DA occur or there is a substantial likelihood that they will occur with a frequency and level of public health concern across various geographic areas of the country. Furthermore, the EPA has demonstrated in section VI of the final rule preamble that PFOA and PFOS and the Hazard Index PFAS (PFHxS, PFNA, HFPO-DA, and PFBS) often co-occur and that the four Hazard Index PFAS often co-occur with each other (outside of their co-occurrence with PFOA and/or PFOS). Therefore, if PFOA, PFOS, and/or PFHxS are observed, there is a substantial likelihood PFNA, HFPO-DA,

and PFBS may also co-occur. Please see sections 3.2.2 and 6.3 of the EPA response in this *Response to Comments* document for more on PFAS co-occurrence.

The Chemours Company FC, LLC (Doc. #1845, SBC-046052)

ii. It is arbitrary and capricious for EPA to find that HFPO-DA occurs with a frequency and at levels of public health concern in the absence of any supporting data

In addition to violating the SDWA's express requirements, as described above, it is also arbitrary and capricious for EPA to find that HFPO-DA occurs in public water systems "with a frequency and at levels of public health concern" without data to support this finding. 42 U.S.C. [sec] 300g–1(b)(1)(A)(ii). It is especially arbitrary and capricious for EPA to rush into such a finding now when UCMR occurrence data for HFPO-DA will be available in the near future.

Preliminary UCMR occurrence data for HFPO-DA are expected to be published within months, and complete results will be available by 2026. [FN5: Occurrence Data from the Unregulated Contaminant Monitoring Rule, U.S. EPA, https://www.epa.gov/dwucmr/occurrence-data-unregulated-contaminant-monitoring-rule ("EPA anticipates posting the first set of preliminary UCMR 5 results in mid-2023 and expects to update the results approximately quarterly thereafter.").] EPA's decision to establish a NPDWR for HFPO-DA mere months before the data that should be central to EPA's analysis first become available is inexplicable, and suggests that EPA's decision to regulate this compound is detached from the underlying science.

Further, the data which are currently available demonstrate that the occurrence of HFPO-DA is limited to locations proximate to a small number of manufacturing facilities, and national regulations are therefore not appropriate. Thus, the occurrence data which EPA cites in its technical support document indicate that HFPO-DA does not occur at a frequency and level that supports national regulation. EPA first presents a compilation of HFPO-DA occurrence data from 16 states. [FN6: Per- and Polyfluoroalkyl Substances (PFAS) Occurrence and Contaminant Background Support Document, U.S. EPA, EPA 822-P-23-010 (Mar. 2023) at Exhibit 5-12.] The vast majority of detections came from a single state [FN7: Id. at Exhibit 5-13.]—North Carolina—which is also the only state with any detections above 30 ppt. [FN8: Id. at Exhibit 5-14.] Excluding North Carolina, HFPO-DA was detected in just a small fraction of samples, and in many states was not detected at all. [FN9: Id. at Exhibit 5-13; FN10: Detections of HFPO-DA in North Carolina are attributable to the Chemours Fayetteville Works facility. The Fayetteville Works facility is subject to a Consent Order with the North Carolina Department of Environmental Quality and Cape Fear River Watch, a non-governmental organization. Consent Order, North Carolina v. The Chemours Co. FC, LLC (N.C. Super. Ct., Feb. 25, 2019), https://deq.nc.gov/media/12453/download. The Consent Order was intended, and has had the effect, to drastically reduce emissions and discharges of HFPO-DA and other PFAS from the facility.]

In addition, the state data EPA has cited has numerous gaps and inconsistencies which demonstrate that it is not an adequate substitute for UCMR data when evaluating the occurrence of HFPO-DA at a national level. For example:

• Reporting thresholds varied between states, with some states failing to define any reporting threshold.

• Reporting thresholds varied within state data based on the particular laboratory analyzing the data.

• Some states reported at thresholds below laboratory practical quantitation limits ("PQLs"), while others reported at thresholds above EPA's NPDWR HBWC level for HFPO-DA.

• Some states failed to report the samples in which HFPO-DA was not detected. [FN11: PFAS Occurrence and Contaminant Background Support Document at Exhibit 5-12.]

The limited federal data that EPA presents in its technical support document also show nearly nonexistent occurrence of HFPO-DA. Department of Defense drinking water data showed only a single detection out of 994 samples. [FN12: Id. at Exhibit 5-16.] In ambient water, National Water Information System ("NWIS") data and EPA Storage and Retrieval ("STORET") data reported no detections of HFPO-DA across 336 samples. [FN13: Id. at Exhibits 5-17 and 5-18.]

Finally, Chemours has provided to EPA extensive data demonstrating that the occurrence of HFPO-DA is nonexistent or minimal outside of a small number of locations proximate to manufacturing facilities. For example, Chemours previously provided EPA 22 independent reports containing exposure data from the United States, Europe, and China which showed no significant levels of exposure to the general population from food, dust, air, soil, consumer products, firefighting foam, and ground and surface water. [FN14: Letter and Attachments from Sheryl Telford, Chemours, to Elizabeth (Betsy) Behl, U.S. EPA (May 31, 2022).] Further, Chemours previously presented to EPA a compilation of drinking water sample data submitted to EPA from the states and contained in EPA's ECHO database, which showed that HFPO-DA was not detected in 99.7% of drinking water samples. [FN15: Email and Attached Meeting Presentation from Sheryl Telford, Chemours, to Elizabeth (Betsy) Behl, U.S. EPA (April 29, 2022).]

EPA's rush to promulgate a NPDWR before UCMR data are available is without scientific or legal basis, and especially so given the data that do exist show minimal or nonexistent occurrence of HFPO-DA.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. The EPA disagrees that the state data cannot be used to inform the regulatory determination for HFPO-DA and took many quality control steps, as noted in the EPA's response 6.2, to ensure the data were accurately evaluated. As stated in the final rule preamble section III.C., the EPA disagrees that the state monitoring results demonstrate this is a local or regional issue only or that it only occurs near manufacturing facilities, given the documented drinking water occurrence both for detections at any concentrations and at levels

above the HRL in 13 and 5 states, respectively, which is more than the single state specifically documented in this public comment and that evaluates additional and newer data than that provided by the commenter. Moreover, of the 13 states with HFPO-DA detections and 5 states with detections above the HRL, the majority are in states that conducted non-targeted (i.e., not specifically conducted in areas of suspected or known contamination) monitoring efforts. Additionally, HFPO-DA continues to be actively produced and used throughout the U.S and is very stable and persistent in the environment; therefore, the EPA anticipates that drinking water occurrence levels will continue to be found at least to the levels described in the final rule preamble.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045888)

For PFNA, the UCMR 3 data showed that only 0.05% of all samples had detections above the quantitation limit, or MRL [FN35: U.S. EPA, PFAS Occurrence and Contaminant Background Support Document, 2023, EPA–822–P–23–010, at 160, available at: https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0037.]. These detections were found in 14 water systems that serve 526,341 people. [FN36: Id. at 162.] An MCL for PFNA seems to be unnecessary at a national scale.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045587)

Occurrence data for PFNA is available not only through the UCMR 3 program but also as part of numerous state monitoring programs. Data is also currently being collected through the UCMR 5 program by 3,500 systems this year and more than 10,000 systems by the end of 2025 (EPA, 2021c). In review of the UCMR 3 data that is currently available, less than 0.3% of water systems detected PFNA at 20 ppt (twice the level of the proposed HBWC of 10 ppt). Data from state monitoring programs showed similarly extremely low occurrence of PFNA in drinking water. Vermont, for example, required sampling of 1,794 water systems across the state and PFNA was detected above 10 ppt in only 12 systems, or 0.7% of systems (VTDEC, 2023). California monitoring, for example, found that 95% of samples with detections were below 3.2 ppt (California Water Boards, 2023). Monitoring data from Pennsylvania Department of Environmental Protection showed a maximum PFNA concentration of 14 ppt in the state, with a median PFNA level of 5.6 ppt (PADEP, 2023). Data from showed a similar trend of low to minimal occurrence at the HBWC (CDPHE, 2023).

The available data on the production, use, and release of PFNA from the EPA's occurrence analysis indicates that there are not significant sources of PFNA in the United States. While this could be due to inefficiencies in the reporting requirements under the EPA's authorities of the Emergency Planning and Community Right To Know Act's Toxics Release Inventory (TRI) program, the agency must rely on the best available data (AWWA, 2023). EPA recently

proposed rules that will require more improved data reporting on PFAS production, use, and release in the following years (EPA, 2022b).

In review of the available UCMR 3 data, state monitoring data, and manufacturing data for PFNA, the best available evidence does not suggest that there is a substantial likelihood of PFNA occurrence in drinking water with a frequency and at levels of public health concern. Based on the available evidence, and the SDWA statutory criteria, a negative determination is most appropriate for PFNA.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045889)

PFBS was also detected at only 0.05% of water samples in UCMR 3, and the population served by the water systems with detections was 349,933 people [FN37: Id. at 118-120 at exhibit 5-19 and 5-21.]. For PFBS, the highest level detected was 370 ppt, which is far below the HBWC of 2,000 ppt. It is also worth noting that there were no PFBS exceedances above 2000 ppt, and the available state data also showed no detections above 199 ppt. Similarly, Department of Defense drinking water sampling results from drinking water systems and private wells located in covered areas adjacent to 50 installations showed no detection above 362 ppt. Similarly, the USGS National Water Information System (NWIS) showed a maximum detection level of 109 ppt [FN38: Id. at 120-137.]. An MCL for PFBS seems to be unnecessary at a national scale. EPA even admits as much stating "EPA notes that PFBS concentrations do not exceed their HRL of 2000 ppt when considered in isolation."[FN39: 88 Fed. Reg. at 18650.] EPA then suggests that "dose additivity" is a reason to list PFBS [FN40: Id.]. This is not a valid reason to support a determination to regulate.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. As discussed in section 3.1 of the EPA response in this *Response to Comments* document, the EPA is deferring the individual final regulatory determination for PFBS to continue to evaluate the statutory criteria particularly related to its individual known or likely occurrence and, therefore, is also not promulgating an individual MCLG and NPDWR for PFBS in this action. However, regarding the commenter's statement that "dose additivity" is not a valid reason to support a regulatory determination, the EPA disagrees that the dose additive health concerns of PFBS, demonstrated co-occurrence of PFBS in combinations of mixtures with PFHxS, HFPO-DA, and PFNA at a frequency and level of public concern, and meaningful opportunity to reduce health risks from mixtures of these four PFAS (including PFBS) does not meet the statutory criteria for regulation within a mixture. Please see sections 3.2, 3.2.1, 3.2.2, and 3.2.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045589)

PFBS

The method reporting limits of the UCMR 3 program for PFBS provide sufficient clarity on occurrence at levels far below levels of health concern. For example, EPA's health advisory level is 2,000 ppt for PFBS and was only detected in less than 0.2% of systems above the reporting limit of 90 ppt under UCMR3 (EPA, 2022g) . Data from the state of Pennsylvania showed that the maximum PFBS level in drinking water was 13.0 ppt, with a median detected concentration of 4.2 ppt (PADEP, 2023). California monitoring data found that the maximum concentration across the state did not exceed 120 ppt and 95% of systems detected PFBS had levels below 15 ppt (California Water Boards, 2023). Monitoring data from several other states, including Ohio, Colorado, and Vermont show a similar trend (CDPHE, 2023; Ohio EPA, 2023; VTDEC, 2023).

Additionally, the available data on the production, use, and release of PFBS from the EPA's occurrence analysis indicates that there are not significant sources of PFBS in United States. While this could be due to inefficiencies in the reporting requirements of the TRI Program, the agency must rely on the available data. EPA recently proposed rules that will require more improved data reporting on PFAS production, use, and release in the following years.

In review of the available occurrence data, both from UCMR 3 and from state monitoring programs, it is apparent that PFBS does not occur in public water systems with a frequency, and at levels, of public health concern. The evidence from the production, use and release data that is available supports this conclusion. Therefore, at this time the best available public health information does not support a determination to regulate PFBS under the SDWA. In contrast, there is strong evidence that a negative determination is appropriate for PFBS and AWWA recommends that a negative determination be issued. EPA can revise its determination as to PFBS in the future, if new data indicates that such a determination is warranted.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document.

PFAS Regulatory Coalition (Doc. #1761, SBC-046068)

2. There is a lack of occurrence data to support EPA's regulatory determinations for the four additional PFAS.

One of the key criteria for making a regulatory determination is that "the contaminant is known to occur or there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern." SDWA Sec. 1412(b)(1)(A)(ii). EPA states that given the number of factors it considered it cannot identify a standard for occurrence data. But the statute provides the standard. Occurrence at levels of public health concern must be "known" or there must be a "substantial likelihood" of such occurrence. Clearly Congress intended that there be some levels and some frequencies that would be below the threshold of public health concern. EPA must articulate where it drew that line to allow for

meaningful comment. For example, in seven out of the eleven states with occurrence data on which EPA relied, HFPO-DA was not present in more than 1% of the systems. 88 Fed. Reg. 18648, Table 1. Extrapolating this ratio to all 50 states means that 32 states would have this compound in less than 1% of their systems. EPA's approach would lead to a result where a compound can be absent, or present in less than 1% of systems, in nearly two-thirds of the states, yet that would be enough to justify the occurrence criterion.

EPA's conclusion that PFHxS, PFNA, PFBS, and HFPO-DA meet this "occurrence" criterion is also based, in part, on an assumption of an upward trend in detections: "EPA anticipates that national monitoring with newer analytical methods capable of quantifying PFAS occurrence to lower levels, significant occurrence and cooccurrence of these PFAS are likely to be observed." 88 Fed. Reg. 18650. Anticipation of data is not a basis on which to make regulation. Moreover, according to the Agency for Toxic Substances and Disease Registry, levels of PFOS and PFOA in blood have declined by more than 85% for PFOS, and 70% for PFOA. See ATSDR, "PFAS in the U.S. Population," available at https://www.atsdr.cdc.gov/pfas/health-effects/us-population.html#print. EPA's "anticipation" cannot support a determination that the contaminants are "substantially likely" to be present "at levels of public health concern." UCMR 5 data are already being collected, so EPA should pause this rulemaking in order for the Agency to incorporate actual data, not supposition.

We also do not agree that PFBS meets the statutory "occurrence criterion." EPA acknowledges "that PFBS concentrations do not exceed their HRL [health reference level] of 2000 ppt when considered in isolation." 88 Fed. Reg. 18650. But instead of relying on this information to make its "occurrence" decision, EPA instead relies on an assumption that PFBS will co-occur with other PFAS to collectively reach levels of public health concern. This assumption is simply not supported by the data in EPA's Proposal. EPA reports the median sample range of the state sampling data as being between 1.99 – 7.26 ppt. Based on these results, the median contribution of PFBS to the Hazard Index ranges between:

1.99/2000 = 0.000995

7.26/2000 = 0.00363

If these very low levels are thresholds at which EPA believes co-occurrence can contribute to a public health concern, it is hard to imagine any substance that would not meet the "occurrence" test, an outcome that is clearly not supported by the language of the SDWA. Thus, EPA's determination that the data demonstrate that there is a "substantial likelihood" that PFBS will occur at levels of public health concern is not supported by the record.

EPA Response: Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. The EPA is deferring the individual final regulatory determination for PFBS to continue to evaluate the statutory criteria particularly related to its individual known or likely occurrence and, therefore, is also not promulgating an individual MCLG and NPDWR for PFBS in this action. However, regarding the commenter's statement that "it is hard to imagine any substance that would not meet the occurrence test" the EPA disagrees with this statement

because the agency has made regulatory determinations in the past where it found there was not a meaningful opportunity for health risk reduction of a contaminant both for contaminants occurring above and below frequencies and levels of public health concern. Moreover, as discussed in section 3.1.2 of the EPA response in this *Response to Comments* document, a regulatory determination decision is based on a number of factors and there is no one-size-fits-all occurrence threshold. In the specific case of PFBS when considered in mixture combinations with PFHxS, HFPO-DA, and PFNA, the EPA disagrees that the dose additive health concerns of PFBS, demonstrated co-occurrence of PFBS in combinations of mixtures with PFHxS, HFPO-DA, and PFNA at a frequency and level of public concern, and meaningful opportunity to reduce health risks from mixtures of these four PFAS (including PFBS) does not meet the statutory criteria for regulation within a mixture or is not supported by the best available data. Please see sections 3.2, 3.2.1, 3.2.2, and 3.2.3 of the EPA response in this *Response to Comments* document, as well as sections III and IV of the final rule preamble. The Hazard Index approach of considering these four PFAS in mixtures also recognizes these PFAS cause adverse health effects at differing potencies (e.g., the toxicity reference value for PFHxS is slower than the one for PFBS), and that, regardless of these potency differences, all co-occurring PFAS are included in the hazard calculation (i.e., the health effects and presence of lower toxicity PFAS are neither ignored nor are they over-represented).

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045885)

B. Existing occurrence data does not support the regulatory determination

1. SDWA requires collection of UCMR data in order for EPA to make the regulatory determination

To fulfill the second criteria under Section 1412(b)(1)(A) of SDWA, the act requires that EPA demonstrate it knows or "there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern."[FN28: 42 U.S.C. [sec] 300g-1(b).] Here, EPA has done nothing more than show that these PFAS may occur at levels of concern, falling short of the statutory requirement.

SDWA requires that once every five years, EPA issue a new list of unregulated contaminants to be monitored in drinking water,[FN29: 42 U.S.C. [sec] 300g-1(b)(1)(B).] known as the Unregulated Contaminants Monitoring Rule (UCMR). The contaminant occurrence data is a mechanism built into SDWA to obtain nationally representative occurrence data for contaminants in drinking water. Collecting data under the UCMR serves to better inform regulatory determinations, as contaminants are evaluated based on health effects and occurrence information [FN30: 87 Fed. Reg. 68060, 68062 (November 14, 2022).]. EPA has historically relied on the UCMR process to collect occurrence data on contaminants to support a determination on whether to regulate them. In previous regulatory determinations, where both state and UCMR data were available, EPA has determined that UCMR data "are the best available data" representing the national scale [FN31: See 85 Fed. Reg. 43990, 44001 (Jul. 21,

2020).]. EPA also notes this in the proposed rule as well [FN32: 88 Fed. Reg. 18672 states "UCMR 3 monitoring occurred between 2013 and 2015 and is currently the best nationally representative finished water dataset for any PFAS, including PFOA, PFOS, PFNA, PFBS, and PFHxS."].

EPA has simply not collected sufficient data to meet the statutory requirement of knowing or demonstrating there is a substantial likelihood that the four PFAS will occur in public water systems with a frequency and at levels of public health concern. EPA relies on limited UCMR 3 data and state data from only 11 states.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5. Additionally, the EPA disagrees that the agency has circumvented the established process for developing NPDWRs. The EPA also disagrees that the agency has not collected sufficient data to demonstrate there is a substantial likelihood that these PFAS will occur in PWSs with a frequency and at levels of health concern. The EPA implements a monitoring program for unregulated contaminants (i.e., UCMR) under SDWA 1445(a)(2) that requires the EPA to issue a list once every five years of priority unregulated contaminants to be monitored by PWSs, however there is no statutory obligation that a contaminant must be on this list prior to making a determination to regulate, if the agency has sufficiently available information through other sources. The UCMR 3 dataset, along with additional state data and robust analyses, demonstrate sufficient likelihood of occurrence of the PFAS being regulated. As discussed in section 6.2 of the EPA response in this *Response to Comments* document, in addition to UCMR 3 data, the agency also considered occurrence data from 32 states, which provided the agency tens of thousands of additional PFAS monitoring results to inform the agency's decision. These data are summarized in section VI.F of the Federal Register Notice (FRN) and in the *Occurrence Technical Support Document* (USEPA, 2024b).

Midwest Environmental Advocates +more (Doc. #1846, SBC-045827)

Sampling results in Wisconsin indicate that the most concerning contaminants are PFOS, PFOA, PFHxS, and PFBS. These substances are frequently detected in community water systems in multiple geographic locations at levels of concern. The occurrence concentration levels for each contaminant individually and collectively found in community water systems across Wisconsin supports EPA's determination that these substances pose a public health concern. Below is a table summarizing some of the state's occurrence data of concern, focusing on the highest levels detected in each water system: [FN16: Additional information about each water system and its frequent PFAS detections are attached in Appendix A.]

[Table 1: See Docket ID EPA-HQ-OW-2022-0114-1846]

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. The EPA acknowledges the commenter for provided information related to PFAS monitoring in Wisconsin. The agency considered data publicly available from the

Wisconsin Department of Natural Resources and the agency has considered these data prior to finalizing this regulation (please see the *Occurrence Technical Support Document* for more information).

Little Hocking Water Association (Doc. #1835, SBC-045511)

EPA requests comment "on if there are additional data or studies EPA should consider that support or do not support the Agency's preliminary regulatory determination for HFPO-DA, including additional health information and occurrence data." LHWA provides the following data on HFPO-DA occurrence that supports the regulation of HFPO-DA:

1. Chemours began testing for HFPO-DA in the LHWA water system influent water to the carbon treatment system on February 19, 2018. The reported concentration is consistently collected with the same three production wells providing water to the treatment plant. The reported concentration of HFPO-DA was 0.032 ug/L or 32 ppt on February 19, 2018. Attachment 3 shows a graph of the concentration of HFPO-DA since that time. The latest verified data point for April 10, 2023 shows a concentration of 0.49 ug/L or 490 ppt.

These data show the steep upward trend in HFPO-DA occurrence in the LHWA wellfield. Documentation of the data can be found in publicly-submitted data to the Ohio EPA (Chemours, 2023a).

2. For the nearby upstream Belpre water system, described above, recent analysis by Chemours (on March 20, 2023) for HFPO-DA shows a concentration of HFPO-DA of 2.3 ppt in the raw water to the GAC treatment plant (Chemours, 2023b). The concentration of HFPO-DA in the two lead beds of the GAC treatment plant were reported to be 2.6 ppt and 2.4 ppt. This is the first time that HFPO-DA data was available for the Belpre water system. Previous data for HFPO-DA is not available because, prior to this date, only results for PFOA were reported in publicly available information. As stated above, most data-gathering since 2002 focused on PFOA and PFOS. What relatively little data there is for HFPO-DA shows it has quickly spread in the environment and to water supplies.

3. The presence of HFPO-DA was shown to be widespread in surface water in the area around the LHWA wellfield primarily upstream and downwind of the Chemours Washington Works plant. Galloway et al., (2020) noted that HFPO-DA was found to be widespread in surface water up to four miles north of the Washington Works plant at concentrations greater than 100 ppt.

4. HFPO-DA was also found to be present in the most recent sampling of the Ohio River by the Ohio River Valley Water Sanitation Commission (ORSANCO). This is important to public water systems because the Ohio River serves both as a source of recharge to wellfields along the river as well as a direct source of water through river intakes along the river. ORSANCO sampled the Ohio River basin in 2021 and found detections of PFAS at every sampling station, with the highest measured concentration of HFPO-DA at 32.20 ppt (ORSANCO, 2022).

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, the EPA notes that the data submitted by the commenter support the EPA's conclusions that HFPO-DA is substantially likely to occur at a frequency and level of public health concern. The EPA anticipates that due to HFPO-DA's active production and use in the United States that similar or increasing levels will continue to be observed in drinking water for the foreseeable future.

Missouri Department of Natural Resources (Doc. #1563, SBC-042514)

Proposed Revisions to Part 141—National Primary Drinking Water Regulations

In the federal register notice for the proposed rule, EPA specifically requested comments on a number of aspects on the rule. You will find detailed comments from the Department related to many of those specific requests below.

EPA requests comment on its preliminary regulatory determination for PFHxS, HFPODA, PFNA, and PFBS and its evaluation of the statutory criteria that supports the finding. EPA also requests comment on if there are additional data or studies EPA should consider that support or do not support the Agency's preliminary regulatory determination for PFHxS, HFPO-DA, PFNA, and PFBS, including additional health information and occurrence data.

The Department believes that EPA is acting prematurely in making a preliminary regulatory determination for PFHxS, HFPO-DA, PFNA, and PFBS. The Department also believes that EPA should wait to make a determination for these compounds until after it is has completed the occurrence monitoring under UCMR 5 and has had the opportunity to evaluate the associated data. This pause would allow EPA to make a decision based on unbiased, consistently collected, national information rather than relying on data from a subset of states that varies in terms of quantity and coverage, and that includes data from targeted or site-specific sampling efforts where it may be expected to have higher detection rates, or not be representative of levels found in all public water systems (PWS) within a state. By delaying the final regulatory determination for these four PFAS until after completion of UCMR 5 occurrence monitoring, EPA will be able to better determine if the contaminants have widespread co-occurrence in drinking water supplies throughout the country.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, regarding UCMR 5, please see section 6.8 of the EPA response in this *Response to Comments* document.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042728)

Occurrence:

EPA does not yet have a sense of occurrence of the suite of PFAS compounds in drinking water as the Unregulated Contaminant Monitoring Rule (UCMR5) program just commenced at the beginning of this year (2023). EPA's regulatory determination for PFNA, HFPO-D/GenX, and

PFBS are based on a very limited data set. UCMR testing has always been an important step in the EPA rulemaking process; waiting for UCMR5 results would provide a more robust data set for determining occurrence across the nation. EPA should delay promulgation of this rule until it has a chance to vet at least one full year of data obtained through UCMR5.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, regarding UCMR 5, please see section 6.8 of the EPA response in this *Response to Comments* document.

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043436)

• With regard to occurrence data, at the very minimum, EPA should be waiting for the UCMR5 data. EPA's reliance on very limited UCMR3 and state data cannot support a determination that there is a substantial likelihood that the contaminants will occur in public water systems with a frequency and at levels of public health concern. That said, if EPA maintains that these data are sufficient (which they are not), they clearly do not support the regulatory determination to regulate individually or as a mixture.

EPA Response: Please see section 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document. Additionally, regarding UCMR 5, please see section 6.8 of the EPA response in this *Response to Comments* document.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044911)

Section 4: Regulatory Determinations for Additional PFAS

EPA has proposed issuing a regulatory determination for four additional PFAS concurrently with a proposed National Primary Drinking Water Regulations NPDWR for the same chemicals. Those additional PFAS are perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS).

To make this determination, EPA used older data from the Unregulated Contaminant Monitoring Rule (UCMR) 3 and more recent data from states as of August 2021. Some of the states where data was collected have gone through the process of promulgating their own regulation for certain PFAS that are included in this determination. For example, Michigan, a state included in Table 1, has regulated PFHxS, PFNA, PFBS, and GenX in 2020 [FN8: https://www.michigan.gov/pfasresponse/drinkingwater/mcl#:~:text=In%20August%202020%2C%20the%20Michigan,the%20Safe%20Drinking%20Water%20Act.]. This regulation would likely change the percent of samples with detections in those states as utilities presumably would have taken actions to address these detections and stay in compliance. Similarly, New Jersey regulated PFNA in 2018 [FN9: https://www.nj.gov/health/ceohs/documents/pfas_drinking%20water.pdf]. New Hampshire

(2020) [FN10: https://www.pfas.des.nh.gov/drinking-water], Massachusetts (2020) [FN11: https://www.mass.gov/lists/massachusetts-pfas-drinking-water-standard-mcl#massachusetts-pfas-standard-forpublic-drinking-water-supplies-], and Vermont (2019) [FN12: https://dec.vermont.gov/water/drinking-water/water-quality-monitoring/pfas] regulated PFHxS and PFNA. Each of these states are included in Tables 1 and 2, and have implemented measures to reduce concentrations and occurrence of specific PFAS.

An important part of Regulatory Determinations is having a holistic view of occurrence, or nonoccurrence, of these chemicals regionally and nationwide. While EPA does have some older data on occurrence, as mentioned above, this data may be out of date as a result of improvements due to recently promulgated state regulations. Additionally, data from many states is still missing. Fortunately, over the next two years, UCMR will be providing EPA with a large portion of data in the next nine months from UCMR 5 that will be able to fill in these gaps in our understanding of occurrence of these four PFAS chemicals. UCMR 5 will include data from all systems serving 3,300 people or more, and 800 representative public water systems serving fewer than 3,300 people [FN13: https://www.epa.gov/dwucmr/fifth-unregulated-contaminant-monitoring-rule]. This dataset is instrumental in assessing the occurrence of chemicals in our water systems. All four of these proposed additional PFAS are included on UCMR 5.

EPA should wait until it at least has the first year of UCMR 5 data to better assess the occurrence of these chemicals in drinking water systems at the current analytical levels we can achieve. Cleveland Water understands EPA's urgency in regulating PFOA and PFOS, and we strongly support regulation based on sound science and up-to-date data. That is why we believe at least the first year of UCMR 5 data will be crucial to giving the agency a better understanding of occurrence of these four additional PFAS. EPA will have the ability to include this information in a cost-benefit analysis that uses the most current data to calculate number of systems impacted and any additional health benefits associated with these chemicals at levels known to occur.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5. Additionally, the EPA notes that it considers state promulgated standards as a part of its Economic Analysis (EA) for the proposed and final rule. Specifically, to estimate the costs and benefits of the PFAS NPDWR, the EPA assumed that all occurrence model estimates exceeding state limits were equivalent to the state-enacted limit. For these states, the EPA assumed that the state MCL is the maximum baseline PFAS occurrence value for all entry points in the state. This adjustment was made to the occurrence model PFAS estimates for PFOA, PFOS, and PFHxS in the EA. (See chapter 4 in USEPA, 2024a for additional information.)

New York City Department of Environmental Protection (NYCDEP) (Doc. #1679, SBC-044207)

Occurrence Data

EPA uses the UCMR to collect data for contaminants that are suspected to be present in drinking water and do not have health-based standards set under the Safe Drinking Water Act (SDWA).

Occurrence data are collected through UCMR to support the Administrator's determination of whether to regulate particular contaminants in the interest of protecting public health. In its current proposal, EPA intends to finalize these new drinking water MCLs in 2023, which is in advance of the Fifth UCMR sampling window. While occurrence data for PFOA, PFOS, PFNA, PFHxS and PFBS were collected under UCMR3, data collection for hexafluoropropylene oxide dimer acid (HFPO-DA or GenX) will not even begin until 2024 (i.e., these suspected contaminants are included even though EPA does not have data).

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Regarding UCMR 5, which the EPA clarifies is being conducted between 2023 through 2025, please see section 6.8 of the EPA response in this *Response to Comments* document.

Horsham Water & Sewer Authority (HWSA) (Doc. #1686, SBC-043819)

If it is only occurrence data that is insufficient, EPA will very soon have the results of the on-going 5th Unregulated Contaminant Monitoring Rule (UCMR5) and should wait for those results to be sure there is in fact sufficient cause to regulate. Based on existing occurrence information for these compounds, the delaying of setting MCLs for these compounds will not impact the desired health benefits much, if at all.

EPA Response: The EPA disagrees that occurrence data are insufficient to make regulatory determinations or inform this rule. Please **s**ee section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, the EPA disagrees that delaying these NPDWRs further would not impact the desired health benefits because these PFAS have been shown to result in a range of adverse health effects (e.g., developmental effects). Continuing to wait when there is sufficient data now would not only demonstrate that the EPA is not fulfilling its statutory obligations, but it will also allow for more people to potentially be impacted by these health effects.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045892)

4. EPA inappropriately uses anticipated occurrence findings rather than existing data in its preliminary determination

EPA must make the determination to regulate based on existing data. However, EPA seems to include anticipated findings in their determination. EPA states: “EPA anticipates that national monitoring with newer analytical methods capable of quantifying PFAS occurrence to lower

levels, significant occurrence and cooccurrence of these PFAS are likely to be observed."[FN48: 88 Fed. Reg. at 18650.] Yet EPA does not provide any citation or data to support this statement. EPA assumes that the UCMR 5 data will show that the four contaminants are known to occur [FN49: 88 Fed. Reg. at 18651.]. While that is one possibility, considering the costs and importance of this regulatory proposal, EPA should await the analysis of the UCMR 5 data to support its assumptions with respect to these four PFAS to determine whether there is representative data sufficient to demonstrate occurrence that would support a regulatory determination.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Commenter is factually incorrect: the EPA did not base its regulatory determinations on "anticipated data." Rather, the final regulatory determinations were based upon actual, collected data because the EPA presented tens of thousands of samples from UCMR 3 and state monitoring efforts demonstrating there is a substantial likelihood of occurrence as required under SDWA.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045886)

SDWA contemplates EPA's reliance on UCMR data, and, because EPA is currently collecting data on 29 PFAS as part of the UCMR 5, it is premature to propose a regulatory determination for these substances. This data collection will provide national representative information on the occurrence of all four contaminants and will be more relevant for EPA to evaluate in its decision to regulate.

EPA Response: Please see sections 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document. Additionally, the EPA implements a monitoring program for unregulated contaminants (i.e., UCMR) under SDWA 1445(a)(2) that requires the EPA to issue a list once every five years of priority unregulated contaminants to be monitored by PWSs, however there is no statutory obligation that a contaminant must be monitored under the UCMR program prior to making a determination to regulate, if the agency has sufficiently available information through other sources. Additionally, completion of monitoring for a contaminant under UCMR is not required prior to making a regulatory determination nor promulgation of the final rule. The UCMR 3 dataset, along with additional state data and robust analyses, demonstrate sufficient likelihood of occurrence of the PFAS being regulated.

Louisville Water Company (Doc. #1720, SBC-043552)

[In that regard, we are providing the following comments on key issues that we think require consideration.]

2. Having a holistic view of the occurrence of PFAS regionally and nationwide is a critical part of the regulatory determination process. Louisville Water is concerned that the agency is relying on a paucity of older data which may not reflect current conditions, and regional data that likely skews the occurrence data. Under the Safe Drinking Water Act (SDWA), the agency has until

September 2024 to promulgate this rule. We suggest that the agency consider holding off on finalizing the NPDWR for PFAS until the first year of UCMR5 data is available to the agency for review. Additionally, EPA has the option to move forward with the PFOA and PFOS rulemaking, but the statutory deadline of that Regulatory Determination only applies to those PFOA and PFOS. EPA may choose to regulate the four additional PFAS in an expedited manner after a Regulatory Determination is finalized utilizing UCMR 5 data. This latest UCMR5 dataset may also fill in some gaps in the cost-benefit analysis regarding this determination and proposal, which is currently missing. Furthermore, waiting for necessary occurrence data for PFNA, PFBS, PFHxS, and GenX is prudent with regard to making a Regulatory Determination. A pause in making a Regulatory Determination for PFNA, PFBS, PFHxS, and GenX would allow EPA the flexibility to further consider the best action based on best data and make the best decision possible regarding these four chemicals to protect the public's health by ensuring its decisions are well informed and the public does not incur unnecessary costs when it is already struggling with the affordability of water.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5.

Florida Section American Water Works Association - Water Utility Council (FSAWWA WUC) (Doc. #1737, SBC-044491)

EPA' s positive determination for the four PFAS compounds relied on limited occurrence data (for example, Unregulated Contaminant Monitoring Rule, UCMR 3 detection limit s) and more information and analysis is needed to develop the future determinations. EPA should utilize the current UCMR 5 sampling results now underway to build upon its limited database to make a future regulatory determination.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045960)

Section 4: Regulatory Determinations for Additional PFAS

EPA has proposed issuing a regulatory determination for four additional PFAS concurrently with a proposed NPDWR for the same chemicals. Those additional PFAS are perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS).

To make this determination, EPA used older data from the Unregulated Contaminant Monitoring Rule (UCMR) 3 and more recent data from states as of August 2021. Some of these states where

data was collected have gone through the process of promulgating their regulation for certain PFAS that are included in this determination. For example, Michigan, a state included in Table 1, regulated PFHxS, PFNA, PFBS, and GenX in 2020 [FN8: Michigan PFAS Action Response Team. (2023). Maximum Contaminant Levels. https://www.michigan.gov/pfasresponse/drinking-water/mcl]. This regulation would likely change the percent of samples with detections in those states as utilities presumably would have taken actions to address these detections and stay in compliance. Similarly, New Jersey regulated PFNA in 2018 [FN9: New Jersey Department of Health. (2022, July). Per- and polyfluoroalkyl substances in drinking water. https://www.nj.gov/health/ceohs/documents/pfas_drinking%20water.pdf.]. New Hampshire [FN10: New Hampshire Department of Environmental Services. (2023). Drinking water. https://www.pfas.des.nh.gov/drinking-water.] and Massachusetts [FN11: Massachusetts Department of Environmental Protection. (2020). Massachusetts PFAS Drinking Water Standard (MCL). https://www.mass.gov/lists/massachusetts-pfas-drinking-water-standard-mcl#massachusetts-pfas-standard-for-public-drinking-water-supplies-] regulated PFHxS and PFNA in 2020, while Vermont regulated them in 2019 [FN12: Vermont Department of Environmental Conservation. (2023). PFAS & Drinking Water.https://dec.vermont.gov/water/drinking-water/water-quality-monitoring/pfas]. Each of these states is included in Tables 1 and 2 of the preamble and has implemented measures to reduce concentrations and occurrence of specific PFAS.

An important part of Regulatory Determinations is having a holistic view of occurrence, or nonoccurrence, of these chemicals regionally and nationwide. While EPA does have some older data on occurrence, this data may no longer be accurate as a result of recently promulgated state regulations. Additionally, data from many states is still missing. Fortunately, over the next two years, UCMR 5 will provide EPA with a large portion of data that will be able to fill in these gaps in the understanding of occurrence of these four PFAS chemicals, including data from all systems serving 3,300 people or more, and 800 representative public water systems serving fewer than 3,300 people [FN13: EPA. (2021, December 7). UCMR 5. https://www.epa.gov/dwucmr/fifth-unregulated-contaminant-monitoring-rule]. This dataset is invaluable in assessing the occurrence of chemicals in the nation's water systems. All four of these proposed additional PFAS are included in UCMR 5.

EPA should wait until it has the first year of UCMR 5 data to better assess the occurrence of the four HI chemicals in drinking water systems at current achievable analytical levels. AMWA understands EPA's urgency in regulating PFOA and PFOS, and the association strongly supports regulation based on sound science and up-to-date data. That is why AMWA believes at least the first year of UCMR data will be crucial to giving the agency a better understanding of occurrence of these four additional PFAS. With this additional occurrence information, EPA will have the ability to include this information in a cost-benefit analysis that uses the most current data to calculate the number of systems impacted and any additional health benefits associated with these chemicals at levels known to occur.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5. Additionally, the EPA notes that it considers state promulgated standards as a part of its EA for the proposed and final rule Specifically, to estimate the costs and benefits of the PFAS NPDWR, the EPA assumed that all occurrence model estimates exceeding state limits were equivalent to the state-enacted limit. For these states, the EPA assumed that the state MCL is the maximum baseline PFAS occurrence value for all entry points in the state. This adjustment was made to the occurrence model PFAS estimates for PFOA, PFOS, and PFHxS in the EA. (See chapter 4 in USEPA, 2024a for additional information.).

American Water Works Association (AWWA) (Doc. #1759, SBC-045590)

Alternatively, given that the EPA is currently collecting occurrence data for PFBS in drinking water as part of the UCMR 5 program, EPA could consider re-issuing a preliminary determination for PFBS following the completion of this program.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045585)

However, given that the EPA is currently collecting occurrence data for HFPO-DA in drinking water as part of the UCMR 5 program, EPA could consider reissuing a preliminary determination for HFPO-DA following the completion of this program. This approach would ensure that the best available occurrence data is used.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045588)

However, given that the EPA is currently collecting occurrence data for PFNA in drinking water as part of the UCMR 5 program, EPA could consider re-issuing a preliminary determination for PFNA following the completion of this program. This approach would ensure that the best available data is utilized, not only occurrence data but also a forthcoming health assessment for PFNA under IRIS program (EPA, 2023b).

EPA Response: Please see sections 3.1.1 and 3.1.2 of the EPA response in this *Response to Comments* document.

Metropolitan Water District of Southern California (Doc. #1777, SBC-045429)

2. EPA should consider data from UCMR 5 and updated treated drinking water occurrence data from states for PFHxS, GenX chemicals, PFNA, and PFBS

As currently written, EPA proposes considering the UCMR 5 data to support the implementation of monitoring requirements under the proposed rule. However, UCMR 5 monitoring started in January 2023 and will not be completed until December 2025, and EPA expects to finalize this NPDWR Rulemaking by the end of 2023. [FN9: https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas; 88 Fed. Reg. at 18690.] It is unclear how EPA would access all the necessary UCMR 5 data before 2025 and finalize this NPDWR Rulemaking by the end of 2023, two years before UCMR 5 monitoring will be completed. Furthermore, as EPA states, "Additional nationwide monitoring data will be conducted between 2023-2025 under the UCMR 5. This data will serve to demonstrate whether the four PFAS are known to occur. [H]owever, EPA has sufficient evidence now to support a preliminary determination [that] there is a substantial likelihood that these PFAS will occur frequently and at concentrations where they are likely to exceed their respective HRLs based on the increased occurrence trends documented by available information."[FN10: 88 Fed. Reg. at 18651 (emphasis added).] Metropolitan recommends EPA wait until UCMR 5 data become available before making a final determination and proposing NPDWRs and MCLGs for PFHxS, GenX chemicals, PFNA, and PFBS.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document, as well as section 6.8 of the EPA response in this *Response to Comments* document regarding UCMR 5. Please see section VIII of the final rule preamble for use of previously collected data, such as UCMR 5, to support the final rule's initial monitoring requirements.

New England Water Works Association (Doc. #1836, SBC-045378)

Occurrence:

EPA does not yet have a sense of occurrence of the suite of PFAS compounds in drinking water as the Unregulated Contaminant Monitoring Rule (UCMR5) program just commenced at the beginning of this year (2023). EPA's regulatory determination for Perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) are based on a very limited data set. UCMR testing has always been an important step in the EPA rulemaking process; waiting for UCMR5 results would provide a more robust data set for determining occurrence across the nation, and establishing the extent of need and sources for funding compliance. EPA should delay promulgation of this rule until it has a chance to vet at least one full year of data obtained through UCMR5.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document.

The Chemours Company FC, LLC (Doc. #1845, SBC-046051)

B. Regulating HFPO-DA under the SDWA would be premature, arbitrary, and capricious based on existing occurrence data showing limited detections and pending the forthcoming UCMR data

i. The SDWA requires EPA to base its decision to regulate a contaminant on occurrence data which are not yet available for HFPO-DA

EPA's decision to issue a national primary drinking water regulation ("NPDWR") for HFPO-DA at this time is premature and procedurally flawed. The SDWA establishes a two-step, data-driven process for EPA to determine whether to regulate unregulated contaminants. EPA's action here circumvents this well-established process under the SDWA and the statute's requirement that regulations be based on supporting scientific data. EPA has proceeded in a manner here that is at odds with the SDWA and that is arbitrary, capricious, and contrary to the principles of best available science.

Occurrence data are central to the statutory process for regulating a new contaminant under the SDWA. Every five years, EPA is required to publish a list of contaminants which may require regulation. 42 U.S.C. [sec] 300g–1(b)(1)(B)(i)(I). Contaminants included on this list are subject to certain reporting requirements under the Unregulated Contaminant Monitoring Rules ("UCMRs"). 40 C.F.R. [sec] 141.40(a); Id. [sec] Data collected under this rule are then published in an occurrence data base under 42 U.S.C. [sec] 300j–4(g).

Every five years, EPA must evaluate at least five contaminants on the UCMR list and issue determinations on whether or not to regulate the contaminants. 42 U.S.C. [sec] 300g–1(b)(1)(B)(ii)(I). A decision to regulate must be based on findings that:

(i) the contaminant may have an adverse effect on the health of persons;

(ii) the contaminant is known to occur or there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern; and

(iii) in the sole judgment of the Administrator, regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems.

42 U.S.C. [sec] 300g–1(b)(1)(A).

Critically, these required findings "shall be based on the best available public health information, including the occurrence data base established under section 300j-4(g) of this title." 42 U.S.C. [sec] 300g–1(b)(1)(B)(ii)(II) (emphasis added). Even for contaminants which do not first appear on a UCMR list, EPA has the same obligations to base its findings on the best available public health information, including the occurrence data base. 42 U.S.C.

[sec] 300g–1(b)(1)(B)(ii)(III).

This two-step data-driven SDWA process has for decades ensured that EPA decisions to issue NPDWRs for new contaminants—decisions which often have major economic impacts—are based on the best available science. Indeed, Chemours is not aware of any other contaminant for which EPA has issued a NPDWR without first publishing UCMR occurrence data.

Yet for HFPO-DA, EPA proposes to issue drinking water regulations in the absence of any such data. HFPO-DA was first included in a UCMR list in December 2021. 86 Fed. Reg. 73,131 (Dec. 27, 2021). In that rule, EPA itself acknowledged that the SDWA requires EPA to "maintain UCMR data in the [National Contaminant Occurrence Database] and use the data when evaluating the frequency and level of occurrence of contaminants in drinking water at a level of public health concern." Id. at 73,136 (emphasis added).

The required monitoring period for HFPO-DA will run from 2023 to 2025, and no UCMR data for HFPO-DA was available at the time EPA issued its proposed regulations. As such, it is impossible for EPA to have "use[d] the data when evaluating the frequency and level of occurrence" of HFPO-DA or to have made its required findings to regulate "based on…the occurrence data base" as mandated by the SDWA. Id.; 42 U.S.C. [sec] 300g– 1(b)(1)(B)(ii)(II). Finalizing the proposed drinking water regulation for HFPO-DA at this time would therefore violate EPA's obligations under the SDWA.

Further, if EPA intends to consider UCMR data for HFPO-DA for a final rulemaking, EPA must repropose regulations in order to allow the public an adequate opportunity to comment on EPA's interpretation of that UCMR data. When determining whether additional rounds of notice and comment are required to comply with fair notice obligations under the Administrative Procedure Act, agencies should consider "whether a new round of notice and comment would provide the first opportunity for interested parties to offer comments that could persuade the agency to modify its rule." American Water Works Ass'n v. EPA, 40 F.3d 1266, 1274 (D.C. Cir. 1994). Indeed, an agency "must provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully." Nat'l Lifeline Ass'n v. Fed. Commc'ns Comm'n, 921 F.3d 1102, 1115 (D.C. Cir. 2019). Here, EPA is required to base its core findings to regulate HFPO-DA on UCMR occurrence data, but EPA has not yet published any such data for HFPO-DA. 42 U.S.C. [sec]300g–1(b)(1)(B)(ii)(II). [FN4: Further, the limited non-UCMR data summary that EPA does present, discussed in the subsection below, lacks clear references to the underlying data sets, preventing interested parties from conducting independent analysis.] If EPA intends for this rulemaking to rely on any such data, once it becomes available, EPA needs to provide the public with new notice and opportunity to comment in light of the essential information that such data would provide.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document regarding the EPA's regulatory determination for HFPO-DA, as well as section 6.8 of the EPA response in this *Response to Comments* document and section VI.G of the final rule preamble regarding UCMR 5. Additionally, the EPA disagrees that the agency has circumvented the established process for developing NPDWRs or is acting arbitrarily. The EPA implements a monitoring program for unregulated contaminants (i.e., UCMR) under SDWA

1445(a)(2) that requires the EPA to issue a list once every five years of priority unregulated contaminants to be monitored by PWSs; however, contrary to the commenter's statement that the EPA has violated its obligations under SDWA, there is no statutory obligation that a contaminant must be monitored under the UCMR program prior to making a determination to regulate, if the agency has sufficiently available information through other sources.

Pertaining to the commenter's statement, "Chemours is not aware of any other contaminant in which the EPA has issued an NPDWR without first publishing UCMR data", the agency notes that it has completed multiple regulations since the passage of the 1996 SDWA amendments which did not have UCMR data, including the Revised Total Coliform Rule (RTCR), Long Term 2 Enhanced Surface Water Treatment Rule (LT2), and the Stage 2 Disinfectants and Disinfection Byproducts Rule. The robust amount of state occurrence data for HFPO-DA represents the current best available information and demonstrate sufficient likelihood of occurrence of the PFAS being regulated, as required under SDWA.

Specific to commenter's statements about the occurrence database under 42 U.S.C. [sec] 300j–4(g), although preliminary and partial UCMR 5 results appear in the 1445(g) database as of the date of this final rule, the EPA does not consider such results to be "best available" until the full monitoring cycle is complete because UCMRs are designed to yield statistically valid and nationally representative data that can be used to inform decisions once complete. Because at the time of the EPA's rule, UCMR 5 data are preliminary and partial, they are not considered "best available" and thus are not a basis for this final rule. The reference to "use of data" in the UCMR 5 FRN discussed by the commenter is referring to use of a complete and final UCMR 5 dataset.

The agency further disagrees with the commenter's claim that the non-UCMR data presented in the proposed rule lacked clear references to the underlying datasets as this information was transparently provided through references within the *Occurrence Technical Support Document* and available for review and opportunity for comment during the full public comment period. Specifically, in this document, the EPA cites at least 18 underlying datasets containing approximately 10,000 sample results of HFPO-DA in drinking water from 16 states with clear information and links how to access the datasets directly from that support document. The commenter's failure to review those datasets which were clearly available in the rule proposal is not grounds for delaying this regulation. In the final regulation, based on public comment, the EPA updated the occurrence information and final rule *Occurrence Technical Support Document* (USEPA, 2024b) to include over 35,000 sample results of HFPO-DA from 25 states. These updated results were confirmatory of the EPA's findings related to HFPO-DA occurrence and co-occurrence with other PFAS in the proposal.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045961)

To reiterate, AMWA was and is extremely supportive of the Regulatory Determination to regulate PFOA and PFOS. EPA has the option to move forward with the PFOA and PFOS rulemaking, as the statutory deadline of that Regulatory Determination only applies to those two

contaminants based on the timeline outlined under SDWA. EPA can still choose to regulate these four additional PFAS in an expedited manner after a Regulatory Determination is finalized utilizing UCMR 5 data, but AMWA stresses the importance of the UCMR 5 data EPA will soon receive. This UCMR 5 dataset will also fill in some gaps in the cost-benefit analysis regarding this determination and proposal, which is currently missing. Additionally, as the decision in NRDC v. Michael Regan [FN14: NRDC v. Michael Regan. No. 20-1335. U.S. Court of Appeals. (2023, May 9). https://www.cadc.uscourts.gov/internet/opinions.nsf/E8EC4867311BA7BA852589AA0052854F/$file/20-1335-1998466.pdf] demonstrated, once a positive determination is made, even if the UCMR 5 data later show very little to no occurrence, EPA cannot "backslide" or reverse its decision to regulate the contaminant(s). AMWA wants EPA to make the best decision possible on these four chemicals to protect the public's health by ensuring its decisions are well-informed and that the public does not incur unnecessary costs.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document. Additionally, regarding UCMR 5, please see section 6.8 of the EPA response in this *Response to Comments* document.

Bowling Green Municipal Utilities (Doc. #1767, SBC-043928)

Inadequate Basis for Regulatory Determinations: EPA's positive regulatory determinations for perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-D or GenX), and perfluorobutanesulfonic acid (PFBS) rely on very limited relevant occurrence data. Under Safe Drinking Water Act (SDWA), EPA has a responsibility to demonstrate that regulatory requirements are for contaminants that occur or are likely to occur at levels of public health concern in drinking water and that there is a meaningful opportunity for health risk reduction through a drinking water standard.

EPA Response: Please see section 3.1.2 of the EPA response in this *Response to Comments* document.

3.1.3 EPA's Preliminary Regulatory Determinations for PFHxS, PFNA, HFPO-DA, and PFBS – Statutory Criterion #3 Meaningful Opportunity

Summary of Major Public Comments and EPA Responses

The EPA received many comments on the agency's evaluation of the third statutory criterion under Section 1412(b)(1)(A) of SDWA. Most commenters supported the EPA's evaluation under the preliminary determination that individual regulation of PFHxS, PFNA, HFPO-DA, and PFBS presents a meaningful opportunity for health risk reduction and that the EPA has sufficiently justified this statutory criterion as well as the health and occurrence criterion. This included comments highlighting the extensive amount of work done by several states developing regulatory and non-regulatory levels for several PFAS compounds, including the PFAS for which the EPA is making regulatory determinations individually. These commenters also noted

the need for a consistent national standard for use in states where a state-specific standard has not yet been developed. Several commenters have also noted that although some states have developed or are in the process of developing their own state-level PFAS drinking water standards, regulatory standards currently vary across states. These commenters expressed concern that absence of a national drinking water standard has resulted in risk communication challenges with the public and disparities with PFAS exposure. Some commenters noted there are populations particularly sensitive or vulnerable to the health effects of these PFAS, including newborns, infants, and children. The EPA agrees with commenters that there is a need for a national PFAS drinking water regulation and that moving forward with a national-level regulation for PFHxS, PFNA, HFPO-DA, mixtures of these three PFAS and PFBS, as well as PFOA and PFOS, will provide improved national consistency in protecting public health and may reduce regulatory uncertainty for stakeholders across the country.

A few commenters expressed support for the EPA's evaluation of meaningful opportunity based on the treatment technologies which can remove the six PFAS for which the EPA is finalizing regulation. Furthermore, these commenters noted the meaningful opportunity to not only provide protection from the six regulated PFAS, but also other PFAS that will not be regulated as a part of this action.

Several commenters did not support the EPA's evaluation of the third statutory criterion, offering that in their opinion the EPA failed to justify there is a meaningful opportunity for health risk reduction for the PFAS individually and stating that the EPA should consider other factors such as costs. A few of these commenters wrote that the EPA provided limited rationale and factors for its meaningful opportunity determination. The EPA disagrees with these commenters that the agency failed to justify that there is meaningful opportunity for health risk reduction or that the EPA provided limited rationale and factors in its meaningful opportunity evaluation for these contaminants individually. As described in the EPA's March 2023 proposal and in section III.D. of the final rule preamble, the EPA fully considered many factors including individual contaminant toxicity and health effects, individual contaminant occurrence at frequencies and levels of public health concern, availability of similar treatment technologies to remove these four PFAS and analytical methods to measure them, and their individual chemical and physical properties leading to their environmental persistence. Additionally, the EPA notes in the proposed and final rule preamble, and as demonstrated through representative occurrence data, for the three contaminants individual occurrence is not only at a regional or local level, rather it covers multiple states throughout the country; therefore, a national level regulation is necessary to ensure all Americans served by PWSs are equally protected.

Some comments indicate that the health and occurrence information do not support that establishing drinking water standards presents a meaningful opportunity for health risk reduction The agency disagrees with the commenters' assertion that the health and occurrence information are insufficient to justify a drinking water standard as supported in sections III.B. and III.C. of the final rule preamble, and the agency finds that there is a meaningful opportunity for health risk reduction potential based upon multiple considerations including the population exposed to

PFHxS, PFNA, and HFPO-DA including sensitive populations and lifestages, such as newborns, infants and children.

Other comments assert that the EPA must evaluate the potential implementation challenges and cost considerations of regulation as part of the meaningful opportunity evaluation. The EPA disagrees with these commenters. The SDWA states that that the meaningful opportunity for health risk reduction for persons served by PWSs is in the sole judgement of the Administrator and does not require that the EPA consider costs for a regulatory determination. The SDWA does require that costs and benefits are presented and considered in the proposed rule's Health Risk Reduction Cost Analysis (HRRCA) which the EPA did for the proposal and has updated as a part of the final rule within section XII.

A few other commenters provided that due to all of the additional human health exposure pathways other than drinking water for these PFAS, that regulation of drinking water would not represent a meaningful opportunity for overall health risk reduction. While the EPA recognizes that drinking water is one of several exposure routes, the EPA disagrees with these commenters. Removing the PFAS that have been found to occur or are substantially likely to occur from drinking water systems will result in a significant improvement in public health protection. The EPA also notes that through its PFAS Strategic Roadmap and associated actions, the agency is working expeditiously to address PFAS contamination in the environment and reduce human health PFAS exposure through all pathways. While beyond the scope of this rulemaking, the EPA is making progress implementing many of the commitments in the Roadmap, including those that may significantly reduce PFAS source water concentrations.

Individual Public Comments

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043437)

• Based on the foregoing, EPA cannot reasonably conclude that regulation of these four PFAS would present a meaningful opportunity for health risk reduction, and the Proposed Rule fails in any effort to so justify. EPA has gotten ahead of the science and data and, consequently, has issued a Proposal that is premature and overly conservative

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

Consumer Reports (Doc. #1656, SBC-043182)

In terms of a meaningful opportunity to reduce the health risk of these 4 PFAS by regulating them, in addition to showing that the four PFAS and their mixtures cause adverse health impacts, and occur in the drinking water at frequencies and levels of public health concern, the data also show that PFHxS, GenX chemicals, PFNA, and PFBS and their mixtures are environmentally

persistent. In addition, there are validated EPA-approved methods to measure PFHxS, GenX chemicals, PFNA, and PFBS, and mixtures of these contaminants.

Finally, there are available technologies–including granular activated carbon (GAC), AIX resins, reverse osmosis (RO), and nanofiltration (NF)–that are capable of reducing PFHxS, GenX chemicals, PFNA, and PFBS. A number of these technologies, particularly the ones using sorptive and high-pressure membrane technologies, have been shown to remove PFHxS, GenX chemicals, PFNA, and PFBS, and their mixtures and have also been documented to remove other PFAS contaminants2 [FN2: McCleaf, P., Englund, S., Östlund, A., Lindegren, K., Wiberg, K., and Ahrens, L. 2017. Removal Efficiency of Multiple Poly-and Perfluoroalkyl Substances (PFASs) in Drinking Water using Granular Activated Carbon (GAC) and Anion Exchange (AE) Column Tests. Water Research, 120(2017):77–87. https://doi.org/10.1016/j.watres.2017.04.057; Sörengård, M., Östblom, E., Köhler, S., and Ahrens, L. 2020. Adsorption Behavior of Per-and Polyfluoralkyl Substances (PFASs) to 44 Inorganic and Organic Sorbents and Use of Dyes as Proxies for PFAS Sorption. Journal of Environmental Chemical Engineering, 8(3):103744. https://doi.org/10.1016/j.jece.2020.103744; Mastropietro, T.F., Bruno, R., Pardo, E., and Armentano, D. 2021. Reverse Osmosis and Nanofiltration Membranes for Highly Efficient PFASs Removal: Overview, Challenges and Future Perspectives. Dalton Transactions, 50(16):5398–5410. https://doi.org/10.1039/d1dt00360g]. Given that these removal/mitigation technologies can remove multiple PFAS, we agree with EPA that regulation of PFHxS, GenX chemicals, PFNA, and PFBS, and their mixtures will provide protection from PFAS that will not be regulated as part of this proposed NPDWR.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044445)

c. EPA's proposed PFAS drinking water standards present a meaningful opportunity for health risk reduction.

EPA correctly found that regulating the six PFAS subject to this rule presents a meaningful opportunity for health risk reduction for consumers of drinking water from public water systems. Four technologies are available to reduce the concentrations of these PFAS in water: granular activated carbon (GAC), aqueous ion exchange (AIX) resins, reverse osmosis (RO), and nanofiltration (NF). Because the four PFAS co-occur with other PFAS for which the Agency is not currently making a preliminary regulatory determination, regulation of the four PFAS represents a meaningful opportunity to reduce the overall public health risk from all other PFAS that co-occur and are co-removed with them. [FN29: 88 Fed. Reg at 18651.] In the rulemaking, EPA proposes these four technologies as Best Available Technologies, after considering: (1) the capability of a high removal efficiency; (2) a history of full-scale operation; (3) general geographic applicability; (4) reasonable cost based on large and metropolitan water systems; (5) reasonable service life; (6) compatibility with other water treatment processes; and (7) the ability

to bring all the water in a system into compliance. [FN30:Id. at 18683.] These technologies have demonstrated PFAS removal efficiencies that can exceed 99 percent, [FN31:Id. at 18684-85] with EPA finding GAC and AIX resins to be the most affordable technologies over a range of small water system sizes. [FN32:Id. at 18687-88.] The PFAS Rule is well justified because the standards present a meaningful opportunity to reduce human health risk.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

City of Lancaster, Pennsylvania (Doc. #1695, SBC-044995)

4. Labeling the PFAS Chemicals as a Hazardous Chemical: By labeling this chemical family as hazardous there is a massive list of complications that need to be considered.

As stated by the EPA Technical Fact Sheet on PFAS, water is 20% of the PFAS exposure for most individuals and this regulation is clamping down on the water suppliers who received the contaminants from other point and non-point sources. 80% of the PFAS exposure comes from people's food sources and other products they live with in their daily lives. There have been studies showing that the wrappers for chocolate cake mix contain 1,700 ppt which is 425 times the water MCL. Many food products are known to have these chemicals, and this creates two distinct problems for the EPA.

Regulating prematurely is in effect penalizing the water industry that neither creates nor pollutes with PFAS. It will not stop the exposure of 80% of the contamination sources and it will not protect the citizenry of the US from exposing themselves to the major products/sources that contaminate with PFAS. This will have repercussions financially for many industries and create a cost that many industries will not be able to overcome. Irresponsible regulation has the potential to negatively impact the economy.

EPA Response: The EPA disagrees that regulation of these PFAS in public drinking water systems will not result in significant improvements in public health protection. Please see section 3.1.3 of the EPA response in this *Response to Comments* document. Regarding evaluation of the costs and benefits of the rule under the HRRCA, as required under SDWA, please see section XII of the final rule preamble and section 13 of this document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045894)

C. EPA has not demonstrated that this proposed regulation presents a "meaningful opportunity" for health risk reduction

Although the final element of the regulatory determination provides some discretion to define what constitutes a meaningful opportunity to address health risk reduction, that discretion is not unlimited. The Administrator's decision must be grounded on data, consider the costs of the decision, and have an articulable and understandable demonstration that the choice made is rationally related to the facts. It cannot be random choice without any reason or system.

EPA has failed to demonstrate with an adequate basis that the proposal to regulate PFNA, PFHxS, PFBS, and HFPO-DA (and mixtures of these PFAS) presents a meaningful opportunity for health risk reduction for persons served by the over 66,000 public water systems potentially impacted by this rulemaking. Keeping in mind that cost considerations are heavily imbedded in multiple elements of SDWA, those considerations are necessarily implicated in determining what is "meaningful." Failure to consider costs at this stage omits an essential element of the process that EPA must undertake before regulating these PFAS in public water systems, many of which are very small. EPA must also consider the downstream costs to the industries that rely on public water systems.

EPA provides very limited rationale for its meaningful-opportunity determination, primarily resting on speculative potential benefits. The proposal discusses the need to address the four PFAS due to the potential adverse human health effects, potential for co-exposures of these PFAS, and the availability of analytical methods to measure and treatment technologies (irrespective of costs) to remove them from drinking water. EPA does not enumerate a list of factors for its consideration of a meaningful opportunity for health risk reductions. In the past, EPA has looked to occurrence data and populations served by water systems to support a positive or negative determination based on the "meaningful opportunity" factor [FN52: 86 Fed. Reg. at 12283.]. As discussed, the health data and the occurrence data for the four PFAS do not support such a determination.

Further, EPA does not factor in costs in its justification that there are treatment technologies available to remove the PFAS from drinking water. Even if these technologies are available, there will be a limited supply of technologies available for the thousands of water systems that will suddenly need them all at the same time, and high costs for public water systems to implement and maintain the treatment technologies. EPA has not assessed the impact of a shift in demand on GAC, ion-exchange resin, and membrane markets. Compliance with the rule would be cost-prohibitive and may result in systems having to shut down or pass the high costs down to their ratepayers. EPA must consider the extraordinary compliance challenges and costs that this rule would impose on water systems, and those industries that rely on these water systems, for regulating the four PFAS because these factors impact whether this approach to regulate the PFAS is a "meaningful" opportunity to reduce health risk.

In conclusion, absent substantial evidence in the record to support the three statutory criteria of health effects, occurrence, and a meaningful opportunity for health risk reduction, EPA's preliminary determination to regulate PFNA, PFBS, PFHxS, and HFPO-DA is arbitrary and capricious and contrary to the requirements of SDWA.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document. Section 1412(b)(1)(A)(2)(iii) provides that "in the sole judgment of the Administrator, regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems." Accordingly, the EPA has followed SDWA, and based on the available information, the EPA Administrator has, in their sole judgement and as provided explicitly through the statute, made this determination. The EPA has

thoroughly evaluated the commenter's concerns and information provided to consider whether the comments would impact the administrator's judgement; however, whether there is a meaningful opportunity for health risk reduction remains a determination in the sole judgement of the EPA Administrator. Importantly, the EPA disagrees with commenter's unfounded assertion that the Administrator's judgement for these regulatory determinations is "not grounded in data" or that "the choice was not rationally and related to the facts" as the commenter claims. Further, the EPA disagrees with the commenter's assertion that it does not enumerate a list of factors for its consideration of a meaningful opportunity for health risk reductions or that it did not provide information on the occurrence data and populations served by water systems to support the determination. The Administrator's reasoning is clearly articulated through the availability of this exact information in section III of the final rule preamble. Furthermore, the agency used its Protocol developed under Regulatory Determination 3 (USEPA, 2014) and also used in the Regulatory Determination 4. Hence, this evaluation is clearly not random as the commenter claims, and includes a comprehensive assessment of meaningful opportunity for each unique contaminant including the nature of the health effects, sensitive populations affected, including infants, children and pregnant and nursing women, number of systems potentially affected, and populations exposed at levels of public health concern, geographic distribution of occurrence, technologies to treat and measure the contaminant, among other factors. For the EPA's specific evaluation of the health and occurrence statutory criteria for regulation and the EPA's responses, please see sections 3.1.1 and 3.1.2, respectively, in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045406)

The EPA should finalize the proposed drinking water standard as quickly as possible.

Drinking water standards for PFAS are long overdue. The EPA has known about the risks associated with PFAS since at least 1998 and was alerted to the presence of PFAS in drinking water by at least 2001. [FN10: Env't Working Grp., For 20-plus years, EPA has failed to regulate 'forever chemicals' (Jan. 9, 2020). https://www.ewg.org/research/20-plus-years-epa-has-failed-regulate-forever-chemicals.] For decades, millions of Americans have been exposed to unsafe levels of PFAS in their drinking water. The EPA's proposed MCLs and health-based water concentrations (HBWCs) show that PFOA, PFOS, GenX, PFBS, PFHxS, and PFNA are likely toxic at lower levels than all other regulated contaminants under the Safe Drinking Water Act (SDWA), including contaminants like ethylene dibromide, regulated at 50,000 ppt in drinking water,[FN11: Env't Prot. Agency, National Primary Drinking Water Regulations, https://www.epa.gov/ground-water-anddrinking-water/national-primary-drinking-water-regulations (last updated January 26, 2022).] and dioxin (2,3,7,8-TCDD), regulated at 30 ppt in drinking water. [FN12:Id.]

Treating PFAS in drinking water presents a meaningful opportunity to reduce exposure and consequent health risks. Quick action by the EPA to finalize the proposed MCLs will dramatically reduce levels of PFOA, PFOS, PFNA, PFHxS, PFNA, PFBS, and GenX in drinking

water. Drinking water is a major exposure pathway for PFAS chemicals, accounting for roughly twenty percent of exposure. [FN13: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18654, 18664-65, 18670 (March 29, 2023).] In highly contaminated communities, drinking water likely accounts for an even larger percentage of exposure. Reducing exposure through drinking water will lower PFAS levels in blood, improving health outcomes. Levels of PFOA and PFOS in blood have dropped dramatically because of the EPA agreement with manufacturers to phase out the use of PFOA and PFOS by 2015. According to analysis of the National Health and Nutrition Examination Survey, which has measured PFAS in blood in the U.S. population since 1999, from 1999-2000 to 2017-2018 levels of PFOA in blood have declined more than 70 percent and levels of PFOS in blood have declined more than 85 percent. [FN14: Agency for Toxic Substances and Disease Registry, PFAS in the U.S. Population, https://www.atsdr.cdc.gov/pfas/health-effects/us-population.html (last reviewed Dec. 22, 2022).]

Epidemiological evidence also links reductions in PFAS in drinking water to lower PFAS blood levels. For example, a 2017 analysis looked at PFOA blood serum levels over time in both Cincinnati and in a Northern Kentucky suburb. Both communities are downriver from the Washington Works Plant in Parkersburg, West Virginia and use the Ohio River as a drinking water source. In 1992, Cincinnati began treating its drinking water with granular activated carbon, but Northern Kentucky did not adopt any treatment technologies that would reduce PFAS levels in finished tap water. The researchers noted that PFOA levels in blood serum went down during the 1990s in Cincinnati but rose in Northern Kentucky. The researchers concluded that difference in blood serum levels was likely attributable to the granular activated carbon technology adopted in Cincinnati, which is effective at filtering PFOA. [FN15: Robert L. Herrick et al., Polyfluoroalkyl Substance Exposure in the Mid-Ohio River Valley, 1991-2012, 228 ENV'T POLLUTION 50 (2017), https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5540235/.]

PFAS are highly persistent in the environment, earning them the moniker "forever chemicals."[FN16: Joseph Allen, These Toxic Chemicals are Everywhere—Even in your Body. And They Won't Ever Go Away, WASHINGTON POST (Jan. 2, 2018), https://www.washingtonpost.com/opinions/these-toxic-chemicals-are-everywhere-and-they-wont-ever-go-away/2018/01/02/82e7e48a-e4ee-11e7-a65d-1ac0fd7f097e_story.html.] PFAS bioaccumulate in the blood [FN17: Half-life estimates range from over two years from PFOA and PFNA to 5.4 years for PFOS to 8.5 years for PFHxS. See ANNA READE, TRACY QUINN, & JUDITH S. SCHREIBER, NAT. RES. DEF. COUNCIL, SCIENTIFIC & POLICY ASSESSMENT FOR PER- AND POLYFLUOROALKYL SUBSTANCES IN DRINKING WATER at 12 (April 12, 2019), https://www.nrdc.org/sites/default/files/media-uploads/nrdc_pfas_report.pdf.] and other organs [FN18: Francisca Perez et al., Accumulation of Perfluoroalkyl Substances in Human Tissues, 59 ENV'T INT'L 354 (2013), https://pubmed.ncbi.nlm.nih.gov/23892228/.] where they can stay for long periods, even decades. For communities already devastated by decades of unwitting exposure through drinking water, relief cannot come soon enough. Although the EPA's statutory deadline is not until

September 2024, we urge the EPA to finalize the proposed rule well ahead of the deadline so that the proposed regulations can be implemented as quickly as possible.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045409)

It is appropriate and necessary for the EPA to make the additional regulatory determinations and propose the additional NPDWRs to address the urgent public health risks presented by PFHxS, PFNA, PFBS, and GenX. As detailed in the proposed rule, there is a significant body of scientific evidence associating adverse health effects with exposure to PFHxS, PFNA, PFBS, and GenX. [FN23: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18645-47 (March 29, 2023).] Three of those four PFAS—PFBS, PFHxS, and PFNA—are widely detected at military bases [FN24: Melanie Benesh, The Pentagon Should Address All Types of PFAS on Military Bases, ENV'T WORKING GRP. (May 26, 2020), https://www.ewg.org/news-insights/news/pentagon-should-address-all-types-pfas-military-bases.] and all four have been detected in drinking water monitoring. [FN25: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18671-80 (March 29, 2023).] Off the shelf technology is available to treat all four PFAS in drinking water—creating a meaningful opportunity for health risk reduction.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045675)

Moreover, EPA's decision to regulate the HI substances as a mixture led to an inflated sense of the opportunity for risk reduction. In the section on this criterion, the only factors considered discussed the substances as a group. There was no analysis of how, individually, the substances presented a meaningful opportunity to reduce risk to the public (Section VII). This omission violates the requirements for regulating new substances under the SDWA.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that it only discussed the PFAS as a group as shown in section III.D. of the final rule preamble where it discussed both the regulatory determination for PFHxS, PFNA, and HFPO-DA individually and the regulatory determination for mixtures of these three PFAS and PFBS. For the EPA's responses related to meaningful opportunity of the determination to regulate mixtures of PFHxS, PFNA, HFPO-DA, and PFBS, please see section 3.2.3 of the EPA response in this *Response to Comments* document.

Ohio Environmental Council (Doc. #1794, SBC-045323)

Because drinking water is a significant pathway of PFAS exposure, addressing contamination before it reaches our taps is key to reducing associated health problems. The Safe Drinking Water Act requires that national drinking water standards present a meaningful opportunity to reduce health risks. EPA's proposal does just that – it would significantly reduce exposure to PFAS in drinking water and as a result, lower risks of related health impacts.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

Environmental Working Group et al. (Doc. #1810, SBC-044687)

Because drinking water is a significant pathway of PFAS exposure, addressing contamination before it reaches our taps is key to reducing associated health problems. The Safe Drinking Water Act requires that national drinking water standards present a meaningful opportunity to reduce health risks. EPA's proposal does just that – it would significantly reduce exposure to PFAS in drinking water and as a result, lower risks of related health impacts.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045828)

C. Regulation presents a meaningful opportunity to reduce the risk that PFAS poses to Wisconsin' residents.

Wisconsin's residents who rely on the state's public water systems for drinking water will benefit from the proposed regulation. As described above, these PFAS may cause adverse health effects and they occur frequently in public water systems throughout Wisconsin, often together, at levels that pose a serious risk to public health. The best available science and occurrence data from the state supports EPA's judgement about the pressing need to reduce health risks from PFAS exposure via drinking water. Thus, commenters support the proposed rule as a meaningful opportunity to reduce health risks to the people of Wisconsin and nationwide.

EPA Response: Please **s**ee section 3.1.3 of the EPA response in this *Response to Comments* document.

New York State Department of Health (NYS DOH) (Doc. #1677, SBC-044954)

16. EPA requested comment on the regulation of GenX compounds as part of this proposed rulemaking. Based on monitoring conducted in NYS to date, four public water systems are known to be above the health-based standard of 10 ppt. Although we do not oppose regulation of GenX compounds, the benefit of this regulation will not likely be widespread in New York.

EPA Response: Please see section 3.1.3 of the EPA response in this *Response to Comments* document. Additionally, as often observed, specific contaminant occurrence can be site-dependent, and while a contaminant may not occur as the same levels in all localities and states, the EPA has demonstrated that PFHxS, PFNA, and HFPO-DA occur or there is a substantial likelihood they will occur with a frequency and level of public health concern across various geographic areas of the country. For the EPA's response on the individual occurrence statutory criterion, please see section 3.1.2 in this *Response to Comments* document.

Alliance of Nurses for Healthy Environments (Doc. #1544, SBC-042669)

Because drinking water is a significant pathway of PFAS exposure, addressing contamination before it reaches our taps is key to reducing associated health problems. The Safe Drinking Water Act requires that national drinking water standards present a meaningful opportunity to reduce health risks. EPA's proposal does just that –instituting regulations with the capacity to significantly reduce exposure to PFAS in drinking water and as a result, lower risks of related health impacts.

EPA Response: Please see section 3.1.3 of the EPA response in this *Response to Comments* document.

Environmental Protection Network (EPN) (Doc. #1773, SBC-043841)

Preliminary Determination

The Safe Drinking Water Act (SDWA) requires EPA to consider the following three criteria when making a determination to regulate: 1) the contaminant may have an adverse effect on the health of persons; 2) the contaminant is known to occur or there is a high chance that it will occur in public water systems often enough and at levels of public health concern; and 3) in the sole judgment of the Administrator, regulation of the contaminant presents a meaningful opportunity for health risk reductions for persons served by public water systems.

EPA considered many scientific studies demonstrating that these four PFAS chemicals have adverse effects on multiple biological systems and functions, including thyroid hormone levels, lipid synthesis and metabolism, fetal and infant development, and immune and liver function. EPA also considered data from UCMR3 and twelve state monitoring programs showing that these four chemicals occur above levels of concern in public water systems serving millions of people. Clearly the Administrator can conclude that regulation of these four PFAS compounds presents a meaningful opportunity for health risk reductions for persons served by public water systems.

EPA Response: Please see section 3.1.3 of the EPA response in this *Response to Comments* document.

Missouri Department of Natural Resources (Doc. #1563, SBC-042516)

EPA requests comment on its evaluation that regulation of PFHxS, HFPO–DA, PFNA, PFBS, and their mixtures, in addition to PFOA and PFOS, will provide protection from PFAS that will not be regulated under this proposed rule.

As noted in our previous comment, the Department believes that regulation of PFHxS, HFPO–DA, PFNA, PFBS, and their mixtures should be deferred until after UCMR 5 data is evaluated for all 29 PFAS at the order of magnitude lower detection limits than those used during the UCMR 3 nationwide occurrence study. It makes sense that where a system installs treatment to address these proposed PFAS, it will also address other unregulated contaminants. However, it is unknown to what extent adding these four PFAS mixtures will have to increase protection without further study of the co-occurrence and health impacts of other unregulated PFAS mixture contaminants. In addition to evaluating whether the regulation of PFOA and PFOS and the four PFAS included in the hazard index will provide protection from unregulated PFAS, EPA should also evaluate whether regulation of PFOA and PFOS alone would produce similar protections from unregulated contaminants. States that have already required systems to install PFAS treatment will also have raw water data showing concentrations and mixtures of PFAS that caused the need for the treatment. The data from more than 23 states can then be used to show what effect treatment has on occurrence data obtained from UCMR 5.

EPA Response: Regarding meaningful opportunity to regulate PFHxS, PFNA, HFPO-DA, PFBS, and mixtures of these four PFAS, please see sections 3.1.3, and 3.2.3 of the EPA response in this *Response to Comments* document. Please see sections 3.1.2, 3.2.3, and 6.3 of the EPA response in this *Response to Comments* document regarding PFAS occurrence and co-occurrence.

3.2 EPA's Preliminary Regulatory Determination Summary – Mixture of Four PFAS

Summary of Major Public Comments and EPA Responses

As discussed in comments within section 3.1.1, several commenters expressed support for the EPA's preliminary regulatory determinations to individually regulate PFHxS, PFNA, HFPO-DA, and PFBS. The majority of these same commenters also expressed support to regulate mixtures of PFHxS, PFNA, HFPO-DA, and/or PFBS, including that the EPA has appropriately determined that the three statutory criteria for regulation have been met for mixtures of the four contaminants using the best available information. Conversely, many other commenters that did not agree that the agency presented sufficient information to make a preliminary determination for PFHxS, PFNA, HFPO-DA, and PFBS individually also did not agree that the EPA presented sufficient information to regulate mixtures of the four contaminants, with some commenters similarly recommending that that the agency withdraw the portion of the proposed rule associated with these mixtures because in their view there is insufficient health effects and/or occurrence data at this time to support the EPA's action. The EPA disagrees with these

commenters because there is information to support the regulation of mixtures of PFHxS, PFNA, HFPO-DA, and/or PFBS, based on the three statutory criteria as discussed in the final rule preamble in section III.B, C, and D.

The EPA received comments on its statutory authority to regulate mixtures of PFHxS, PFNA, HFPO-DA, and/or PFBS, specifically the agency's interpretation under Section 1401(6) that a mixture of two or more contaminants also qualifies as the definition of a contaminant under SDWA since a mixture itself meets the same definition. A few commenters disagreed and contended that a mixture does not meet the definition of being a single contaminant under SDWA, with some citing Toxic Substances Control Act's (TSCA) definition of a chemical substance. The EPA disagrees with these commenters. First, the EPA notes that TSCA's definitions are not relevant to SDWA's definition. Second, the SDWA definition of a contaminant does not specify that a contaminant is only a singular chemical. The SDWA definition is very broad, specifically stating that a contaminant is "any physical, chemical or biological or radiological substance or matter" (emphasis added) with no specific description or requirement for how it is formed. Matter for example, by definition, is comprised of either pure substances or mixtures of pure substances. A pure substance is either an element or compound, which would include any PFAS chemical. The statute encompasses matter which is a broad term that includes mixtures and therefore definitionally includes PFAS mixtures, comprised of a combination of PFAS (chemical substances), as itself qualifying as a "contaminant" under SDWA. Moreover, other provisions of the statute would be restricted in a manner inconsistent with Congressional intent if the EPA were to adopt the cabined approach to "contaminant" suggested by some commenters. For example, Section 1431 of SDWA provides important authority to the EPA to address imminent and substantial endangerment to drinking water supplies posed by "a contaminant" that is present in or threatened those supplies. Congress clearly intended this authority to be broad and remedial, but it would be significantly hampered if the EPA would be restricted to only addressing individual chemicals and not mixtures threatening a water supply. For these reasons, the EPA's interpretation of the definition of contaminant is the only reading that is consistent with the statutory definition and use of the term in context, and to the extent definition of contaminant is ambiguous, the EPA's interpretation represents the best interpretation of that term. Finally, even if a mixture is considered a group, as some commenters suggest, Congress clearly contemplated that the EPA could regulate contaminants as groups. See H.R. Rep. No 93-1185 (1974), reprinted in 1974 U.S.C.C.A.N. 6454, 6463-64 (noting the tens of thousands of chemical compounds in use commercially, with many more added each year, of which many will end up in the nation's drinking water and finding that "[i]t is, of course, impossible for EPA to regulate each of these contaminants which may be harmful to health on a contaminant-by-contaminant basis. Therefore, the Committee anticipates that the Administrator will establish primary drinking water regulations for some groups of contaminants, such as organic and asbestos.") Thus, the EPA has the authority to regulate a mixture as a contaminant under SDWA.

The commenters also suggested that the EPA has not followed its *Supplementary Guidance for Conducting Health Risk Assessment of Chemical Mixtures* (USEPA, 2000a), specifically that the

agency did not use a "sufficiently similar mixture" where "components and respective portions exist in approximately the same pattern" and suggested that there has to be consistent co-occurrence of the mixture components. The EPA disagrees with these comments. For the EPA's response to these comments, please see section 4.3.2 of the EPA response in this *Response to Comments* document.

Many other commenters supported the EPA's interpretation of regulating a mixture as a "contaminant" that consists of a combination of certain PFAS, citing the EPA's broad authority under SDWA to set regulatory standards for groups of related contaminants and the EPA precedent for doing so under other NPDWRs including disinfection byproducts (DBPs; for total trihalomethanes [TTHMs] and the sum of five haloacetic acids [HAA5], (USEPA, 1979; USEPA, 2006)), as well as radionuclides (USEPA, 2000b) and polychlorinated biphenyls (PCBs). The EPA also noted some of these examples within the proposed rule. One commenter disagreed that these previous EPA grouping approaches are applicable to mixtures of the four PFAS, noting that TTHMs and HAA5 are byproducts of the disinfection process and are the result of naturally occurring compounds reacting with the disinfectants used in drinking water treatment; thus, their formation cannot be controlled and is dependent on the presence and amount of disinfectant. As a result of these factors, measuring them as a class is required; however, the four PFAS are not byproducts, and the presence of one PFAS does not change the presence of the other PFAS. Moreover, the commenter provided that related to radionuclides, alpha particles are identical regardless of their origination and using this example for PFAS is not supported since the four PFAS are fundamentally different. The EPA disagrees with this commenter. As noted above, the SDWA definition of contaminant is very broad ("any physical, chemical or biological or radiological substance or matter" (emphasis added)) with no limitations, specific description or requirement for how it is formed. The statute therefore easily encompasses a mixture, comprised of a combination of PFAS (chemical substances), as itself qualifying as a "contaminant" under SDWA. Moreover, as also noted above, to the extent the mixture is considered a "group," Congress clearly anticipated that the EPA would regulate contaminants by group. As a result, even if the PFAS "group" is different than other SDWA regulatory groupings, such a regulation is clearly authorized under the statute. Furthermore, it makes sense to treat these mixtures as a "contaminant" because the four PFAS share similar characteristics: it is substantially likely that they co-occur; the same treatment technologies can be used for their removal; they are measured simultaneously using the same analytical methods; they have shared adverse health effects; and they have similar physical and chemical properties resulting in their environmental persistence.

Individual Public Comments

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043072)

PFHxS, PFNA, HFPO-DA, and PFBS as a Mixture

As part of the Proposal, EPA sought public comment not only on the preliminary regulatory determination for PFHxS, PFNA, HFPO-DA, and PFBS individually but also as a mixture. Specifically, EPA highlights that Section 1401(6) of SDWA defines the term contaminant to mean "any physical, chemical or biological or radiological substance or matter in water" and therefore a mixture of two or more "contaminants" qualifies as a "contaminant" because the mixture itself is "any physical, chemical or biological or radiological substance or matter in water."

Aqua appreciates the Agency's interest in addressing multiple PFAS beyond PFOA and PFOS. However, the proposed approach to address these additional PFAS through a determination that these PFAS as a mixture meet the definition of being a single "contaminant" under SDWA is not appropriately supported. A chemical substance refers to a substance of similar chemical composition as opposed to similar constituents. Under the EPA's Toxic Substances Control Act (TSCA) a chemical substance may be a mixture of contaminants formed either naturally or through a chemical formulation process. EPA's "Supplemental Guidance for Conducting Health Risk Assessment of Chemical Mixtures," which EPA cites in crafting the risk assessment framework for the Proposal, specifically indicates that opportunities to infer hazard for a mixture must be from a "sufficiently similar mixture." The guidance goes on further to note that a mixture is sufficiently similar when the "components and respective portions exist in approximately the same pattern."

EPA Response: See section 3.2 of the EPA response in this *Response to Comments* document.

Protecting Our Water, Environment, and Ratepayers (POWER) (Doc. #1714, SBC-045939)

COMMENT 5 — THE PROPOSED HAZARD INDEX IS NOT SUPPORTED BY PRECEDENT OR SCIENCE.

The Safe Water Drinking Act precedent that EPA cites does not support grouping PFHxS, HFPO- DA, PFNA, and PFBS.

In the proposed rule, EPA justifies the novel Hazard Index approach by stating that it has a history of grouping compounds. Specifically, EPA points to regulating total trihalomethanes ("TTHM") and haloacetic acids ("HAA5") as a group in drinking water treatment and considering all alpha- particles together in the radionuclide rule. Though it is true that the EPA has considered compounds in groups before, that precedent does not support doing so for PFHxS, HFPO-DA, PFNA, and PFBS.

Although the grouping of the TTHMs and the HAA5 is similar to the proposed grouping of PFAS compounds, these examples are inapplicable to the proposed drinking water standard. TTHMs and HAA5 are byproducts of the cleanup process that are the result of naturally occurring compounds reacting with the disinfectants used in treatment. [FN22: https://www.epa.gov/sites/default/files/2014-04/documents/pn_haa5_mcl.pdf; https://www.epa.gov/sites/default/files/documents/PN_TTHM_MCL.pdf.] In other words, the concentration of HAA5 and TTHM depends on the amount of disinfectant. Because the amount of each of TTHM or HAA5 cannot be controlled and depends on the amount of disinfectant used, measuring them as a class is required. This is different from the situation for the four PFAS included in the Hazard Index. The four PFAS compounds are not byproducts of the treatment process and the presence of one PFAS does not change the presence of the other three. For these reasons, regulating these as a group is not justified by the EPA's previous actions.

Furthermore, the regulation of the PFHxS, HFPO-DA, PFNA, and PFBS as a class is different than measuring man-made and natural alpha particles together. Alpha particles are identical no matter where they come from. Therefore, it is logical to consider them together. Because the four PFAS compounds are fundamentally different, grouping them together is not supported by the radionuclide rule.

Although the EPA has grouped compounds together previously, fundamental differences between these groupings makes that precedent inapplicable to support grouping PFBS, PFNA, HFPO-DA , and PFHxS together.

EPA Response: See section 3.2 of the EPA response in this *Response to Comments* document.

Uttara Jhaveri (Doc. #1778, SBC-045442)

The proposal to not set a single proposed standard for PFNA, PFHxS, PFBS and GenX chemicals, but a limit for a mix of them is a reasonable consideration. [FN11: Id.] The limit for the mix of the PFNA, PFHxS, PFBS and GenX chemicals considers the public health aspect of the decrease in the relative concentrations of certain PFAS such as PFOA, PFOS, and PFNA due to their voluntary phase-out of production and replacement in the United States. [FN12: Id.] However, other PFAS such as PFBA, PFBS, and HFPO–DA may increase in concentration as their production, use, and discharge into source water continue in the United States. [FN13: Id.]

EPA Response: See section 3.2 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045958)

Section 3.2: PFAS mixture of PFBS, PFNA, GenX, PFHxS

EPA is proposing a HI of 1.0, equal to the MCLG, for the mixture of PFBS, PFNA, GenX, and PFHxS. Each PFAS in this mixture has a proposed HBWC: 10 ppt for GenX, 2000 ppt for PFBS,

10 ppt for PFNA, and 9 ppt for PFHxS. EPA proposed this action to account for dose-additive health impacts of these chemicals in co-occurrence.

As mentioned earlier, EPA has limited occurrence data for these additional PFAS and is in the process of developing a human health toxicity assessment for PFNA and PFHxS. The human health toxicity assessment should be done before a Regulatory Determination, and certainly before a proposed regulation, as this is paramount to assessing the impact on public health. In contrast, EPA in 2022 used a toxicity assessment from 2021 to develop a drinking water health advisory for PFBS, which is currently the basis for its HBWC. EPA should be using the same method to create the HBWC if it plans to group these PFAS into a HI.

EPA Response: Please see section 3.2 of the EPA response in this *Response to Comments* document. Regarding the EPA's evaluation of the second statutory criterion on occurrence data, please see sections 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document. Regarding the EPA's evaluation of the first statutory criterion on health effects, please see sections 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document.

<u>The Chemours Company FC, LLC (Doc. #1845, SBC-046050)</u>

I. EPA's proposed regulation of HFPO-DA does not comply with the legal requirements of the SDWA

A. The SDWA does not authorize EPA to regulate mixtures

EPA has proposed to regulate a mixture of four different compounds (PFHxS, HFPO-DA, PFNA, and PFBS) under a single MCL. EPA's approach—utilizing a so-called "hazard index" metric—is entirely unprecedented. Indeed, EPA concedes, "this is the first use of an HI approach for a SDWA National Primary Drinking Water Regulation." PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18669 (proposed Mar. 29, 2023).

But even more importantly, EPA's effort to regulate a mixture of compounds is illegal because EPA lacks authority to do so under the Safe Drinking Water Act. The SDWA allows EPA to set individual MCLGs and MCLs for a single contaminant only. EPA has no authority to set such levels for mixtures or multiple contaminants. Specifically, the SDWA provides that "for each contaminant" that EPA determines to regulate, EPA must publish maximum contaminant level goals and promulgate national drinking water regulations. 42 U.S.C. [sec] 300g-1(b)(1)(E) (emphasis added). The SDWA defines the term "primary drinking water regulation" as a regulation which specifies contaminants that may have any adverse health effect on persons and "specifies for each such contaminant . . . a maximum contaminant level" or treatment technique. 42 U.S.C. [sec] 300f(1) (emphasis added). Courts interpreting the SDWA's requirements also note that MCLGs and MCLs are to be set for "each identified contaminant." E.g., City of Portland, Oregon v. E.P.A., 507 F.3d 706, 709 (D.C. Cir. 2007) ("[The SDWA] requires EPA to set a 'maximum contaminant level goal' (MCLG) for each identified contaminant at a level at

which no known adverse health consequences will occur. It then requires EPA to set a 'maximum contaminant level' (MCL) for each contaminant as close to the MCLG as is feasible." (emphases added; internal citations omitted)). [FN2: EPA's proposed regulation of mixtures is also inconsistent with the SDWA's instruction to set the MCL for each contaminant as close to the MCLG as is "feasible." See 42 U.S.C. [sec] 300g-1(b)(4)(B). Whereas it is clear how that would be done for a single contaminant (based on the best feasible technology and treatment techniques for that contaminant, see id. [sec] 300g-1(b)(4)(D)-(E)), it is not at all clear how that would be done for contaminant mixtures where the threshold for one compound depends on the presence or absence of the others.]

The term "each" is not defined in the SDWA, and in the absence of such a definition, courts "construe a statutory term in accordance with its ordinary or natural meaning." F.D.I.C. v. Meyer, 510 U.S. 471, 476 (1994). Black's Law Dictionary defines the term "each" as "a distributive adjective pronoun, which denotes or refers to every one of the persons or things mentioned; every one of two or more persons or things, composing the whole, separately considered." Black's Law Dictionary (6th ed. 1990) (emphasis added). Thus, in using the term "each contaminant," the SDWA clearly states that contaminants should be separately considered when setting MCLGs and MCLs. Nothing in the SDWA suggests otherwise or supports EPA's HI approach for mixtures here.

EPA contends that the SDWA defines the term "contaminant" "very broadly to mean any 'physical, chemical, biological, or radiological substance or matter in water.'" Id. at 18664 (quoting 42 U.S.C. [sec] 300f(6)). EPA asserts that "[a] mixture of two or more 'contaminants' qualifies as a 'contaminant' because the mixture itself is 'any physical, chemical or biological or radiological substance or matter in water.'" Id. (emphasis in original). This unbounded definition is without support, particularly in light of the clear statutory language limiting EPA's authority to "each" contaminant (in the singular). If the term "contaminant" were intended to include a mixture, it would have been defined by Congress in the statute as such. EPA cannot enlarge or add a different meaning to a term that is expressly defined by statute. See Meese v. Keene, 481 U.S. 465, 484 (1987) ("It is axiomatic that the statutory definition of the term excludes unstated meanings of that term.").

Moreover, as EPA is well aware, Congress is quite capable of authorizing the regulation of chemical mixtures when it wishes to do so. EPA specifically relies on CERCLA as an example of EPA's use of the HI approach. PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18669 (proposed Mar. 29, 2023). But what EPA fails to mention is that CERCLA expressly defines a "contaminant" to include "any element, substance, compound, or mixture . . . ." 42 U.S.C. [sec] 9601(33) (emphasis added). Since, unlike CERCLA, the SDWA's definition of "contaminant" does not expressly include a mixture, EPA simply cannot add that word and does not have statutory authority to regulate mixtures or groups of contaminants together under the SDWA.

EPA's efforts to grant itself statutory authority where there is none are unavailing. For example, EPA notes that it has "a longstanding history of regulating contaminants in this manner (i.e., as

contaminant groups or mixtures)" and cites as examples the regulation of trihalomethanes, haloacetic acids, and radionuclides. PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18664 (proposed Mar. 29, 2023). First, the fact that EPA may have exceeded its statutory permission in some prior instance does not give it carte blanche authority to do so again. Either EPA has the authority or it does not. See Louisiana Pub. Serv. Comm'n v. F.C.C., 476 U.S. 355, 374 (1986) ("[A]n agency literally has no power to act . . . unless and until Congress confers power upon it."); Ball, Ball & Brosamer, Inc. v. Reich, 24 F.3d 1447, 1450 (D.C. Cir. 1994) ("An agency can neither adopt regulations contrary to statute, nor exercise powers not delegated to it by Congress."). Moreover, none of the federal register notices for EPA's regulation of trihalomethanes, haloacetic acids, and radionuclides under the SDWA discuss the HI approach, let alone provide any legal authority for regulating groups of contaminants together under the statute. [FN3: See National Interim Primary Drinking Water Regulations; Control of Trihalomethanes in Drinking Water, 44 Fed. Reg. 68624, 68624 (Nov. 29, 1979); National Primary Drinking Water Regulations: Disinfectants and Disinfection Byproducts, 63 Fed. Reg. 69390, 69392 (Dec. 16, 1998); National Primary Drinking Water Regulations: Stage 2 Disinfectants and Disinfection Byproducts Rule, 71 Fed. Reg. 388, 392 (Jan. 4, 2006); National Primary Drinking Water Regulations; Radionuclides; Final Rule, 65 Fed. Reg. 76708, 76732 (Dec. 7, 2000).] Thus, EPA's prior regulation of trihalomethanes, haloacetic acids, and radionuclides cannot be used to justify or authorize either the regulation of a mixture or the HI approach under the SDWA.

EPA also cites the statute's requirement that MCLGs be set at a level "which allow[s] for an adequate margin of safety." PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18654 (proposed Mar. 29, 2023). EPA states that the HI itself "provides an added margin of safety with respect to potential health hazards of mixtures of these PFAS." Id. This argument simply proves too much. As discussed above, there is no support in the SDWA for EPA's mixture approach, and EPA cannot shoehorn authority to regulate mixtures under the guise of an "adequate margin of safety." In fact, the U.S. Supreme Court has been abundantly clear on this point. For example, in the context of the Clean Air Act, the U.S. Supreme Court explicitly held that the statute's "adequate margin of safety" language did not permit EPA to consider implementation costs in setting national ambient air quality standards because it is "implausible that Congress would give to the EPA through these modest words the power to determine whether implementation costs should moderate national air quality standards." Whitman v. Am. Trucking Associations, 531 U.S. 457, 468 (2001). The same reasoning applies here—EPA cannot use the SDWA's "adequate margin of safety" language to justify regulating contaminant mixtures because such "vague" and "modest" words do not provide the clear congressional authorization required to regulate in that manner. See also Sackett v. EPA, No. 21-454, slip op. at 20 (U.S. May 25, 2023) ("We have often remarked that Congress does not 'hide elephants in mouseholes' by 'alter[ing] the fundamental details of a regulatory scheme in vague terms or ancillary provisions.'"); W. Virginia v. Env't Prot. Agency, 142 S. Ct. 2587, 2609 (2022) ("Extraordinary grants of regulatory authority are rarely accomplished through 'modest words,' 'vague terms,' or 'subtle device[s].' Nor does Congress typically use oblique or elliptical

language to empower an agency to make a 'radical or fundamental change' to a statutory scheme." (citations omitted)).

Finally, with regard to the hazard index approach itself, it is worth noting that EPA concedes, "this is the first use of an HI approach for a SDWA National Primary Drinking Water Regulation." PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18669 (proposed Mar. 29, 2023). As the U.S. Supreme Court has made clear, novel uses of regulatory power are inherently suspect. See Util. Air Regul. Grp. v. EPA, 573 U.S. 302, 324 (2014) ("When an agency claims to discover in a long-extant statute an unheralded power to regulate 'a significant portion of the American economy,' we typically greet its announcement with a measure of skepticism." (internal citation omitted)); accord NFIB v. Dep't of Labor, 142 S. Ct. 661, 666 (2022).

EPA's assertion that it has the statutory authority to regulate mixtures of contaminants under the SDWA also runs afoul of the major questions doctrine. Under this doctrine, an "extraordinary grant[] of regulatory authority" on an issue of "economic and political significance" requires an agency to "point to 'clear congressional authorization' to regulate in that manner." W. Virginia, 142 S. Ct. at 2608–09, 2614. For the reasons stated herein, there simply is no "clear congressional authorization" for EPA either to regulate mixtures of contaminants under the SDWA or to utilize their "novel" hazard index approach in doing so.

EPA Response: Please see section 3.2 of the EPA response in this *Response to Comments* document. The commenter's argument that the EPA's effort to regulate a mixture of compounds is illegal because the SDWA provides that "for *each* contaminant" that the EPA determines to regulate, the EPA must publish MCLGs and promulgate national drinking water regulations. 42 U.S.C. [sec] 300g-1(b)(1)(E) (emphasis added) ignores that the EPA has concluded that a mixture of two or more of the regulated PFAS itself qualifies as a "contaminant" because the mixture itself is "any physical, chemical or biological or radiological substance or matter in water" (emphasis added). In addition, the court decisions cited by commenters do not address the question of whether a mixture meets the SDWA definition of "contaminant." The EPA is thus promulgating national drinking water standards for "each" contaminant. The EPA's conclusion is based on the text of the definition in the SDWA; that Comprehensive Environmental Response Compensation and Liability Act (CERCLA) includes the word "mixture" does not narrow the SDWA's definition which includes "*any* physical, chemical, biological, or radiological substance or matter in water." 42 U.S.C. [sec] 300f(6) (emphasis added). Furthermore, contrary to commenter's assertion that it is not at all clear how to comport with the SDWA's instruction to set the MCL for each contaminant as close to the MCLG as is "feasible" for a contaminant that is a mixture, the final rule properly establishes an MCL for each contaminant, including the mixture that is a contaminant. Congress has clearly authorized the EPA to regulate mixtures [or "in this manner"] by defining contaminant broadly enough to include mixtures. This is confirmed by the SDWA's legislative history, in which Congress expressly anticipated that the Administrator would establish primary drinking water regulations for some groups of contaminants Moreover, regulation of a contaminant that is a

mixture simply is not an extraordinarily greater grant of authority than the authority to regulate singular chemical by singular chemical. As discussed in section 3.2 of the EPA response in this *Response to Comments* document, the EPA notes that it has previously regulated groups of contaminants in NPDWRs under SDWA. Similarly, the EPA (and states) regularly use the Hazard Index approach to inform potential health risks of chemical mixtures associated with contaminated sites/locations under CERCLA/Superfund Amendments and Reauthorization Act (SARA); as such, the application of the Hazard Index approach under a regulatory purview is not novel for the agency (see section VI.B of the proposed rule preamble). In addition, commenter mischaracterizes the preamble discussion regarding the definition of MCLG. The EPA's discussion in section IV.B of the proposed rule preamble (page 18654) explains the basis for the EPA's decision to select the Hazard Index approach to address mixtures and is not focusing on the definition of contaminant.

American Water Works Association (AWWA) (Doc. #1759, SBC-045591)

PFHxS, PFNA, HFPO-DA, and PFBS as a Mixture

As part of the proposal, EPA also sought public comment on the preliminary regulatory determination for PFHxS, PFNA, HFPO-DA, and PFBS as a mixture. Specifically, EPA highlights that Section 1401(6) of SDWA defines the term contaminant to mean "any physical, chemical or biological or radiological substance or mater in water" and therefore a mixture of two or more "contaminants" qualifies as a "contaminant" because the mixture itself is "any physical, chemical or biological or radiological substance or mater in water."

AWWA appreciates the agency's interest in addressing additional PFAS beyond PFOA and PFOS. However, the proposed approach to address these additional PFAS through a preliminary determination that these PFAS as a mixture meet the definition of being a single "contaminant" under SDWA is not appropriately supported. As recognized by the TSCA, any mixture is not considered a chemical substance, instead a mixture of contaminants formed either naturally or through a chemical formulation process may be considered a chemical substance (EPA, 2023e). EPA's "Supplemental Guidance for Conducting Health Risk Assessment of Chemical Mixtures", which EPA cites in crafting the risk assessment framework for the proposal, specifically indicates that opportunities to infer hazard for a mixture must be from a "sufficiently similar mixture" (EPA, 1986). The guidance goes on further to note that a mixture is sufficiently similar when the "components and respective portions exist in approximately the same pattern" (EPA, 1986).

EPA Response: Please see section 3.2 of the EPA response in this *Response to Comments* document.

3.2.1 Statutory Criterion #1 – Adverse Health Effects for Mixture of Four PFAS

Summary of Major Public Comments and EPA Responses

Many commenters expressed support for the EPA's determination that mixtures of PFHxS, PFNA, HFPO-DA, and/or PFBS meet the statutory criterion for adverse health effects using the best available information. Other commenters did not agree that the agency presented sufficient information to make a preliminary determination to regulate mixtures of PFHxS, PFNA, HFPO-DA, and/or PFBS, with some commenters recommending that that the agency withdraw the portion of the proposed rule associated with mixtures of these four PFAS because in their view, the EPA's mixtures assessment approach was flawed or there is insufficient health effects and/or occurrence data at this time to support the EPA's action. Commenters, both within this section and as described in sections 4.3.1, 4.3.2., and 4.3.3, raised concerns about the uncertainty factors applied for each of the four PFAS in the Hazard Index. Some commenters claimed that the EPA did not follow its guidance or SAB recommendations. For the EPA's responses to these comments, please see sections 4.3.1, 4.3.2, and 4.3.3 in this *Response to Comments* document.

Individual Public Comments

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043058)

3. The proposed positive regulatory determination, and concurrent regulation, of perfluorohexanesulfonic acid (PFHxS), PFNA, HFPO-DA, and PFBS are based on a scientifically flawed risk assessment approach to mixtures of PFAS that is not supported by the EPA's guidance materials. The Agency should re-propose the determination and regulation for additional PFAS following completion of UCMR 5 and a refinement of the hazard index approach.

EPA Response: See sections 3.2 and 3.2.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.1, 4.3.2, and 4.3.3 of the EPA response in this *Response to Comments* document regarding the regulatory determination health effects statutory criterion and risk assessments. Regarding UCMR 5, please see sections 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043074)

Aqua does not support the regulatory determination of PFHxS, PFNA, HFPO-DA, and PFBS as a mixture. While EPA claims that mixtures of these PFAS may co-occur and represent a combined risk, the supporting information fails to create a sufficient record that this is the case. This is true both for evidence of occurrence and demonstration that these PFAS pose a combined risk. This lack of toxicological support for this approach is apparent in the Agency's proposed approach to use a hazard index for these compounds through a methodology that is contrary to federal agency guidance.

Aqua recommends that if EPA is interested in addressing additional PFAS through this rulemaking effort and through a regulatory determination for a mixture of PFAS, that EPA re-issue a preliminary determination for additional PFAS following the completion of the UCMR 5 program and further refinement of the hazard index approach. Delaying this action would also ensure that EPA may consider toxicological assessments for additional PFAS, which are currently in development.

EPA Response: See sections 3.2 and 3.2.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.1, 4.3.2, and 4.3.3 of the EPA response in this *Response to Comments* document regarding the regulatory determination health effects statutory criterion and risk assessments. Regarding the EPA's evaluation of the regulatory determination occurrence statutory criterion and UCMR 5, please see sections 3.1.2, 3.2.2, 6.3, and 6.8 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045594)

AWWA does not support the preliminary determination of PFHxS, PFNA, HFPO-DA, and PFBS as a mixture as the statutory factors under the SDWA to support a determination are not present. While EPA claims that mixtures of these PFAS may co-occur and represent a combined risk, the supporting information fails to create a sufficient record that this is the case. This is true both for evidence of occurrence and demonstration that these PFAS pose a combined risk. This lack of toxicological support for this approach is apparent in the agency's proposed approach to use a hazard index for these compounds through a methodology that is contrary to federal agency guidance. The preliminary determination for PFHxS, PFNA, HFPO-DA, and PFBS as a mixture is not sufficiently supported and the information for three of these compounds suggests a negative determination is most appropriate.

EPA Response: See sections 3.2 and 3.2.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.1 and 4.3.2 of the EPA response in this *Response to Comments* document regarding the regulatory determination health effects statutory criterion and risk assessments. Regarding co-occurrence, please see sections 3.1.2, 3.2.2, and 6.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045607)

AWWA recommends that the EPA re-issue the preliminary determination for PFHxS, PFNA, HFPO-DA, and PFBS as a mixture and recommends that prior to re-issuing a preliminary determination for a mixture of PFAS work towards refining the proposed approach to align with guidance from federal agencies (including the agency itself) and recommendations from the SAB. Aligning the use of the hazard index with agency guidance and SAB recommendations is not only necessary for sound policy, but necessary to comply with both the SDWA and the APA. Further, EPA should follow its own guidance before finalizing any risk assessment for mixtures of PFAS, by EPA ensuring that appropriate peer review be conducted to confirm the agency is

relying on the best available science. [FN19: U.S. EPA, Peer Review Handbook, 4th edition, 2015, available at: https://www.epa.gov/sites/default/files/201510/documents/epa_peer_review_handbook_4th_edion_october_2015.pdf.] AWWA notes that EPA followed a more robust process in evaluating PFOA and PFOS and recommends that EPA apply at least the same level of rigor to its analysis of PFHxS, PFNA, HFPO-DA, and PFBS. Failing to do so, or failing to acknowledge this change, and providing a reasoned explanation for the change, would violate the APA.

EPA Response: See section 3.2.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.1 and 4.3.2 of the EPA response in this *Response to Comments* document regarding risk assessment.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044443)

a. EPA's proposed PFAS drinking water standards are necessary to protect public health.

EPA's proposed MCL for PFOA and PFOS of four parts per trillion (individually), and the agency's proposed Hazard Index-based MCL for mixtures containing PFHxS, GenX, PFNA, and/or PFBS are strongly supported by health effects data. The MCLs reflect both EPA's well-supported analysis of that data and its commitment to protecting human health.

Data about how these six PFAS chemicals affect human health comes from human and animal studies examining how these PFAS enter our bodies and the associated health effects. Much of the research has focused on the health effects of specific PFAS chemicals in isolation, but there is also substantial data demonstrating the adverse health effects of PFAS chemicals as components of a mixture. [FN11: A coalition of nonprofits, research institutes and universities have created a database concerning PFAS toxicology called the PFAS-Tox Database that includes, among many others, studies on PFHxS, GenX, PFNA, and PFBS. In addition, the database contains at least 204 studies on PFAS mixtures. See Pelch KE, Reade A, Kwiatkowski CF, Wolffe T, Merced-Nieves FM, Cavalier H, Schultz K, Rose K, Varshavsky J. 2021. PFAS-Tox Database available at https://pfastoxdatabase.org/.] In fact, there is sufficient data concerning certain PFAS chemicals for EPA to assess their toxicity and publish detailed assessments about their safety. [FN12: See, e.g., United States Environmental Protection Agency, Drinking Water Health Advisory for Perfluorooctanoic Acid (PFOA), EPA Document Number: 822-R-16-005, May 2016, https://www.epa.gov/sites/default/files/2016-05/documents/pfoa_health_advisory_final_508.pdf; see, e.g., United States Environmental Protection Agency, Drinking Water Health Advisory for Perfluorooctane Sulfonate (PFOS), EPA Document Number 822-R-16-004, May 2016,https://www.epa.gov/sites/default/files/201605/documents/pfos_health_advisory_final_508.pdf.] These PFAS chemicals are associated with a wide range of serious adverse health effects when people ingest them through drinking water, including without limitation, various cancers, liver disease and damage, issues with growth and development like low birth weight, changes in hormone levels, weakened immune system, diabetes, and fertility issues. [FN13: See the

following illustrative examples of such studies. Studies concerning PFAS and Cancer: Jiang H., et al. Associations between Polyfluoroalkyl Substances Exposure and Breast Cancer: A Meta-Analysis. Toxics. 2022; https://doi.org/10.3390/toxics10060318; Keck School of Medicine of the University of Southern California, Synthetic "forever chemical" linked to liver cancer, https://keck.usc.edu/synthetic-forever-chemical-linked-to-livercancer/, (full study available at https://doi.org/10.1016/j.jhepr.2022.100550); Scott M. Bartell & Verónica M. Vieira (2021) Critical review on PFOA, kidney cancer, and testicular cancer, Journal of the Air & Waste Management Association, https://doi.org/10.1080/10962247.2021.1909668; Joseph J. Association between per- and polyfluoroalkyl substances exposureand risk of diabetes: a systematic review and metaanalysis., J Expo Sci Environ Epidemiol, https://doi.org/10.1038/s41370-022-00464-3. Studies Concerning PFAS and Fertility. Mount Sinai, Exposure to Chemicals Found in Everyday Products Is Linked to Significantly

Reduced Fertility (2023), https://www.mountsinai.org/about/newsroom/2023/exposure-to-chemicals-found-ineveryday-products-is-linked-to-significantly-reduced-fertility (full study available at https://pubmed.ncbi.nlm.nih.gov/36801327/); Wei Wang, The effects of perfluoroalkyl and polyfluoroalkyl substances on female fertility: A systematic review and meta-analysis, Environmental Research, https://doi.org/10.1016/j.envres.2022.114718.]

PFOS and PFOA have been conclusively found to be highly harmful to human health even at miniscule levels of exposure, with both chemicals being linked to a wide variety of adverse health effects. The five health effects of PFOA and PFOS with the strongest human evidence are decreased vaccine response, delayed growth and development (e.g., decreased birth weight), increased cholesterol, increased levels of an enzyme that is an indicator of liver damage, and (for PFOA) kidney and testicular tumors. [FN14: Interstate Technology Regulation Council, Human and Ecological Health Effects and Risk Assessment of Per- and Polyfluoroalkyl Substances (PFAS) (Sept. 2022), https://pfas1.itrcweb.org/wp-content/uploads/2022/09/HH_Eco_PFAS_Fact-Sheet_082422_508.pdf.].

For PFHxS, PFNA, PFBS and GenX, there is likewise substantial evidence that all are individually harmful to human health. Each contaminant has been the subject of numerous animal and/or human health studies that show likely health effects. [FN15: Pelch KE, Reade A, Kwiatkowski CF, Wolffe T, Merced-Nieves FM, Cavalier H, Schultz K, Rose K, Varshavsky J. 2021. PFAS-Tox Database https://pfastoxdatabase.org/. Database listing 578 studies for PFHxS, 631 studies for PFNA, 150 studies for PFBS, and 29 studies for GenX.] In each case, EPA appropriately used such studies to set levels of protection called Health Based Water Concentrations (HBWC) for PFHxS and PFNA, PFBS and GenX, to provide appropriate protections against adverse health impacts. [FN16: PFAS National Primary Drinking Water Regulation Rulemaking, 88 FR 18638-01 at 18645-47.] For example, EPA based its HBWC for PFHxS on an Agency for Toxic Substances and Disease Registry (ATSDR) intermediate-duration oral Minimal Risk Level (MRL). [FN17:Id. At 18645-46.] The PFHxS MRL in turn was based on studies showing that PFHxS can harm the development of liver and thyroid tissue including a study on rats that showed risks to the thyroid at a certain level of exposure. [FN18: See, Agency for Toxic Substances and Disease Registry (ATSDR), Toxicological profile for Perfluoroalkyls, http://dx.doi.org/10.15620/cdc:5919.] Both ATSDR and EPA appropriately used this study to identify an exposure level without appreciable risk for humans, accounting for relevant factors like age and other sensitivities that may differ between species and including an uncertainty factor to account for chronic exposure through drinking water. [FN19: PFAS National Primary Drinking Water Regulation Rulemaking, 88 FR 18638-01 at 18645-46.]

Multiple PFAS are often present in drinking water and other sources of PFAS exposure, and as a result, in human blood serum. [FN20: See, e.g, California State Water Resources Control Board, Geotracker – PFAS Map, https://geotracker.waterboards.ca.gov/map/pfas_map (searchable map linking to test results in water throughout California with data showing PFAS mixtures in many sampling events); Biomonitoring California, Results for Perfluoroalkyl and Polyfluoroalkyl Substances (PFASs), https://biomonitoring.ca.gov/results/chemical/2183 (showing that the PFAS

at issue in this regulation are present in nearly all blood serum samples and in mixtures across several different cohorts).] To evaluate the impacts of exposure to multiple PFAS, researchers also consider PFAS mixtures and their impact on health. [FN21: See Pelch KE, Reade A, Kwiatkowski CF, Wolffe T, Merced-Nieves FM, Cavalier H, Schultz K, Rose K, Varshavsky J. 2021. PFAS-Tox Database https://pfastoxdatabase.org/ (listing 204 studies on "PFAS Mix").] For example, a recent study by the University of Southern California's Keck School of Medicine used human blood serum to examine the impacts of PFAS mixtures on the human thyroid and metabolism, and it found that exposure to a PFAS mixture is associated with an increase in a thyroid hormone. According to the researchers, this is especially concerning because thyroid hormones play an important role in child development during puberty, which can have important effects on a range of diseases later in life, including diabetes, cardiovascular disease and cancer. [FN22: Keck School of Medicine of the University of Southern California, Keck School of Medicine study finds "forever chemicals" disrupt key biological processes, https://keck.usc.edu/keckschool-of-medicine-study-finds-forever-chemicals-disrupt-key-biological-processes/,published study available at: https://doi.org/10.1289/EHP11372.] Another recent study concerning PFAS mixtures found lower odds of "attaining a clinical pregnancy within one year of follow-up and delivering a live birth when the combined effects of seven PFAS as a mixture were considered." [FN23: Mount Sinai, Exposure to Chemicals Found in Everyday Products Is Linked to Significantly Reduced Fertility (2023),https://www.mountsinai.org/about/newsroom/2023/exposure-to-chemicals-found-ineveryday-products-is-linked-to-significantly-reduced-fertility(study available at https://pubmed.ncbi.nlm.nih.gov/36801327/).] These studies illustrate both the need to regulate the six PFAS subject to the PFAS Rule and EPA's sound judgment in employing the agency's Hazard Index approach, with its rulemaking based on the risks to human health posed by PFHxS, PFNA, PFBS and GenX individually and in mixtures.

EPA Response: Please see sections 3.2 and 3.2.1 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045670)

EPA also violates its own guidance when it does not discuss the critical implications of the collective application of the uncertainty factors when considering these four PFAS together in the HI. The uncertainty factors when compared across PFHxS, HFPO-DA, PFNA, and PFBS are 3,000, 3,000, 300, and 300, respectively. Though the uncertainty factors across the four PFAS may not be purely multiplicative, EPA's own guidance (USEPA 2002) clearly recommends "limiting the total UF applied for any particular chemical to no more than 3000 and avoiding the derivation of a reference value that involves application of the full 10-fold UF in four or more areas of extrapolation" because uncertainty in four or five areas "may also indicate that the database is insufficient to derive a reference value." As stated previously, USEPA (2002) recommends "justification for the individual factors selected for each chemical," guidance that should also apply when considering uncertainty across multiple reference values under the HI. Taken together, in proposing the HI, EPA has failed to follow its own guidance, which

recommends that clear justification for the uncertainty factors, consideration of areas of overlapping uncertainty, and implications for the reliability of the reference values be provided.

EPA Response: See section 3.2.1 of the EPA response in this *Response to Comments* document, as well as sections 4.3.1, 4.3.2, and 4.3.3 of the EPA response in this *Response to Comments* document.

Protecting Our Water, Environment, and Ratepayers (POWER) (Doc. #1714, SBC-045942)

COMMENT 6 — BECAUSE THE RESEARCH TO DETERMINE THE TOXICITY LEVELS AND POTENTIAL HARMS RELATING TO THE COMPOUNDS INCLUDED IN THE HAZARD INDEX IS CURRENTLY BEING PERFORMED, THE PRELIMINARY REGULATORY DETERMINATION TO REGULATE THE MIXTURE OF PFHXS, HFPO-DA, PFNA, AND PFBS IS PREMATURE.

EPA has already laid out plans to review the toxicity and/or risk of PFHxS, HFPO-DA, PFNA, and PFBS. Given that the research and analysis intended to inform the drinking water regulations is currently being done, it is premature to make a regulatory determination to regulate the mixture of these compounds until that research and analysis is complete.

Setting the Hazard Index now prior to the human health toxicity assessment renders the human health toxicity assessment pointless.

The human health toxicity assessment "provides hazard identification, dose-response information, and derives toxicity values called oral reference doses ("RfDs") for chronic and subchronic exposures."[FN25: EPA, Human Health Toxicity Assessments for GenX Chemicals (last updated Dec. 27.2022) (https://www.epa.gov/chemical-research/human-health-toxicity-assessments-genx-chemicals)] Its purpose is to help policy makers consider if and when it is appropriate to reduce exposure to the compound. Therefore, the human health toxicity assessment is another tool that is necessary to inform and determine the potential risk of the compound.

In the proposed NPDWR, EPA acknowledges that the human health toxicity assessments for PFHxS and PFNA are currently ongoing and are supposed to undergo public comment this year. If the Hazard Index is finalized as written, the human health toxicity assessment, when complete, will be unable to inform policy makers of the potential risk.

POWER! therefore requests EPA delay setting MCLs for PFHxS and PFNA until the human health toxicity assessments are complete.

EPA Response: Please see sections 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document. Additionally, see section 4.3.3 of the EPA response in this *Response to Comments* document related to ATSDR health assessments.

3.2.2 Statutory Criterion #2 - Occurrence for Mixture of Four PFAS

Summary of Major Public Comments and EPA Responses

The EPA received many comments on the agency's evaluation of the second statutory criterion under Section 1412(b)(1)(A) of SDWA. The EPA notes that some comments related to occurrence of the four PFAS are also contained within section 6 of this document. As demonstrated in comments within this section, section 3.1.2, and section 6, many commenters supported not only the EPA's preliminary regulatory determinations to individually regulate PFHxS, PFNA, HFPO-DA, and PFBS, but also expressed support for the EPA's preliminary determination that mixtures of these four PFAS meet the second statutory occurrence criterion under SDWA, citing that the agency has used the best available information to determine that there is a substantial likelihood that combinations of these PFAS will co-occur in mixtures at a frequency and level of public health concern. One commenter stated that the additional occurrence data presented by the EPA in the proposal for the Hazard Index PFAS supports the EPA's proposed determination that these PFAS should be regulated under the SDWA. Comments in section 6 also supported the EPA's co-occurrence analyses.

Conversely, many other commenters both in this section and in section 6 of this document did not agree that the agency presented sufficient occurrence information to make a preliminary determination for PFHxS, PFNA, HFPO-DA, and PFBS individually also did not agree that the EPA presented sufficient co-occurrence information to regulate mixtures of the four contaminants or that a determination not to regulate (i.e., negative determination) these four PFAS in mixtures is more appropriate. The EPA disagrees with these commenters that it has not met the second statutory criterion for mixtures of these four PFAS as demonstrated in sections III.C., VI.C, and VI.D of the final rule preamble, as well as the *Occurrence Technical Support Document*, all of which document measured co-occurrence of PFHxS, PFNA, HFPO-DA, and PFBS above their HRL, including that across 21 states there are at least 211 PWSs serving approximately 4.7 million people with results above a Hazard Index of 1 for mixtures with two or more of the Hazard Index PFAS. Specifically evaluating the presence of PFBS, in these same 211 systems where the Hazard Index was found to be greater than 1, PFBS was observed at or above its PQL in mixtures with one or more of the other three Hazard Index PFAS in at least 72 percent (152) of these systems serving approximately 4.5 million people. Additionally, as described in section III of the final rule preamble, PFHxS, PFNA, HFPO-DA, and PFBS are all very stable and persistent in the environment, and all are either still being actively used or legacy stocks may be used and imported into the U.S. Consequently, there is a substantial likelihood that environmental contamination of sources of drinking water from these PFAS will continue to co-occur to at least the levels described in the final rule preamble.

Specifically, a few commenters stated that there was not supporting evidence for the co-occurrence of the four Hazard Index PFAS. The EPA disagrees; the extent to which Hazard Index PFAS chemicals co-occur in the non-targeted state dataset is discussed extensively in the record for this rulemaking and made evident through the system level analysis in section VI.C. of

this preamble and also described in section III.C. As also discussed elsewhere in the record for this rulemaking, in both system level and sample level analyses where PFOA and/or PFOS were reported present and all four Hazard Index PFAS were monitored, two or more Hazard Index PFAS were reported present more than half of the time. Further, the odds ratios tables in Exhibit 11 of the final rule preamble provide a statistical examination of pairwise co-occurrence. The odds ratio is a statistic that quantifies the strength of association between two events. In the context described here, an "event" is the reported presence of a specific PFAS contaminant. The odds ratio between PFOA and PFHxS, for example, reflects the strength of association between PFHxS being reported present and PFOA being reported present. If an odds ratio is greater than 1, the two events are associated. The higher the odds ratio, the stronger the association. For every pair of PFAS chemicals included in the proposed regulation, the odds ratio was found to be statistically significantly greater than 1. This means there was a statistically significant increase in the odds of a PFAS being present if the other PFAS compound was detected (e.g., if PFOA is detected, PFHxS is more likely to also be found). In most instances the odds appeared to increase in excess of a factor of ten. Thus, based on the large amount of available data, the chemicals are clearly demonstrated to co-occur rather than occur independently of one another, further supporting the agency's determination for combinations of mixtures of the four PFAS. Related to PFAS co-occurrence, please also see section 6.3 of the EPA response in this *Response to Comments* document.

Individual Public Comments

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043073)

In review of the data presented by EPA there is not sufficient supporting evidence that these compounds co-occur significantly in drinking water systems to satisfy the requirement for the mixture of these compounds to be considered "sufficiently similar." First, there is a complete lack of national occurrence data for HFPO-DA. For HFPO-DA, PFBS, and PFNA the available data for occurrence shows that these compounds – if they do occur – occur at exceptionally low levels and rarely above levels of public health concern. Furthermore, an analysis of the co-occurrence for this mixture of PFAS demonstrates an apparent lack of supporting evidence that these compounds all occur at the same time and in similar proportions (if at all).

EPA's groupwise occurrence provides neither a clear nor transparent characterization of occurrence, nor co-occurrence, of PFNA, PFHxS, PFBS, and HFPO-DA. Most of the data tables in the analysis rely on a presentation of at least one of these compounds. This data does not provide necessary information to support a conclusion of co-occurrence given that it does not indicate the compound(s) that are detected and the level of the detected compound(s). This is an important consideration, as a detection of PFBS is likely to bias these results and represents a significantly different level of public health concern in comparison to a detection of PFOA or PFOS. With a detection limit for PFBS of 3.0 ppt, a sample with a detection of PFBS may be, and is likely to be, representative of a level that is less than one-hundredth of the level that a public health concern may begin.

EPA Response: Please see sections 3.1.2, 3.2.2, and 6.3 of the EPA response in this *Response to Comments* document. Additionally, the EPA disagrees that these PFAS do not co-occur as documented in sections III.C., VI.C, and VI.D of the final rule preamble and the *Occurrence Technical Support Document* (USEPA, 2024b), nor do they need to co-occur in similar proportions. Rather, the purpose of the Hazard Index is to consider varying proportions of the Hazard Index PFAS which can collectively co-occur in different combinations of mixtures resulting in dose additive adverse health impacts when they are simultaneously co-occurring in these mixtures. Since each of the component Hazard Index PFAS are individually compared to their respective HBWC value, their proportions to the overall Hazard Index are appropriately accounted for and one or more Hazard Index PFAS will not bias the results. Moreover, this approach also recognizes that exposure to the PFAS included in the Hazard Index is associated with adverse health effects at differing potencies (e.g., the toxicity reference value for PFHxS is lower than the one for PFBS) and that, regardless of these potency differences, all co-occurring PFAS are included in the hazard calculation (i.e., the health effects and presence of lower toxicity PFAS are neither ignored nor are they over-represented).

The EPA further disagrees that it does not present necessary information to indicate the levels of the detected compounds in its Hazard Index analyses, as these are transparently presented in sections III.C., VI.C. VI.D. of the final rule preamble and within the *Occurrence Technical Support Document* (USEPA, 2024b).

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043098)

The determination for the mixture of these PFAS is similarly lacking in co-occurrence data and is inconsistent with EPA guidance.

EPA Response: Please see sections 3.2.2 and 6.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045602)

Earlier in these comments, AWWA raised issues regarding the EPA's occurrence analysis and the proposal's lacking evidence for occurrence, let alone co-occurrence, of these four PFAS. Notably, EPA has not demonstrated that there is or "there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern" [FN18: 42 U.S.C. § 300g-1(b).] as required under the SDWA, and at most has shown that they may potentially occur at levels of concern.

EPA Response: Please see sections 3.2.2 and 6.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045592)

The occurrence analysis provided by EPA does not demonstrate that PFHxS, PFNA, HFPO-DA, and PFBS can be grouped together as a mixture within a manner consistent with well-established agency guidance. First, there is a complete lack of national occurrence data for HFPO-DA and the data for PFBS shows a significant lack of occurrence in drinking water. Furthermore, data for PFNA shows a very low level of occurrence on its own, let alone with the other three PFAS. EPA's groupwise occurrence provides neither a clear nor transparent characterization of occurrence, nor co-occurrence, of PFNA, PFHxS, PFBS, and HFPO-DA. The supporting documentation fails to illustrate a pattern of co-occurrence of these four compounds; in fact, most of the information on co-occurrence of these compounds is relative to PFOA and PFOS. Given that the determination is for PFHxS, PFNA, HFPO-DA, and PFBS the co-occurrence of these individual compounds with PFOA and PFOS does not demonstrate the other four compounds cooccur.

Furthermore, the information that is provided does not demonstrate occurrence of PFHxS, PFNA, HFPODA, and PFBS at or above levels of potential health risk. Instead, occurrence is consistently described as a function of detection. Unfortunately, this is also not useful in supporting a preliminary determination. Detections are not equivalent to potential risk, which is most easily demonstrated in comparing the meaning of a detection for PFBS and PFHxS. While a detection of PFHxS at 10 ppt is 100% of the proposed HBWC while a detection of PFBS at 10 ppt is only 0.5% of the proposed HBWC. Detection of PFBS is likely to bias these results and represents a significantly different level of public health concern in comparison to a detection with other PFAS.

To further investigate co-occurrence for the PFAS, AWWA conducted an analysis of PFAS occurrence data that was collected from nearly 8,000 water systems by Corona Environmental Consulting (Corona, 2021). The results of this analysis are shown in the table. While some systems may detect more than one of these PFAS, the occurrence of these PFAS together at levels above the HBWC are much more limited, if at all.

Table 4-1: Co-Occurrence of PFBS, PFHxS, and PFNA in Drinking Water (N=7,989) (Corona, 2021)

[Table 4-1: See Docket ID EPA-HQ-OW-2022-0114-1759]

While there are scientific studies evaluating the hypothesis that exposure to multiple PFAS may lead to adverse health effects, the proposal and its supporting documentation do not substantiate a preliminary determination nor a determination to regulate the mixture of PFHxS, PFNA, HFPO-DA, and PFBS. There is a lack of information showing co-occurrence and, therefore, co-exposure to these compounds.

EPA Response: Please see sections 3.1.2, 3.2.2, and 6.3 of the EPA response in this *Response to Comments* document. The agency disagrees that it also presented information on detections and does not consider the relative proportions of each of the four PFAS within the

Hazard Index. The purpose of the Hazard Index is to consider varying proportions of the Hazard Index PFAS which can collectively co-occur in different combinations of mixtures resulting in dose additive adverse health concerns when they are simultaneously co-occurring in these mixtures. Since each of the component Hazard Index PFAS are individually compared to their respective HBWC value, their proportions to the overall Hazard Index are appropriately accounted for and one or more Hazard Index PFAS will not bias the results. The EPA further disagrees that it does not present necessary information to indicate the levels of the detected compounds in its Hazard Index analyses, nor are the Hazard Index results presented biased – they are based on measured concentration samples with co-occurring Hazard Index PFAS.

The EPA disagrees with the commenter's claim that most of the information on co-occurrence of these compounds is relative to PFOA and PFOS and that the co-occurrence of the Hazard Index PFAS with PFOA and PFOS does not support demonstration of the Hazard Index PFAS co-occurring. As described in sections VI.C. and VI.D. of the final rule preamble because not as many states have monitored for the Hazard Index PFAS as compared to PFOA and PFOS, their occurrence information is less extensive than the occurrence information for PFOA and PFOS. Therefore, establishing co-occurrence of Hazard Index PFAS with PFOA and PFOS is important to better understand the likelihood of Hazard Index PFAS occurrence. The EPA evaluated this through its groupwise analysis (which was only a part of the agency's co-occurrence analyses), where results generally indicated that when PFOA and PFOS were found, Hazard Index PFAS were considerably more likely to also be present, and also concluded that when Hazard Index PFAS were found (with no consideration of PFOA and PFOS) it was more likely multiple Hazard Index PFAS were present than a single Hazard Index PFAS. In fact, when evaluating only a subset of the available state data representing non-targeted monitoring where either three or four Hazard Index PFAS were monitored, regardless of whether PFOA or PFOS were reported present, two or more of the Hazard Index PFAS were reported in approximately 12.1 percent of monitored systems. Additionally, for systems that only measured PFOA and/or PFOS and did not measure the Hazard Index PFAS, it can be assumed that the Hazard Index PFAS are more likely to be present in those systems, and that Hazard Index occurrence may be underestimated. Moreover, while PFOA and PFOS are not included within the Hazard Index PFAS or the determination to regulate mixtures of these PFAS, the pervasive occurrence of PFOA and PFOS shown in section VI of the final rule preamble is a strong indicator that these other Hazard Index PFAS are also more likely to be found than what has been reported in state monitoring data to date.

Regarding the PFAS occurrence analysis referenced by the commenter, the EPA evaluated this report and determined it uses a non-nationally representative set of systems to extrapolate to the nation. The set of systems included the 4,920 UCMR 3 systems but added an additional 3,069 systems from select states. New England accounted for about 70 percent of these additional systems (1,142 were in New Hampshire, 605 were in Vermont, 298 were in Massachusetts, and 73 in Rhode Island). An example of the impact of this approach is that New Hampshire went from representing less than 0.5 percent of systems in the nationally representative set of systems in UCMR 3 to representing over 14.6 percent of systems included in the Black & Veatch

extrapolation. Similarly, Vermont went from representing about 0.24 percent of UCMR 3 systems to representing about 7.7 percent of the systems in the final set of systems used for extrapolation. This indicates substantial bias in results that overrepresents the New England region. Thus, the agency asserts the results of this analysis would not be nearly as representative as the analysis conducted by the EPA and presented in the proposed and final rule preamble.

3M Company (Doc. #1774, SBC-045663)

b. EPA Has No Meaningful or Sound Occurrence Data for the HI MCL Substances

The SDWA requires that before it can promulgate an NPDWR, EPA must determine that, among other things, the substance is "known to occur or there is substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern.3 [FN33: SDWA [sec]1412(b)(1)(A)(i) and (ii).] Alleged co-occurrence of the four HI-PFAS is the basis for EPA's HI MCL. EPA's justification for the HI approach depends in part on the four HI-PFAS substances most frequently co-occurring as a mixture, rather than individually. [FN34: For PFHxS, the median sample concentrations range from 2.14 to 11.3 ppt. The HRL for this substance is 9.0 ppt. For HFPO-DA, the median sample concentrations range from 1.7 to 9.7 ppt. The HRL for this substance is 10.0 ppt. For PFNA, the median sample concentrations range from 2.1 to 7.46 ppt. The HRL for this substance is 10.0 ppt. For PFBS, the median sample concentrations range from 1.99 to 7.26 ppt. The HRL for this substance is 2000.0 ppt. The maximum sample did not even exceed the HRL for PFBS.] But EPA's analysis does not demonstrate that there is substantial likelihood that the four HI-PFAS co-occur with each other. Instead, EPA analyzed where any of the four HI-PFAS individual and either PFOA or PFOS co-occur.

Exhibit 6-3 summarizes co-occurrence of combinations of PFAS in the UCMR3 data. The combination of the four HI-PFAS is not listed. [FN35: Many of the combinations included in Exhibit 6-3 indicate PFHpA is detected, which is irrelevant to the proposed regulation of the four HI-PFAS as a mixture, given that PFHpA is not one of the four HI-PFAS.] Importantly, it appears there were no records in the UCMR3 data of the four HI-PFAS co-occurring.

Section 6 of the Background Support Document (USEPA 2023h) presents analyses of the co-occurrence rate of PFOA, PFOS and any of the four HI-PFAS, but does not specifically address co-occurrence of the four HI-PFAS proposed for regulation as a mixture using the HI approach. The analyses, discussion, and Exhibits 6-2, 6-4 and 6-5 also focus on co-occurrence of PFOA and PFOS with the four HI-PFAS, rather than co-occurrence of the four HI-PFAS with each other. That analysis is irrelevant to the decision to regulate the four HI-PFAS as a mixture, since neither PFOA nor PFOS is included in the group to be regulated as a mixture.

There are also significant issues with the sampling on which EPA relies that call into question the reliability of the data. Data are evaluated at the sample and PWS level, though it is not clear if sample counts represent unique locations or include multiple samples from the same location. Evaluating multiple samples from the same location within a system could overestimate the

frequency of co-occurrence. The co-occurrence data presented at the system level for detection of any HI-PFAS show wide variability among states (USEPA 2023h, p. 197). And the states with the most systems tested, Michigan and Ohio, show much lower frequency of detection of any HI-PFAS (i.e., 6.5 percent and 3.9 percent respectively) than states with fewer system tested (USEPA 2023h, p. 197). This observation suggests that data from states with fewer systems sampled may not be representative of occurrence in those states.

EPA's failure to include all states' data violates the fundamental scientific principle that one cannot selectively use data to generate a preferred outcome. The data set used covers 11 states and is described as "limited to samples from non-targeted monitoring efforts where at least one HI PFAS was analyzed and PFOS and PFOA were analyzed sufficiently to determine whether one was present." Although the state of Alabama analyzed for all four HI-PFAS and PFOA and PFOS, data from Alabama are not presented and no explanation for the omission is provided (USEPA 2023h, p. 11). Sampling efforts are ongoing in 6 of the 11 states presented (Illinois, Massachusetts, Michigan, New Hampshire, New Jersey, and Vermont); for these states, data collected after May 2021 are available but are not used by EPA for the co-occurrence analysis (USEPA 2023h, p. 11). EPA's PFAS Analytical Tools webpage (https://echo.epa.gov/trends/pfas-tools) lists data for several additional states (e.g., Oregon, Rhode Island) also not considered in EPA's co-occurrence analysis.

EPA also uses different data sets for the evaluations of co-occurrence and of affected systems, creating a fundamental disconnect such that one analysis cannot be used to inform the other. For example, in estimating the number of systems affected by the proposed MCLs, EPA uses an occurrence model that incorporates data from 17 states (USEPA 2023f, p. 18678). The 17 states include Arizona, California, Delaware, Georgia, Maine, and Pennsylvania (Cadwallader 2022). For these states, EPA considers the sampling "targeted" and omits them from the cooccurrence evaluation (USEPA 2023h, p. 11). Conversely, data from the state of Colorado are included in the co-occurrence evaluation but are not included in this modeling of affected systems. Different and unstated rationale for including state data for these two purposes suggest that those criteria were arbitrary.

EPA failed to include more recent samples that would improve the representativeness of the analysis. Specifically, EPA's analysis of co-occurrence does not include samples collected after May 2021 and uses different data sets than are used for EPA's occurrence modeling. The data set used to evaluate co-occurrence is limited to data available on public state websites through August 2021, which was limited to samples collected through May 2021.

EPA Response: See section 3.2.2 of the EPA response in this *Response to Comments* document. The commenter incorrectly states that the referenced support document (USEPA, 2023b) does not present co-occurrence of the Hazard Index PFAS without also considering co-occurrence with PFOA and PFOS, as these analyses are clearly provided in Exhibits 5-52, 5-53, 6-12, and 6-13 displaying the EPA's Hazard Index analyses and the EPA's pairwise odds ratios co-occurrence analyses of the extensive amount of available state data. Additionally, the EPA disagrees with the commenter that the EPA only analyzed where any of the Hazard Index PFAS

and either PFOA or PFOS co-occur as the EPA conducted multiple co-occurrence analysis, only some of which considered PFOA and PFOS co-occurrence with the Hazard Index PFAS. The EPA further disagrees with the commenter that consideration of co-occurrence of the Hazard Index PFAS with PFOA and PFOS does not support demonstration of the Hazard Index PFAS co-occurring or that it is an irrelevant analysis. As described in sections III.C, VI.C. and VI.D. of the final rule preamble because not as many states have monitored for the Hazard Index PFAS as compared to PFOA and PFOS, their occurrence information is less extensive than the occurrence information for PFOA and PFOS. Therefore, establishing co-occurrence of Hazard Index PFAS with PFOA and PFOS is important to better understand the likelihood of Hazard Index PFAS occurrence. The EPA evaluated this through its groupwise analysis (which was only a part of the agency's co-occurrence analyses), where results generally indicated that when PFOA and PFOS were found, Hazard Index PFAS were considerably more likely to also be present, and also concluded that when Hazard Index PFAS were found (with no consideration of PFOA and PFOS) it was more likely multiple Hazard Index PFAS were present than a single Hazard Index PFAS. In fact, when evaluating only a subset of the available state data representing non-targeted monitoring where either three or four Hazard Index PFAS were monitored, regardless of whether PFOA or PFOS were reported present, two or more of the Hazard Index PFAS were reported in approximately 12.1 percent of monitored systems Additionally, for systems that only measured PFOA and/or PFOS and did not measure the Hazard Index PFAS, it can be assumed that the Hazard Index PFAS are more likely to be present in those systems, and that Hazard Index occurrence may be underestimated. Moreover, while PFOA and PFOS are not included within the Hazard Index PFAS or the determination to regulate mixtures of these PFAS, the pervasive occurrence of PFOA and PFOS shown in section VI of the final rule preamble is a strong indicator that these other Hazard Index PFAS are also more likely to be found than what has been reported in state monitoring data to date.

The agency disagrees with the commenter's claim that there are significant issues with the sampling that call into question the reliability of the data. Appropriately, the EPA evaluates the data at both the sample and system level to ensure accurate representation of the available data and that it is not overestimated. In some instances, there may be unique locations that conducted multiple sampling efforts that EPA accounts for in its analyses. There is no scientifically valid reason why the EPA would not count these multiple results and include within its analyses since they are unique sampling events, however this is accounted for in the system level analyses where the system is included only once to ensure no over-representation. Further, while EPA agrees with the commenter there is variability across the states, using the two states referenced by the commenter, Michigan and Ohio, Table 13 in the final rule preamble which provides a summary of systems exceeding the Hazard Index (based on non-targeted state datasets only), shows that Michigan and Ohio have a higher percent of systems exceeding the EPA's final Hazard Index of 1 than over half of the states included within that table. This observation would instead suggest that due the variability noted by the commenter and agreed with by the EPA, there is no correlation between number of systems tested and frequency and/or level of detection.

The commenter claims that EPA failed to include all states' data and "selectively used data to generate a preferred outcome." The EPA strongly disagrees with the commenter's inaccurate assertion and, as described in section 6.2 of the EPA response in this *Response to Comments* document, the agency evaluated all best available state data which includes updated data for the final rule from 32 states through May 2023. The agency evaluated these data as they were presented directly by states, ensuring sufficient quality assurance; therefore, the agency did not selectively use the data and represented it transparently and accurately for its intended purpose. For some purposes, this was to separately present the non-targeted (or data not collected solely in areas of known or potential contamination) so as to not do exactly what the commenter claims and potentially over-represent or bias the data results. The agency clearly stated this intended purpose in the proposed and final rule preamble (see proposed rule sections III.B.5 and III.C.5 and final rule section III.C.). Additionally, for some states such as Alabama referenced by the commenter, which only reported data for detections, it would not have been appropriate to include frequency of detection as there could not be accurate representation of that dataset without also including the non-detection sample results. The commenter incorrectly states this explanation was not included as it was clearly articulated in the proposed and final rule preamble, as well as the proposed rule *Occurrence Technical Support Document* (see Exhibit 2-4; USEPA, 2023b).

Regarding the commenter's claim that the EPA did not include its rationale for using the state data differently for varying analysis purposes, as discussed previously in this response, the agency disagrees and within sections III and VI of the final rule preamble EPA clearly articulates its rationale which includes that "due to the reporting limitations of some of the available state data (e.g., reporting combined analyte results rather than individual analyte results), the EPA did not utilize all of these data in the subsequent occurrence analyses/co-occurrence analyses." Consequently, the criteria were not arbitrary as suggested by the commenter. Specific to the EPA's national occurrence model, please see section 6.5 of the EPA response in this *Response to Comments* document.

Little Hocking Water Association (Doc. #1835, SBC-045513)

Additional occurrence data for HI PFAS supports EPA's proposed determination that these PFAS should be regulated under the SDWA.

One statutory criterion for regulation under the SDWA is a determination that there is a substantial likelihood that contaminants at issue will occur and co-occur with a frequency and at levels of public health concern in public water supplies, based on EPA's evaluation of the best available occurrence information. In the proposed rule, EPA is proposing to determine that this statutory criterion has been met for PFHxS, HFPO-DA, PFNA and PFBS (the HI PFAS), and EPA is seeking public comment on whether additional data or studies exist which EPA should consider that support or do not support this preliminary decision. EPA also "requests comment on additional occurrence data the Agency should consider regarding its decision that PFHxS,

HFPO-DA, PFNA, and PFBS and their mixtures occur or are substantially likely to occur in PWSs with a frequency and at levels of public health concern."

Data on co-occurrence of PFHxS, HFPO-DA, PFNA and PFBS supports EPA's determination that the HI PFAS will occur and co-occur in public water supplies with a frequency and at levels that require regulation.

1) As discussed above in the section titled "Support of preliminary regulatory determinations for PFHxS, HFPO-DA, PFNA, and PFBS," Attachment 3 shows the presence of HFPO-DA in Little Hocking's raw water and the exponential increase of the concentrations of HFPO-DA since February 2018 (data from Chemours, 2023a).

2) Also as discussed above, the presence of HFPO-DA in the Belpre raw water as well as the two lead beds of its GAC filtration system were documented to be present at concentrations of 2.3 ppt, 2.4 ppt and 2.6 ppt, respectively (data from Chemours, 2023b). This data is from March 20, 2023 wherein Chemours began reporting for the first time in 17 years of testing for 18 PFAS analyzed using Method 537.1. The data for the monthly sampling in April 2023 is not yet publicly available, but, based on results from Little Hocking (which is 3.8 miles away), HFPO-DA will likely continue to be present and reported.

3) The table below shows concentrations of PFAS in Belpre raw water and the lead beds of its GAC System on and shows the presence of three of the four HI PFAS that are proposed to be regulated using the Hazard Index MCL (March 20, 2023 data from Chemours, 2023b). This table is the only data available for Belpre and shows that not only is HFPO-DA present in the raw water (at 2.3 ppt), but that concentrations of PFBS (at 24 ppt) and PFHxS (at 35 ppt) are also present. This data shows the co- occurrence of these chemicals and also shows that the concentration of PFHxS alone would exceed the hazard index of 1 (35/9 = 3.89, which is >1).

[Table 1: See Docket ID EPA-HQ-OW-2022-0114-1835]

4) The table above showing data for the occurrence of HI PFAS in the two GAC system lead beds for the Belpre water system also shows that even in the lead beds, calculation of the HI would result in an exceedance of the proposed hazard index. For example, the hazard index for 1N Lead would be calculated as follows:

[Table 2: See Docket ID EPA-HQ-OW-2022-0114-1835]

Similarly, lead bed 1S, would also exceed the proposed hazard index as follows:

[Table 3: See Docket ID EPA-HQ-OW-2022-0114-1835]

5) The four available dates for which Chemours has made data available for all 18 PFAS sampled under Method 537.1 show that of the four HI PFAS, only HFPO-DA is present. The table below (data source: Chemours, 2023a) shows additional PFAS that are not currently proposed to be regulated (PFHxA and PFHpA) are present in Little Hocking's raw water:

[Table 4: See Docket ID EPA-HQ-OW-2022-0114-1835]

And PFHxA and PFHpA were present in the east lead bed of Little Hocking's GAC plant on May 8, 2023, as shown in the below table (data source: Chemours, 2023a).

[Table 5: See Docket ID EPA-HQ-OW-2022-0114-1835]

However, due to the testing methodology used, the conclusion cannot be drawn that PFBS and PFHxS are absent in the raw water. Due to the elevated concentrations of PFOA in the raw water on the order of 7,000 ppt (see Attachment 1), Chemours has instructed the laboratory to analyze the raw water samples at a dilution of 5X and 50X. Although this is reportedly designed to protect the laboratory equipment for carry-over, the resulting reporting limit has ranged from 8.3 ppt to 9.5 ppt, thus effectively preventing detections of lower concentrations of other compounds of interest.

6) Co-occurrence of HI PFAS with PFOA and PFOS are not limited to the mid-Ohio Valley. In 2020, the Ohio EPA tested approximately 1500 public water supplies for six PFAS including PFOA, PFOS, HFPO-DA, PFBS, PFHxS and PFNA (data from which is reported in other sections of the proposed rule). Of the approximately 1500 public water systems tested, two public water systems were found to exceed the Ohio EPA action level of 70 ppt for PFOA or PFOS or the two combined. One of those systems, the Aullwood Audubon Center in Dayton, Ohio was served by a well that was contaminated and was ultimately connected to a public water supply that did not have measurable concentrations of PFAS that exceeded an Ohio Action Level.

7) Although the contamination was addressed in the public water system, the Ohio Department of Health was subsequently concerned that the area around the Aullwood Audubon Center was served by private water wells that utilized the same aquifer. Testing of 49 private wells for the same six PFAS (PFOA, PFOS, HFPO-DA, PFBS, PFHxS, and PFNA) showed the presence of PFAS in five of the private wells (Ohio Department of Health, 2021). The Ohio Health Department encouraged private well owners to have their wells tested.

8) A larger study of private wells in the area was conducted by Montgomery County, Ohio and Butler Township under a contract. As part of this contract, 155 wells were sampled for 18 PFAS by Method 537.1 in 2022 and 2023. The publicly-available portion of the results from the study are posted on the Butler Township Website (2023) and show that 70 of the 155 wells sampled had detections of at least one PFAS and two had concentrations of PFOA/PFOS that exceeded 70 ppt. Of the 18 PFAS that were tested for, there were detections of seven different PFAS, including three of the four of the HI PFAS proposed to be regulated under this proposed rule. The table below shows the maximum concentration of each of the detected PFAS (data source, Butler Township Website, 2023). Calculations showed that of the 70 private wells with detections, 34 locations would exceed the proposed MCLs for PFOA or PFOS. Calculations also showed that two additional wells that did not already exceed the proposed MCLs for PFOA and/or PFOS would exceed the proposed hazard index. If a private well exceeded the proposed MCL for PFOA and/or PFOS, the hazard index was not calculated separately, but some wells would also have exceeded the hazard index. Although this data was collected from private wells,

it is representative of the concentrations in the aquifer that was utilized by Aullwood Audubon and is still used by other smaller public water supplies.

[Table 6: See Docket ID EPA-HQ-OW-2022-0114-1835]

EPA Response: Please see section 3.2.2 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045891)

3. The co-occurrence data do not support a listing for the mixture of the four PFAS

To attempt to support its proposal to regulate these four PFAS as a mixture, EPA uses the UCMR 3 data to evaluate co-occurrence of PFAS [FN44: U. S. EPA, PFAS Occurrence and Contaminant Background Support Document, 2023, EPA–822–P–23–010, at 192-194, available at: https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0037.]. Focusing on detections (e.g., occurrences above the minimal reporting level), these data show 11 occurrences of PFNA, 27 occurrences of PFHxS, and 3 occurrences of PFBS. As presented, however, it is impossible to discern the co- occurrences of these four PFAS due to a lack of occurrences in the available data. If we include PFOA and PFOS in considering occurrence, only one occurrence also includes PFHxS and PFNA. As PFOA and PFBS only co-occurred twice, it is likely that PFBS never co-occurred with PFHxS, PFNA, PFOA, and PFOS. If it had, EPA likely would have presented those data. In the state data, there was co-occurrence of all six PFAS in only 0.3% of the samples [FN45: Id. at exhibit 6-8.]. While EPA relies on an analysis by Cadwallader et al., 2022, to evaluate co-occurrence, that study's model did not include PFBS and PFNA because the reported values from UCMR 3 were insufficient to fit a national model [FN46: Cadwallader, A., Greene, A., Holsinger, H., Lan, A., Messner, M., Simic, M., and Albert, R. 2022. A Bayesian Hierarchical Model for Estimating National PFAS Drinking Water Occurrence. AWWA Water Science, 4(3):1284. https://doi.org/10.1002/aws2.1284.]. It is also worth noting that Cadwallader et al., 2022, referred to the state datasets as being "insufficient" to act in place of UCMR data [FN47: Id.]

EPA Response: Please see section 3.2.2 of the EPA response in this *Response to Comments* document. The EPA disagrees that the co-occurrence analyses do not support the EPA's determination to regulate mixtures of the four Hazard Index PFAS as described in section VI.C. and III.C. of the final rule preamble and also within section 6.3 of the EPA response in this *Response to Comments* document. The commenter's co-occurrence analysis also only includes consideration of UCMR 3 data, and does not provide an evaluation using the extensive amount of available state data, which, as described in section 6.1 of the EPA response in this *Response to Comments* document, have significantly lower reporting limits than were available under UCMR 3. Consequently, the agency has supplemented these data with available state data to ensure consideration of all best available information. Furthermore, the EPA asserts that the mixture approach for the Hazard Index PFAS does not require all four Hazard Index PFAS to be present simultaneously to be health protective, and combined with this factor, as well as the lack of state

data considered, the commenter's analysis would not be representative of the best available occurrence information.

American Water Works Association (AWWA) (Doc. #1759, SBC-045595)

AWWA recommends that if EPA is interested in addressing additional PFAS through a regulatory determination for a mixture of PFAS, that EPA reconsider their approach to addressing PFAS as a mixture and delay re-issuing a preliminary determination until after the data collection activities for UCMR 5 are complete. Delaying this action would also ensure that EPA may consider health assessments for additional PFAS, which are currently in development (EPA, 2023b).

EPA Response: Please see sections 3.2.2, 3.1.2, and 6.8 of the EPA response in this *Response to Comments* document regarding the EPA's evaluation of the second regulatory determination statutory criterion on occurrence as well as UCMR 5. Please see sections 3.1.1, and 3.2.1 of the EPA response in this *Response to Comments* document pertaining to the EPA's evaluation of the first regulatory determination statutory criterion on health effects.

American Chemistry Council (ACC) (Doc. #1841, SBC-052933)

The proposal to address mixtures of the four PFAS also relies on an assumption that the substances co-occur in the nation's drinking water. As described in more detail below, however, EPA does not have national occurrence for PFBS, HFPO-DA, and PFNA.

EPA Response: Please see section 3.2.2 of the EPA response in this *Response to Comments* document. For additional information related to occurrence for PFBS, HFPO-DA, and PFNA, please see section 3.1.2 of the EPA response in this *Response to Comments* document.

3.2.3 Statutory Criterion #3 - Meaningful Opportunity for Mixture of Four PFAS

Summary of Major Public Comments and EPA Responses

The EPA received many comments on the agency's evaluation of the third statutory criterion under Section 1412(b)(1)(A) of SDWA. As demonstrated through comments within this section and section 3.1.3, most commenters supported not only the EPA's evaluation under the preliminary determination that individual regulation of PFHxS, PFNA, HFPO-DA, and PFBS meet the third statutory meaningful opportunity criterion, but also expressed support for the EPA's preliminary determination that mixtures of these four contaminants also presents a meaningful opportunity for health risk reduction and that the EPA has sufficiently justified this statutory criterion as well as the health and occurrence criterion. These commenters shared many of the same supporting factors of meaningful opportunity for both individual regulation of PFHxS, PFNA, and HFPO-DA, as well as mixtures of these three PFAS and PFBS. The EPA agrees with these commenters and refers to the comments and the EPA's response in section 3.1.3 in this *Response to Comments* document.

Specifically, a few commenters provided comment on the EPA's evaluation of meaningful opportunity of mixtures of these four PFAS based on the treatment technologies which can remove all of the six PFAS for which the EPA is finalizing regulation. The majority of these commenters noted the meaningful opportunity to not only provide protection from the six regulated PFAS, but also other PFAS that will not be regulated as a part of this action, with one commenter providing it was unclear if that is a reasonable assumption. The agency agrees with commenters that there is meaningful opportunity to simultaneously provide protection to PFAS other than the six being regulated under this final rule as the technologies that will remove these six PFAS can also remove other PFAS therefore it is reasonable to assume they will have some co-removal benefits. The EPA does acknowledge, however, that drinking water treatment systems will achieve greater removal efficiencies if the systems are developed and optimized to target specific PFAS.

Several commenters both in this section and section 3.1.3 did not support the EPA's overall evaluation of the third statutory criterion, also offering many of the same opposition factors and that the EPA failed to justify that there is a meaningful opportunity for both individual regulation of PFHxS, PFNA, and HFPO-DA, as well as mixtures of these three PFAS and PFBS. The EPA disagrees with these commenters that the agency failed to justify that there is meaningful opportunity for health risk reduction or that the EPA provided limited rationale and factors in its meaningful opportunity evaluation for these contaminants as mixtures. As described in the EPA's March 2023 proposal and in section III.D. of the final rule preamble, the EPA fully considered many factors specific to mixtures including dose additive toxicity and health concerns, co-occurrence of mixtures of these four PFAS at frequencies and levels of public health concern, availability of similar treatment technologies to remove these four PFAS and analytical methods to measure them, and their collective chemical and physical properties leading to their environmental persistence. Additionally, the EPA notes the proposed and final rule preamble, and as demonstrated through representative co-occurrence data, for mixtures of the four co-occurrence is not only at a regional or local level, rather it covers multiple states throughout the country; therefore, a national level regulation is necessary to ensure all Americans served by PWSs are equally protected.

Some comments indicate that the health and occurrence information do not support that establishing drinking water standards presents a meaningful opportunity for health risk reduction. The agency disagrees with the commenters' assertion that the health and occurrence information are insufficient to justify a drinking water standard as supported in sections III.B. and III.C. of the final rule preamble, and the agency finds that there is a meaningful opportunity for health risk reduction potential based upon multiple considerations including the population exposed to mixtures of PFHxS, PFNA, HPFO-DA, and/or PFBS including sensitive populations and lifestages, such as newborns, infants and children.

Other comments assert that the EPA must evaluate the potential implementation challenges and cost considerations of regulation as part of the meaningful opportunity evaluation. As stated in the EPA's response 3.1.3, the EPA disagrees with these commenters. SDWA states that that the

meaningful opportunity is in the sole judgement of the Administrator and does not require that the EPA consider costs for a regulatory determination. The SDWA does require that costs and benefits are presented and considered in the proposed rule's HRRCA which the EPA did for the proposal and has updated as a part of the final rule within section XII.

New York City Department of Environmental Protection (NYCDEP) (Doc. #1679, SBC-044204)

May 30, 2023

Michael S. Regan, Administrator

U.S. Environmental Protection Agency EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 28221T

1200 Pennsylvania Avenue NW Washington, DC 20460

(Via Federal eRulemaking Portal)

Re: Comment on EPA's Per-and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation

Docket ID No. EPA- HQ- OW- 2022- 0114

Dear Administrator Regan,

As the largest water supply in the nation, with both unfiltered and filtered systems, the New York City Department of Environmental Protection (DEP) supports the US Environmental Protection Agency's (EPA) goal of protecting public health by reducing exposure to per- and polyfluorinated substances (PFAS). In addition to having conducted monitoring for PFAS compounds at the entry points to the distribution system (EPTDS) as required by the third Unregulated Contaminant Monitoring Rule (UCMR), DEP conducts ongoing, proactive monitoring as part of an emerging contaminant monitoring effort. In 2016, New York State (NYS) became the first state in the nation to regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS). In 2020, NYS set drinking water maximum contaminant levels (MCLs) for PFOA and PFOS at 10 ppt. NYS is also currently considering additional drinking water standards and notification levels for up to 23 PFAS.

Hazard Index

EPA's proposed National Primary Drinking Water Regulation (NPDWR) would establish Maximum Contaminant Level Goals (MCLGs) of zero and Maximum Contaminant Levels (MCLs) of 4.0 parts per trillion (ppt) for both PFOA and PFOS, which are more stringent than any current state regulation. The proposed action would also implement the use of a Hazard Index (HI) to consider the combined toxicity for perfluorononanoic acid (PFNA), GenX Chemicals, perfluorohexane sulfonate (PFHxS) and perfluorobutanesulfonic acid (PFBS). Hazard Indices have never been used for national drinking water regulations.

In section III.F. p. 18652, EPA seeks comment on "evaluation that regulation... will provide protection from PFAS that will not be regulated as part of the proposed PFAS NPDWR." It is not clear that this is a reasonable assumption. PFAS compounds seem to be tailored for specific industries, and, therefore, the assumption of co-occurrence seems less a result of the pollutant source and more a result of the ubiquitous nature of forever chemicals collecting in watersheds. As EPA identifies toxicity and occurrence data, other compounds should be regulated specifically as individual analytes or within an HI.

EPA Response: Please see section 3.2.3 of the EPA response in this *Response to Comments* document.

Aidan Cecchetti (Doc. #1640, SBC-044358)

We have developed the comments contained within this letter to address some of the issues we believe to be most important for EPA to consider when revising and promulgating a final PFAS NPDWR. Our most critical comments are summarized in Table 1.

Table 1: Summary of comments on the proposed PFAS NPDWR.

[Table 1: See Docket ID: EPA-HQ-OW-2022-0114-1640]

*In Docket ID: EPA-HQ-OW-2022-0114 contained within Federal Register Vol. 88, No. 60.

Additional details regarding the topics highlighted in Table 1, and other topics discussed in Docket ID: EPA-HQ-OW-2022-0114, are included in our full comments in the following section. As relevant, we have included the language of EPA's requests for comments from the Federal Register as well as page numbers to make clear to which requests we are responding. All page numbers are taken from Federal Register Vol. 88, No. 60.

Full Comments on EPA's Proposed PFAS NPDWR

• EPA requests comment on its evaluation that regulation of PFHxS, HFPO-DA, PFNA, PFBS, and their mixtures, in addition to PFOA and PFOS, will provide protection from PFAS that will not be regulated under this proposed rule (pg. 18652 Federal Register Volume 88, Number 60).

o The commenters agree with EPA's determination that the regulation of the listed PFAS will also provide some level of protection from PFAS not currently regulated in the proposed NPDWR. The most common treatment methods available for removal of PFHxS, HFPO-DA, PFNA, PFBS, PFOA, and PFAS (e.g., GAC, RO, and ion exchange) will also provide for some level of removal of non-regulated PFAS. However, the degree of public health protection provided to non-regulated PFAS is nonquantifiable without additional data on occurrence, toxicity, and effectiveness of treatments in removing those additional PFAS, particularly when PFAS are present in variable mixtures.

EPA Response: Please see section 3.2.3 of the EPA response in this *Response to Comments* document.

3.3 EPA's Concurrent Preliminary Regulatory Determination and Proposed NPDWR

Summary of Major Public Comments and EPA Responses

The EPA received several comments related to the EPA's interpretation in the proposal that the agency may, as it did here, issue a preliminary regulatory determination concurrent with a proposed NPDWR. Many stated that the EPA is authorized under SDWA to process these actions concurrently and agreed with the EPA's interpretation of the statute, noting that the EPA has followed all requirements under SDWA including notice and opportunity for public comment on both the preliminary regulatory determination and proposed NPDWR, and that simultaneous public comment periods are not precluded by SDWA. Several other commenters expressed disagreement with the EPA's interpretation. These dissenting commenters contend that the statute only allows the EPA to "publish such proposed regulation concurrent with the determination to regulate" (i.e., in their view, the final determination), not the "preliminary determination to regulate." Moreover, some of these commenters further indicated that they believe the EPA's final determination to regulate must precede the EPA's proposed regulation. The EPA disagrees with commenters who stated that the EPA cannot issue a preliminary determination concurrent with a proposed NPDWR. Section 1412(b)(1)(e) states that "[t]he Administrator shall propose the maximum contaminant level goals and national primary drinking water regulation for a contaminant not later than 24 months after the determination to regulate under subparagraph (B), and may publish such proposed regulation concurrent with the determination to regulate" (emphasis added). The EPA maintains its interpretation that "determination to regulate" in the second phrase of 1412(b)(1)(E) allows for concurrent processing of a preliminary determination and proposed rule, not a final determination and proposed rule.

The first clause of the provision provides an enforceable 24-month deadline for the EPA to issue a proposed rule once it has decided to regulate. Contrary to the suggestion of some commenters, the statutory language providing that the EPA "shall" propose an NPDWR "not later than 24 months after the determination to regulate" states when the 24 months to issue a proposed rule begins, i.e., the deadline is 24 months after making a final determination to issue a proposed regulation. The phrase "after the determination to regulate" here simply identifies when SDWA's deadline begins to run; there is no textual or other indication in the language that Congress meant it to constitute the beginning of an exclusive 24-month window in which the EPA is permitted to propose an NPDWR. Further, though the EPA's reading is clear on the face of the provision, it is also supported by language elsewhere in SDWA illustrating that when Congress intends to provide a window for action -- as opposed to a deadline for action -- it knows how to do so clearly. In fact, Congress did so in this very provision when it required the EPA to "publish a maximum contaminant level goal and promulgate a national primary drinking water regulation within 18 months after the proposal thereof." See also, 42 U.S.C. section 1448 (providing, among other things, that petitions for review of the EPA regulations under SDWA "shall be filed within the 45-day period beginning on the date of the promulgation of the regulation …")

(emphasis added). In addition, the phrase "not later than," expressly acknowledges that the EPA may issue a proposed rule concurrent with a final determination. And because this language only provides a deadline without a beginning trigger, the language in the first clause of this provision would also not preclude the EPA from issuing a proposed rule at any time prior to the expiration of the 24 months after a final regulatory determination, including issuing the proposed rule on the same day as the preliminary regulatory determination.

The second clause, which states that the Administrator "may publish such proposed regulation concurrent with the determination to regulate" should not be read to limit when the EPA can issue a proposed rule prior to a final determination. First, Congress's use of the phrase "determination to regulate" elsewhere in SDWA is not consistent, requiring the agency to discern its meaning based on statutory context. Second, reading "determination to regulate" to refer to a final determination would, without good reason, hinder Congress' goal in enacting this provision, to accelerate the EPA action under SDWA. Finally, the EPA's interpretation to allow for concurrent processes is fully consistent with, and indeed enhances, the deliberative stepwise process provided in the statute for regulating new contaminants.

Language throughout the statute demonstrates that Congress did not use the term "determination to regulate" consistently. In fact, "preliminary determination" only appears once in the entire provision, "final determination" is never used, and the remainder of the references simply refer to "determination." Specifically, section 1412(b)(1)(B)(ii)(I) expressly requires public comment on a "preliminary" regulatory determination made as part of the contaminant candidate listing process. The rest of section 1412(b)(1)(B)(ii) and (iii) as well as the title of the provision only refer to a "determination to regulate" or "determination." For example, 1412(b)(1)(B)(iii) states that "[e]ach document setting forth the determination for a contaminant under clause (ii) shall be available for public comment at such time as the determination is published."[2] Although this provision only refers to a "determination for a contaminant under clause (ii)," this language clearly refers to public comment on a preliminary determination and not a final determination to regulate. The EPA has interpretated "determination" in this paragraph to refer to "preliminary determination" because that is the best interpretation to effectuate Congressional intent to provide public comment prior to issuing a final determination. The EPA has done the same with Section 1412(b)(1)(E) here, as only a reading that allows for, in appropriate cases, concurrent processing of a preliminary determination to regulate and proposed NPDWR allows for rulemaking acceleration by the EPA as Congress envisioned. To the extent there is ambiguity, the EPA's reading of Section 1412(b)(1)(E) is the best one to effectuate these purposes.

The EPA could issue a proposed rule concurrent with a final determination; there is nothing in the statute or the Administrative Procedure Act (APA) that requires the EPA to wait. The SDWA

[2] Even the first clause of Section 1412(b)(1)(E) setting the 24-month deadline uses "regulatory determination" without further clarifying whether it is preliminary or final. Again, it is clear when viewed in context that the term refers to a final determination, as triggering a deadline to propose regulations on a preliminary decision to regulate would not be reasonable, as the agency may change its mind after reviewing public comment, obviating the need for a proposed NPDWR.

gives the EPA 24 months to act after a final determination but does not require the agency to wait 24 months. The "no later than" language in the first clause of Section 1412(b)(1)(E), expressly acknowledges that the EPA may issue a proposed rule concurrent with a final determination. Therefore, construing the second phrase of Section 1412(b)(1)(E) simply to authorize the EPA to issue a proposed rule concurrent with a final determination renders that provision of the statute authorizing the EPA to publish such proposed regulation concurrent with the determination to regulate a nullity. The well-known tools of statutory construction direct the agencies and courts not to construe statutes so as to render Congress's language mere surplusage, yet that it is what commenters' interpretation would do. The EPA's construction is the one which gives meaning to that language.

Moreover, the EPA's interpretation of "determination to regulate" in the phrase "may publish such proposed regulation concurrent with the determination to regulate" in section 1412(b)(1)(E) to be a preliminary determination best effectuates Congress' goal in enacting this provision, to accelerate the EPA action under SDWA when the EPA determines such a step is necessary and the EPA has, as it does here, a sufficient record to proceed with both regulatory determination and regulation actions concurrently. In addition to authorizing concurrent processes, Congress' intent to expedite regulatory determinations when necessary is evidenced more generally by the text and structure of Section 1412(b)(1)(B)(ii). The statute contemplates regulatory determinations could be made as part of the 5-year cycle for the contaminant candidate list under Section 1412(b)(1)(B)(ii)(I) but may also be made at any time under Section 1412(b)(1)(B)(ii)(III). The fact that Congress provided the EPA with express authority to make a regulatory determination at any time is a recognition that the EPA may need to act expeditiously to address public health concerns between the statutory periodic 5-year cycle. The EPA's interpretation of the relevant language in Section 1412(b)(1)(E) best effectuates all provisions of the statute because simultaneous public processes for off-cycle regulatory determinations and NPDWRs allow for administrative efficiency that may be needed to address pressing public health concerns.

Finally, the EPA's interpretation of the statute allowing for concurrent processes is fully consistent with the stepwise process for issuing an NPDWR set out by the statute. Here, the EPA provided for public comment on an extensive record for both the regulatory determinations and the proposed regulatory levels and it is not clear what further benefit would be provided by two separate public comment periods. This is especially true given the D.C. Circuit's ruling in National Resources Defense Council (NRDC) v. Regan, 67 F.4th 397 (D.C. Cir 2023), which held that the EPA cannot withdraw a final determination to regulate a contaminant. Thus, even if the EPA were to provide two separate comment periods, the information provided on a proposed rule cannot be used to undo a final regulatory determination. Indeed, although not required by the statute, the EPA in proposing actions concurrently provides commenters with much more information to evaluate the preliminary regulatory determinations. This is because the EPA has provided not just the information to support the preliminary determinations to regulate but also the full rulemaking record and supporting risk, cost, occurrence, and benefit analysis that supports the proposed MCLs. Further, the EPA has a much more comprehensive record for the

regulatory determinations to ensure that the final determination, which cannot be withdrawn, is based on the comprehensive record provided by the rulemaking and HRRCA development processes.

Washington Suburban Sanitary Commission (WSSC Water) (Doc. #1585, SBC-042768)

Regulatory determination for PFHxS, HFPO-DA. PFNA and PFBS:

EPA has requested comments on its preliminary regulatory determination of PFHxS, HFPODA, PFNA, and PFBS in this rulemaking. WSSC Water disagrees with EPA's interpretation of Section 1412(b)(1)(E) of SDWA, which allows for proposing a drinking water regulation concurrently with a determination to regulate. WSSC Water believes that the three statutory criteria - adverse health effects, occurrence, and meaningful opportunity for public health protection - must be met prior to the final determination to regulate, at which point EPA can propose a regulation. Additionally, since HFPO-DA was not included in the UCMR3 monitoring program, we recommend that EPA postpone the regulatory determination for this compound until a substantial amount of data has been gathered through the UCMR5 program.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. Regarding the EPA's evaluation of the second regulatory determination statutory criterion for HFPO-DA and UCMR 5, please see section 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043099)

Furthermore, the proposed regulation of these compounds concurrently with the preliminary determination is beyond EPA's authority under SDWA. EPA is recommended to re-issue the preliminary determinations following availability of UCMR 5 data and to withdraw and re-issue the proposed regulation following a final determination.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. Regarding UCMR 5, please see sections 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document.

Florida Section American Water Works Association – Water Utility Council (FSAWWA WUC) (Doc. #1737, SBC-044490)

XIV. Request for Comment on Proposed Rule: Section Ill-Regulatory Determinations for Additional PFAS, Section V-Maximum Contaminant Level Goal (MCLG) and Section VI Maximum Contaminant Level (MCL)

The Florida Water Sector recommends EPA remove preliminary regulatory determinations as well as the Hazard Index MCLG and MCLS for PFHxS, HFPO-DA, PFNA, and PFBS from a

final rule. We further recommend EPA obtain more data and information for the four compounds before releasing a potential new regulatory determination.

• We do not support EPA's approach to simultaneously release 4 new PFAS (PFHxS, HFPO DA, PFNA, and PFBS) preliminary regulatory determinations with a proposed MCLG and MCL Hazard Index. The term preliminary shows EPA still has significant questions about the determination themselves and make NPDWR development premature . For comparison, the PFOS and PFAS MCLGs and MCLs were developed two years from the time EPA made their positive regulatory determination and with considerably more information and data.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. For the EPA's evaluation of the regulatory determination statutory criteria for PFHxS, PFNA, HFPO-DA and mixtures of these three PFAS and PFBS, please see sections 3.1, 3.1.1, 3.1.2, 3.1.3, 3.2, 3.2.1, 3.2.2, and 3.2.3 of the EPA response in this *Response to Comments* document. Additionally, the term preliminary does not describe the substance of the regulatory determinations and so does not represent a conclusion that the EPA has significant questions about the determination themselves; preliminary here means these determinations are subject to notice and comment, as these were.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043077)

Additionally, the Agency has noted that SDWA provides EPA with the authority to concurrently propose a determination and to propose a drinking water regulation for these PFAS. In review of the statutory language, SDWA provides EPA with the authority to "publish such proposed regulation concurrent with the determination to regulate." A determination to regulate is distinctly different from a preliminary determination. Specifically, a preliminary determination applies to the proposed action while a determination to regulate applies to a final action. While this language authorizes EPA to propose regulation as part of the same action as a determination to regulate, it does not authorize that the proposed regulation be concurrent with a preliminary determination. This lack of authority further points to the need for the EPA to re-issue a proposed regulation for PFHxS, PFNA, HFPO-DA, and PFBS.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce (Doc. #1537, SBC-042651)

There are a number of other issues associated with the proposed MCLs that deserve in depth discussion, including the benefits identified by the agency, the health end points, and the possible conflict between other Administration policies, such as the energy intensity of the some of the proposed technology solutions and the possible creation of significant volumes of hazardous waste. There are procedural problems as well, as EPA bypassed an important step of the Safe Drinking Water Act two-step process for the four PFAS (other than PFOA and PFOS). EPA is

issuing the preliminary regulatory determination and the national drinking water standard at the same time for these contaminants.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. Regarding the rule benefits, please see section 13.4 of the EPA response in this *Response to Comments* document. Regarding the EPA's response on the first statutory criterion for regulatory determination, please see sections 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document. The EPA notes that while commenter implies this drinking water regulation will result in hazardous waste as regulated under Subtitle C of RCRA, PFAS are not currently regulated as hazardous waste. The EPA included as part of a sensitivity analysis in its EA for this rule estimates of cost for disposal of water treatment residuals in Subtitle C landfills, not because they would be required, but because some entities might elect to use these facilities. As part of that effort, the EPA did an evaluation of the potential impact on hazardous waste landfill capacity and determined that even if water treatment facilities preferentially used Subtitle C landfills it would likely have a negligible impact on the national capacity. The EPA disagrees with the commenters characterization of "possible conflict between other Administration policies" and has followed the requirements of SDWA and all other required statutes in making the regulatory determinations and proposing and finalizing the NPDWRs.

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043441)

Based on the foregoing, EPA must withdraw its Proposed Rule and re-propose in strict compliance with the SDWA and upon an adequate record.

Sincerely,

/s/Laurie Matthews

Laurie Matthews

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043432)

I. EPA's simultaneous issuance of a preliminary regulatory determination and proposal of a MCLG and MCL circumvents the SDWA process.

Prior to this Proposal, EPA has not published a preliminary determination under the SDWA to regulate PFNA, PFHxS, PFBS and GenX. Notwithstanding, the Proposed Rule proposes MCLGs and MCLs for those substances simultaneously with a preliminary regulatory determination. This

is contrary to the statutory language and, accordingly, EPA must re-propose its determination and rescind its proposed MCLGs and MCLs as required by the SDWA.

Section 300g-1(b) of the SDWA sets forth the standards and procedures for regulating previously unregulated substances [FN4: 42 U.S.C. § 300g-1(b). EPA must determine: (1) a contaminant may have adverse health effects; (2) a contaminant is known to occur or substantially likely to occur in public water systems with a frequency and at levels of public health concern; and (3) there is a meaningful opportunity for health risk reduction through a national drinking water regulation]. First, EPA must issue a preliminary determination to regulate. Then, "after notice of the preliminary determination and opportunity for public comment" EPA then determines whether or not to regulate such contaminants [FN5: U.S.C. § 300g-1(b)(1)(B)(ii)(I) (emphasis added).]. EPA may propose MCLGs and MCLs concurrent with, or following, the final determination. Specifically, for any contaminant EPA determines to regulate, EPA shall publish MCLGs and NPDWRs not later than 24 months after the determination to regulate, and may publish such proposed regulation concurrent with the determination to regulate [FN6: 42 U.S.C. § 300g-1(b)(E).]. EPA must publish a MCLG and promulgate a NPDWR within 18 months after the proposal thereof or within the date of any extension. [FN7: Id]

The statutory intent is clear – EPA may propose MCLGs and NPDWRs only after or together with a final determination to regulate. [FN8: See Congressional Research Service, Regulating Contaminants Under the Safe Drinking Water Act (SDWA), R46652 at 11 (January 5, 2022) ("Once the Administrator determines to regulate a contaminant, SDWA requires EPA to propose a 'national primary drinking water regulation'").] If Congress meant otherwise, the allowance that EPA "may" publish an MCLG and NPDWR with the final determination to regulate would be unnecessary. Importantly, to do otherwise would deprive the public of the opportunity to comment on whether EPA's preliminary determination is appropriate and satisfies the regulatory criteria set forth at 42 U.S.C. § 300g-1(b)(1)(A).

This determination is not without regulatory import. In Nat. Res. Def. Council v. Regan, No. 201335 (D.C. Cir. May 9, 2023), the DC Circuit held that once EPA made a determination to regulate a contaminant, it may not withdraw that determination and is obligated to regulate that contaminant. The Court explained that the SDWA "frontloads" EPA's discretion in selecting contaminants for regulation following the procedure set forth in the statute. [FN9: Nat. Res. Def. Council v. Regan at 4.]. Following that, however, the SDWA sets forth a "strict, mandatory scheme governing the regulatory process." [FN10: Id.] Thus, the two-step process ensures that the public has an opportunity to comment, and EPA has an opportunity to consider those comments, prior to making a final regulatory determination and being committed to setting a MCLG and NPDWR.

EPA should not be seeking to compress the SDWA process into one proposal. EPA must reconsider its proposal of MCLGs and MCLs for the four PFAS and, instead, thoroughly consider public comments regarding the use of the best available peer-reviewed science, particularly in connection with its assessment of potential adverse health effects, whether the occurrence data are sufficiently robust and indicate a substantial likelihood of occurrence, and

whether regulation presents a meaningful opportunity for health risk reduction. Only after that should EPA develop proposed MCLGs and MCLs.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. As the EPA has explained, the agency has sufficient information to determine whether to regulate these contaminants and to propose the regulation. The public has been provided with an opportunity to comment on each of these proposals. For the EPA's evaluation of the regulatory determination criteria for both individual contaminant regulation and regulation of mixtures, please see sections 3.1, 3.1.1, 3.1.2, 3.1.3, 3.2, 3.2.1, 3.2.2, and 3.2.3 of the EPA response in this *Response to Comments* document. The EPA has requested and received additional data and information, for both the preliminary regulatory determination and the proposed rule, so an additional notice and comment opportunity is not required.

Western Urban Water Coalition (WUWC) (Doc. #1768, SBC-043949)

III. EPA's Proposed MCLs and MCLGs for PFHxS, GenX Chemicals, PFNA, and PFBS are Premature and Subject to Challenge

WUWC is also concerned that the issuance of a preliminary determination concurrent with proposed MCLs and MCLGs for PFHxS, GenX Chemicals, PFNA, and PFBS conflicts with the SDWA's established process for regulating drinking water contaminants and is vulnerable to legal challenges. The SDWA provides a two-step process for the regulation of drinking water contaminants. First, "after notice of the preliminary determination [to regulate contaminants] and opportunity for public comment," EPA must "make determinations of whether or not to regulate such contaminants."[FN32: SDWA § 1412(b)(1)(B)(ii); 42 U.S.C. §300g-1(b)(1)(B)(ii)] Second, EPA must "publish maximum contaminant level goals and promulgate, by rule, national primary drinking water regulations" for each contaminant EPA determines to regulate. [FN33: SDWA § 1412(E); 42 U.S.C. §300g-1(E)]

In the Proposed Rule, EPA claims that the SDWA allows it to publish a proposed drinking water regulation concurrent with its preliminary determination to regulate. [FN34: 88 Fed. Reg. at 18644 ("Section 1412(b)(1)(E) authorizes EPA to issue a preliminary determination to regulate a contaminant and a proposed NPDWR addressing that contaminant concurrently and request public comment at the same time.")] However, the statute only allows EPA to "publish such proposed regulation concurrent with the determination to regulate," not the "preliminary determination to regulate."[FN35: SDWA § 1412(E); 42 U.S.C. §300g-1(E); see also Nat. Res. Def. Council v. Regan, No. 20-1335, 2023 WL 3312344, at *1 (D.C. Cir. May 9, 2023) (stating that EPA must make a preliminary determination and then may make a final determination "[a]fter the comment period ends" for the preliminary determination).] EPA itself has published materials that document the normal SDWA regulatory process. [FN36: See e.g., U.S. EPA, SDWA Evaluation and Rulemss, https://www.epa.gov/sdwa/sdwa-evaluation-andrulemaking-process.] WUWC members appreciate EPA's sense of urgency to regulate PFAS under the

SDWA, but EPA should follow the procedures set forth in the SDWA to reduce the Proposed Rule's vulnerability to legal challenges.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

California-Nevada Section American Water Works Association (CA-NV AWWA) (Doc. #1775, SBC-045278)

The Safe Drinking Water Act establishes a multi-step process for developing National Primary Drinking Water Regulations. This includes an incremental process for requiring a preliminary determination and public comment period prior to finalizing a regulatory determination. EPA should follow the standard process for PFHxS, PFNA, PFBS, and HFPO-DA (GenX), including a preliminary regulatory determination and full public review. This normal, stepwise process would permit a more thorough evaluation of occurrence, technological feasibility, and economic feasibility prior to proposing a final regulatory determination, and better appraisal of the complicated Hazard Index approach.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044446)

2. EPA has authority to issue a preliminary determination and simultaneously propose MCLs and MCLGs for PFAS in drinking water.

EPA's decision to issue a preliminary determination and simultaneously publish proposed MCLGs and national primary drinking water regulations for PFAS was proper and lawful. The SDWA, 42 U.S.C. § 300g-1(b)(1)(A), expressly authorizes EPA to proceed in this manner. Moreover, EPA has provided the required notice and opportunity to comment on its preliminary determination to regulate the subject four PFAS, in accordance with 42 U.S.C. § 300g-1(b)(1)(B)(ii). The Agency has also provided the required notice and opportunity for comment on its proposed rule publishing MCLGs and setting national primary drinking water regulations for the subject suite of six PFAS. [FN33: See 42 U.S.C. § 300g-1(b)(1)(E); 5 U.S.C. § 553(c).]

EPA also acted reasonably in scheduling the comment periods to occur simultaneously for the preliminary determination to regulate the four PFAS and for the proposed rule to establish MCLGs and setting national primary drinking water standards for the subject PFAS. Simultaneous, rather than sequential, comment periods are not precluded by the SDWA and here serve the purposes both of best promoting public health and furthering administrative efficiency. Indeed, the Act expressly states that EPA may propose such a regulation "concurrent with the determination to regulate," [FN34: 42 U.S.C § 300g-1(b)(1)(E).] and does not prohibit a proposal to set national primary drinking water standards made simultaneously with a proposed determination to regulate. And while the SDWA prescribes a deadline for EPA to propose a

regulation setting national primary drinking water standards (subject to notice and comment), being "no later than 24 months after the determination to regulate," [FN35:Id. (emphasis added).] the Act does not set a time before which the agency may set a national primary drinking water standard (subject, of course, to notice and comment). Thus, the SDWA allows for simultaneous comment periods here.

Given the need to promptly address the significant demonstrated risks to human health posed by the four subject PFAS, EPA was well within its discretion to schedule these simultaneous comment periods. Moreover, these simultaneous comment periods promote appropriately efficient decision-making by EPA because the standard for a determination to regulate matches the standard for issuing a national primary drinking water regulation. [FN36: See 42 U.S.C. §§ 300g-1(b)(1)(B)(ii)(II), 300g-1(b)(1)(A).] The standard for each turns on: (a) the contaminant's potential for adverse health effects, (b) the likelihood that the contaminant will occur sufficiently frequently in public water supplies, and (c) whether regulation of the contaminant presents a meaningful opportunity for health risk reduction. [FN37:Id.] These simultaneous comment periods facilitate fuller, more comprehensive, and more efficient consideration by EPA of its rulemaking in accordance with these standards.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045745)

9. Combining a preliminary regulatory determination within a notice of proposed rulemaking is inconsistent with EPA's established process for the promulgation of drinking water regulations under the SDWA.

Of the six PFAS included in the proposal, only PFOA and PFOS went through the established regulatory determination process as mandated in the Safe Drinking Water Act. PWD appreciates efforts to streamline the regulatory process, but not at the expense of scientifically sound regulations. It is recommended that EPA use the regulatory determination process to gather more data to inform the rulemaking for PFNA, PFHxS, PFBS, and HFPO-DA.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that the regulatory determinations are not informed by the best health, occurrence and other data as described in sections 3.1 and 3.2 of the EPA response in this *Response to Comments* document.

American Chemistry Council (ACC) (Doc. #1711, SBC-044466)

[The Agency's proposal suffers from the following significant shortcomings –]

• The decision to propose an MCL/MCL Goal and preliminary regulatory determination concurrently for the four PFAS violates the requirements of the Safe Drinking Water Act, and

EPA Response: The EPA disagrees. Please see section 3.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045873)

Comments of the U.S. Chamber of Commerce and its Coalition

EPA PFAS National Primary Drinking Water Regulation Rulemaking Preliminary Regulatory Determination and Proposed Rule

Docket ID No. EPA-HQ-OW-2022-0114 88

Fed. Reg. 18638 (Mar. 29, 2023)

Submitted on regulations.gov

May 30, 2023

Executive Summary

Under the Safe Drinking Water Act (SDWA), EPA is required to regulate contaminants in drinking water by following a multi-step process established in the statute. The critical finding for preliminary and final determinations to regulate requires EPA use the best available public health information to show that a contaminant may have an adverse effect on human health, it occurs frequently enough to present a health concern, and there is a meaningful opportunity for health risk reductions by regulating public water systems. If EPA, based on SDWA's rigorous scientific standards, decides to regulate, the Agency must not impose maximum contaminant levels (MCLs) for regulation that are more stringent than feasible, considering costs to regulated entities.

In this proposed rule, EPA targets six per- and polyfluoroalkyl substances (PFAS) for regulation under SDWA: perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS). EPA expects this action to directly affect 66,000 public water systems across the country. But in EPA's rush to regulate these six PFAS and address a priority for the Agency, it deviates from its statutory procedures under SDWA. EPA proposes near-zero levels of these six PFAS in drinking water and employs a novel approach to setting an MCL for the mixture of four of the six PFAS without having satisfied the required scientific, legal, or procedural requirements to justify the proposed rule.

EPA Response: The EPA notes that this comment is the commenter's summary of how they perceive the key requirements of the rule and the EPA does not agree with their assertions. The EPA has responded to commenter's substantiative comments throughout this *Response to Comments* document. The EPA has used best available science to develop this regulation and the agency has met the legal and procedural requirements of SDWA and other obligations. Please

see section 3 of the EPA response in this *Response to Comments* document for discussion of Regulatory Determinations, section 4 on MCLGs, section 5 on MCLGs, and section 6 on Occurrence. In regard to the EPA following the SDWA statutory process and the commenter's claim that the EPA "deviates from its statutory procedures under SDWA", the agency disagrees and refers the commenter to see section 3.3 of the EPA response in this *Response to Comments* document. In regard to the Hazard Index MCL, please see section 5.2 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045895)

III. The Proposed MCL and MCLG for PFNA, PFHxS, PFBS, and HFPO-DA (and Mixtures of These PFAS) Is Legally and Technically Flawed and Cannot Be Finalized in Its Current Form

EPA proposes (simultaneously with its preliminary determination) a MCL and MCLG of "1.0 (unitless) hazard index" for PFNA, PFHxS, PFBS and HFPO-DA as a mixture. The proposed MCL and MCLGs for PFNA, PFHxS, PFBS, and HFPO-DA (and mixtures of these PFAS) cannot be finalized because the procedures EPA used to propose the MCLs and MCLGs for these four PFAS violate SDWA. And, the Hazard Index approach is inconsistent with SDWA requirements. Should, in the future, data from UCMR 5 identify occurrence of these four PFAS at levels of public health concern EPA can revisit whether regulation is necessary consistent with SDWA requirements.

In March 2021, EPA issued a final regulatory determination to regulate PFOA and PFOS as contaminants under SDWA. Now, EPA proposes a MCL of 4 ppt and MCLG of 0 for PFOA and for PFOS. As discussed, the scientific data EPA uses to support the proposed MCLs and MCLGs for PFOA and PFOS do not comport with SDWA's mandate for EPA to use the best available science in carrying out national drinking water regulations.

EPA Response: Regarding the EPA's concurrent preliminary regulatory determination and proposed NPDWR for PFNA, PFHxS, PFBS, HFPO-DA, and mixtures of these four PFAS, please see section 3.3 of the EPA response in this *Response to Comments* document. Specifically pertaining to the EPA's evaluation of the second regulatory determination statutory criterion on occurrence of PFNA, PFHxS, PFBS, HFPO-DA, and mixtures of these four PFAS, please see sections 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document. The EPA disagrees that the Hazard Index approach is inconsistent with SDWA requirements as described in section 5.2 of the EPA response in this *Response to Comments* document. Additionally, the EPA disagrees that it has not used the best available science to support the proposed MCLs and MCLGs for PFOA and PFOS. Please see sections 5.1 and 4.1.2 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045897)

B. EPA failed to follow the process mandated by SDWA in proposing the preliminary determinations for PFNA, PFHxS, PFBS, and HFPO-DA simultaneously with their proposed MCL and MCLG

EPA has decided in this proposal to simultaneously issue a preliminary regulatory determination for PFNA, PFHxS, PFBS, and HFPO-DA and a proposed MCL and MCLG for these four PFAS. In doing so, it has side-stepped the statutory process for regulating contaminants under SDWA and deprived the public of sufficient time to provide public comments on the proposal.

SDWA requires that a preliminary regulatory determination be made prior to proposing an MCL:

For each contaminant that the Administrator determines to regulate under subparagraph (B), the Administrator shall publish maximum contaminant level goals and promulgate, by rule, national primary drinking water regulations under this subsection. The Administrator shall propose the maximum contaminant level goal and national primary drinking water regulation for a contaminant not later than 24 months after the determination to regulate under subparagraph (B),and may publish such proposed regulation concurrent with the determination to regulate. The Administrator shall publish a maximum contaminant level goal and promulgate a national primary drinking water regulation within 18 months after the proposal thereof. The Administrator, by notice in the Federal Register, may extend the deadline for such promulgation for up to 9 months [FN54: 42 U.S.C. [sec] 300g-1(b)(1)(E) (emphasis added)].

The "subparagraph (B)" referred to in this paragraph means the section of SDWA regarding EPA's determination to regulate contaminants "after notice of the preliminary determination and opportunity for public comment."[FN55: 42 U.S.C. [sec] 300g-1(b)(1)(B)(ii).] Therefore, the statutory procedure for regulation of contaminants is that EPA first issues a preliminary determination and provides an opportunity for comment. Then, after consideration of public comments, EPA may issue a final regulatory determination and concurrently (if the determination is positive) propose a NPDWR and MCLG for the contaminant for public comment. This statutory approach ensures that stakeholders could comment on the preliminary determination and then again after EPA makes a final determination on proposed MCLs and MCLGs for the contaminant. Indeed, this is the process that EPA has followed in the past.

In contrast to that usual course, EPA explains in the preamble that it interprets "determination to regulate" to mean the regulatory process for determining to regulate a contaminant, which begins with a preliminary determination. EPA thus claims that the statute allows it to issue a proposed regulation concurrent with a preliminary determination to regulate [FN56: 88 Fed. Reg. at 18644.]. This interpretation of SDWA is flawed because a preliminary determination is not a "determination to regulate." The entire scheme Congress set out in SDWA reflects a step-by-step process in which EPA collects data on contaminants, seeks public input and consultation with scientific authorities, proposes to regulate or not regulate the contaminant based on evaluation of the three statutory factors, and proposes (and accepts comment on) and adopts regulatory

limitations if it decides regulation is warranted. EPA's interpretation eliminates the distinction between preliminary and final determinations, upending Congress's intent to create multiple opportunities for public comment before EPA makes such an impactful decision. The text is clear, and EPA's proposed interpretation is not reasonable.

EPA justifies its corner-cutting with its goal to reduce these PFAS "expeditiously" and points to a "public urgency" to reduce PFAS concentrations in drinking water [FN57: 88 Fed. Reg. at 18652.]. But EPA's desire to rush to the finish line cannot overcome the statutory process. By short circuiting the procedures for regulating contaminants, the Agency failed to provide the public with the opportunity to comment on the preliminary determination for these four PFAS and provide EPA with necessary data, including occurrence data EPA acknowledges it does not have, to make the threshold decision on whether the statutory criteria are met to justify the proposal of a NPDWR or MCLG for the four PFAS. As proposed, stakeholders had only 60 days to provide comment not only on EPA's preliminary determination that these four PFAS must be regulated but also on the proposed MCL and MCLG Hazard Index—a completely novel approach to setting an MCL and MCLG.

To comply with SDWA requirements for regulating contaminants, EPA must withdraw its proposed MCL and MCLG for the four PFAS and, instead, first consider public input on the preliminary determination, i.e., whether the four PFAS warrant regulation at all. Then, to cure the legal defect in the proposal, EPA would have to re-propose the final determination and the NPDWR with an additional comment period before finalizing the regulatory limits on these substances [FN58: As EPA issued a previous regulatory determination for PFOA and PFOS, this comment is not applicable to the portion of the proposal setting MCLs for those substances.].

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. The EPA is not rushing to the finish line and its actions are consistent with the statutory procedures. As the EPA has explained, the agency has sufficient information, including occurrence data, to determine whether to regulate these contaminants and to propose the regulation (see section 3 of the EPA response in this *Response to Comments* document regarding the EPA's preliminary regulatory determinations, as well as section 6 related to occurrence). The public has been provided with an opportunity to comment on each of these proposals. The EPA has requested and received additional data and information, for both the preliminary regulatory determination and the proposed rule, so an additional notice and comment opportunity is not required.

<u>Environmental Working Group (EWG) (Doc. #1721, SBC-045408)</u>

The EPA has clear legal authority to make a regulatory determination at any time, regardless of whether a substance appears on the CCL, so long as the contaminant meets the above-listed criteria. [FN21: 42 U.S.C. [sec] 300g-1(b)(1)(B)(ii)(III).] And while the EPA has 24 months to issue a national primary drinking water regulation after a regulatory determination, the EPA may

also issue NPDWRs "concurrent with the determination to regulate" [FN22: 42 U.S.C. [sec] 300g-1(b)(1)(E).] as it has done in this proposed rulemaking.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045552)

4. The agency's proposed regulation concurrent with preliminary regulatory determinations is not within the scope of authorities granted by the Safe Drinking Water Act (SDWA), does not fulfill the obligations under the Administrative Procedures Act, and is inappropriate. Proposed regulation of additional PFAS should not occur until a determination to regulate is issued.

We hope that these comments will help EPA finalize the rule by effectively leveraging science and the authorities of the Safe Drinking Water Act. If you have any questions regarding this correspondence, please contact me or Chris Moody at 202.326.6127 or cmoody@awwa.org.

Best Regards,

ON BEHALF OF THE AMERICAN WATER WORKS ASSOCIATION

G. Tracy Mehan III

Executive Director for Government Affairs

Attachment (1)

cc: Ryan Albert, EPA / OW

Jennifer McLain, EPA / OW

The American Water Works Association is an international, nonprofit, scientific and educational society dedicated to providing total water solutions assuring the effective management of water. Founded in 1881, the Association is the largest organization of water supply professionals in the world. Our membership includes more than 4,500 utilities that supply roughly 80 percent of the nation's drinking water and treat almost half of the nation's wastewater. Our 50,000-plus total membership represents the full spectrum of the water community: public water and wastewater systems, environmental advocates, scientists, academicians, and others who hold a genuine interest in water, our most important resource. AWWA unites the diverse water community to advance public health, safety, the economy, and the environment.

AWWA Comments on the Proposed "PFAS National Primary Drinking Water Regulation Rulemaking"

Docket ID No: EPA-HQ-OW-2022-0114 [Link: https://www.regulations.gov/docket/EPA-HQ-OW-2022-0114]

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045560)

Finally, the proposed regulation concurrent with preliminary determinations is not within the scope of the EPA's authority under SDWA. While EPA is authorized to issue a proposal concurrent with a determination to regulate, this is a distinctly different action from a preliminary determination.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045634)

Additionally, the EPA's statement that it has legal authority to concurrently propose a drinking water regulation with a preliminary determination is a misinterpretation of SDWA.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045608)

EPA stated that SDWA provides the agency with the authority to concurrently propose a preliminary regulatory determination and to propose a drinking water regulation for these PFAS, but this is not the case. SDWA provides EPA with the authority to "publish such proposed regulation concurrent with the determination to regulate". A determination to regulate is distinctly different from a preliminary determination. Specifically, a preliminary determination applies to the proposed action while a determination to regulate applies to a final action. While this language authorizes EPA to propose regulation as part of the same action as a determination to regulate, it does not authorize that the proposed regulation be concurrent with a preliminary determination.

EPA itself has distinguished between a preliminary and final regulatory determination, the latter of which it interprets to mean the "determination to regulate." [FN20: See 76 Fed. Reg. 7762, 7763 (Feb. 11, 2011) ("What is EPA's final regulatory determination on perchlorate and what happens next?" . . . . "the Agency has made a determination to regulate perchlorate in drinking water [and] EPA is initiating the development of a proposed NPDWR for perchlorate.").]

Second, SDWA Section 1412(b)(1)(B)(ii) specifically uses different terms for a determination to regulate and a preliminary determination:

"Not later than 5 years after August 6, 1996, and every 5 years thereafter, the Administrator shall, after notice of the preliminary determination and opportunity for public comment . . . make determinations of whether or not to regulate such contaminants." [FN21: 42 U.S.C. § 300g–1(b)(1)(B)(ii). See also NRDC v. EPA, No. 20-133, slip op. at 4 (D.C. Cir. May 9, 2023) ("After the comment period ends, EPA must make its final regulatory determination.") (emphasis added); id. at 11 ("[T]he preliminary determination precedes the notice and comment period. Once that period ends, the agency makes its regulatory determination, and that determination is final.").]

In addition, collapsing these steps into a single proposal undermines the SDWA's mandate that EPA use the best available public health information to make regulatory determinations in accordance with the three statutory criteria. While EPA is collecting public comment on the preliminary determination (and is seeking more studies and health information from the public), how would it know that regulation is warranted when it lacks a complete record? Instead, the notice and comment provisions exist to allow EPA to collect the data it needs to decide whether to regulate and to ensure the statutory criteria for it to do so are present. EPA's approach is also inconsistent with SDWA Section 1412(b)(4)(C), which states that "[a]t the time the Administrator proposes a national primary drinking water regulation under this paragraph, the Administrator shall publish a determination as to whether the benefits of the maximum contaminant level justify, or do not justify, the costs…" [FN22: 42 U.S.C. § 300g–1(a)(3).] EPA cannot reach such a decision while it is collecting public health data from the preliminary determination phase because it cannot simultaneously determine whether the benefits of regulation justify the costs. And notably, Congress knows how to direct simultaneous regulatory

actions under the SDWA when it intends to, but did not do so here. [FN23: For example, Section 1412(a)(3)) states: "Whenever a national primary drinking water regulation is proposed under subsection (b) for any contaminant, the maximum contaminant level goal for such contaminant shall be proposed simultaneously. Whenever a national primary drinking water regulation is promulgated under subsection (b) for any contaminant, the maximum contaminant level goal for such contaminant shall be published immediately."]

Because the SDWA does not provide EPA with the authority to propose a preliminary determination to regulate at the same time as a proposed regulation (and as a result it has not been agency practice to do so previously), EPA must re-issue a proposed regulation for PFHxS, PFNA, HFPO-DA, and PFBS after accepting public comment on its preliminary determination to regulate those substances in order to comply with its obligations under the SDWA and APA.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. Contrary to commenter's interpretation, the EPA's statement in the final regulatory determination on perchlorate that "the Agency has made a determination to regulate perchlorate in drinking water" is descriptive and not a preclusive interpretation of the phrase. The EPA maintains its interpretation that "determination to regulate" in the second phrase of 1412(b)(1)(E) allows for concurrent processing of a preliminary determination and proposed rule, not a final determination and proposed rule. As the EPA has explained, the agency has sufficient information, including health and occurrence data , to determine whether to regulate these contaminants and to propose the regulation (see section 3 of the EPA response in this *Response to Comments* document regarding the EPA's preliminary regulatory determinations, section IV related to MCLGs, and section 6 related to occurrence). The public has been provided with an opportunity to comment on each of these proposals. The EPA has requested and received additional data and information, for both the preliminary regulatory determination and the proposed rule, so an additional notice and comment opportunity is not required.

PFAS Regulatory Coalition (Doc. #1761, SBC-046067)

A. EPA's regulatory determinations for four additional PFAS are inappropriate.

1. The EPA Proposal fails to follow the procedures set forth in the Safe Drinking Water Act.

The Safe Drinking Water Act gives EPA the authority to establish national primary drinking water regulations "in accordance with the procedures established by this subsection." SDWA 1412(b)(1)(A). Yet, in the EPA Proposal, the Agency deviates from those procedures by combining three separate rulemakings into one – 1) drinking water standards for PFOA/PFOS; 2) regulatory determinations for four additional compounds; 3) drinking water standards for the four additional compounds.

The proposed drinking water standards for PFOA/PFOS first involved EPA, after what the Agency says was "careful consideration of public comments" (88 Fed. Reg. 18644), making a regulatory determination for these two compounds in a prior rulemaking in March 2021. More

specifically, on March 10, 2020, EPA published a preliminary regulatory determination for eight contaminants on the Contaminant Candidate List (CCL 4), two which were PFOA and PFOS. 85 Fed. Reg. 14098 (Mar. 10, 2020). On March 3, 2021, EPA made a final regulatory determination for only PFOA and PFOS and decided not to regulate the other six contaminants. 86 Fed. Reg. 12272 (Mar. 3, 2021). After deliberating for an entire year, EPA moved forward to the next stage of regulation for only two of the eight compounds for which it had made a preliminary regulatory determination.

Here, in contrast, EPA is making a regulatory determination for four compounds and moving forward with proposed drinking water standards in the same step. The consolidation of the Regulatory Determination and proposed drinking water standards for the four additional compounds is problematic in that it provides neither EPA nor the public with the time or information for appropriate consideration of the Regulatory Determination, as required by the Safe Drinking Water Act, instead assuming an outcome and proceeding directly to a proposed drinking water standard. EPA took a year to deliberate on the regulatory determination for PFOA and PFOS, yet is only giving the public 62 days to consider and comment not just on the regulatory determination for PFHxS, PFNA, PFBS, and HFPO-DA but also on the novel approach of using a Hazard Index (HI) as an MCL. This is especially problematic when, through a response letter EPA issued to the Coalition on May 5, 2023, EPA refused to grant an extension of the comment period.

EPA cites "public urgency" rather than consideration of best available science under the framework of the Safe Drinking Water Act as the rationale for this Proposal. 88 Fed. Reg. 18652. We understand that a sense of urgency is driving the Agency to move forward in this manner, but that must not be at the expense of due deliberation of the new and important issues raised in the EPA Proposal. EPA lacks authority to so sharply change course in setting MCLs. EPA's proposal to depart from its long-established MCL process and prior interpretations of its statutory authority is arbitrary and capricious.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. The commenter mischaracterizes the EPA's fourth regulatory determination, where the agency made a preliminary determination to regulate PFOA and PFOS and a preliminary determination not to regulate six other non-PFAS contaminants. After considering public comment, the EPA finalized determinations for all eight of these contaminants. Similarly, after considering public comment on the EPA's five preliminary regulatory determinations (PFHxS, PFBS, PFNA, HFPO-DA, and mixtures containing two or more of these PFAS), the EPA is finalizing four of those determinations. Additionally, the commenter mischaracterizes that the EPA cites "public urgency rather than consideration of best available science" as the rationale for its proposal to regulate PFHxS, PFNA, HFPO-DA, PFBS and mixtures containing two or more of these four PFAS. Though the EPA does acknowledge "public urgency to reduce PFAS concentrations in drinking water" in the proposal, the agency does so only after providing all of the necessary information and rationale to satisfy the statutory requirements and does not consider "public urgency" as a factor or in lieu of the requirements

under SDWA to consider the best available science (see section 3 of the EPA response in this *Response to Comments* document regarding the EPA's preliminary regulatory determinations). Regarding the commenter's request for an extension to the public comment period, please see section 17.1 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045653)

EPA's Proposed Hazard Index-Based MCL for PFHxS, PFBS, PFNA, and HFPO-DA Does Not Comply with the SDWA

EPA's proposed Hazard Index-based Maximum Contaminant Level (HI-MCL) for PFHxS, PFBS, PFNA and HFPO-DA is procedurally improper and substantively incorrect, for several reasons.

As an initial matter, the SDWA does not permit the Agency to simultaneously issue a notice of intent to regulate and a proposed MCLG and MCL. EPA may issue a decision to regulate at the same time that it proposes an MCLG and MCL, but it may not provide initial public notice that it is contemplating regulation at the same time it proposes the regulation. The failure to undertake the statutorily required two-step process undermines the validity of the EPA's proposals.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045662)

V. EPA'S PROPOSED STANDARDS FOR PFHxS, PFBA, PFNA, AND HFPO-DA ARE PROCEDURALLY AND TECHNICALLY FLAWED

a. The SDWA Does Not Permit Publication of a Preliminary Determination to Regulate at the Same Time as a Proposed NPDWR.

EPA issued its proposed NPDWRs for PFHxS, PFBA, PFNA, and HFPO-DA (the HI MCL) without adhering to the Congressionally prescribed procedure for setting MCLs under the SDWA. The Proposed Rule is therefore arbitrary and capricious and violates the SDWA. See Chevron USA Inc. v. Natural Resources Defense Council, 467 U.S. 837 (1984) ("[i]f the intent of Congress is clear… the agency… must give effect to the unambiguously expressed intent of Congress").

The SDWA requires EPA to make a "preliminary determination" to regulate a substance and provide notice and an opportunity for public comment on that preliminary determination. [FN31:42 USC [sec] 300g-1(b)(1)(B)(ii)(I)] The independent step of issuing notice of a preliminary determination reflects an intentional, discrete step in the regulatory process sanctioned by Congress. Once EPA has solicited and considered comment on that preliminary determination, EPA can make a final "determination to regulate." This two-step process is clearly reflected in the language of 42 USC [sec] 300g-1 (b)(1)(B)(ii)(I)-(b)(1)(B)(ii)(III).

Section (b)(1)(B)(ii)(I) states a "determination" to regulate a substance on the CCL "shall" only be issued "after notice of the preliminary determination and opportunity for public comment."

While the SDWA allows EPA to publish a proposed regulation "concurrent with the determination to regulate," id. at [sec] (b)(1)(E), it does not permit the EPA to skip the "preliminary determination to regulate" step, as it did here. To the contrary, the SDWA distinguishes between the process of issuing a "preliminary determination" that is subject to public comment (i.e., a proposed rule) and the "mak[ing of]" a final determination (i.e., a final rule). Id. Similarly, SDWA Section (b)(1)(B)(ii)(2) lists factors that must support the final "determination," not the "preliminary determination." Further, section (b)(1)(B)(ii)(III) states the same "determination" can be made even if the substance does not appear on the CCL, as required by (b)(1)(B)(ii)(I). These distinctions confirm that Congress intended a "determination to regulate" under the SDWA to mean a final determination and not a preliminary determination. Stated differently, EPA has the authority to promulgate a final decision to regulate in the same rulemaking as a proposal for additional drinking water standards. However, the SDWA does not give EPA the authority to issue a proposed NPDWR and a preliminary regulatory determination at the same time – but this is precisely what EPA did in this rulemaking.

EPA has recognized that "[t]he development of the CCL, regulatory determinations, and any subsequent rulemaking should be viewed as a progression where each process builds upon the previous process, including the collection of data and analyses conducted." [FN32: 85 Fed. Reg. at 14100] EPA's truncated regulatory determination in this case minimizes time for public-review and violates the plain language of the SDWA.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Metropolitan Water District of Southern California (Doc. #1777, SBC-045428)

1. EPA's proposed MCLs and MCLGs for PFHxS, GenX chemicals, PFNA, and PFBS are premature and should follow EPA's established regulatory process

As proposed, EPA is issuing a preliminary determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA), and its ammonium salt (also known as GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS as contaminants under the Safe Drinking Water Act (SDWA), while at the same time proposing a NPDWR and MCLGs for these four PFAS and their mixtures. However, pursuant to the SDWA, EPA must make a final determination to regulate prior to or concurrent with a proposed NPDWR.

Section 1412(b)(1)(B)(ii) of the SDWA explains the two-step process for how EPA regulates drinking water contaminants. The first step is that EPA must, "after notice of the preliminary determination [to regulate contaminants] and opportunity for public comment, . . . make determinations of whether or not to regulate such contaminants."[FN3: 42 U.S.C. §

1412(b)(1)(B)(ii)(I).] The second step is that for each contaminant EPA determines to regulate, EPA must "publish maximum contaminant level goals and promulgate, by rule, national primary drinking water regulations . . . ."[FN4: 42 U.S.C. § 1412(b)(1)(E).] The deadline for EPA to propose the MCLG and NPDWR is "not later than 24 months after the determination to regulate [FN5: 42 U.S.C. § 1412(b)(1)(E).]

EPA relies on Section 1412(b)(1)(E) to justify its ability to publish a proposed drinking water regulation concurrent with a preliminary determination to regulate. [FN6: 88 Fed. Reg. 18638, at 18644 (Mar. 29, 2023) ("Section 1412(b)(1)(E) authorizes EPA to issue a preliminary determination to regulate a contaminant and a proposed NPDWR addressing that contaminant concurrently and request public comment at the same time.").] But such language is not in Section 1412(b)(1)(E). Instead, Section 1412(b)(1)(E) states that EPA "may publish such proposed regulation concurrent with the determination to regulate." The "determination to regulate" is EPA's final determination to regulate, not its preliminary determination to regulate.

If Congress had meant that EPA could publish a proposed regulation at the same time as it issues a preliminary determination to regulate, Congress would have used the word "preliminary" (as it did in Section 1412(b)(1)(B)(ii)(I)), but Congress did not use the adjective "preliminary" to describe "determination to regulate" in Section 1412(b)(1)(E). [FN7: See, e.g., Reiter v. Sonotone Corp., 442 U.S. 330, 339, 99 S. Ct. 2326, 60 L. Ed. 2d 931 (1979) (the Court is "obliged to give effect, if possible, to every word Congress used").]

This interpretation is consistent with EPA's own explanation of its rulemaking process under the SDWA. According to EPA's SDWA Evaluation and Rulemaking Process, "EPA publishes preliminary regulatory determinations for public comment and considers those comments prior to making a final regulatory determination. If EPA makes a positive regulatory determination for any contaminant, it will begin the process to establish a national primary drinking water regulation, which typically includes a Maximum Contaminant Level (MCL)."[FN8: https://www.epa.gov/sdwa/sdwa-evaluation-and-rulemaking-process.] Accordingly, Metropolitan recommends that EPA follow the procedure set forth in the SDWA and first make a final determination to regulate PFHxS, GenX chemicals, PFNA, and PFBS before proposing NPDWRs and MCLGs for them, as was done for PFOA and PFOS. Otherwise, EPA's NPDWR Rulemaking could be subject to challenge, which would delay the process of establishing NPDWRs and MCLGs for these four PFAS.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. The EPA's description of its typical SDWA rulemaking process does not preclude the process it has undertaken in this rulemaking, consistent with the agency's interpretation of the SDWA.

Office of Advocacy at the U.S. Small Business Administration (Doc. #1807, SBC-045493)

Most importantly, Advocacy recommends that the agency proceed in a step-by-step manner contemplated by the statute by first issuing a preliminary determination for the four PFAS and then after the agency finalizes its determination, it can then propose the appropriate NPDWR.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Office of Advocacy at the U.S. Small Business Administration (Doc. #1807, SBC-045491)

III. Advocacy is concerned about the agency's concurrent proposal of a preliminary determination and the proposed regulation of four PFAS chemicals.

Advocacy is concerned about EPA's approach in issuing both a preliminary regulatory determination and national primary drinking water regulations for the four PFAS chemicals, (PFHxS, GenX chemicals, PFNA, and PFBS) in the same action. To support its justification for its concurrent proposal approach, EPA cites "[f]or each contaminant that the Administrator determines to regulate under subparagraph (B)…[EPA]may publish such proposed regulation concurrent with the determination to regulate."[FN18: 88 Fed. Reg.18644 citing 42 U.S.C. §300g–1 (b)(1)(E).] EPA's reliance, however, is misplaced because statutory language does not permit a proposed concurrent regulation with a preliminary determination; it only allows a concurrent proposal with a "determination to regulate." The agency equates the "determination to regulate" with a "regulatory process…that beings with a preliminary determination."[FN19: Id. at 18644]. "Determination" is defined as "the act of deciding definitely and firmly."[FN20: See, Merriam Webster Dictionary. Determination Definition & Meaning - Merriam-Webster (last visited May 30, 2023).] Therefore, it cannot be considered to be a preliminary process where a decision is being contemplated and is not yet decided. EPA further asserts that this provision authorizes a more expedited process. This is also incorrect. The SDWA includes a separate provision that allows for such an expedited process, to allow proposals concurrent with a preliminary determination because it allows EPA to "...promulgate an interim national primary drinking water regulation for a contaminant without making a determination for the contaminant…"[FN21: 42 U.S.C. §300g-1(b)(1)(D).].

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document.

Office of Advocacy at the U.S. Small Business Administration (Doc. #1807, SBC-045495)

Advocacy also recommends that EPA address small entity concerns with its proposed actions for PFHxS, GenX chemicals, PFNA, and PFBS, by issuing regulations in accordance with the SDWA.

If you have any questions or require additional information, please contact me or Assistant Chief Counsel Tayyaba Zeb at (202) 798-7405 or by email at tayyaba.zeb@sba.gov.

American Chemistry Council (ACC) (Doc. #1841, SBC-044849)

SDWA Does Not Authorize EPA to Issue a Preliminary Regulatory Determination Simultaneously with a Proposed Standard

In proposing a preliminary regulatory determination for PFNA, PFHxS, PFBS, and HFPO-DA at the same time as it proposes national drinking water standards for these four substances EPA seeks to subvert the process clearly laid out in the SDWA. As part of this process, the Act instructs EPA to first collect data on the occurrence of contaminants, followed by the issuance of a preliminary determination to regulate and opportunity for public comment based on the "best available public health information, including the occurrence data," after which the Agency may issue a final determination to regulate which the Act notes shall be considered final agency action and subject to judicial review. Once a regulatory determination is made, the Act defines the process for establishing an MCL and MCL Goal, including the use of the best available science and an opportunity for public comment on the Agency's analysis of benefits and costs of the proposal.

EPA decision to propose a preliminary regulatory determination and regulatory standard for the four substances simultaneously is in violation of the Act. Although the Act allows EPA to propose a drinking water regulation "concurrent with the determination to regulate," [FN198: 43 U.S.C. Section 300g-1(b)(1)(E)] a preliminary determination cannot be considered a "determination to regulate." The Agency's interpretation ignores the Act's establishment of a two-step process – a preliminary regulatory determination followed by a final determination –

and eliminates a critical opportunity for public comment process laid out in the statute. The Agency's rationale that there is "public urgency" [FN199: 88 Fed. Reg. 18652] to reduce PFAS does not outweigh its statutory requirements.

Consistent with the statute, EPA should withdraw the current proposal for the four substances and conduct an evaluation to determine whether any of substances meet the criteria under Section 1421(b)(1)(A) for a preliminary determination to regulate. Such a determination likely will require the Agency to wait for occurrence data from the ongoing UCMR 5 national survey of water systems.

EPA Response: Please see section 3.3 of the EPA response in this *Response to Comments* document. Regarding the EPA's evaluation of the second regulatory determination statutory criterion on occurrence, please see sections 3.1.2 and 3.2.2 of the EPA response in this *Response to Comments* document. Additionally, please see section 6.8 of the EPA response in this *Response to Comments* document pertaining to UCMR 5.

4 Maximum Contaminant Level Goals (MCLGs)

4.1 MCLG Derivation for PFOA or PFOS

4.1.1 Systematic Review Protocol for PFOA and PFOS used to Determine the Weight of Evidence for Carcinogenicity and Cancer Classifications

Summary of Major Public Comments and EPA Responses

Several commenters expressed support or criticism of the EPA's systematic review protocol used in the cancer assessments for PFOA and PFOS, including specific topics such as the agency's approach for conducting study evaluations and weight of evidence determinations and the agency's use of epidemiological studies as supporting evidence for the cancer classifications consistent with the *Office of Research and Development* (*ORD) Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a), hereafter referred to as the "IRIS Handbook" or "EPA peer-reviewed human health risk assessment methodology". The EPA's responses to these issues as well as others expressed by individual commenters are described in further detail below.

A few commenters agreed with the systematic review protocol the EPA used to evaluate the studies that supported the PFOA and PFOS cancer classification determinations in the draft toxicity assessments (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c), with one commenter stating that the approach was "thorough and well-reasoned." Commenters stated that the systematic review protocol was clear because the EPA had addressed all concerns highlighted during the peer review process.

One commenter asserted that the EPA did not conduct a systematic review of the literature and did not follow the IRIS Handbook (USEPA, 2022a) to develop the toxicity assessments for PFOA and PFOS. This commenter stated the EPA lacked "a predefined protocol" and that the "systematic review methods lack[ed] transparency and consistency." The commenter took particular issue with the EPA's protocols for study quality evaluations, stating that they were inconsistent and not aligned with the IRIS Handbook (USEPA, 2022a). The EPA disagrees with this commenter's incorrect claims. The EPA adopted the overall approach and steps in the IRIS Handbook (USEPA, 2022a) and the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a) to develop PFOA- and PFOS-specific protocols that then formed the basis for performing study quality evaluations, evidence integration, and critical study selection in the toxicity assessments for PFOA and PFOS (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c). The EPA did not put these predefined protocols out for public comment prior to the draft assessment development because these predefined protocols were largely consistent with the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a) which had already received public comment. Additionally, this predefined protocol was made available for public comment as Appendix A of the toxicity assessments at the time of rule proposal (USEPA, 2023b; USEPA, 2023c). Importantly, the EPA's Office of Water collaborated with the EPA's Office of Research and Development in conducting study quality evaluations, evidence

integration, and selection of critical studies to ensure consistency with the IRIS Handbook (USEPA, 2022a) and the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a).

Individual Public Comments

Washington State Department of Health (DOH) (Doc. #1665, SBC-044406 & SBC-044407)

Page 18729. Section V – Maximum Contaminant Level Goal.

EPA requests comment on the derivation of the proposed MCLG for PFOA and its determination that PFOA is Likely to be Carcinogenic to Humans and whether the proposed MCLG is set at the level at which there are no adverse effects to the health of persons, and which provides an adequate margin of safety. EPA is also seeking comment on its assessment of the noncancer effects associated with exposure to PFOA and the toxicity values described in the support document on the proposed MCLG for PFOA.

• DOH appreciates that EPA updated the literature review and added a systematic review of study quality for their determination of the PFOA and PFOS MCLGs.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document. In response to Science Advisory Board (SAB) peer review, the EPA did update the literature search to identify new literature, reflected in the *Public Comment Draft – Toxicity Assessments and Proposed Maximum Contaminant Level Goals (MCLGs) for PFOA and PFOS* (USEPA, 2023f; USEPA, 2023a). However, the study quality evaluation step was not "added" but rather updated to reflect new literature in the draft assessments (USEPA, 2023f; USEPA, 2023a), in contrast to the commenter's suggestion. The EPA conducted study quality evaluation as part of the systematic review process *prior* to the 2022 SAB review, as reflected in the *Proposed Approaches to the Derivation of a Draft Maximum Contaminant Level Goal for PFOA and PFOS in Drinking Water* (USEPA, 2021b; USEPA, 2021c) published for peer review in 2021. Study quality evaluations were conducted during the systematic review of the literature when the assessments were first initiated, consistent with the process described in the IRIS Handbook (USEPA, 2022a), and therefore, has been an integral part of and these draft assessments. Additionally, the protocols for study quality evaluations were externally peer reviewed by the Science Advisory Board (SAB) PFAS Review Panel.

Silent Spring Institute (Doc. #1784, SBC-053325)

Silent Spring Institute supports these evidence-based regulations and commends the EPA for their systematic review of the available scientific literature. We found the EPA's overall approach to determining the maximum contaminant level goals (MCLGs) for PFOA and PFOS to be thorough and well-reasoned.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document. The commenter supports the "evidence-based regulations and commends the EPA for their systematic review of the available scientific literature."

Environmental Protection Network (EPN) (Doc. #1773, SBC-043842)

PFOA and PFOS MCLGs

EPA's Science Advisory Board (SAB) supported many of the elements of EPA's proposed PFOA and PFOS health-based values in the agency's 2022 interim drinking water health advisory document. However, the SAB expressed concerns over the systematic review process used to select the critical studies for health effects. EPA has addressed these concerns by providing additional clarity on the systematic review process and expanding the systematic review steps included in the health effects assessment. EPA has provided technical support documents for this rule that include the updated health effects literature search and new evaluations of models, methods, and data.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document. The commenter supports the EPA's approach and states that the EPA has fully addressed the SAB panel's comments about the clarity regarding the systematic review protocol. However, the SAB did not review the 2022 interim drinking water health advisory (HA) document, but instead received the *Proposed Approaches* documents (USEPA, 2021b; USEPA, 2021c) for review, along with two other technical documents.

3M Company (Doc. #1774, SBC-053146& SBC-045650)

EPA Did Not Establish and Follow Required Procedures Designed to Ensure SDWA Compliance and Promote Regulation Based on the Best Available Science

EPA did not follow established best practices, including its own long-standing guidance, to conduct a systematic review of the relevant scientific literature. A proper systematic review is important to ensure that the Agency's conclusions are driven by science and are transparent to the public. Although EPA has long-standing guidance on how to conduct a systematic review, it did not follow it. Here, EPA's own SAB, in its Review of EPA's Analyses to Support EPA's National Primary Drinking Water Rulemaking for PFAS, "identified multiple inconsistencies and deficiencies in both the description and execution of the systematic review process utilized in the evaluation of both PFOA and PFOS." (USEPA SAB 2022, p. 3.) SAB also noted that EPA did not publish a pre-defined review protocol, did not have transparent criteria for study inclusion and exclusion, omitted studies that should have been considered, and improperly categorized studies, resulting in a review with "major deficiencies." (USEPA SAB 2022, p. 3.) These issues were so significant that at least one SAB member indicated EPA's systematic review did not "represent the state of practice."

As discussed herein, EPA did not meaningfully implement SAB's feedback. This resulted in an after-the-fact systematic review protocol that is contrary to the SAB's feedback and the Agency's own guidance. See e.g., ORD Staff Handbook for Developing IRIS Assessments, (USEPA ORD 2022, pp. xiv-xvii) ("The transparency and scientific rigor of the IRIS process is enhanced through the application of systematic review . . . The IRIS process applies a systematic review approach from the literature identification stage through the selection of studies for dose-response assessment"); USEPA SAB 2022 p. 3 ("Before initiating a systematic review process, it is essential to clearly define the study question to be addressed and to develop a protocol.") (emphasis added).

The absence of a rigorous, prescribed systematic review has had a serious impact on the rulemaking process. For example, the lack of a pre-defined review protocol led to outsized weight being placed on studies that have highly material deficiencies while underweighting higher-quality studies that do not support the proposed limits. Further, EPA reliance on cancer endpoints as the basis for a maximum contaminant level goal (MCLG) of zero for PFOA and PFOS is not consistent with the evidence EPA presents nor with its own guidance. Similarly, EPA did not establish review processes designed to ensure that the weight of evidence supports its new classification of PFOS as "likely" to be carcinogenic to humans.

EPA's derivation of its alternate, non-cancer reference doses (RfDs) for PFOA and PFOS are similarly in need of reconsideration and revision. In calculating the RfDs, EPA did not follow its own guidance documents including EPA's ORD Staff Handbook for Developing IRIS Assessments (USEPA ORD 2022). These procedures are important for transparency and reproducibility in study evaluation. An appropriate evaluation of the existing literature, consistent with EPA guidance, would have found many of the studies that EPA relied on to calculate the extremely low RfDs for these PFAS were low quality and at high risk of bias, therefore leading EPA to reach different conclusions.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document. The commenter is incorrect in stating that the EPA did not follow its own guidance in conducting a systematic review for the toxicity assessments, that the EPA did not meaningfully implement SAB's feedback, and that the protocol published at the time of rule proposal was "after-the-fact." As outlined in section 4.1.1 of the EPA response in this *Response to Comments* document and described in more detail below, the EPA followed agency methodology in conducting a systematic review for the toxicity assessments (i.e., the IRIS Handbook (USEPA, 2022a)), responded to and implemented the SAB's feedback which mitigated the highlighted "deficiencies" (described in USEPA, 2023d) and established internal protocols *prior* to initiating the systematic review which were fully detailed in Appendix A of USEPA (2023f) and USEPA (2023a). Therefore, there is no basis for the commenter's claim that the "absence" of a systematic review has had a serious impact on the rulemaking process. Similarly, the EPA's conclusions on the carcinogenicity of PFOA and PFOS did follow agency guidance (USEPA, 2005) and long-standing practice of establishing the MCLG at zero under the

Safe Drinking Water Act (SDWA) (see USEPA, 1998; USEPA, 2000a; USEPA, 2001; *See* S. Rep. No. 169, 104th Cong., 1st Sess. (1995) at 3).

First, as the EPA noted in its response to SAB comments (USEPA, 2023d):

> "*EPA established internal protocols for the systematic review steps of literature search, population, exposure, comparator, and outcome (PECO) development, literature screening, study quality evaluation, and data extraction prior to initiating the systematic review for PFOA and PFOS. However, the agency recognizes that components of the protocols were not thoroughly included in the November 2021 draft Proposed Approaches documents. The EPA has since incorporated detailed, transparent, and complete protocols for all steps of the systematic review process into the updated versions of the Proposed Approaches documents, now named the Proposed MCLG documents (see Appendix A of both documents). Additionally, the protocols and methods have been updated and expanded based on SAB recommendations to improve the clarity and transparency of the process used to derive the MCLGs for PFOA and PFOS."*

The EPA emphasizes, again, that the PFOA and PFOS systematic review protocols were developed *prior* to initiating the literature searches and systematic reviews for the toxicity assessments of PFOA and PFOS. Additionally, the EPA did not put these predefined protocols out for public comment prior to assessment development because these predefined protocols were largely consistent with the Systematic Review Protocol for the PFAS Integrated Risk Information System (IRIS) Assessments (USEPA, 2021a) which had already received public comment. Therefore, the protocols published at the time of rule proposal were not developed "after-the-fact" as the commenter inaccurately claims but were improved to increase transparency and clarity as requested by the SAB PFAS Review Panel (USEPA, 2022b). The final protocols, which have again been updated to reflect public comment as well as the final literature searches and reviews, are available as Appendix A of the final toxicity assessments for PFOA and PFOS (USEPA, 2024a; USEPA, 2024b). The EPA provides specific responses to comments regarding methods of study quality evaluation and the cancer assessments and reference doses (RfDs) in sections 4.1.4, 4.2.1.2, 4.2.1.3, 4.2.1.4, and 4.2.1.5 of this response to public comment document.

Second, the EPA disagrees with the claim that it did not follow its own guidance when developing these assessments. Please see sections 4.1.1 and 4.1.2 of the EPA response in this *Response to Comments* document.

Finally, the EPA disagrees with the claim that it did not "meaningfully implement" the SAB PFAS Review Panel's feedback and notes that the commenter appears to have mischaracterized quotes from the SAB final report (USEPA, 2022b). For example, the commenter stated, "SAB also noted that the EPA did not publish a pre-defined review protocol, did not have transparent criteria for study inclusion and exclusion, omitted studies that should have been considered, and improperly categorized studies, resulting in a review with 'major deficiencies.'" In actuality, the SAB stated, "The lack of a protocol… was seen as a major deficiency of the reviews" and the

SAB asked that the EPA "provide additional clarification and corrections to the existing systematic reviews to fill in gaps about how specific tasks were completed" and to "establish protocols prior to beginning any new systematic review process" (USEPA, 2022b). As the EPA noted in the paragraph above, the toxicity assessments for PFOA and PFOS followed pre-established protocols drafted prior to systematic review initiation and mimicking components of the IRIS Handbook (USEPA, 2022a) and the *Systematic Review Protocol for the PFBA, PFHxA, PFHxS, PFNA, and PFDA (anionic and acid forms) IRIS Assessments* (USEPA, 2021a). These protocols were described briefly in the methods section of the *Proposed Approaches* documents (USEPA, 2021b; USEPA, 2021c). The EPA then implemented the SAB's recommendation by turning these pre-established protocols into a publicly available protocol document which described the systematic review approach used for the draft assessments (USEPA, 2023b; USEPA 2023c). Regarding how the EPA considered and implemented all of the SAB PFAS Review Panel's comments, please see section 4.1.3.

3M Company (Doc. #1774, SBC -045660)

A proper systematic review of the relevant scientific literature is the foundation for the agency to reach scientifically sound conclusions. As described by EPA's IRIS Handbook, EPA must review the full body of available scientific information, identify the subset of that information that is the best available, explain the basis for that decision, and then analyze that information to come to an ultimate conclusion (USEPA ORD 2022, EPA 2012). The agency cannot make its regulatory decision and selectively cite scientific studies that support the decision while ignoring equally valid but contradictory scientific information. For two of the six substances—PFHxS and PFNA—EPA did not conduct a systematic review and instead relied on the conclusions of the Agency for Toxic Substances and Disease Registry (ATSDR). For the remaining four substances, EPA has selectively cited studies to support its decision.

In reviewing EPA's draft documents, EPA's own SAB and numerous other commenters pointed out several major failings, including that EPA failed to publish a pre-defined review protocol. The SAB noted significant concerns that the reviews for PFOA and PFOS do not appear to have established a predefined protocol. The lack of a protocol led to a lack of clarity across each of the major systematic review steps for both chemicals and was seen as a major deficiency of the reviews. (USEPA SAB 2022, p. 3)

For example, the SAB "found that the inclusion and exclusion of epidemiologic and animal studies was inconsistent across endpoints, leading to confusion about the criteria being used." Similarly, the SAB found that EPA's literature review ignored studies that should have been considered, including some of those EPA relied on for its 2016 health advisory levels (HALs) for PFOA and PFOS, and some of which may have changed EPA's conclusions regarding the potential hazard of exposure to PFOA and PFOS at low levels.27 Indeed, the SAB concluded that "[t]he rationale for not considering studies, particularly human studies, that were included in the [2016 HALs] is not clear or supportable. There is no reason to conclude that the earlier studies are less relevant or of lesser quality than the newer studies." (USEPA SAB 2022, p. 5;

see also p. 14-15.) The SAB also "concluded that the decision to exclude literature published within the timeframe of the development of the 2016 health effects support document in the current literature search was unjustified." (USEPA SAB 2022, p. 5)

EPA's lack of a review protocol raises serious questions about the integrity of EPA's systematic review. It precludes clarity into how EPA decided which studies to review, how to weigh the studies it did review and, ultimately, how it decided which studies would form the foundation for its proposed levels. EPA also did not follow the same protocol across the multiple reviews it conducted, another major failure that the SAB identified (EPA SAB 2022).

EPA has not sufficiently addressed these and the SAB's other foundational concerns in the Proposed Rule. Instead, and as discussed below, EPA continues to pick and choose scientific studies based on unknown and non-transparent conditions (violating EPA's own procedures on conducting systematic reviews) which appears to have biased EPA's review to favor studies that support the low regulatory levels EPA has proposed and omit discussion of studies that do not support those levels. In short, EPA's systematic review was not grounded in "sound and objective scientific practices," a flaw it has not remedied.28 These classification and review protocol errors are identified throughout the comments herein as they relate to specific topics in the rulemaking.

EPA Response: The commenter repeats criticisms about the systematic review protocol and treatment of studies considered in its assessments of PFOA and PFOS, citing the final report produced by the SAB PFAS Review Panel (USEPA, 2022b). Please see the EPA responses to comment Doc. #1774, SBC-053146 and SBC-045650 in section 4.1.1 in this *Response to Comments* document. The EPA implemented recommendations from the SAB in the draft toxicity assessments released for public comment to address the SAB's concerns, and the EPA describes how every recommendation from the SAB was considered in its response to comment document (USEPA, 2023d). Please see section 4.1.1 of the EPA response in this *Response to Comments* document for additional details. The EPA did not "pick and choose scientific studies based on unknown and non-transparent conditions" as the commenter inaccurately suggested. The EPA describes all of the available evidence identified from the systematic literature searches and reviews, regardless of whether they support the "low regulatory levels" in Chapter 3 and provides rationale for study selection for reference dose (RfD) and cancer slope factor (CSF) derivation in Chapter 4 of the final toxicity assessments (USEPA, 2024d; USEPA, 2024c). The EPA followed the systematic review protocol for all studies including those identified from the 2016 *Health Effects Support Documents* (HESDs) (USEPA, 2016a; USEPA, 2016b). In contrast to the commenter's claims, the EPA did follow a systematic approach to identifying, screening, and assessing the quality of studies. Please see the EPA response to comment Doc. #1774, SBC-053425 in section 4.1.1 in this *Response to Comments* document for more detail.

Responses to comments regarding PFNA and PFHxS are provided in section 4.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-053425)

EPA did not provide sufficient information about why it excluded certain studies or which population, intervention, control, and outcomes (PECO) criteria the studies that it did exclude failed to meet, resulting in a lack of transparency regarding EPA's systematic review. The SAB, in response to charge question #1, recommended several changes to the evidence identification step of the PFOA and PFOS systematic reviews. EPA responded that a publicly accessible interactive flow diagram1 provides clarity about why EPA excluded specific studies at the title-abstract and full-text review steps. Although this flow chart is publicly accessible and provides high-level reasons for exclusion such as "Not PECO Relevant" it does not give insight to the particular PECO criteria that was not achieved. For example, according to the flow chart, McDonough et al. (2020) was excluded at the screening level. From a review of the title/abstract, it appears that McDonough et al. (2020) meets all PECO criteria outlined in Appendix A Table A-1 (EPA, 2023e).

EPA's methodology for study identification and inclusion is problematic and unclear.

· It is not clear why EPA excluded certain studies from consideration here that it had previously relied on for its 2016 Health Effects Support Documents (HESDs) for PFOA and PFOS (EPA 2016a, 2016b). In response to charge question #1 regarding the adequacy of EPA's systematic review methods, the SAB on August 22, 2022 recommended, "Earlier literature used for the 2016 HESDs must be included in the literature search and considered for both strength of evidence evaluation and dose response." EPA responded that it expanded the assessment to include epidemiological and animal studies identified in EPA's 2016 HESDs for PFOA and PFOS. The MCLG Assessment Protocol also states that EPA reviewed studies captured by the 2016 HESD. However, EPA does not describe in its protocol whether these were included based on subjective judgement or whether they were incorporated into the literature screening process applied to the other studies (i.e., evaluated against the PECO criteria). Further, Tables A-6 and A-7 state that 62 epidemiological and 11 animal studies identified in the HESD summary tables were included in EPA's MCLG assessments, respectively. However, in a query of the Interactive Reference Flow Diagram, it appears that only 58 studies total were included for review. Without the proper documentation, it is unclear whether the 15 unaccounted for studies were intentionally or erroneously excluded.

· EPA should not use filters as a means of exclusion without the use of quality control (QC) of title/abstracts excluded at this stage. In Appendix A of the draft toxicity assessments for PFOA and PFOS, the protocol states that the methodology includes use of SWIFT-Review and SWIFT-Active, which are well-known systematic review tools that can be used to implement machine-learning techniques. Here, SWIFTReview was used to apply "evidence stream filters" for human, animal (all), animal (human health model), [no tag], epidemiological quantitative analysis, and in vitro. The result of this is the automated exclusion of approximately 2200 studies. The validity and reliability of SWIFT-Review as a tool to exclude citations has not been studied (Howard et al., 2016; Pelch and Kwiatkowski, 2022) and is therefore unreliable as a basis to filter studies in the manner EPA applied here.

· EPA's review of and reliance on erratums is unclear. Inclusion criteria in Table A-9 of Appendix A states that "erratums and corrections were considered not relevant." This may have resulted in incomplete evidence identification as erratums and corrections could potentially contain updated information and inform study quality evaluation, impacting overall study rating and thus reliability. Further, although Table A-9 states that erratums and corrections were considered irrelevant, Table B-26 includes a reference to Shin et al., 2013 in context of "updated values in Erratum." It is not clear when or how this effort took place or whether it was systematic. It is also unclear whether corrigendum were included in this category of literature.

· It is unclear whether short-term studies reporting immune and neurological health outcomes were considered for weight of evidence (WOE) evaluation or tagged as supplemental. The protocol states different applications of criteria for short-term (<28 day) exposures. In Table A-8, it is stated that studies with <28 days of dosing will be tagged as supplemental except for reproductive, developmental, immune and neurological health outcomes. However, Table A-11 only states the same exception for developmental/reproductive outcomes. Due to the method of reporting exclusions and studies tagged as supplemental it is not feasible to ascertain whether there was consistent evaluation of short-term immunological and neurological health outcome studies.

EPA Response: The commenter incorrectly stated that the EPA did not provide enough information detailing the consistent application of screening criteria for individual studies that were excluded because they failed to meet the screening criteria. The commenter noted that the SAB PFAS Review Panel made several recommendations in response to charge question #1 during their evaluation of the *Proposed Approaches* documents (USEPA, 2021b; USEPA, 2021c; USEPA, 2022b). The commenter did not include the complete SAB recommendation, which was:

> *"[t]he Panel notes that the document's transparency would be enhanced through a diagram or flowchart depicting the overall process of study identification and inclusion," and "[a] list of excluded evidence after the full-text review should be developed and made publicly accessible. This may help provide clarity about why specific studies were excluded"* (USEPA, 2022b).

The EPA responded to the SAB recommendations by developing the Interactive Reference Flow Diagram, which exceeds both of these requests. This interactive diagram allows users to search for individual studies to identify whether studies were excluded and which step they were excluded. It specifies how the EPA identified the studies (e.g., the date range of the literature search update), which studies were screened for mechanistic and Absorption, Distribution, Metabolism, and Excretion (ADME)/toxicokinetic data, and which studies were extracted and reasons why certain studies were not extracted. The EPA's inclusion of this interactive flow diagram in the draft and final assessments has further enhanced the transparency of systematic review decisions by providing the ability to track at the individual study level. It also allows for tracking and sorting of thousands of studies through the assessment process.

The commenter incorrectly suggests that McDonough et al. (2020) was excluded from the assessment for seemingly unclear reasons. First, the commenter is not clear on which McDonough et al. (2020) publication they are referencing since there are two, but the EPA assumes the commenter is referencing the health effects study under Health and Environmental Research Online ID Number (HEROID) 6988474 since the other McDonough et al. (2020) study under HEROID 6512120 is about PFAS bioaccumulation only and therefore not PECO relevant. Second, in the assessments, the EPA has provided all the information required for a reader to understand how studies were screened and why studies were excluded. In this example, McDonough et al. (2020), can be previewed in the interactive flow diagram (including links to the Health and Environmental Research Online [HERO] page where the reference can be accessed), and the PECO criteria for inclusion and exclusion is located in Table A-1 of Appendix A (USEPA, 2024a; USEPA, 2024b). From the title alone ("Immunotoxicity of an Electrochemically Fluorinated Aqueous Film-Forming Foam"), a screener would note that the study may only pertain to PFAS mixtures, not PFOA or PFOS individually, a requirement for inclusion as dictated by the PECO in Table A-1 of Appendix A. Upon further evaluation of the abstract, the text clearly states, "[a]dult female and male C57BL/6 mice were given a commercial AFFF formulation for 10 days via gavage," and only received a single-dose of PFOA as a positive control (McDonough et al., 2020). In contrast to the commenter's assertion, this study clearly does not meet the PECO outlined in Table A-1 (USEPA, 2024a; USEPA, 2024b), though it would meet several supplemental tags of this assessment, including "Only One Exposure Group" and "Mixture Studies." The EPA recognizes that it may be unclear why this study was tagged as excluded instead of supplemental. When using SWIFT-Active (Sciome Workbench for Interactive Computer-Facilitated Text-Mining), the supplemental tag is included under the umbrella of exclude to train the model specifically for inclusion. To address this issue, the EPA has updated the Interactive Literature Flow diagram to reflect the studies tagged through the use of SWIFT-Active as supplemental instead of excluded.

The commenter mistakenly suggests that the EPA did not describe in the protocol how studies from the 2016 HESDs were included into the assessments (USEPA, 2016a; USEPA, 2016b). The EPA clearly stated in Section A.1.5.4 of both the PFOA and PFOS *Proposed MCLG* appendix documents that key studies from the 2016 HESD were reviewed and those studies that were considered relevant to one or more of the five main health outcomes were included in the toxicity assessment (USEPA, 2023b; USEPA, 2023c). These studies were listed in Tables A-6 and A-7 of the PFOA and PFOS *Proposed MCLG* appendix and can be tracked for their relevancy in the Interactive Reference Flow diagram. Specifically, the EPA reviewed the epidemiological studies that were included in the 2016 HESD summary tables and identified those that were relevant to one or more of the five main health outcomes (i.e., Developmental, Immune, Hepatic, Cardiovascular, and Cancer) (USEPA, 2016a; USEPA, 2016b). A total of 62 epidemiological studies were included and are listed in Table A-6 (USEPA, 2023b; USEPA, 2023c). The EPA focused on the HESD summary tables since the epidemiological studies were not considered quantitatively in the HESDs. The animal toxicological studies that were considered for dose-response in the 2016 HESDs were also incorporated into the current assessments. To address the

commenter's concern, the EPA has added additional detail to Section A.1.5.4 to clearly state how studies from the 2016 HESDs were incorporated into the final toxicity assessments (USEPA, 2024a; USEPA, 2024b).

For PFOA, the text for Table A-6 in the *Proposed MCLG* document indicates there were 62 epidemiological studies identified in the HESD summary tables that were included in the assessment (USEPA, 2023b). There was a minor error in the number of epidemiological studies for this table, as the total is actually 59 studies. To address this error identified by the commenter, the EPA has corrected the text above Table A-6 in the final PFOA toxicity assessment (USEPA, 2024a). Using the Interactive Flow Diagram[1], of these 59 studies, 45 were marked as relevant human and 14 were marked as did not extract. Of these 14 studies, 12 studies were listed as '*Low* confidence/*uninformative* study quality rating' and 2 studies were listed as 'Overlap with other study' as the reasons for not being extracted. The text for Table A-7 indicates there were 11 animal toxicological studies identified in the HESD summary tables that were included in the EPA's draft assessment. All 11 studies were considered relevant and included in the final toxicity assessment (USEPA, 2024d; USEPA, 2024a).

For PFOS, the text for Table A-6 in the *Proposed MCLG* document indicates there were 51 epidemiological studies identified in the HESD summary tables that were included in the assessment (USEPA, 2024b). There was a minor error in the number of epidemiological studies for this table, as the total is actually 47 studies. To address this error identified by the commenter, the EPA has corrected the text above Table A-6 in the final PFOS toxicity assessment (USEPA, 2024b). Using the Interactive Flow Diagram, of these 47 studies, 35 were marked as relevant human and 12 were marked as did not extract. Of these 12 studies, 10 studies were listed as '*Low* confidence/*uninformative* study quality rating' and 2 studies were listed as 'Overlap with other study' as the reasons for not being extracted. The text for Table A-7 indicates there were 9 animal toxicological studies identified in the HESD summary tables that were included in the EPA's draft assessment. Of these 9 studies, 8 were considered relevant and included in the PFOS draft assessment and 1 study was marked as '*Low* confidence/*uninformative* study quality rating' and was not extracted.

As indicated above, the EPA clearly explains the process for inclusion of the key studies from the 2016 HESD documents, the use of the literature screening process to determine relevancy, and the outcome of screening for each study in the Interactive Reference Flow diagram. All studies

[1] In tracking these studies through the Interactive Flow Diagram, it should be noted that as a publication moves through the systematic review steps in the Interactive Reference Flow diagram, the first three sections (e.g., Identification, Screening, and Eligibility) are identical for both the PFOA and PFOS diagrams. This is clearly indicated by the bold 'PFOA' and 'PFOS' in the 'References screened for PFOA and PFOS' and 'References assessed for eligibility for PFOA and PFOS' boxes. For the Eligibility section, a new option 'Relevant to PFOA/PFOS only' was added for increased clarity and indicate when a publication contained information for only one chemical. For the last section (e.g., Relevant), the 'To PFOA/PFOS' toggle button can be used to confirm whether or not the paper was considered relevant for the chemical of interest, tagged as containing mechanistic or toxicokinetic supplemental information, or was not extracted. If the publication was not extracted, hovering over the number in the 'Did Not Extract' box identifies the reason the publication was not extracted.

listed in Tables A-6 and A-7 of the PFOA and PFOS *Proposed MCLG* appendices were properly documented and accounted for (USEPA, 2023b; USEPA, 2023c).

The commenter stated that the EPA should not use evidence stream filters, such as those applied when screening with SWIFT-Review, to automate the screening process because the tool has not been studied and is unreliable. These claims are incorrect. First, the search filters of SWIFT-Review have been widely used in prior and ongoing IRIS assessments as an initial tool for problem formulation and to prioritize records for subsequent title-abstract screening with other software (USEPA, 2022a). Similarly, SWIFT-Active Screener has also been, "widely used in IRIS assessments for title and abstract screening, especially when there are many studies to screen (e.g., 2,000+) or there is time urgency," as was the case for the assessments of PFOA and PFOS under SDWA (USEPA, 2022a). Second, the EPA's use of SWIFT software was presented to the SAB PFAS Review Panel as part of the *Proposed Approaches* documents. In response to EPA's first charge question regarding study identification and inclusion, "[t]he Panel noted that the use of SWIFT and DistillerSR to sort the literature and process for quality evaluation and confidence determination were reasonable steps" (USEPA, 2022b). Third, the use of SWIFT-Review and SWIFT-Active Screener was also documented in the IRIS PFAS Systematic Review Protocol, which was published for public comment in 2019 and subsequently updated in 2020 and again in 2021 (USEPA, 2021a). Fourth, the citation provided by the commenter, Howard et al. (2016), is a peer-reviewed publication which describes the validity and reliability of the SWIFT-Review tool. Therefore, it is unclear why the commenter cites this publication to support the claim that the tool has *not* been studied. The EPA recognizes that when conducting a systematic review on a database as large as PFOA and PFOS, whether using active learning software or not, there is always a chance of the exclusion of relevant studies. This is one reason why the agency requested that both the SAB PFAS Review Panel (in 2021) and public commenters (in 2023) provide citations that they believed the EPA may have overlooked.

The commenter noted that the review and incorporation of errata in the draft toxicity assessments was unclear. The agency recognizes the confusion resulting from the quoted statement and has subsequently revised Appendix A of the toxicity assessments (USEPA, 2024a; USEPA, 2024c) to state: "Errata, corrections, and corrigenda were tagged to the original study and not considered a separate relevant record." More specifically, when an erratum, correction, or corrigendum to a study that met PECO criteria was identified, the EPA tagged them to the original study but did not treat them as unique, individual studies that met PECO. Errata, corrections, corrigenda were uploaded to the screening software (i.e., DistillerSR and SWIFT-Active Screener) along with all other search results identified in that literature update, uploaded in HERO, given a unique HEROID, and tagged as related to the original study. An example of this is the erratum published by Shin et al. (2013) which accompanied the original article (Shin et al., 2011), as the commenter mentioned. When an erratum or correction was identified, the EPA updated the information extracted from the original study, including information related to study quality evaluation metrics, with any corrections or additional information published in the erratum. Therefore, the EPA's draft assessments did have all relevant data incorporated using a systematic methodology.

Lastly, the commenter noted a minor discrepancy between Table A-8 and Table A-11 in the *Proposed MCLG* appendices (USEPA, 2023b; USEPA, 2023c). To address this comment, the EPA has revised Table A-11 to be consistent with Table A-8, which was correct. The EPA consistently evaluated short-term Immunological and Neurological health outcome studies and included animal toxicological studies with less than 28-day exposure durations as PECO-relevant for these health outcomes.

3M Company (Doc. #1774, SBC-045661)

EPA's methodology for study identification and inclusion lacks integrity and transparency. In response to SAB comments, EPA expanded its assessment to include epidemiological and animal studies identified in EPA's 2016 Health Effects Support Documents for PFOA and PFOS. However, it is unclear whether these studies were incorporated into the literature screening process applied to other citations or included based on subjective judgement. It is also unclear why 15 studies identified in the 2016 Health Effects Support Documents were not accounted for in the review.[FN29: See Tables A-6 and A-7 of the 2016 HESD summary tables and Interactive Reference Flow Diagram for PFOA & PFOS | Tableau Public.] EPA also implemented the use of SWIFT-Review [FN30: "SWIFT" is an acronym for Sciome Workbench for Interactive computer-Facilitated Text-mining. It is software that uses statistical modeling and machine learning to conduct automated document prioritization. See https://www.epa.gov/sites/default/files/2018-02/documents/d-4_swift_demo_abstract_-_nas_2018.pdf.] for a portion of study identification, which has yet to be validated for this purpose. This may have resulted in inadvertently excluding relevant studies. Additional study types that may have been inappropriately excluded from the review according to the reported methodology include erratums, corrections, and corrigendums. This issue is discussed in detail in Appendix A, Detailed Technical Comments on the Non-cancer Reference Doses (RFDs) and Economic Analysis for PFOA and PFOS.

Increased transparency in reporting is needed.

The SAB recommended changes to the evidence identification step of the PFOA and PFOS systematic reviews, including providing a more transparent reporting of output. EPA responded by providing a publicly accessible interactive flow diagram. That diagram, however, does not give insight into the specific Population, Exposure, Comparator, and Outcomes (PECO) criteria that EPA decided certain studies did not meet. PECO criteria define the objectives of the review and inform the "inclusion and exclusion criteria for a review, as well as facilitating the interpretation of the directness of the findings based on how well the actual research findings represent the original question."(Morgan et al. 2018) EPA's failure to identify the PECO criteria that excluded studies did not meet precludes independent appraisal of why those studies were excluded. This issue is discussed in detail in Appendix A.

EPA did not refine study quality criteria to the topic per standard IRIS systematic review guidelines.

To evaluate study quality and risk of bias in the PFOA and PFOS assessments, EPA said it used its IRIS assessment tool. EPA IRIS Handbook (USEPA ORD 2022) guidance states that to evaluate studies, chemical-, outcome- or exposure-specific considerations should be developed as needed to identify issues expected to result in critical biases and that should reduce the confidence rating of a study (ORD Handbook, p. 4-2). Contrary to EPA's own guidance, the only apparent modification EPA made to its IRIS assessment tool for study evaluation in this rulemaking was to the exposure assessment domain criteria. This modification is insufficient in that it fails to account for critical issues that could render studies unreliable for dose-response assessment – a critical part of EPA's analysis here. Critical omissions include lack of consideration of factors that are specific to exposure, outcome ascertainment, confounding factors that affect the association of interest, and sensitivity issues such as external validity and study construct. This issue is discussed in detail in Appendix A.

The study quality evaluation protocol used in EPA's assessments of PFOA and PFOS generated inconsistent study confidence ratings.

EPA did not correctly evaluate and rate studies for reverse causality, which is a type of bias where the health outcome affects physiological factors that moderate exposure measurement. (Andersen et al. 2021). If reverse causality is not accounted for in a study, the observed effects may not result from the exposure and could be mischaracterized as adverse. Although guidance provided for PFAS-Specific Exposure Measures states that concern for potential bias due to reverse causality with no direct evidence should be rated as 'deficient,' EPA did not consistently rate study design aspects that may impact reverse causality in the body of evidence it considered. In a review of crosssectional studies that fall into the category of "potential reverse causality," the Exposure Methods ratings were inconsistent and generally rated as adequate or good rather than deficient. Further, subjectivity introduced by the Guidance allows reviewers to increase confidence in studies reporting an effect if its confidence was reduced due to sensitivity only. How and when this was applied by EPA in its review here is not readily transparent. Lastly, the lack of transparency and objectivity in the study quality evaluation guidance also contributes vague overall study confidence ratings that do not appear to take the individual domain metric ratings into consideration. This issue is discussed in detail in Appendix A.

EPA's inconsistent systematic review methods violated its own guidance and resulted in exclusion of relevant studies and reliance on low-confidence studies that may be unsuitable for regulatory decision-making.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document and the EPA response to comment Doc. #1774, SBC-053425 in section 4.1.1 in this *Response to Comments* document regarding the EPA's process of how each study in the PFOA and PFOS assessments are properly documented and the process of study inclusion and exclusion. The EPA maintains that there is enough information provided in the protocol and Interactive Flow Diagram for a reader to "independently appraise" individual studies and provides an example of this in the EPA response to comment Doc. #1774, SBC-053425 in section 4.1.1 in this *Response to Comments* document.

The commenter first incorrectly stated that the EPA "only" made modifications to one study quality evaluation domain (i.e., the exposure assessment domain). In fact, the EPA incorporated several outcome-specific modifications and PFAS-specific modifications. For example, the EPA stated in Section 3.4.4.1.2 of the draft toxicity assessments that, "For the Confounding domain, downgrading of studies occurred when key confounders of the fetal growth and PFAS relationship, such as parity, were not considered." Other alterations specific to the developmental health outcome are also described in that section. Additionally, as described previously, the EPA based the systematic review protocol used in these assessments on the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a). This resulted in the EPA's consideration and incorporation, when relevant, of the PFAS-specific alterations described in that protocol (e.g., in Section 6.2.1 ("Epidemiology Study Evaluation Criteria Specific to These Five Per- and Polyfluoroalkyl Substances (PFAS)") for the PFOA and PFOS toxicity assessments. Altogether, these examples clearly refute the commenter's assertion that the EPA "fails to account for critical issues that could render studies unreliable." The commenter also stated that the EPA's modification to the IRIS assessment tool for study evaluation was insufficient but did not make suggestions for specific modifications to study quality domains to support that assertion. Responses to specific health outcome study quality concerns have been made throughout this *Response to Comments* document, most notably in section 4.2.1.The commenter additionally incorrectly stated the study quality evaluation protocol used by the EPA generated inconsistent study confidence ratings, raising reverse causality and study sensitivity as specific concerns. The commenter states there was a lack of transparency and that individual domain metric ratings did not appear to be taken into account. The commenter also infers that all cross-sectional studies should be rated as *deficient* in the Exposure Methods domain. The EPA disagrees with these comments for the following reasons.

First, the EPA would direct the commenter to review the footnote in Table A-19 in the *Proposed MCLG* appendices (USEPA, 2023b; USEPA, 2023c), which defines reverse causality as a scenario where "the outcome of interest cause[s] a change in the measured exposure." Reverse causality is not inherent to a study design (e.g., not necessarily a concern in all cross-sectional studies simply because of their design), but issues with reverse causality may be raised about studies using certain study designs that analyzed outcomes that may affect PFAS metabolism. While evaluating studies, the EPA considered concerns regarding reverse causality on a health outcome- or endpoint-specific basis where consideration was supported by the established epidemiological literature (Radke et al., 2019). For example, health conditions, such as decreased renal function or diabetes, may affect clearance of PFAS from the body (Jain and Ducatman, 2019a), thus potentially resulting in a change in the measured PFAS exposure. Therefore, reverse causality was considered for these health outcomes.

Second, the EPA disagrees with the comment claiming that there was inconsistent application of criteria for Overall Study Confidence related to Study Sensitivity. The commenter partially cites a note included in the Overall Study Confidence rating criteria and then asserts that it is unclear when that note was applied by the EPA. The entirety of the note stated, "Reviewers should mark studies that are rated lower than high confidence only due to low sensitivity (i.e., bias towards

the null) for additional consideration during evidence synthesis. If the study is otherwise well-conducted and an effect is observed, the confidence may be increased" (USEPA, 2023b; USEPA, 2023cj; Table A-25). It is clear from this full excerpt that the EPA should consider this factor for studies rated lower than *high* confidence when the rating was lowered only because of a *deficient* study sensitivity rating. The EPA clearly provided all evaluation domain ratings for each study in figures within the draft toxicity assessments, including for studies with an overall confidence lower than *high* and a sole *deficient* rating for the Sensitivity domain (USEPA, 2023f; USEPA, 2023a), and also provided links to the Health Assessment Workplace Collaborative (HAWC) project page (hawc.epa.gov) that provides further detail on the basis of those ratings (e.g., when overall confidence was increased as a result of this note).

Lastly, the EPA disagrees that it "vaguely" or did not transparently conduct the study quality evaluations. The protocols in Appendix A explicitly describe factors considered during study evaluations (USEPA, 2023b; USEPA, 2023c; USEPA, 2024a; USEPA, 2024c). The EPA considered all individual domain ratings during study quality evaluations, the discussion for which are transparently and readily accessible through the health outcome heatmaps throughout the assessments and in the HAWC project page (https://hawc.epa.gov/assessment/100500248/), in contrast to the commenter's claim.

Regarding the EPA's consideration of agency guidance and methodologies, please see section 4.1.2 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-053426)

To evaluate study quality and risk of bias, EPA used the IRIS assessment tool. EPA's ORD Staff Handbook for Developing IRIS Assessments (IRIS Handbook) guidance states that to evaluate studies, EPA should develop additional chemical-, outcome- or exposure-specific considerations as needed in order to identify issues that would be expected to result in critical biases and should reduce the confidence rating of a study (ORD Handbook 2022, p. 4-2). Although EPA stated that the methods used for its systematic review of the literature for health effects of PFOA and PFOS and toxicity assessment were consistent with those described in the IRIS Handbook, in Appendix A of the draft toxicity assessments for PFOA and PFOS, the only domain modified for the current topic was Exposure Measurement. This single modification to the exposure assessment domain is inadequate to evaluate biases effectively.

EPA modified the Exposure Assessment domain criteria to include specific considerations to rate the analysis of PFAS that directly measured exposure (blood, serum, plasma) vs. indirect measures (breastmilk, drinking water, residence, occupation) (EPA 2023a, B Appendix). EPA gave all exposure mediums a rating of "good" if well-established methods were used, or if less-established methods were used, they had to be supported by inter-method validation (one method vs. another) in the target population. EPA should further delineate the medium of exposure because PFAS measures in different mediums do not all have the same level of accuracy. Potential inaccuracies in exposure characterization due to measurement in various mediums may

also affect confidence in dose-response assessment and estimates of external dose. Further discussion of this is provided in Section 2.1.8 of this appendix.

EPA made only minor modifications to the assessment tool, and did not account for most factors that are specific to either the exposure, outcome ascertainment, confounding factors that affect the association of interest, and sensitivity issues including external validity and study construct. Transparency in the methods EPA used to evaluate overall study confidence and perform a formal critical appraisal of quality and risk of bias is vital for understanding the uncertainties in the risk assessment. Had EPA appropriately completed the critical appraisal by making recommended modifications to the assessment tool, EPA would have found much of the body of evidence to be of low quality and at high risk of bias. It is imperative that EPA follows the guidelines of IRIS when using its method for the systematic review and critical appraisal of the literature to understand the uncertainties surrounding the risk assessment.

EPA reportedly assessed seven evaluation domains for epidemiological study evaluation, including: participant selection, exposure measurement criteria, outcome ascertainment, potential confounding, analysis, selective reporting and study sensitivity. Guidance provided to the reviewers for the exposure measurement domain is presented in two tables in EPA's (2023a,b) Appendix A (Tables A-18 and A-19). It is unclear which of these were used by reviewers to develop ratings for the exposure measurement domain, or if they were meant to be complementary to each other. The use of both tables to guide a reviewer in the selection of the appropriate rating may introduce inconsistencies given the amount of information required to interpret the confidence in this metric for each publication.

Table A-19, which provides guidance for PFAS-Specific Exposure Measurements, states that a "deficient" rating should be given when there is concern for potential bias due to reverse causality with no direct evidence. Despite this guidance, study design aspects that may impact reverse causality are not rated consistently by EPA in the body of evidence. Inherent to their study design, cross-sectional studies assess the exposure and an outcome at a single point in time (in contrast to a prospective cohort study). Due to the nature of these studies, they would have fallen into the category of "potential reverse causality," though EPA did not rate any as deficient for this metric. EPA did not justify its reasoning for increasing confidence ratings. To exemplify these inconsistencies, Table 1 [see original comment] below shows a selection of studies evaluated for this domain along with their ratings and justification.

Further, study quality evaluation guidance in the protocol (Appendix A) introduces potential for subjective confidence ratings (EPA 2023a,b). This guidance directs reviewers in the following manner (PDF pgs. 110 [human], 135 [animal]): "Reviewers should mark studies that are rated lower than high confidence only due to low sensitivity (i.e., bias towards the null) for additional consideration during evidence synthesis. If the study is otherwise well-conducted and an effect is observed, the confidence may be increased." It is not clear how EPA applied this guidance in the assessments of PFOA and PFOS, nor does it appear consistent.

EPA Response: The commenter asserted that the EPA's exposure-specific modification to the IRIS study quality evaluation criteria was insufficient because the medium of exposure was not further delineated to account for varying levels of accuracy across different exposure media. The commenter further repeats that the EPA's modification to the "assessment tool" was minor and raises concerns about unaccounted factors, but the commenter does not mention which factors were of specific concern nor does the commenter provide any supplemental information or data to support these concerns. First, please see the EPA response to comment Doc. #1774, SBC-045661 in section 4.1.1 in this *Response to Comments* document.

The commenter does not provide an actual recommendation for how the EPA should delineate medium of exposure in addition to how the EPA already does delineate this factor, which is described in detail in the assessment in section Appendix A.1.7.1.2 (PFAS-specific exposure assessment criteria). For example, in this section the EPA states, "[s]tandard analytical methods of individual PFAS in serum or whole blood using quantitative techniques, such as liquid chromatography triple quadrupole mass spectrometry, are considered well-established methods." All of the studies the EPA considered for dose-response analyses reported serum concentrations as the exposure medium and used well-established methods as described in the protocol, thus negating the commenter's concern that, "inaccuracies in exposure characterization due to measurement in various mediums may also affect confidence in dose-response assessment." The commenter stated that further information was provided in Section 2.1.8 of the appendix document which does not exist ("Appendix A to 3M Comments on EPA Proposed National Primary Drinking Water Standard").

In contrast to the claim made by the commenter, the chemical-, exposure-, and outcome-specific modifications that the EPA made to the PFOA and PFOS systematic review protocols were sufficient, transparent, and based on the best available peer-reviewed science and methods. The EPA modified the systematic review protocol consistent with the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a), as well as the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a), prior to initiation of the draft assessments. Exposure-specific modifications were appropriately made to the criteria in consultation with topic-specific technical experts to account for "chemical-specific knowledge or methodological concerns" (USEPA, 2022a). Further, the EPA considered additional chemical-, exposure-, and outcome-specific factors when reviewing studies for their use in quantitative analyses. For example, the EPA prioritized studies on birth weight (BWT) that measured PFAS serum concentrations during early pregnancy over those that reported PFAS serum concentrations in cord blood or later trimesters due to potential hemodynamics issues (e.g., increase in maternal blood volume over the course of pregnancy; see Section 3.4.4 of USEPA (2024a) and USEPA (2024b) for further discussion).

The commenter incorrectly stated that the EPA provided study quality reviewers with two different sets of exposure assessment criteria in Appendix A (Tables A-18 and A-19; USEPA, 2023b; USEPA, 2023c). The commenter further noted it was unclear which set was used by reviewers or if they were complementary. The commenter argued that the use of both tables as

complementary sets of criteria "may introduce inconsistencies given the amount of information" required to determine an exposure assessment rating. The commenter stated that the criteria listed in Table A-19 were not applied consistently, specifically regarding reverse causality in cross-sectional analyses. The commenter stated that the study evaluation guidance potentially introduces "subjective confidence ratings." The EPA disagrees with all of these comments and has provided clarifying information in the paragraphs below.

First, Tables A-18 and A-19 in Appendix A (USEPA, 2023b; USEPA, 2023c) were used as complementary sets of criteria for exposure assessment. The *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a) lays out basic criteria and also states, "additional chemical-, outcome-, or exposure-specific considerations for evaluating studies are developed as needed in consultation with topic-specific technical experts." For this assessment, additional exposure-specific criteria were developed for PFOA and PFOS. The EPA disagrees that the use of complementary sets of criteria introduces inconsistencies in study quality evaluation. PFAS-specific criteria listed in Table A-19 (USEPA, 2023b; USEPA, 2023c) provide further exposure-specific considerations in addition to the standard exposure assessment criteria provided in the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a), and there are no disagreements between criteria from the two tables. The EPA has added this additional detail to Section A.1.7.1 of Appendix A to make it clear that Tables A-18 and A-19 are complementary (USEPA, 2024a; USEPA, 2024c). Study quality evaluators rely on the criteria listed in Table A-18 for high-level conceptual questions regarding potential biases in exposure measurement, while Table A-19 provides evaluators additional specific criteria to seek out for answering the conceptual questions prompted by the criteria provided in Table A-18. While Table A-19 provides highly detailed criteria, information on these criteria helps the evaluator synthesize the study's whole exposure assessment protocol and determine whether the study can reliably distinguish between levels of exposure in a time window considered most relevant for an effect with respect to the development of the outcome. Regarding consistent application, some variation in justification is anticipated and accepted across a team of experts reviewing studies because scientific expertise and judgment is required to make decisions. In fact, the IRIS Handbook (USEPA, 2022a) notes that, "the use of scientific expertise and judgment is an inherent part of the process." Consistency across study evaluators is increased by the EPA's practice of conducting two independent review for primary evaluations and having a third, more experienced reviewer, conduct QC and finalize the study ratings across all evaluation domains.

Second, reverse causality is dependent on the outcome of interest and not inherent to a certain study design, as noted in the footnote of Table A-19 (USEPA, 2023b; USEPA, 2023c). This was previously described in the EPA response to comment Doc. #1774, SBC-045661 in section 4.1.1 in this *Response to Comments* document. While evaluating studies, the EPA considered potential for reverse causation on an outcome-specific basis, where consideration was supported by the established epidemiological literature (Radke et al., 2019). Certain health conditions, such as decreased renal function or diabetes, may affect clearance of PFAS from the body (Jain and Ducatman, 2019a); potential for reverse causality was considered in these cases. Thus, there are examples of cross-sectional analyses with exposure assessment rated as Deficient based on

reverse causality (e.g., Kataria et al., 2015) that were dependent on the outcome of interest (e.g., renal function). However, reverse causality is unlikely to be a concern in cross-sectional studies or studies of any other design for health outcomes unrelated to distribution or clearance of PFAS from the body. In these cases, cross-sectional measurements of PFAS were determined to be representative of past exposure due to the long half-lives of PFOA and PFOS in the body.

Lastly, the EPA disagrees that the guidance provided in the study quality evaluation protocol (Appendix A; USEPA, 2023b; USEPA, 2023c) introduces subjective confidence ratings. The specific piece of guidance the commenter cites describes scenarios where an overall study confidence was decreased solely due to a *deficient* rating in the Sensitivity domain. This would apply to studies of *low* or *medium* confidence. The guidance states an overall confidence rating may be increased if an effect was observed despite the limitations in sensitivity. The observed effect would be reported by the study authors and would not be based on a subjective decision of the reviewer. To the extent the commenter is raising concerns about subjectivity of the protocol, the IRIS Handbook recognizes that expert scientific judgment is an inherent part of the systematic review process (USEPA, 2022a); as described above, any differences in professional judgment are mitigated by the use of multiple reviewers and pre-established evaluation criteria.

Mike Pettit (Doc. #1542, SBC-043344)

This paper will merely highlight major issues and causes for concern that should be addressed before any type of rash decisions are made that would severely impact communities across the States. Page 244 and beyond are prime examples of these types of issues. Derived data can be useful however, derivations of derivations ultimately imbue a growing sense of error since they are, at their very core, speculations. Without properly controlled studies to accurately measure slopes of correlation, the amount of hidden error may not be realized at first and then incorrect conclusions may be drawn and imposed on the general populace. The very liberal usage of the term “estimate” in all of its tenses combined with the again, very liberal, usage of the term “suggestive” does not lend any form of certainty or gravity to the serious tone originally laid out in this memo.

By the memo’s own admission on pg 265, the weight of the terms and their relative strength is mentioned in this sentence: “discuss the weight of evidence supporting associations between PFOA or PFOS exposure with health outcomes as indicative (likely), inadequate, or suggestive.” That would immediately mean that the term “suggestive” is the weakest term of correlative strength and that heavy usage frankly does not lend any level of confidence. The term “suggest” and its tenses appears 51 times within the memo whereas “indicative” appears 8 times. That alone should speak for itself. The term “positive association” shows up 16 times however the strength of these associations are actually never delineated and the papers that are referenced really provide very weak positive associations or extreme circumstances such as acute, chronic exposure at levels far beyond what anyone in any normal situation would ever experience. In such instances, yes there would be an issue but the same could be said of vitamins, alcohol, and bananas. If anyone were to consume a huge amount of any of those things, there would be health

complications and concerns. That does not mean that those things are outlawed or even seriously regulated. Bananas have minimal regulations and if someone buys 100 pounds of them, that might raise a few eyebrows but nothing beyond that. Vitamins, again minimally regulated, and alcohol, the most regulated of these and a known carcinogen, is easy enough to buy with the right identification with no legal limits on how much a single individual can buy. So bananas (which are slightly radioactive), multivitamins (which can be overdosed), and alcohol (known carcinogen and major cause of vehicular death/homicide) are less regulated than a serious of non-reactive chemicals that have very little known issues and side effects.

The reason these chemicals are called “forever chemicals” to begin with is that they are mainly comprised of carbon-fluorine bonds which are the strongest bonds in organic chemistry and because of that bond, they are famously nonreactive. What this now means is that it is chemically inert, and will chemically barely react with anything within the body. The issue would then be not how the chemical reacts with the body but how the body reacts to the chemical, which is an entirely different animal and will vary from person to person. This has to do with genetics, genetic predispositions, community, living conditions, etc. It would be difficult at best to try to fully quantify the effects these chemicals would have without conducting long range, chronic studies that take into account a myriad of limiting factors. Extrapolation of data that does not or can not take these factors into full consideration should only be taken with the utmost caution. The amount of interfering factors that can be and are present would easily confound results into completely erroneous conclusions.

This brief digression has a purpose- of the 8 mentions of the term “indicative,” twice it was used as the definition and expanding the definition therein, once was used to explain why certain evidences were not used in the economic analysis, once mentioned that the evidence was indicative, but it could not be valued enough clinically to be included, another time it is mentioned that the slope implied only a small change in risk, twice it was used to say that there is moderate evidence to support a potential change as marked by elevated liver enzymes which are indicative of liver damage, and finally it was used to mentioned in the context of regulations of TTHMs. So of the 8 usages of the term, only two are directly used in reference to PFAS/PFOA but are later discounted, and two are loosely assigned with an idea that there is moderate evidence as shown by a secondary product that is indicative of liver disease and are thus not even fully linked together. Therefore, half of the strongest terms that could be used is not even used to support the evidence. This is a major cause of concern for the most obvious of reasons. There is a serious lack of sincerity and integrity showcased in this instance. There cannot be any strict, or even serious, type of regulations placed in this instance, such as enforcing 4 parts-per-trillion limit. If any are placed, this is either an error or has another reason behind it- it has nothing to do with the weight of the scientific evidence. If anything, this should prompt further, more focused research before anything is concluded. Surely this is a lesson that should have been learned with the advent of the first Covid-19 shot that caused severe and sometimes fatal after effects simply because the process was rushed which resulted in poor decisions being made and unnecessary suffering to occur. The short conclusion therefore of all of this, is that the vast majority of the claims are extrapolations that by their very nature cannot take into account all of the confounding

factors listed out in the previous paragraph. Again, this raises to the issue of drawing lines in the sand that scientifically cannot be drawn. The facts simply are not there.

EPA Response: The commenter suggests that the EPA's use of "derivations of derivations" introduces error, however the commenter does not define how the EPA used "derivations of derivations" and does not provide evidence that the studies used in the PFOA and PFOS toxicity assessments are improperly controlled. Please see section 4.1.2 of the EPA response in this *Response to Comments* document which details how the EPA used best available science and followed agency guidance in producing the PFOA and PFOS toxicity assessments.

The commenter took Issue with the language the EPA used to describe conclusions about the strength of evidence from reviewing the available in the health effects information. The commenter suggested that the ordering of the term "suggestive" last in the list of potential judgments led readers to believe this was the weakest term regarding supporting evidence. These terms are commonly used across agency assessments that follow the systematic review process outlined in the IRIS Handbook (USEPA, 2022a). The EPA's usage of terms such as "indicates" and "suggestive" was a direct result of the EPA responding to the SAB recommendation to "implement a structured, consistent process with consistent terminology for analyzing and synthesizing animal evidence, human evidence, and overall evidence" (USEPA, 2022b). The EPA used the same terminology in the toxicity assessments for evidence integration judgment terms that are defined in the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a); these terms were also described in detail in Appendix A of the PFOA and PFOS draft toxicity assessments (USEPA, 2023b; USEPA, 2023c). In response to the concern raised by this commenter about the potential for confusion in the ordering of evidence judgments, the EPA has updated the quoted text to place the terms in the same order as described in the IRIS Handbook (USEPA, 2022a) and Appendices (USEPA, 2024a; USEPA, 2024b).

Additionally, the commenter incorrectly stated that the EPA described many positive associations observed in the literature but does not provide details on the relative strength of these associations. The EPA disagrees with these statements. The EPA used multiple methods to transparently describe and depict the available evidence, including descriptions of statistical significance where applicable, providing forest plots within synthesis sections, and tables of detailed study results (USEPA, 2023f; USEPA, 2023a). The magnitude of association between studies reporting effect estimates with different units (e.g., per ng/mL increase, per ln-ng/mL increase, per Interquartile Range [IQR] increase) are not directly comparable without transformation. The EPA demonstrated the strength of association across studies for the specific outcomes of concern for all relevant studies within each priority health outcome category (e.g., total cholesterol for Cardiovascular) by including forest plots which display effect estimates (i.e., regression coefficients, percent change, odds ratios (ORs), etc.). These are included in the human evidence synthesis sections for each priority health outcome (USEPA, 2024d; USEPA, 2024c): Hepatic (Sec. 3.4.1.1), Immune (Sec. 3.4.2.1), Cardiovascular (Sec. 3.4.3.1), and Developmental (Sec. 3.4.4.1). The EPA has also provided detailed results from all included studies in Appendix D of the final toxicity assessments for PFOA and PFOS (USEPA, 2024a; USEPA, 2024b).

The commenter also incorrectly claimed that the cited studies actually provide weak evidence of positive associations and that health effects are only observed under "extreme" circumstances. In fact, significant effects were observed in studies of impacted or high-exposure communities, as well as studies of the general population. Significant adverse effects associated with elevated PFOA exposure were observed in multiple general population studies for BWT (Chu, 2020; Wikström, 2020), Alanine Aminotransferase (ALT) (Lin, 2010; Salihovic, 2018), antibody response in children (Granum, 2013; Zhang, 2023), and total cholesterol in adults (Fan, 2020; Nelson, 2010; Dong, 2019). Similar significant adverse effects were observed in studies with general population exposure levels for PFOS: BWT (Bjerregaard-Olesen, 2019; Chu, 2020; Lauritzen, 2017; Luo, 2021; Wikström, 2020), ALT (Lin, 2010; Yamaguchi, 2013), antibody response in children (Granum, 2013; Zhang, 2023), and total cholesterol in adults (Nelson, 2010; Liu, 2018; Dong, 2019; Fan, 2020). These studies were described in detail in the draft toxicity assessments published at the time of rule proposal (USEPA, 2023f; USEPA, 2023a).

The commenter incorrectly claimed, without providing a citation, that because PFAS are "chemically inert" that they will not react with the body. The EPA disagrees with this statement that PFAS are chemically inert, and notes that there is sufficient toxicokinetic and mechanistic evidence to support the fact that PFOA and PFOS interact with biological processes in multiple organisms, including humans. As noted in the Toxicokinetic Synthesis, "PFOA binds to the liver fatty acid binding protein (L-FABP) [in liver cells] through polar and hydrophobic interactions (Luebker, 2002; Zhang, 2013; Yang, 2020)" (USEPA, 2023f, Sec. 3.3.1.2.2). Similar findings were observed for PFOS: "*in vitro* analyses found that plasma proteins can bind PFOS in plasma from humans, cynomolgus monkeys, and rats (Kerstner-Wood, 2003)." Additionally, "PFOS was highly bound (99.8%) to albumin and showed affinity for low-density lipoproteins (95.6%) with some binding to alpha-globulins (59.4%) and gamma-globulins (24.1%)" (USEPA, 2023a, Sec. 3.3.1.2.1). These documented findings demonstrate that PFOA and PFOS are not "chemically inert" in the body. There are additional findings of PFOA and PFOS interacting with biological processes that are summarized in the mechanistic syntheses for Hepatic (Sec. 3.4.1.3), Immune (Sec. 3.4.2.3), Cardiovascular (Sec. 3.4.3.3), and Developmental (Sec. 3.4.4.3) outcomes in the draft and final toxicity assessments (USEPA, 2023f; 2023a; 2024d; 2024c).

The commenter lastly stated that more research is needed prior to finalizing the PFAS National Primary Drinking Water Regulation (NPDWR). The EPA disagrees with this claim. Please see section 4.2.1 of the EPA response in this *Response to Comments* document.

Virginia Municipal Drinking Water Association (VMDWA) (Doc. #1657, SBC-043164)

Instead, EPA's proposal appears to rely heavily and near exclusively on extrapolation from lab animal studies (rats and mice). Given the American experience with well-known PFAS exposures, VMDWA believes the final MCLs would benefit from closer review and consideration of human health data as a complement to animal studies. VMDWA desires a final regulation that protects public health without misprioritizing limited public resources and causing unnecessary financial burdens on the public.

EPA Response: With respect to the commenter's suggestion that the EPA preferentially use human data over animal toxicological data to inform the MCLGs for PFOA and PFOS, the EPA considered all relevant data to inform the cancer classification determinations and evidence integration judgments for noncancer health outcomes associated with PFOA and PFOS exposures, consistent with agency guidance (USEPA, 2005) and the agency's peer reviewed human health assessment methodology (USEPA, 2022a). To support the PFOA and PFOS cancer classifications and evidence integration judgments for noncancer health effects, the EPA documented the integrated weight of evidence across the available epidemiological, animal toxicological, and mechanistic data (see Sections 3.4 and 3.5 of USEPA (2024a) and USEPA (2024b)). The available human data for PFOA and PFOS includes *high* and/or *medium* confidence epidemiological studies that showed consistent direction of effect and coherence with evidence presented in animal toxicological studies. Therefore, in contrast to the commenter's claims, the available human data was used to inform the conclusions of the toxicity assessments of PFOA and PFOS (USEPA, 2024d; USEPA, 2024c). Regarding the use of animal studies to serve as the basis of the MCLGs and Health-Based Water Concentrations (HBWCs) for PFNA, PFHxS, HFPO-DA, and PFBS, please see sections 4.3.2 and 4.3.3 of the EPA response in this *Response to Comments* document and the EPA response to comment Doc. #1642, SBC-043484 in section 4.3.3 in this *Response to Comments* document. Regarding the financial considerations of this rulemaking, please see sections 2.4 and 13.8 of the EPA response in this *Response to Comments* document.

Maryland Association of Municipal Wastewater Agencies (MAMWA) (Doc. #1658, SBC-043399)

Instead, EPA's proposal appears to rely heavily and near exclusively on extrapolation from lab animal studies (rats and mice). Given the American experience with well-known PFAS exposures, VMDWA believes the final MCLs would benefit from closer review and consideration of human health data as a complement to animal studies. VMDWA desires a final regulation that protects public health without misprioritizing limited public resources and causing unnecessary financial burdens on the public.

EPA Response: Please see the EPA response to comment Doc. #1657, SBC-043164 in section 4.1.1 in this *Response to Comments* document.

Mike Pettit (Doc. #1542, SBC-043350)

And while animal studies have been invaluable in advancing our understanding of biology and medicine, there are several potential flaws in extrapolating data from animal studies to humans. It is important to consider these limitations when interpreting the results of such studies:

• Species differences: Animals, especially non-human mammals, have distinct physiological, anatomical, and genetic differences compared to humans. These disparities may limit the applicability of findings from animal studies to human conditions

• Metabolic and immunological differences: Variations in metabolic pathways, immune responses, and drug metabolism between species can lead to different outcomes in animals compared to humans, reducing the reliability of animal studies for predicting human responses

• Behavior and cognitive differences: The cognitive and behavioral aspects of animals can differ significantly from humans, which can impact the interpretation and applicability of study results, particularly in the fields of psychology, neuroscience, and behavioral sciences

• Experimental conditions: The laboratory setting in which animal studies are conducted often differs significantly from real-life human environments. Factors such as housing, diet, and stress can influence the results and may not accurately represent human conditions.

• Limited genetic diversity: Laboratory animals often come from a small gene pool, which may not represent the wide genetic diversity found in human populations. This can lead to differences in susceptibility to diseases and treatment responses between animals and humans.

• Sample size and statistical power: Animal studies often have smaller sample sizes than human studies, which can limit their statistical power and lead to a higher risk of false positives or negatives.

• Overemphasis on positive results: Publication bias towards positive results may lead to an over-representation of successful animal studies, creating a skewed perception of the effectiveness of treatments and interventions when applied to humans

• Lack of standardization: Variability in experimental design, methods, and reporting among animal studies can make it challenging to compare and synthesize results across studies, limiting their applicability to human research.

Summary

As previously notated, there may very well be some potential health concerns for the general populace and in certain cases, severe concerns depending on genetic susceptibility. That said, there has not been near enough research that has been specifically targeted to the PFAS effects on humans and at what concentrations is to considered a level of concern. There is data from a singular study previously cited from rats but the serious problems of extrapolation have already been discussed. The issue lies in that there are serious regulations being expressed and potentially enforced that have very little scientific bearing and backbone. If the driving force is something other than science, then that needs to addressed in its own proper place, but leave the scientific claims out of it. If, and when there is any type of actual research of serious nature done, then more lines and conclusions can be drawn but as it stands currently there is little to no bearing that can be drawn from a scientific point of view. Regulations are understandable, and necessary in many cases, but making a law based on pure conjecture is foolish.

Clean water should be for everyone- that much is sure. Inane rulings that do nothing but cause needless headache and wasteful spending are for no one. The EPA needs to revise their current procedures and scientific work if they are going to use science as a claim for wasting money and

time. If the EPA wishes to use another reason for their ruling apart from scientific impetus, then that is up to the EPA's discretion. Unpacking all the reasons as to why there may be a drive to spend massive amounts of tax payer money is outside of the scope of this paper. This is a call to be better because the American people need it. Regardless of the agenda, priority, or reason, everyone needs to have water that is safe to drink. That is a fundamental need. Safe drinking water does not inherently mean pure water, as pure water is its own animal with potential risks. Realistically, proper definitions of what safe drinking water is and is not needs to be readily available for the public to avoid needless panic and misinformation.

Summarizing all of this, the EPA just generally needs to do better. There are claims, movements, and laws being proposed and enacted that have no actual bearing apart from lobbyists, unknown agendas, ignorance, and fear. Official and truthful statements need to be issued, actual studies done properly, and real, logical regulations put in place if necessary. Be better and do better.

EPA Response: Please see section 4.1.1 of the EPA response in this *Response to Comments* document for a discussion of the EPA's protocol related to systematic review methodology and see the EPA response to comment Doc. #1657, SBC-043164 in section 4.1.1 in this *Response to Comments* document regarding the EPA's consideration of human studies in the assessments for PFOA and PFOS. Please see section 4.1.2 of the EPA response in this *Response to Comments* document for a discussion of the EPA's use of the best available science and Agency guidance. The EPA disagrees with commenter's assertion that there is insufficient information to know the adverse effects associated with PFOA or PFOS exposure in humans and the concentrations of PFOA or PFOS that are associated with adverse effects. The results of the EPA's systematic review demonstrate that there are hundreds of *medium* and *high* confidence epidemiological studies that investigated and reported adverse health effects of PFOA and PFOS. See section 4.2.1 and the subsequent responses in sections 4.2.1.2, 4.2.1.3, 4.2.1.4, and 4.2.1.5 of the EPA response in this *Response to Comments* document. Please see section 4.2.2 of the EPA response in this *Response to Comments* document regarding the concentrations of PFOA and PFOS that result in these adverse effects and for more detail on extrapolating from animal studies to derive a CSF. Please see the EPA response to comment Doc. #1542, SBC-043345 in section 4.1.4.2 in this *Response to Comments* document for a response to the commenter's incorrect claim about the use of a singular study in rats to inform the PFOS cancer classification.

Regarding commenter's statements that "Inane rulings that do nothing but cause needless headache and wasteful spending are for no one" and "EPA just generally needs to do better," the EPA has developed a science-based, health protective, and implementable regulation. As discussed in the record for this rule, the PFAS NPDWRs were developed under the authority of the Safe Drinking Water Act, and are consistent with applicable requirements.

4.1.2 The EPA's Use of the Best Available Science, Agency Guidance, and EPA Data Quality Control Procedures to Make Conclusions in the EPA Toxicity Assessments for PFOA and PFOS

Summary of Major Public Comments and EPA Responses

A few commenters claimed that the EPA did not use the best available science when developing the draft toxicity assessments for PFOA and PFOS, asserting that the EPA did not follow its own guidance or data quality standards and that the EPA's systematic review process was flawed. Please see section 4.1.1 of the EPA response in this *Response to Comments* document regarding the systematic review process. The commenters appear to misunderstand what a systematic review is and the types of data that are used in a systematic review and toxicity assessment. As defined in the IRIS handbook, a systematic review is a "structured and documented process for transparent literature review using explicit, pre-specified scientific methods to identify, select, assess, and summarize the findings of similar but separate studies" (USEPA, 2022a). This approach allows for the retrieval, organization, evaluation, synthesis, integration, and presentation of scientific information in a more structured and transparent manner (USEPA, 2022a). The process minimizes bias and improves accuracy through the establishment of protocols prior to initiating the systematic review, the use of multiple independent reviewers at the screening and study quality evaluation steps, and the engagement of a team of experts in different disciplines (e.g., epidemiologists, toxicologists, statisticians) to develop the toxicity assessments and perform independent QA of data extraction, evidence syntheses, evidence integration judgments and selection of critical effects and studies used for point-of-departure (PODD derivation.

As mentioned above, the purpose of a systematic review is to review the existing literature, not to generate original data such as those published in human epidemiological and animal toxicological studies. Further, the Handbook also describes the type of literature what that does is not provide original data, which includes "other agency assessments, informative scientific literature reviews, editorials, or commentaries" (USEPA, 2022a). The EPA uses original data provided in studies identified through literature searches for the systematic review, consistent with the IRIS Handbook (USEPA, 2022a). The commenter appears to misunderstand what constitutes "original data," which is not necessarily individual-level exposure or response data for each subject or animal. Original data can also be summary statistics based on individual-level data (e.g., mean, variance, regression coefficients). Having individual-level data for each subject is not required for inclusion in the systematic review process or use in toxicity value derivation (USEPA, 2022a). Additionally, the EPA does not generate original data through the systematic review process. Therefore, the commenter's claims about original data are moot. The EPA is consistent with the IRIS Handbook in identifying appropriate studies with original data for use in the systematic review. The core databases that were searched in the PFOA and PFOS toxicity assessments are the consistent with those outlined in the Handbook Section 2.3.2 (USEPA, 2022a). Additionally, the same types of studies and often the same exact studies are used in the recent draft IRIS PFAS assessments (e.g., Budtz-Jorgensen & Grandjean (2018), Sagiv et al.

(2018)). Further, the Handbook also describes what is not original data which includes "other agency assessments, informative scientific literature reviews, editorials, or commentaries" (USEPA, 2022a). Therefore, commenters who claim that the EPA did not use the best available science, did not follow agency methodology for systematic review, and did not adhere to data and quality control procedures for generating original data are incorrect.

One commenter stated that the EPA did not use the best available peer-reviewed science because the assessments did not follow methodological or statistical guidance. Specifically, this commenter stated that the EPA did not follow *A Review of the Reference Dose and Reference Concentration Processes* (USEPA, 2002) when selecting uncertainty factors and claimed the EPA did not follow guidance on data quality (USEPA, 2003a; USEPA, 2006a; USEPA, 2014a). The commenter stated they believed that the assessments contained flaws including exclusion of covariates in modeling, reliance on peer-reviewed studies published by non-EPA employees, and an inability to replicate results.

The EPA has provided all of the necessary information for replication of the modeling performed in these toxicity assessments to derive toxicity values. For example, all of the dose-response modeling inputs, outputs, assumptions, and equations are provided in Appendix E of the toxicity assessments (USEPA, 2024a; USEPA, 2024b). The pharmacokinetic (PK) models are also described in detail in section 4.1.3 and Appendix F of the toxicity assessments (USEPA, 2024d; USEPA, 2024c; USEPA, 2024a; USEPA, 2024b). Further, the code for the PK models was put on GitHub https://github.com/USEPA/OW-PFOS-PFOA-MCLG-support-PK-models) and the model code was thoroughly QA'd through the established EPA Quality Assurance Project Plan (QAPP) for Physiologically-Based Pharmacokinetic (PBPK) models (USEPA, 2018a). The EPA has followed statutory requirements to use the best available science in the development of the PFOA and PFOS toxicity assessments by 1) considering relevant peer-reviewed literature identified through performing systematic searches of the scientific literature or submitted through peer review or public comment; and 2) relying on peer-reviewed, and publicly available EPA human health risk assessment methodology (e.g., USEPA, 2002) as well as peer-reviewed systematic review best practices (USEPA, 2022a; USEPA, 2021a). These agency risk assessment guidance, methodologies, and best practices serve as the basis for the PFOA and PFOS health effects systematic review methods used to identify, evaluate, and analyze the available data. Not only did the EPA incorporate literature identified in previous assessments, as recommended by the SAB (USEPA, 2022b), but the EPA also conducted several updated systematic literature searches, the most recent of which was completed in February 2023. This approach ensured that the literature under review encompassed studies that were included in the 2016 HESDs (USEPA, 2016b; USEPA, 2016a) and more recently published studies. The results from most recent literature search provide further support for the conclusions made in the draft toxicity assessments for PFOA and PFOS (USEPA, 2023f; USEPA, 2023a) and are described in Appendix A of the final toxicity assessments (USEPA, 2024a; USEPA, 2024b). The EPA also reviewed and considered studies identified in public comments and provides discussion about consideration of these in section 4.2.6 of the EPA response in this *Response to Comments* document.

As described in section 4.1.1 of the EPA response in this *Response to Comments* document, the PFOA and PFOS systematic review protocol is consistent with the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a) and further implemented PFAS-specific protocol updates outlined in the *Systematic Review Protocol for the PFBA, PFHxA, PFHxS, PFNA, and PFDA (anionic and acid forms) IRIS Assessments* (USEPA, 2021a). The EPA additionally followed peer-reviewed human health risk assessment methods for developing toxicity values (e.g., USEPA, 2002), conducting benchmark dose (BMD) modeling (USEPA, 2012), and other analyses. In the PFOA and PFOS toxicity assessments and the appendices, the EPA clearly describes the specific methods used and how those methods and decisions are consistent with current agency best practices and recommendations (i.e., through quotes and citations) described in various guidance documents (USEPA, 2024d; USEPA, 2024c; USEPA, 2024a; USEPA, 2024b).

Regarding data quality control, data quality objectives are an integral part of the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a), and many of the data quality concepts considered in the agency documents cited by the commenter (USEPA, 2003; USEPA, 2006a; USEPA, 2006b; USEPA, 2014b) are addressed through the EPA's implementation of the IRIS Handbook (USEPA, 2022a) in the development of the PFOA and PFOS toxicity assessments. Furthermore, this work was conducted under a programmatic QAPP, which ensures that all agency data quality guidance is followed, including those cited by the commenter (ICF, 2024). Additionally, by developing and implementing a systematic review protocol consistent with the IRIS Handbook (USEPA, 2022a), the EPA reduced potential confirmation bias, a concern raised by another commenter, by conducting multiple independent evaluations of studies, relying on a data-driven, weight of evidence approach, and incorporating expertise from across the agency.

In many cases the commenters have misinterpreted the methods and decisions the EPA used to analyze the data or misinterpreted the guidance itself. For example, one commenter mistakenly suggested that the EPA did not consider covariates in its analyses of epidemiological studies; the EPA described which covariates were considered in each analysis in several sections of the draft toxicity assessments and appendices (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c), including in descriptions of the studies in Section 3 and modeling of the studies in Appendix E. The EPA also notes that the primary studies that provide the data also describe covariate adjustments in their published analyses.

Individual Public Comments

3M Company (Doc. #1774, SBC-045649)

EXECUTIVE SUMMARY

As discussed below, EPA's proposed NPDWRs violate the Safe Drinking Water Act (SDWA) because they are not based on the "best available, peer-reviewed science," [[FN1: 42 U.S.C.A. [sec] 300g-1(b)(3)(A)]] and because EPA did not follow statutorily defined procedures and, in

many cases, its own well-established guidance in promulgating them. EPA did not appropriately establish and follow processes designed to help ensure its rulemaking reflects the weight of the evidence-based conclusions about potential consequences of exposure to the PFAS at issue, and the levels at which such consequences could be observed. The processes for collecting and evaluating scientific research are not matters of interpretation or preferred approach. They are foundational scientific practices and guidance, including, in many cases, the Agency's own guidance. Here, EPA has significantly deviated from those foundational practices. This has resulted in a proposal for incredibly low regulatory limits for PFOA, PFOS, and the Hazard Index (HI) substances (perfluorohexanesulfonic acid [PFHxS], perfluorobutane sulfonic acid [PFBS], perfluorononanoic acid [PFNA], and hexafluoropropylene oxide dimer acid [HPFO-DA]) in drinking water without showing that any benefits of such low limits are justified by their significant costs. The agency's flawed process has resulted in proposed NPDWRs that are arbitrary and capricious as they do not achieve the goal of appropriately balancing the costs of compliance against the expected benefits.

EPA Response: The EPA disagrees with these general statements which are not supported by specific citations to guidance and processes that the EPA failed to follow. Please see section 4.1.2 of the EPA response in this *Response to Comments* document and responses to the commenters specific concerns in the EPA response to comment Doc. #1774, SBC-045701, SBC-045680, SBC-045702, SBC-053418, and SBC-045681 in section 4.1.2 in this *Response to Comments* document. Regarding the Hazard Index for PFAS, please see section 4.3 of the EPA response in this *Response to Comments* document. Regarding the EPA's economic analysis, please see section 4.13 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-053417)

EPA acknowledges significant uncertainty in the scientific literature, to the point that it incorporated uncertainty factors so high as to be the maximum that could be considered as the basis of reference value according to EPA's IRIS Handbook. EPA cannot cite scientific uncertainty as a basis for relying on subpar studies that fit its predetermined conclusion. [FN55: See City of Waukesha, 320 F.3d at 254.] Nor can EPA simply default to caution when scientific evidence directs the agency otherwise. [FN56: See Chlorine Chemistry Council v. EPA, 206 F.3d 1286, 1290-91 (D.C. Cir. 2000)] (EPA cannot "reject 'best available' evidence simply because of the possibility of contradiction in the future by evidence unavailable at the time of action – a possibility that will always be present.")

EPA Response: The commenter's statement that the EPA "incorporated uncertainty factors so high as to be the maximum that could be considered as the basis of reference value according to the EPA's IRIS Handbook" is incorrect. The EPA IRIS Handbook recommends the maximum composite uncertainty factors that can be applied without excessive uncertainty as 3,000 fold (USEPA, 2022a). For all candidate RfDs derived from the epidemiological data, including those selected as the basis of the overall RfDs for PFOA and PFOS, the composite uncertainty factor (UF) applied to the POD_{HED}s was 10 based on the intraspecies UF that

accounts for inter-individual or intraspecies variability in susceptibility across humans. For candidate RfDs derived from animal toxicological studies of PFOA and PFOS, none of the composite UFs exceeded 300. In short, this is a full order of magnitude (10 times) lower than the EPA's recommended maximum composite UF. The EPA's rationale for selecting uncertainty factors is provided in Section 4.1.5.5 of the final toxicity assessments (USEPA, 2024d; USEPA, 2024c). Further discussion on uncertainty factor selection is provided in the EPA Response to comment Doc. #1774, SBC-045702 in section 4.1.2 in this *Response to Comments* document. Additionally, the EPA disagrees that the agency relied on "subpar studies" to develop the assessment conclusions. The merits of critical studies are described in section 4.1.4 (cancer assessment) and 4.2.1 and 4.2.2 (noncancer assessment) of the EPA response in this *Response to Comments* document. In contrast to the commenter's claims, the EPA relied on the best available science published on or before the date of the final literature search for these assessments to support this rulemaking (see USEPA, 2024d; USEPA, 2024c; USEPA, 2024a; USEPA, 2024b); the agency did not rely on "future" evidence that is currently unavailable. The EPA is not "simply defaulting to caution when the scientific evidence directs otherwise" as the commenter suggests. As discussed in this rulemaking record, the EPA's determinations with respect to PFOA and PFOS are well supported and based on the best available peer reviewed science available at the time of this rulemaking. Unlike the situation in *Chlorine Chemistry Council v. EPA*, 206 F.3d 1286, 1290-91 (D.C. Cir. 2000), the EPA has maintained that PFOA and PFOS are *Likely to be Carcinogenic to Humans* from its proposal through this final rule and explained the bases for these classifications in the administrative record, including section 4.1.4 of the EPA response in this *Response to Comments* document, and the final toxicity assessments for PFOA and PFOS (USEPA, 2024d; USEPA, 2024c).

3M Company (Doc. #1774, SBC-045680)

VI. EPA's PROPOSED MCLGS AND MCLS FOR PFOA AND PFOS ARE NOT BASED ON BEST AVAILABLE SCIENCE

EPA's process flaws have resulted in a proposed NPDWR that does not comply with the SDWA's statutory requirement to rely only on "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices," rendering the proposed rule arbitrary, capricious, and in excess of statutory authority. [FN52: 42 U.S.C. § 300g-1(i).] An agency must be prepared to provide a "full analytical defense" of its approach. [FN53: Chemical Manufacturers Association v. EPA, 28 F.3d 1259, 1265 (D.C. Cir. 1994)] As many courts have noted, "[t]he deference accorded an agency's scientific or technical expertise is not unlimited." [FN54: Brower v. Evans, 257 F.3d 1058, 1067 (9th Cir.2001).]

First, as explained in Section III, EPA's evaluation of relevant scientific literature has serious procedural issues that raise significant questions regarding the Agency's scientific conclusions. For example, EPA did not follow basic principles or even its own guidance in conducting its review and evaluation analysis of studies, which resulted in the use of low-quality papers and

datasets that cannot be reproduced. Flaws in EPA's scientific approach that forms the basis of the standards proposed in this rulemaking are described in detail below.

As described in the sections below, EPA's proposed NPDWRs violate numerous foundational scientific practices such that it cannot represent the "best available, peer-reviewed science," in violation of both the SDWA and the Administrative Procedures Act's requirement that an agency's actions not be arbitrary.

a. EPA Did Not Follow Best Practice and Its Own Guidelines for Data Quality Control

EPA has published a series of quality control (QC) and best practice guidelines for program development and project development (USEPA 1992,2002a), data quality objectives (USEPA 2003, 2006), and good statistical practice (USEPA, 2006). EPA has also published approved methods and software for calculating benchmark doses (BMD) and their uncertainty (USEPA 2012, 2022c) which have been developed into an interactive web site. These guidelines are intended to ensure that the resulting decisions made by EPA meet the highest scientific standards, including reproducibility of results, appropriate data treatment, ensuring representative data, and accurate identification and quantification of true risk to human populations and environmental metrics. The IRIS Handbook and USEPA (2012) provide criteria for how to review literature studies and categorize them based on availability of data, study design, testing procedures, statistical methods, and deficiencies.

The methods and procedures EPA used to support the Proposed Rule did not follow these established procedures, and lack good data practice, sound statistical analysis practice, consistency of methods and models, and the ability to replicate analytical results. EPA has not proposed data quality objectives (DQOs) or Quality Assurance Project Plans (QAPP) for any data source chosen for the Proposed Rule, and/or associated findings used to establish the MCLG. DQOs are required for any research initiative in order to document and ensure that data are collected properly, data are treated using good statistical practice, and any findings can be replicated by scientists and data analysts not working at EPA. EPA's own documents provide guidance on DQOs, program planning, good data practice, and good statistical practice (USEPA 2003, 2006, 2014).

Nor has EPA followed its own requirements and guidance (as listed in the foregoing paragraph) for collecting and analyzing data. Rather, for the MCLG and associated analyses, EPA has largely relied on previously published studies conducted by non-EPA employees for which EPA has not verified data collection, data treatment, outlier detection, variance estimation, elimination of records, or good statistical practice. For example, EPA has selected papers where the data used to calculate BMDs and other measures of risk were not publicly available or were difficult and time-consuming to obtain (e.g., Budtz-Jørgensen and Grandjean, 2018; Shearer et al., 2021). The inability to replicate study findings violates a key principle of the scientific method. [FN57: This is a critical and highly relevant topic given that peer review is only as good as the information provided. Lack of transparency in publications and other related issues may limit the effectiveness of peer review and the ability to replicate results of the study. See, e.g.,

https://www.news-medical.net/life-sciences/What-is-theReplication-Crisis.aspx; see also Improving transparency and scientific rigor in academic publishing (Prager et al. 2019) https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6346653/.] This action also is in direct violation of the IRIS Handbook (USEPA ORD 2022), which states that studies with no original data are "tracked for potential use in identifying missing studies, background information, or current scientific opinions," meaning they are not included in the quantitative IRIS assessment. Further, EPA's guidance for considering literature toxicity studies (USEPA ORD 2022) lists specific criteria for invalidation of studies, including "inadequate or missing analytical data," "deficiencies in reporting of study data," and "lack of appropriate statistical methodology." Had EPA's analysis comported with its guidance, many of the studies that EPA relied upon would have been categorized as invalid and therefore presumably not appropriate for use. Exclusion of significant studies, such as Budtz-Jorgensen and Grandjean (2018) and Shearer et al. (2021) would alter EPA's findings.

EPA Response: Please see section 4.1.2 of the EPA response in this *Response to Comments* document for general responses to three incorrect claims about the EPA's process to develop the toxicity assessments: 1.) that the EPA followed a flawed process and did not use the best available, peer-reviewed science when developing the proposed PFAS NPDWR; 2.) that the EPA did not follow guidance or methodologies (e.g., USEPA, 2012; USEPA, 2022a) in conducting its review and evaluation of studies, nor did the EPA follow established data quality practices, resulting in the use of low-quality data; and 3.) that the EPA did not propose data quality objectives (DQOs) or QAPPs for data supporting the proposed rule. The EPA's responses to more specific comments are provided below.

The EPA disagrees with the commenter's assertions that the EPA toxicity assessment development did not follow agency guidance and methodologies. The commenter appears to misunderstand the EPA's peer-reviewed human health risk assessment methodology and the IRIS Handbook (USEPA, 2022a). Specifically, the commenter incorrectly stated that the EPA relied on previously published studies from non-EPA authors that did not provide original data, an approach that the commenter incorrectly claims conflicts with the IRIS Handbook. Consistent with the IRIS Handbook and agency human health risk assessment practice, the EPA considered peer-reviewed, publicly available studies *regardless of authorship affiliations* (USEPA, 2022a). As outlined in the IRIS Handbook, systematic review is a scientifically sound process that is used to identify, evaluate, and integrate health effects data following chemical exposure based on a large body of evidence from peer-reviewed publications by authors with or without EPA affiliation. Systematic review enables the agency to follow a rigorous process designed to increase transparency, consistency, and the quality of health assessments. It allows the agency to make conclusions across the entire body of evidence according to a protocol in lieu of relying upon single studies to draw conclusions. The studies reviewed by the EPA were peer-reviewed publications and technical reports. To suggest that peer-reviewed publications do not have original data is fundamentally incorrect. This approach is consistent with current agency human health risk assessment methods (i.e., under the IRIS and Provisional Peer-Reviewed Toxicity Values (PPRTV) programs, the Office of Pesticides Program, and the Office of Pollution

Prevention and Toxics). The EPA followed protocols consistent with the IRIS Handbook (USEPA, 2022a) and the *Systematic Review Protocol for the IRIS PFAS Assessments* (USEPA, 2021a) to evaluate individual studies for relevance and study confidence, which included domains similar to the commenter's mentioned criteria for "invalidation of studies" (see Appendix A; USEPA, 2024a; USEPA, 2024b). Therefore, the EPA complied with its own guidance and has followed standard practice in its inclusion and evaluation of the available literature for PFOA and PFOS.

In the case of PFOA and PFOS, studies presenting original data (e.g., unique datasets, modeling results, statistical analyses) were used to draw hazard conclusions and derive quantitative values in the assessments. The EPA also notes that the commenter has incorrectly interpreted the definition of "original data" as described by the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a), which provides examples of studies lacking original data as "other agency assessments, informative scientific literature reviews, editorials, or commentaries." Further, for all studies quantitatively considered in these assessments (e.g., used in BMD analysis), the EPA has made the information on the data used to calculate toxicity values and processes for obtaining additional information, when necessary, from study authors publicly available (see Appendix E of the toxicity assessments; USEPA, 2024a; USEPA, 2024b).

3M Company (Doc. #1774, SBC-053418 & SBC-045681)

b. EPA Did Not Follow Its Own Guidelines on Good Statistical Practice

Throughout the technical documents supporting the rule, EPA's statistical and modeling analyses conflict with guidance (USEPA 1992, 2002, 2003, 2006a, 2006b). This failure to follow the practices specified in EPA's guidance results in very low to negligible confidence in the quantitative findings on a consistent basis. Below are a few of the many examples of EPA's practices that are counter to the guidance on statistical and modeling practices cited above. Appendix A and Appendix B, EcoStat Comments on the United States Environmental Protection Agency's Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation, include more fulsome explanation of each of these issues.

· Frequently, EPA does not have the original data sets used by the authors in papers EPA considers of high quality. This directly contradicts the IRIS Handbook literature screening steps that exclude studies without provided data. Therefore, EPA and other scientists cannot replicate the results of the original authors, nor can EPA evaluate the authors' consideration of non-detects, outlier detection, sensitivity studies, or data transformations.

· When building statistical models, EPA often ignores fundamental covariates like gender, ethnicity, age, body weight, geographic region, etc. Papers selected by EPA may consider these variables and provide graphics, but the factors are not considered as fundamental covariates within the models that are used to estimate BMDs or to estimate public health risk When models are incorrectly built (e.g., leaving out key variables), the effect is to generate incorrect model

error estimates for hypothesis testing, which has the effect of overestimating the significance of PFAS concentrations in the model (Heinze et al 2018).

Because EPA frequently lacks the source data used in outside publications, and because these data are frequently unavailable to the public, EPA attempts to infer the statistical properties of the unavailable data for the purpose of model building. This approach is clearly a violation of EPA's QC guidelines (USEPA 1992, 2002). For example, EPA attempts to generate a "pooled variance" having only the 25th and 75th percentiles of a data set to infer the median and mean values. EPA states that "[i]f access to data and methods cannot occur, EPA should, to the extent practicable, apply especially rigorous robustness checks to analytical results and carefully document all checks that were undertaken." (USEPA 2002) Sound statistical practice recognizes that there are many (if not hundreds) of empirical distributions with the same 25 th and 75 th percentiles that result in different median and mean values. Accordingly, assuming any single distribution, without the ability to assess the original data, is inappropriate, unreliable, and subjective and does not adhere to the "rigorous robust checks" recommended in EPA's own guidance (USEPA 2002).

· EPA has selected papers and data sources to support the rule without establishing that the information is representative of national US populations. Therefore, findings from these papers cannot be inferred to the entire US population. Regional data, data from the Faroe Islands, data collected without a sampling frame, or data collected where sampling weights cannot be determined should not be used for setting a national standard.

· EPA has not included time-based effects in the models used to support the rule. 3M's assessment of NHANES data clearly demonstrates that changes in serum levels of PFOA and PFOS over time Hfluence the modeling results and should be considered in models for all human risk endpoints evaluated in the technical support documents.

EPA Response: The commenter incorrectly stated that the EPA did not have original data sets of peer-reviewed publications, and, therefore, the EPA is directly contradicting the IRIS Handbook literature screening steps that exclude studies without provided data (USEPA, 2022a). As noted in the response to comment Doc. #1774, SBC-045680 and in section 4.1.2 in this *Response to Comments* document, the commenter appears to misunderstand what constitutes "original data" as described by the IRIS Handbook (USEPA, 2022a). Please also see the EPA response to comment Doc. #1774, SBC-045701 in section 4.1.2 in this *Response to Comments* document regarding the commenter's claims about data availability.

The commenter incorrectly states without support that "[w]hen building statistical models, EPA often ignores fundamental covariates." First, the commenter incorrectly implies that the EPA built statistical models in the toxicity assessments for PFOA and PFOS. In actuality, the EPA uses peer-reviewed literature on the exposure-outcome relationship to inform dose-response modeling consistent with the IRIS Handbook (USEPA, 2022a). Second, the commenter does not identify the specific model at issue here.

Additionally, the EPA disagrees that the assessments ignore fundamental covariates because the agency addresses covariates throughout the systematic review process, specifically, when assessing study confidence (e.g., in the Confounding domain) and when selecting studies for toxicity value derivation (see chapters 4 and 7 of USEPA (2022a)). For example, potential for confounding by covariates was considered as a part of the study evaluation criteria for all epidemiology studies (USEPA, 2024a; USEPA, 2024b; Section A.1.7.1.5). Confounders are factors that are associated with both exposure and outcome but are not in the causal pathway (USEPA, 2022a). Lack of consideration of relevant confounders may bias the result toward or away from the null, depending on how the confounder impacts the exposure and outcome. Multiple approaches, including non-statistical approaches (e.g., directed acyclic graphs), for identifying confounders are important considerations as covariates may actually be mediators or factors related to unmeasured intermediates (USEPA, 2024a; USEPA, 2024b; Section A.1.7.1.5). The commenter also appears to misunderstand the impact of not including certain covariates, suggesting incorrectly that it would overestimate the effect of PFAS exposure, when in fact, overadjustment for these factors would generally bias estimates towards the null. As such, epidemiological studies do not require consideration of the same "fundamental" list of covariates and instead should only consider relevant covariates or "key" covariates, as stated by the commenter, that may influence the study results. The EPA evaluated each study analysis for how well it considered and addressed confounding holistically. Studies selected for POD derivation were rated at least *medium* confidence, and the EPA outlines specific considerations for selecting "studies with a design or analysis that addresses relevant confounding for a given outcome" in the assessment appendices (USEPA, 2024a; USEPA, 2024b; Section A.1.11.1).

The commenter incorrectly suggested that the EPA "violated" quality control guidelines by inferring statistical properties of unavailable data during model building. The commenter provided an example of the EPA deriving central tendency estimates from percentiles provided by study authors and alleged that a single distribution was assumed without providing evidence or justification. The commenter's characterization of the EPA's analysis is incorrect. For example, the EPA used the stated approach for statistical modeling of diphtheria and tetanus endpoints, not because the EPA assumed a "single distribution," but based on the knowledge of the log-normal distribution for diphtheria and tetanus antibody concentrations, which has been documented in multiple studies, including Timmerman et al (2021). Further discussion regarding calculations that facilitated modeling of epidemiological data is in section 4.2.2 of the EPA response in this *Response to Comments* document.

The commenter incorrectly suggests that the EPA should have used data from the U.S. population for setting a national standard and further, that the EPA did not consider the representativeness of study populations to the U.S. population. The EPA selected studies according to the protocol outlined in Appendix A of the toxicity assessments (USEPA, 2024a; USEPA, 2024b; Section A.1.11.1). Importantly, the EPA's established peer-reviewed human health risk assessment methods do not outline restrictions based on study or data source location, as this factor does not necessarily impact the inherent quality of studies (USEPA, 2022a).

Furthermore, in cases when data originating from the United States is limited, it is necessary to rely on studies conducted in other populations.

Regardless, the EPA considered the representativeness of study populations to the U.S. population when selecting studies for point-of-departure human equivalent dose (POD_{HED}) derivation. For example, one factor that contributed to the selection of Wikstrom et al. (2020) over Sagiv et al. (2018) was related to the comparability of study population exposure levels in the United States. Specifically, Sagiv et al. (2018) was conducted between 1999 and 2002, when PFOA and PFOS exposure concentrations in the United States were much greater. Wikstrom et al. (2020) conducted their study more recently, between 2007 and 2010, resulting in exposure levels that are more comparable to those observed in the United States today. The selection of Wikstrom et al. (2020) as the critical study was consistent with the IRIS Handbook to select studies with "exposures near the range of typical environmental human exposures" (USEPA, 2022a). These points are further discussed in section 4.2.2.2.3 of the EPA response in this *Response to Comments* document and section 4 of (USEPA, 2024d; USEPA, 2024c).

The commenter incorrectly stated that the EPA did not consider time-based effects in models, and the commenter suggested these changes over time in serum PFOA and PFOS exert a greater influence on the modeling results. The EPA disagrees with these claims. First, the EPA considered changes in serum PFOA and PFOS over time by modeling results for several time periods of National Health and Nutrition Examination Survey (NHANES) data (i.e., 1999–2018, 2003–2014, 2003–2018, and 2017–2018) (USEPA, 2024a; USEPA, 2024b; Section E.1.3.1). Second, as shown by the modeling results in Appendix E of the toxicity assessments, the estimated benchmark dose lower limits (BMDLs) are comparable across time periods (e.g., USEPA, 2024a; USEPA, 2024b; Table E-18), indicating that the changes over time in serum PFOA and PFOS concentrations do not have a significant impact on the conclusions of this rule.

<u>3M Company (Doc. #1774, SBC-045701)</u>

1. Lack of consistent quality control practice by EPA in the Proposed Rule and supporting documents negates the validity of key findings.

EPA has not proposed data quality objectives (DQOs) or Quality Assurance Project Plans (QAPP) for any data source chosen and associated findings used to establish the MCLG. EPA and National Institutes of Health (NIH) National Institute of Environmental Health Sciences (NIEHS) program offices, are required to generate quality assurance/quality control (QA/QC) plans that include the derivation of analysis-specific, and data-specific DQOs. Under standard quality control practices, DQOs are required for any research initiative in order to document and ensure that data are collected properly, data are treated using good statistical practice, and any findings can be replicated by scientists and data analysts not working at EPA. EPA's own documents provide guidance on DQOs, program planning, good data practice, and good statistical practice. (See e.g. USEPA 2003, 2006, 2014).

EPA has not followed its own requirements and guidance for collecting and analyzing data. Rather, for the MCLG and associated analyses, EPA has largely relied on previously published studies conducted by non-EPA employees for which EPA has no control over data collection, data treatment, outlier detection, variance estimation, elimination of records, or good statistical practice. For example, EPA has selected papers where the data used to calculate BMDs and other measures of risk, were not publicly available or difficult and time-consuming to obtain (e.g., Budtz-Jørgensen & Grandjean, 2018; Shearer et al., 2021). EPA has violated a key principle of statistical analysis, which requires that all studies and findings be available to the outside public and the findings replicated.

***

EPA has established guidance that it should use DQOs as an insurance to create analyses of high caliber that are scientifically defensible. Here, EPA failed to establish DQOs, contrary to its own guidance.

EPA Response: Regarding comments on the EPA's data quality objectives and QAPP, please see section 4.1.2 of the EPA response in this *Response to Comments* document.

Regarding comments that the EPA did not follow its own requirements and guidance for data collection and analysis by relying on studies published by non-EPA entities, see the EPA response to comment Doc. #1774, SBC-045680 and section 4.1.2 in this *Response to Comments* document.

The commenter incorrectly states that the EPA selected studies that were not publicly available or were difficult to obtain and cannot be replicated. As outlined in Appendix A of the final toxicity assessments for PFOA and PFOS (USEPA, 2024a; USEPA, 2024b), the EPA followed a protocol for study identification that is consistent with the *ORD Staff Handbook for Developing IRIS Assessments* (USEPA, 2022a) and the *Systematic Review Protocol for the PFAS IRIS Assessments* (USEPA, 2021a). These protocols include statements that the literature search should "identify full reports of primary studies (i.e., original data sources of health effects)" from databases such as PubMed and Web of Science, as well as gray literature sources. The EPA provided information regarding these studies on the HERO project page (https://heronet.epa.gov/heronet/index.cfm/project/page/project_id/2608). The EPA's study evaluation process reflects the confidence in the study conduct and data quality, including reporting, in each publication. This is the EPA's current best practice for transparency and reproducibility in human health risk assessment (USEPA, 2022a). It is not required that all studies and findings be available to the public. In fact, the individual-level data is typically not provided in published epidemiological studies often due to privacy concerns. Study authors provide the summary data that are needed for hazard identification and quantitation. In Appendix E of the final toxicity assessments, the EPA provided all of the publicly available data and presented the calculations needed to replicate the models used to derive PODs for each endpoint of interest (USEPA, 2024a; USEPA, 2024b).

Regarding comments related to the EPA's approaches for POD derivation, please see section 4.2.2, and specifically, subsection 4.2.2.3 and comment Doc. #1774, SBC-053446 in section 4.2.2.3 in in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045702)

8. EPA is overly conservative in the calculation of RfDs.

EPA employs a series of highly conservative uncertainty and safety factors to generate an RfD. These values are not consistent with best practice for selection of such factors. EPA did not use robust statistical uncertainty techniques, as is expected as part of best available science, in order to replace the arbitrary safety and uncertainty factors with data-based measures of uncertainty. Model-based prediction uncertainty (for both statistical and toxicological models) approaches are available and should be used by EPA in place of overly conservative and subjective factors.

Classic safety factors and uncertainty factors are generally not based on models or data, which, as noted above does not meet EPA's own quality assurance guidelines. Any uncertainty used by EPA should be peer-reviewed, and based on actual data (e.g., uncertainty in BMD dependent on choice of model, BMR, p(0), etc.). Safety factors should be based on true data, and in particular, reflect the ability of others replicate EPA's results. EPA does not have actual data sets for many of the endpoints addressed in the rulemaking, and EPA did not oversee the work ensuring good quality control of the author's findings.

Without proper uncertainty analysis based on EPA's guidance on good statistical practice, the uncertainty and safety factors employed by EPA do not result in a scientifically defensible RfD value.

EPA Response: The commenter asserted that the EPA used conservative uncertainty and safety factors to derive an RfD, that these uncertainty factors are not consistent with best practice and do not meet the EPA's quality assurance guidelines, and that the EPA should replace the uncertainty factors with data- or model-based measures of uncertainty. The commenter's viewpoint is that safety factors should "reflect the ability of others [to] replicate EPA's results." The commenter incorrectly claims that the EPA's current approach does not result in a scientifically defensible RfD value. The EPA disagrees with all of these claims. The EPA followed agency best practices and guidance in applying uncertainty factors to derive RfDs for PFOA and PFOS (USEPA, 2002; USEPA, 2022a). The EPA has followed the same definitions of the applied uncertainty factors as has been used since the establishment of the 2002 agency document, *A Review of the Reference Dose and Reference Concentration Processes* (USEPA, 2002). This document has been applied repeatedly through its use in peer-reviewed agency assessments and is cited in more recent agency human health risk assessment methodology (USEPA, 2022a). The EPA cannot respond to the comment on the "model-based prediction uncertainty" and "data-based measures" of uncertainty due to a lack of detail in the comment (i.e., the commenter did not provide specific citations) for the EPA to review and evaluate. Regardless, the topics of "model-based prediction uncertainty" and "data-based measures" of

uncertainty have not been published in any peer-reviewed agency guidance or human health risk assessment documents. In fact, had the EPA used any approach other than the defined uncertainty factors, the EPA would be deviating from long-standing best practices and would be inconsistent with the agency's own methodologies (USEPA, 2002). In the PFOA and PFOS toxicity assessments, the EPA followed current best practices for setting uncertainty factors (USEPA, 2002; USEPA, 2022a).

Additionally, the commenter's belief that safety factors applied to the RfD should "reflect the ability of others [to] replicate EPA's results" is erroneous. Uncertainty factors are used in the derivation of RfDs to account for uncertainty (i.e., a lack of knowledge) and variability (i.e., heterogeneity and diversity) of the contaminant health effects database (USEPA, 2002); they are not related to replication of the EPA's analyses. Specifically, the EPA human health risk assessment practice is to consider the application of individual uncertainty factors account for "(1) the variation in sensitivity among the members of the human population (i.e., interhuman or intraspecies variability); (2) the uncertainty in extrapolating animal data to humans (i.e., interspecies variability); (3) the uncertainty in extrapolating from data obtained in a study with less-than-lifetime exposure to lifetime exposure (i.e., extrapolating from subchronic to chronic exposure); (4) the uncertainty in extrapolating from a LOAEL rather than from a no-observed-adverse effect level (NOAEL); and (5) the uncertainty associated with extrapolation from animal data when the database is incomplete" (USEPA, 2002).

Following these methods (USEPA, 2002; USEPA, 2022a), to derive RfDs for PFOA and PFOS from epidemiological studies, the EPA used relatively low composite (i.e., total) uncertainty factors of 10, in contrast to the commenter's claims that the EPA "employs a series of highly conservative uncertainty and safety factors to generate an RfD." The application of this 10x composite uncertainty factor was reviewed by the SAB PFAS Review Panel, who stated:

> *"The Panel generally finds these [uncertainty factor] values to be adequate and supported by the scientific rationale provided by the agency. The values were found to be appropriate and sufficiently protective, with rationale that was clearly described in the draft MCLG documents"* (USEPA, 2022b).

Overall, the EPA disagrees with the commenter's supposition that the approach to uncertainty factor application does not result in a scientifically defensible RfD. As discussed, the EPA followed longstanding agency human health risk assessment methods and received support from the SAB in its selection and rationale for the applied uncertainty factors (USEPA, 2002; USEPA, 2022a; USEPA, 2022b).

The commenter also stated that the "EPA does not have actual data sets for many of the endpoints addressed in the rulemaking, and EPA did not oversee the work ensuring good quality control of the author's findings." This claim is demonstrably incorrect. As described in previous responses (see the EPA response to comment Doc. #1774, SBC-045701 in section 4.1.2 in this *Response to Comments* document), the EPA provided all data and calculations needed to replicate the models used to derive PODs for each endpoint of interest in Appendix E of the draft and final toxicity

assessments (USEPA, 2023b; USEPA, 2023c; USEPA, 2024a; USEPA, 2024b). The EPA's study evaluation process reflects the confidence in the study conduct and data quality, including reporting, in each publication. Only studies of *high* or *medium* confidence were quantitatively considered in these assessments.

Raptor Pharm & Tox, Ltd (Doc. #1644, SBC-043417 & SBC-043418)

Based on EPA's handling and interpretation of these studies, it is clear to Raptor that EPA has not taken the due care to establish that there are adverse health outcomes in the studies being cited and used as the basis of the critical effect, PODs, and ultimately the RfD.

Raptor has identified that EPA exhibited a pattern, with respect to this drinking water standard, that do not uphold the high level of quality and scientific integrity required to generate a science-based policy.

Raptor suggests that EPA use the scientific approach outlined by the philosopher of science Karl Popper, and adapted by Raptor, when formulating a science-based policy. Raptor is concerned that EPA staff and management may have allowed their personal policy preferences and scientific biases to drive their assessment. In other words, the concern is that EPA succumbed to confirmation bias in looking for studies that supported the policy preferences of staff, management, and the administration. Popper identified confirmation bias as a significant problem in science, and he stated, in his book Conjectures and Refutations (1962):

"I found that those of my friends who were admirers of Marx, Freud, and Adler, were impressed by a number of points common to these theories, and especially by their apparent explanatory power. These theories appeared to be able to explain practically everything that happened within the fields to which they referred. The study of any of them seemed to have the effect of an [35] intellectual conversion or revelation, opening your eyes to a new truth hidden from those not yet initiated. Once your eyes were thus opened you saw confirming instances everywhere: the world was full of verifications of the theory. Whatever happened always confirmed it. Thus its truth appeared manifest; and unbelievers were clearly people who did not want to see the manifest truth; who refused to see it, either because it was against their class interest, or because of their repressions which were still 'un-analysed' and crying aloud for treatment."

And Popper also identified the solution:

"Confirming evidence should not count except when it is the result of a genuine test of the theory; and this means that it can be presented as a serious but unsuccessful attempt to falsify the theory."

Raptor concludes that US EPA did not take a refutation approach in developing this policy. US EPA did not critically analyze the scientific studies in order to refute those studies, or their underlying hypothesis that low levels of PFOS and PFOA cause adverse human health outcomes. In fact, one only needs to read US EPA's inappropriate explanation of why Budtz-Jorgensen and Grandjean was included to know that US EPA was fishing for studies – "Budtz-Jørgensen and

Grandjean (2018) was ultimately selected for the immune outcome because the response reported by this study reached statistical significance, this analysis considered co-exposures of other PFAS, and it was the more health-protective of the two vaccine-specific responses reported by Budtz-Jørgensen and Grandjean (2018)."

The reason this explanation is inappropriate is because US EPA was focused on "statistical significance". This is in direct violation of the advice given by the American Statistical Association when it stated that statistical significance should not be the driver of decisions. Rather, the effect size needs to be biologically meaningful (https://www.amstat.org/asa/files/pdfs/p-valuestatement.pdf).

EPA Response: The EPA disagrees with the commenter's incorrect characterization that the EPA "succumbed to confirmation bias," did not take a "refutation approach" in developing conclusions in the PFOA and PFOS toxicity assessments and that the EPA did not critically analyze the studies used to support the PFOA and PFOS toxicity assessments. Please see section 4.1.2 of the EPA response in this *Response to Comments* document.

The EPA has followed multiple steps within the systematic review process with one underlying purposes of reducing risks associated with confirmation bias At the EPA, achieving consensus on scientific issues is driven by following the current human health risk assessment methods and approaches (e.g., USEPA, 2002 and USEPA, 2022a). Policy preferences of staff, management and the administration are not considered within this systematic process. Here, the EPA used state of the art systematic review methods to critically analyze the health effects literature for PFOA and PFOS, methods that are consistent with the IRIS Handbook (USEPA, 2022a). Please see section 4.1.1 1 of the EPA response in this *Response to Comments* document.

Finally, the toxicity assessment for PFOA and PFOS underwent an independent, rigorous peer review by the EPA's Science Advisory Board PFAS peer review panel, which included 16 external scientists with expertise in human health risk assessment, including epidemiology and toxicology. Their conclusions, recommendations and report were later reviewed by more than 40 other scientists who serve on the Science Advisory Board (USEPA, 2022b). Among other things, when an SAB panel or subcommittee is formed, it is established while considering scientific credentials, disciplinary expertise in relevant fields, and background and experiences that would help members contribute to the diversity of perspectives on the committee, such as geographical, social, cultural, educational backgrounds, professional affiliations, and other considerations. The EPA's SAB has aa set of ethics requirements for panelists including disclosing financial information in order for the SAB to determine whether there are ethics issues with service on an advisory panel (https://sab.epa.gov/ords/sab/r/sab_apex/sab/ethicsreqsforadvisors?session=16384952239507).

As discussed elsewhere in this *Response to Comments* document and administrative record, the SAB provided a generally favorable review of the EPA's PFOA and PFOS draft toxicity assessments' conclusions (see section 4.1.3 of the EPA response this *Response to Comments* document). Where the SAB provided suggestions and feedback, the EPA considered

those recommendations and updated the assessments to respond to that input. By implication, if the results and findings of its toxicity assessments were merely driven by confirmation bias, as the commenter's unsubstantiated claim states, then the SAB's review would also fundamentally be driven by the confirmation biases of each of the diverse individual scientists on that panel. Such a conclusion is illogical and unsupported by any evidence. In short, many dozens of scientists from the EPA and outside organizations provided expert input on the EPA's draft PFOA and PFOS toxicity assessments.

Additionally, the commenter cited only one example to support their incorrect claim that the EPA "focused" on statistical rather than biological significance when selecting the critical study that serves as the basis of the candidate RfD for immune effects (i.e., Budtz-Jorgensen & Grandjean, 2018). Both statistical and biological significance were considered when evaluating studies for dose-response modeling. While statistical significance was not the sole factor, it is nonetheless one important factor considered by the EPA when selecting critical studies for POD derivation, determining evidence integration judgments, selecting model results, or to support other decisions made throughout the toxicity assessments. For the immune health outcome-specific RfD, the EPA selected Budtz-Jørgensen and Grandjean (2018) as the critical not only because it demonstrated a statistically significant effect, but also because this study's analysis considered co-exposures of other PFAS, unlike the other critical epidemiological studies which were the bases of the candidate RfDs for the immune health outcome (i.e., Timmerman et al. (2021) (PFOA and PFOS) and Zhang et al. (2023) (PFOS only)), and was a good estimate of 5 percent extra risk (USEPA, 2024d; USEPA, 2024c). Therefore, the commenter's claim that the EPA was "fishing for studies" is unsupported. While all of this information and rationale were presented in the draft toxicity assessments and the appendices published for public comment (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c), the EPA recognizes that the information was not presented together in a single location in the public comment draft. Therefore, to clarify this issue, the EPA has updated the final toxicity assessments to present this rationale more clearly in one section, section 4.1 (USEPA, 2024d; USEPA, 2024c).

Raptor Pharm & Tox, Ltd (Doc. #1644, SBC-043424)

The US EPA improperly used studies that do not focus on adverse health outcomes. The US EPA did not use principles of sound science outlined by Karl Popper, the pre-eminent philosopher of science, and the architect of the modern approach to science. The US EPA appears to have succumbed to confirmation bias in its assessment and derivation of safe drinking water standards. However, with a re-analysis of the information that is available in the literature, and a more critical eye towards scientific integrity with respect to the studies themselves, especially a more critical eye to matters of study design, sample size, and actual falsification of the current prevalent theory of the safe levels of these chemicals, US EPA will generate a far more reasonable and scientifically-sound safe drinking water standard.

EPA Response: Please see the EPA response to comment Doc. #1644, SBC-043417 and SBC-043418 in section 4.1.2 in this *Response to Comments* document, as well as section 4.2.2.2.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045596)

6. Proposed Maximum Contaminant Level Goals

The derivation of a science-based maximum contaminant level goal (MCLG) is crucial because it means that it is both of public health and can transparently be communicated to inform decision-making for the public. EPA did not use the best available science in proposing the MCLGs (and MCLs) for these substances as required by SDWA. EPA must also ensure that the underlying science is review by the EPA SAB.

EPA Response: Please see sections 4.1.2 and 4.1.3 of the EPA response in this *Response to Comments* document.

4.1.3 Peer Review of the Science Underlying the Hazard Conclusions, Cancer Classifications and Toxicity Values for PFOA and PFOS

Summary of Major Public Comments and EPA Responses

A couple of commenters suggested that the toxicity assessments for PFOA and PFOS were not adequately peer-reviewed because changes were made post peer review (i.e., after publication of the final report by the SAB PFAS Review Panel (USEPA, 2022b)). The most significant change was the updated cancer classification for PFOS, but other changes included the addition of figures and mechanistic syntheses.

Some commenters also commented on the adequacy of the EPA's response to the SAB PFAS panel's recommendations. One stated that the EPA addressed the SAB's concerns regarding the systematic review protocol in the documents supporting the proposed rulemaking. A few commenters reiterated the importance of SAB recommendations, including to more thoroughly describe systematic review methods used in the assessment (e.g., study inclusion and exclusion criteria), incorporate additional epidemiological studies, provide rationale for critical study selection, and derive candidate toxicity values from both human and animal data. In contrast, a few commenters claimed that the EPA did not adequately consider several recommendations made by the SAB PFAS Review Panel in their final report (USEPA, 2022b), including that the EPA did not incorporate studies from the 2016 HESDs (USEPA, 2016b; USEPA, 2016a) or develop multiple CSFs. One commenter requested clarification on whether the EPA had implemented the feedback from the SAB.

The EPA disagrees that the toxicity assessments for PFOA and PFOS were not adequately peer-reviewed or that the agency did not "meaningfully implement" SAB feedback. The SAB recommendations on the draft toxicity assessments for PFOA and PFOS (USEPA, 2021b; USEPA, 2021c) and subsequent revisions by the agency greatly improved the scientific quality,

clarity, and transparency of the assessments supporting rule proposal (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c) and this final rulemaking (USEPA, 2024d; USEPA, 2024c; USEPA, 2024a; USEPA, 2024b). The EPA agrees with commenters that highlighted the importance of the SAB's suggestions. As outlined in the *EPA Response to Final Science Advisory Board Recommendations (August 2022) on Four Draft Support Documents for the EPA's Proposed PFAS National Primary Drinking Water Regulation* (USEPA, 2023d), the EPA considered all of the comments and recommendations from the SAB prior to publishing the public comment draft assessments (USEPA, 2023f; USEPA, 2023a; USEPA, 2023b; USEPA, 2023c). The response to SAB document also describes how the agency addressed the recommendations made by the SAB in their final report (USEPA, 2022a; USEPA, 2023d). Specifically, improvements to the draft assessments included the addition of thorough and detailed descriptions of the methods used during assessment development, the inclusion of studies from the 2016 HESDs for PFOA and PFOS in the systematic review (USEPA, 2016a; USEPA, 2016b), updates to the literature, implementation of an evidence integration framework (USEPA, 2022a), expansion of rationale for critical study and model selection, development of toxicity values from both animal toxicological and epidemiological data, when warranted, and many other actions. In the very few instances where the EPA did not follow the recommendations of the SAB, the EPA described the rationale for these decisions in the response to SAB comments document (USEPA, 2023d). As described above, many commenters stated recommendations presented by the SAB in its final report (USEPA, 2022b) and requested that the EPA make these changes to the draft assessments. To reiterate, all of the recommendations made by the SAB were considered prior to rule proposal; therefore, many of the comments presented herein had previously been addressed.

Given the comprehensive review by the SAB, the EPA maintains that the PFOA and PFOS draft toxicity assessments, including the conclusions that are material to the derivation of the MCLGs, were adequately peer-reviewed by the SAB PFAS review panel (USEPA, 2022b). Notably, this panel "agreed with many of the conclusions presented in the assessments, framework and analysis" (USEPA, 2022b). The only toxicity assessment conclusion that changed and impacted MCLG derivation between the SAB review and rule proposal was the cancer classification for PFOS of *Suggestive Evidence of Carcinogenicity* was updated to *Likely to Be Carcinogenic to Humans* according to the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005). The rationale for this update was presented in materials published at the time of rule proposal, including the EPA's response to SAB comments (USEPA, 2023d), the draft toxicity assessment for PFOS (USEPA, 2023a) and is presented again in section 4.1.4 of the EPA response in this *Response to Comments* document, as well as in the final toxicity assessment for PFOS (USEPA, 2024c) and the PFOA and PFOS MCLG support document (USEPA, 2024e). USEPA, 2005USEPA, 2005No other major conclusions in either the PFOA or PFOS toxicity assessments changed that impacted MCLG derivation between SAB review and proposal.

In response to commenters who recommended another round of peer review, please see section 4.3.2 of the EPA response in this *Response to Comments* document.

Individual Public Comments

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045904)

C. Cancer classification and slope factors for PFOA and PFOS are not supported by the scientific evidence

EPA has significant irregularities in review and justification for the cancer classifications of PFOA and PFOS. EPA has moved ahead with a carcinogenicity determination for PFOS without SAB comment or approval, and EPA, without explanation, interpreted the same studies on PFOS in two different manners in a 2021 and a 2023 assessment. Now that EPA has developed frameworks for evaluating the scientific evidence, additional peer review is essential before finalization of this rulemaking. Additionally, EPA has failed to respond to SAB direction to develop appropriate multiple candidate cancer slope factors and relied on low confidence epidemiological data.

In the PFOA and PFOS Draft Assessments reviewed by the SAB in 2021, EPA proposed that PFOA was "likely to be carcinogenic" and for PFOS there was "suggestive evidence of carcinogenic potential." The SAB review provides, at best, tepid support for these findings, noting that EPA's rationale for the designations was not adequately provided and that EPA needed to provide a more structured framework to describe the criteria used for these designations [FN124: See SAB report to the EPA Administrator Aug. 22, 2022, at pages 32-38, available at: https://sab.epa.gov/ords/sab/f?p=100:18:16490947993:::RP,18:P18_ID:2601#report.]. For PFOS, the SAB report does not provide a recommendation for what the cancer classification should be. Because the documents provided to the SAB were not sufficiently transparent, the SAB was unable to directly respond to important charge questions and recommended significant changes, including a more structured framework, and inclusion and discussion of mechanistic data.

EPA Response: Please see section 4.1.3 of the EPA response in this *Response to Comments* document. Discussion regarding review of the evidence supporting the EPA's cancer classifications for PFOA and PFOS can be found under section 4.1.4 of the EPA response in this *Response to Comments* document. For responses regarding SDWA's requirements for SAB comment prior to proposal, please see section 4.3.2 of the EPA response in this *Response to Comments* document.

Michigan Farm Bureau (Doc. #1562, SBC-043354 & SBC-043355)

EPA requested the Science Advisory Board (SAB) review the agency's analysis of proposed MCLs, which it published in August of 2022.1 EPA took several steps outlined in the proposed rule to address the SAB's concerns, but several remain unresolved. These concerns are important to understanding and setting the stage for future regulations of PFAS, as well as ensuring that protection from the exposure and health risk from PFAS is reasonable, necessary, and feasible to implement.

The SAB recommended taking actions like ensuring more human studies are included in EPA's models of health outcomes, focusing on consistent frameworks for identifying disease, and synthesizing and integrating information. This is particularly important for the carcinogenic designations for some PFAS, which set a specific need for low concentrations of exposure. In the instance of carcinogenic designation, the SAB remarked it is especially important to include and discuss the strengths and limitations of epidemiological studies to make the agency's decision-making process clear. The SAB recommended further actions such as more clearly identifying reference doses in a dose metric equivalent value to more accurately convert dose to external exposures and water concentrations.

The SAB further pointed out that EPA was inconsistent in how it characterized cardiovascular risk, noting that EPA developed a cardiovascular risk document estimating that reductions in PFOS and PFOA exposure was linked to reductions in cardiovascular disease, but then determining in its proposed Maximum Contaminant Level Goal that the cardiovascular risk was not sufficient to form the basis of a reference dose for determining the exposure risk. EPA must provide more clarity on this and how the cardiovascular risk fits into the regulatory limit proposed for PFAS to help the regulated community understand exposure risk and reduction potential for that risk by implementing testing and treatment of drinking water.

Importantly, the SAB noted that EPA needs to provide more clarity on what forms of PFAS are being included in review of tests and studies, particularly of PFOS and PFOA. This is important because animal studies and human exposure studies, primarily of workers in PFAS-generating or industrial use situations, use different forms and salts of PFOA and PFOS to determine exposure which is then linked to expression of disease. It is crucial to make clear that EPA is comparing "apples to apples" when determining potential disease risk. Further, the SAB emphasized that if EPA declines to use a human health study in favor of animal studies, it must clearly explain its reasoning and establish what quality control and review methodology is used to determine inclusion or exclusion of particular studies. The SAB recommended including several studies including those on human exposure to EPA's list, which we strongly recommend EPA review and transparently indicate what decision-making process was used to include or exclude the findings of such studies.

EPA Response: Please see section 4.1.3 of the EPA response in this *Response to Comments* document. Additionally, see the EPA's Response to SAB Comment document (USEPA, 2023d) and the final toxicity assessments (USEPA, 2024d and USEPA, 2024c) where the EPA describes that changes in total cholesterol are a hazard and are the basis of a candidate RfD for PFOA and PFOS. Also see comments related to the cardiovascular disease (CVD) economic analysis in section 13.4.1 and more specifically, the EPA's response to comment Doc. #1759, SBC-053061 in section 13.4.1 in this *Response to Comments* document for discussion on consistency between the economic analysis and the conclusions on cardiovascular effects in the draft and final toxicity assessments for PFOA and PFOS.

Pennsylvania Municipal Authorities Association (Doc. #1832, SBC-045779 & SBC-045780)

PMAA's specific comments on the Proposal are as follows:

One of PMAA's primary comments with respect to a regulation impacting its members is that any final determination, decision or action made by any regulatory agency such as EPA must be based on the latest and best available health and scientific data and information. PMAA understands that there are a number of ongoing studies at the federal level regarding PFAS. What assurance can be given to PMAA members that the Proposal and the potential regulation of PFAS is based on all of the most recent and peer- reviewed health and scientific data and information?

As discussed herein, an issue of particular importance to PMAA is that the Proposal be based upon the latest and best available health and scientific data and information. However, there needs to be transparency not only as to the documents/studies/reports that were considered in the development of the Proposal, but also as to the documents/studies/reports that were available to the EPA, but not considered in the development of the Proposal, and the reason(s) that they were not considered. In other words, were there documents (e.g. health, toxicological, epidemiological) that the EPA or its Science Advisory Board reviewed, but for some reason, chose not to include in its evaluation process leading to the issuance of the Proposal? Moreover, the final Science Advisory Board consensus report provided recommendations to EPA, which the agency considered for the Proposal (See, EPA-SAB-22-008, August 22, 2022). Did EPA accept all of the aforementioned recommendations and, if not, please explain which recommendations were not accepted, and the rationale for not accepting such recommendations of the Science Advisory Board.

EPA Response: Regarding the EPA's use of the best available peer-reviewed science, please see sections 4.1.2 and 4.1.1 of the EPA response in this *Response to Comments* document. Briefly, the EPA has considered all relevant and peer-reviewed studies published through February 2023. Regarding the commenter's question about whether the EPA accepted the SAB's recommendations, please see section 4.1.3 of the EPA response in this *Response to Comments* document. Additionally, see EPA's Response to SAB Comment document (USEPA, 2023d). Regarding the commenter's questions about which documents, studies, or reports were considered in the development of this rulemaking, the commenter can refer to the systematic review protocol for study identification and relevancy screening in Appendix A of the toxicity assessments (USEPA 2024a; 2024b), as well as the Interactive Reference Flow Diagram, which transparently documents how and when individual studies were identified, as well as how they were categorized during the systematic review process. The studies identified from the literature searches are publicly available on the EPA HERO project page (https://hero.epa.gov/hero/index.cfm/project/page/project_id/2608).

4.1.4 The EPA's Determination that PFOA and PFOS are *Likely to Be Carcinogenic to Humans*

Summary of Major Public Comments and EPA Responses

Many commenters agreed that the available data indicate that exposure to either PFOA or PFOS is associated with cancer in humans and supported the EPA's determinations that PFOA and PFOS are *Likely to Be Carcinogenic to Humans* according to the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005). Multiple commenters agreed that studies published since the 2016 HESDs (USEPA, 2016b; USEPA, 2016a) have strengthened this conclusion. In particular, one commenter supported the EPA's conclusions regarding the human relevance of hepatic and pancreatic tumors observed in rats administered PFOS, citing their own independent health assessment conclusion that "several lines of evidence do not support a conclusion that liver effects due to PFOS exposure are PPARα-dependent" and therefore, may be relevant to humans (NJDWQI, 2018). The EPA agrees with these comments.

Several commenters disagreed with the EPA's determinations that PFOA and PFOS are each *Likely to Be Carcinogenic to Humans*. Two commenters claimed that the tumor types observed in rats (e.g., hepatic tumors) after PFOA or PFOS administration are not relevant to humans. Some commenters also stated that the human data do not support an association between PFOS exposure and cancer. One commenter specifically claimed that Shearer et al. (2021) does not provide sufficient evidence for changing PFOS's cancer descriptor from *Suggestive Evidence of Carcinogenicity* to *Likely to Be Carcinogenic to Humans* because it did not report associations between PFOS exposure and renal cell carcinoma (RCC) and others claimed that the EPA did not provide rationale for updating the cancer descriptor for PFOS. Two commenters stated that the EPA's discussion using structural similarities between PFOA and PFOS as a line of evidence to support the carcinogenicity of PFOS was inconsistent with the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005). A few commenters additionally questioned or disagreed with the determination that PFOA is *Likely to Be Carcinogenic to Humans* because of uncertainties in the epidemiological database and a lack of evidence indicating that PFOA is genotoxic.

The EPA disagrees with these comments. With respect to the relevance of the animal tumors observed in rats after chronic oral exposure to either PFOA or PFOS, the EPA considered all hypothesized modes of action (MOAs) and underlying carcinogenic mechanisms in its cancer assessments, including those that some commenters have argued are not relevant to humans (e.g., peroxisome proliferator-activated receptor α (PPARα) activation), the discussion of which is available in Section 3.5.4.2 of the toxicity assessments for PFOA and PFOS (USEPA, 2024d; USEPA, 2024c). After review of the available mechanistic literature for PFOA and PFOS, the EPA concluded that there are multiple plausible mechanisms, including some that are independent of PPARα, that may contribute to the observed carcinogenicity of either PFOA or PFOS in rats. Further confirmatory support for the EPA's conclusions regarding multiple plausible mechanisms of carcinogenicity comes from literature reviews published by state and global health agencies which concluded that the liver tumors associated with PFOA and/or PFOS

exposure may not entirely depend on PPARα activation and therefore may be relevant to humans (CalEPA, 2021; IARC, 2016; NJDWQI, 2017; NJDWQI, 2018).

The EPA reevaluated the cancer classification for PFOS, which was presented to the SAB PFAS Review Panel as *Suggestive Evidence of Carcinogenicity* (USEPA, 2021c), because in their final report, the SAB stated, "[s]everal new studies have been published that warrant further evaluation to determine whether the "likely" designation is appropriate" for PFOS and requested that the agency provide an "explicit description of why the available data for PFOS do not meet the EPA Guidelines for Carcinogen Risk Assessment (USEPA, 2005) criterion for the higher designation as 'likely carcinogenic" (USEPA, 2022b). Upon consideration of these comments, the EPA determined that PFOS met the criterion for the higher designation of *Likely to Be Carcinogenic to Humans* (USEPA, 2023a; USEPA, 2023d). This conclusion was based on four independent factors. First, the SAB's request that the EPA "reevaluate the 2012 Butenhoff study" and the EPA's subsequent agreement with the SAB after the EPA's reevaluation that the EPA's prior "interpretation of the hepatocellular carcinoma data from the Butenhoff (2012b) study in the 2016 HESD is overly conservative in dismissing the appearance of a dose-response relationship for this endpoint, particularly in females" (USEPA, 2022b). Second, the EPA's incorporation of mechanistic literature, as requested by the SAB, which served as the basis of the EPA's conclusions that multiple, potentially human-relevant modes of action (MOAs) may contribute to the hepatocellular tumors reported in PFOS toxicological studies of rats (USEPA, 2023a). This conclusion aligned with the SAB's comments that "multiple MOAs may be operative" in the reported hepatocellular tumorigenesis and that "the rodent liver tumors caused by PFOS do not appear to be PPAR−α dependent," (USEPA, 2022b). Third, the SAB's comment there were inconsistencies between the EPA's draft conclusions and "the California EPA conclusions based on the same human, animal, and mechanistic evidence presented in the EPA PFOS document," leading the EPA to re-review the California EPA's draft Public Health Goals for PFOA and PFOS technical document (CalEPA, 2021) and identify data indicating the occurrence of tumorigenesis in a second tumor site in male rats (i.e., pancreatic islet cell tumors) (USEPA, 2022b). Fourth, the EPA's identification of new supporting epidemiological literature resulting from the SAB's recommendation that the EPA update the literature search prior to finalization of the assessments (USEPA, 2022b). These factors and the EPA's conclusions were described in sections 3.5 and 6.4 of the draft assessment (USEPA, 2023a) and are presented in sections 3.5 and 5.4 of the final toxicity assessment (USEPA, 2024c). Additionally, the EPA did not rely on results reported by Shearer et al. (2021) as a rationale for updating the cancer classification for PFOS to *Likely to Be Carcinogenic to Humans* (USEPA, 2005) and acknowledges uncertainties in the results provided by this study, including that the effect in the third PFOS exposure quartile was null, the effects were attenuated (i.e., reduced in magnitude) when adjusted for exposure to other PFAS, and there was no association when Exposure to PFOS was considered as a continuous variable, rather than when PFOS levels were stratified by quartiles (USEPA, 2024c; USEPA, 2023a). As described in Sections 3.5.5 and 6.4 of the draft PFOS toxicity assessment (USEPA, 2023a) (Sections 3.5.5 and 5.4 of the final PFOS toxicity assessment; USEPA, 2024c), the available information exceeds the characteristics for the

descriptor of *Suggestive Evidence of Carcinogenic Potential* (USEPA, 2005) because there is statistically significant evidence of multi-sex and multi-site tumorigenesis from a *high* confidence animal toxicological study, as well as mixed but plausible evidence of carcinogenicity in humans, and mechanistic data showing potential human relevance of the observed tumor data in animals. The recently published studies reporting associations between PFOS exposure and hepatocellular carcinoma (HCC) in humans (Goodrich et al., 2022; Cao et al., 2022) strengthen the epidemiological database and support the cancer classification of *Likely to Be Carcinogenic to Humans* for PFOS.

Regarding commenters' claims that the EPA used the structural similarities between PFOA and PFOS as supporting evidence of the carcinogenic potential of PFOS, the EPA did not rely on structural similarities to draw conclusions about the cancer classification (see rationale listed above) but instead used this information as supplemental support for the *Likely* classification. Ie EPA originally included this supplemental line of evidence because the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005) explicitly states that "[a]nalogue effects are instructive in investigating carcinogenic potential of an agent as well as in identifying potential target organs, exposures associated with effects, and potential functional class effects or modes of action." PFOA and PFOS differ in their chemical structure by a single functional group. Nevertheless, since a full structure-activity relationship analysis was not conducted, the EPA removed discussion on this supplemental line of evidence from the toxicity assessment for PFOS (USEPA, 2024c).

Further, the EPA disagrees with comments stating that the epidemiological database for PFOA is too uncertain to support a classification of *Likely to Be Carcinogenic to Humans*USEPA, 2005. As described similarly in both the draft (USEPA, 2023f) and final toxicity assessments for PFOA (USEPA, 2024d), as well as the *Maximum Contaminant Level Goals for Perfluorooctanoic Acid (PFOA) and Perfluorooctane Sulfonic Acid (PFOS)* document (USEPA, 2024j), the available epidemiological data support an increased risk of both kidney and testicular cancers associated with PFOA exposure. There is also evidence that PFOA exposure may be associated with an increased breast cancer risk, based on studies in populations with specific polymorphisms and for specific types of breast tumors. Taken together, these results provide consistent and plausible evidence of PFOA carcinogenicity in humans. Additionally, while genotoxicity is one potential MOA for carcinogenicity, there is no requirement that a chemical be genotoxic for the EPA to classify it as either *Carcinogenic to Humans*, *Likely to Be Carcinogenic to Humans*, or *Suggestive Evidence of Carcinogenic Potential* according to the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005). Importantly, the SAB PFAS Review Panel supported the rationale for the *Likely to Be Carcinogenic to Humans* designation for PFOA in its final report (USEPA, 2022b).

Individual Public Comments

4.1.4.1 General Comments

Rockbridge Area Conservation Council (RACC) (Doc. #1678, SBC-043736)

Comments on EPA Proposed National Primary Drinking Water Regulation (NPDWR)

(https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027)

Rockbridge Conservation PFAS Working Group: Joe DiNardo, David Agnor, Sandra Stuart, Barbara Walsh

We would like to thank the EPA for their tremendous efforts and advances made in establishing guidelines to control the human and environmental impact of Per- and Polyfluoroalkyl Substances (PFAS) including perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). With that said, we respectfully submit the following comments for EPA's review and consideration in light of the proposed National Primary Drinking Water Regulation (NPDWR):

1) EPA Statement:

"Following a systematic review of available human epidemiological and animal toxicity studies, EPA has determined that PFOA and PFOS are likely to cause cancer (e.g., kidney and liver cancer) and that there is no dose below which either chemical is considered safe (see section IV.A and V.A through B of this preamble for additional discussion). Therefore, EPA is proposing to set the health-based value, the MCLG, for both of these contaminants at zero."

We agree with EPA's safety assessment that PFOA and PFOS are likely carcinogenic to humans and with the conclusion that there is no dose that is safe and, therefore, setting an MCLG to "Zero" is warranted.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments.

American Association for Justice (AAJ) (Doc. #1636, SBC-042968)

I. AAJ supports the EPA's science-based conclusion that there is no safe level of PFAS exposure.

An MCLG is defined in Section 1412(b)(4)(A) of the Safe Water Drinking Act (SWDA) as "the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety.'' EPA correctly recognized that scientific evidence widely supports a conclusion that PFOA and PFOS are carcinogenic to humans as well as causing other negative health effects, and therefore correctly proposed MCLGs for these chemicals of zero. AAJ agrees with EPA and the widespread scientific consensus that there is no safe amount of PFAS exposure and urges EPA to implement the proposed MCLGs.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments.

Earthjustice et al. (Doc. #1808, SBC-046101)

B. EPA's MCLs for PFOA and PFOS are Consistent with the SDWA and Supported by the Record

i. EPA Correctly Determined That There is No Safe Exposure Level for PFOA or PFOS

EPA's proposed MCLGs for PFOA and PFOS are consistent with the SDWA's mandate to identify the "level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety." [FN52: 42 U.S.C. § 300g–1(b)(4)(A).] EPA appropriately proposed MCLGs of 0 ppt based on its longstanding policy of "establish[ing] MCLGs of zero for carcinogens … where there is insufficient information to determine … a threshold dose below which no carcinogenic effects have been observed." [FN53: Proposed Rule, 88 Fed. Reg. at 18,659.] There is substantial evidence that both PFOA and PFOS are carcinogenic, with no known safe level of exposure. "The carcinogenicity of PFOA has been observed in both human epidemiological and animal toxicity studies." [FN54: Id. At 18,656.] EPA documented the evidence of PFOA's carcinogenicity in its 2016 PFOA Health Effects Support Document, and subsequent studies have only strengthened and reinforced that finding. [FN55: Id.] A 2022 report from the National Academies of Sciences, Engineering and Medicine ("NAS") found "that there is sufficient evidence for an association between PFAS," including PFOA, "and kidney cancer," [FN56: NAS 2022 at 74.] and the Agency for Toxic Substances and Disease Registry ("ATSDR") has reported "increases in the risk of testicular and kidney cancer associated with PFOA." [FN57: ATSDR 2021 at 523.] Similarly, human and animal studies of PFOS "reported elevated risk of bladder, prostate, kidney, and breast cancers after chronic PFOS exposure." [FN58: Proposed Rule, 88 Fed. Reg. at 18,660.] California's Office of Environmental Health Hazard Assessment ("OEHHA") has listed both PFOA and PFOS as chemicals "known . . . to cause cancer," based on its independent review of the scientific literature. [FN59: OEHHA, Notice to Interested Parties, Chemical Listed Effective February 25, 2022, As Known to the State of California to Cause Cancer: Perfluorooctanoic Acid (2022)("OEHHA 2022"), https://oehha.ca.gov/media/downloads/crnr/listingnoticepfoa022522.pdf; OEHHA, Notice to Interested Parties, Chemicals Listed Effective December 24, 2021, As Known to the State of California to Cause Cancer: Perfluorooctane Sulfonic Acid (PFOS) and Its Salts and Transformation and Degradation Precursors (2021), https://oehha.ca.gov/media/downloads/crnr/noticepfossandsaltstransdegradprecursor122421.pdf.] Additionally, OEHHA has published draft public health goals for PFOA and PFOS in drinking water based on their carcinogenicity. [FN60: OEHHA, Public Health Goals, Perfluorooctanoic Acid and Perfluorooctane Sulfonic Acid in Drinking Water (First Public Review Draft), at 10 (2021) ("OEHHA 2021"), https://oehha.ca.gov/sites/default/files/media/downloads/crnr/pfoapfosphgdraft061021.pdf. 61 Proposed Rule, 88 Fed. Reg. at 18,659–60.] EPA thus appropriately concluded that both PFOA and PFOS are "likely to be carcinogenic to humans." [FN61: Proposed Rule, 88 Fed. Reg. at 18,659–60.]

EPA's established practice, which has been endorsed repeatedly by EPA's Science Advisory Board, the NAS, and other leading authorities, assumes that cancer risks follow a linear dose

response curve, with no safe exposure threshold, in the absence of "scientific evidence demonstrating a threshold level of exposure below which there is no appreciable cancer risk." [FN62: Id. At 18,652–53; see also EPA, Guidelines for Carcinogen Risk Assessment, at 3-21–3-22 (2005).] Here, there is no evidence of a safe level for PFOA and PFOS, and accordingly no basis to depart from EPA's standard approach. Based on substantial evidence of their carcinogenicity and the absence of a safe exposure threshold, EPA appropriately determined that there is no safe level for either PFOA or PFOS.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The commenter cites conclusions by the National Academies of Sciences, Engineering, and Medicine (NASEM, 2022), the Agency for Toxic Substances and Disease Registry (ATSDR) (ATSDR, 2021), and California Environmental Protection Agency's Office of Environmental Health Hazard Assessment (CalEPA, 2021), all of which are cited in the EPA's toxicity assessments.

Environmental Protection Network (EPN) (Doc. #1773, SBC-052871, SBC-043843 & SBC-043845)

EPN supports EPA's finding that PFOA is likely to be carcinogenic and that the cancer slope factor should be based on a study of kidney cancer in human males. EPN also supports EPA's finding that PFOS is likely to be carcinogenic and that the cancer slope factor should be based on a study of liver cancer in male and female rats. As a result, there is no dose below which either chemical can be considered safe, and the MCLGs for PFOA and PFOS are appropriately proposed as zero.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045723)

EPA's Carcinogenic Determination Accurately Reflects the Scientific Understanding

The SDWA directs EPA to set enforceable, nationwide standards for covered drinking water contaminants. [FN31: 42 U.S.C. §§ 300f to 300j-26.] EPA carries out its SDWA obligations by limiting the allowable level of covered contaminants for all public water systems through Maximum Contaminant Level Goals ("MCLG") and MCLs. The statute directs EPA to set the MCLG "at a level at which no known adverse health consequences will occur." [FN32: 42 U.S.C. § 300g-1(b)(4)(A).] EPA is then required to set a MCL as close to the MCLG as is "feasible." [FN33: Id. § 300g-1(b)(4)(B).] The SDWA explains that "feasible" means "feasible with the use of the best technology, treatment techniques and other means which the Administrator finds . . . are available (taking cost) into consideration." [FN34: Id. § 300g-1(b)(4)(D).] Where EPA sets the MCLG, while not an enforceable standard itself, is the floor the enforceable MCL must be based upon. Thus, the MCLGs play a vital role in determining the strictness for each contaminant regulated under the SDWA.

In the Proposed Rule, EPA determined, after "a systematic review of available human epidemiological and animal toxicity studies," that PFOA and PFOS "are likely to cause cancer. . . and that there is no dose below which either chemical is considered safe." [FN35: PFAS National Primary Drinking Water Regulation Rulemaking 60 Fed. Reg. 18638, 18639 (Mar. 29, 2023) (to be codified at 40 C.F.R. pts. 141, 142).] Accordingly, EPA's proposed MCLGs for PFOA and PFOS are zero, representing that there is no safe consumption level for these chemicals. [FN36: Id.] This is the correct conclusion. In prior years, scientists have identified causal links between certain cancers and PFOA and PFOS exposure. [FN37: See, e.g., Grandjean Mem.; see also https://www.tandfonline.com/doi/pdf/10.1080/10962247.2021.1909668 (summarizing scientific research on PFOA. See, e.g., Grandjean Mem. (explaining PFAS links to cancer).] In more recent times, those links have become clearer, with a recent survey of the research concluding that it is "difficult to attribute consistent observations of increased cancer risk in humans exposed to PFOA to chance, bias, or confounding." [FN38: Scott M. Bartell & Verónica M. Vieira, Critical Review on PFOA, Kidnery Cancer, and Testicular Cancer, 71 J. OF THE AIR & WASTE MGMT. Ass'n 663 (2021) (summarizing scientific research on PFOA), available at https://www.tandfonline.com/doi/pdf/10.1080/10962247.2021.1909668.] The association between PFOA and PFOS exposure and cancer is irrefutable. The Commenters urge EPA to adopt an MCLG of zero for PFOA and PFOS.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The commenter cited one review of the cancer literature that the EPA has already included as supporting evidence in the cancer assessment for PFOA (USEPA, 2024d; Bartell and Vieira, 2021).

Consumer Reports (Doc. #1656, SBC-043184, SBC-043185 & SBC-043186)

For contaminants that are carcinogenic, EPA policy is to set the MCLG at zero, unless there is data to show that there is a threshold for a carcinogenic effect. We agree with EPA's conclusion that PFOA is Likely to be Carcinogenic to Humans, based on sufficient evidence of carcinogenicity in humans and animals and the lack of evidence that there is a threshold level of exposure to PFOA below which there is no appreciable cancer risk. We also agree with EPA that the weight of the evidence suggests that PFOS is Likely to be Carcinogenic to Humans. Thus, we support EPA setting the MCLG for PFOA and PFOS at zero.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045248)

EPA appropriately concluded that PFOA and PFOS are "likely to be carcinogenic to humans," and "there is no dose below which either chemical is considered safe." West Virginians have been subject to studies investigating the health effects of PFOA for decades. Numerous studies and long-term health investigations provide evidence that PFOA exposure from the Washington

Works Teflon-manufacturing plant in Parkersburg, WV is associated with higher rates of cancers in mid-Ohio River valley residents [FN3: https://ehp.niehs.nih.gov/doi/10.1289/ehp.1306615; https://ehp.niehs.nih.gov/doi/10.1289/ehp.1205829; http://www.c8sciencepanel.org/index.html]. WV Rivers strongly supports the maximum contaminant level goal (MCLG) of zero for PFOA and PFOS, as any detection of PFOA or PFOS in drinking water can be harmful to human health.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The commenter cited two peer-reviewed publications and a summary of the C8 Science Panel's conclusions on adverse health effects associated with PFOA exposure that the EPA has already included as supporting evidence in the cancer assessment for PFOA (USEPA, 2024d; Barry et al., 2013; Vieira et al., 2013; C8 Science Panel, 2012).

Silent Spring Institute (Doc. #1784, SBC-053330)

The MCLGs of zero for PFOA and PFOS are appropriate based on the weight of evidence for carcinogenicity and other adverse health impacts of PFOA and PFOS at very low exposures. The MCLs of PFOA and PFOS should be set as close to EPA's 2022 interim lifetime health advisories (LHAs) as possible to be protective of both cancer and non-cancer effects.

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The MCLs for PFOA and PFOS are set as close to the MCLGs as feasible, not the interim lifetime HAs for PFOA and PFOS. Please see Section 4.1.5 of the EPA response in this *Response to Comments* document regarding the EPA's MCLGs for PFOA and PFOS and section 5 of the EPA response in this *Response to Comments* document regarding the MCLs for PFOA and PFOS.

Mindi Messmer (Doc. #1788, SBC-044705)

PFOA and other PFAS are endocrine-disrupting chemicals (EDCs) that can disrupt hormonal balance and result in developmental and reproductive abnormalities like the delayed onset of puberty, interference with developmental hormone signaling, and reproductive organ malformation, etc. (Di Nisio et al., 2022; Tarapore & Ouyang, 2021).

Unlike other carcinogens, PFAS chemicals bioaccumulate in the human body with half-lives, or the amount of time needed to reduce the PFAS concentration in the body if all further exposure is halted, ranging from approximately 2 to more than 15 years (Kudo & Kawashima, 2003; Li et al., 2018; Russell et al., 2015) so with each exposure the risk of chronic disease increases.

Human exposure to PFAS is widespread through occupation, ingesting contaminated drinking water, and food that has been in contact with PFAS-coated packaging. Now, four PFAS (PFOA, PFOS, perfluoro hexane sulfonic acid [PFHxS], and perfluorononanoic acid [PFNA]) are detected in 99% of serum samples from humans over 12 in the United States (US), indicating nearly universal exposure (Calafat et al., 2007).

Studies of health outcomes in 69,000 people exposed to PFOA from DuPont's Washington Works plant in West Virginia concluded that PFOA exposure was "more probably than not" associated with testicular and kidney and renal pelvis cancers, ulcerative colitis, thyroid disease, hypercholesterolemia, and pregnancy-induced hypertension (C8 Science Panel, 2020).

Babies are exposed to PFAS in utero through prenatal transplacental transfer as well as early in life since PFAS transfers to breastmilk and contaminated bottled milk. Babies often have higher serum PFAS concentrations than their mothers and increasing PFAS serum levels with longer breastfeeding duration (Fromme et al., 2010; Gyllenhammar, et al, 2018; Papadopoulou et al. 2016; VanNoy et al., 2018). United States Environmental Protection Agency ("EPA") PFOA reference doses are based on concerns relating to developmental endpoints in young children (US Environmental Protection Agency, 2016b).

Previous research indicates that PFOA exposure is also associated with a variety of male and female reproductive outcomes, cancers, impaired developmental outcomes, reduced vaccine response, and more severe COVID-19 outcomes, etc. (see Table 1).

The evidence is clear that exposure to PFAS chemicals causes a wide variety of health effects. Prior research indicates that high levels of PFAS are associated with a variety of adverse health outcomes, including an increased risk of cancer. Researchers have stressed that "the goal is to have zero carcinogens in water" (McMenemy, 2015). We know that we can prevent up to 93% of all human cancers since they are non-hereditary…[but] caused by interaction with environmental factors. Only 7% of all human cancers are hereditary (Seto, et al, 2010).

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The commenter has provided several citations to support their conclusions. Please see section 4.2.6 of the EPA response in this *Response to Comments document* for information related to how the EPA considered references recommended during public comment.

<u>New Jersey Department of Environmental Protection (NJDEP) (Doc. #1699, SBC-045015 & SBC-045016)</u>

Proposed PFOA and PFOS MCLGs of zero based on "Likely to be Carcinogenic to Humans" categorization:

EPA requested comment on its conclusions that PFOA and PFOA are Likely to be Carcinogenic to Humans. The DWQI (2022) agreed that current animal and human data indicate that PFOA should be categorized as a Likely to be Carcinogenic to Humans, and NJDEP concurs with this conclusion. Specifically, two recent studies add to the earlier evidence for carcinogenicity of PFOA. Shearer et al. (2021), cited in the proposed rule, is a human epidemiology study that reports an association of PFOA and kidney cancer within the general population. The National Toxicology Program (NTP, 2020), also cited in the proposed rule, is a chronic rat study that found that PFOA is a more potent carcinogen than two earlier chronic rat studies. Additionally,

NTP (2020) reported that PFOA caused malignant as well as benign tumors, while the earlier chronic studies reported only benign tumors.

The DWQI (2022) did not review EPA's determination that PFOS is Likely to be Carcinogenic to Humans because this conclusion was not publicly available when DWQI (2022) conducted its evaluation. NJDEP has reviewed the more recent EPA weight of evaluation for PFOS in the rule proposal and the draft "USEPA Toxicity Assessment and Proposed Maximum Contaminant Level Goal for Perfluorooctane Sulfonic Acid (PFOS) in Drinking Water" (cited as USEPA [2023c] in the proposed rule). NJDEP agrees with EPA that the available scientific information indicates that it is appropriate to categorize PFOS as Likely to be Carcinogenic to Humans, as summarized in Table 3-26 of USEPA (2023c). NJDEP also agrees the evidence for carcinogenicity of PFOS exceeds the criteria for Suggestive Evidence of Carcinogenic potential, as summarized in Table 6-2 of USEPA (2023c).

NJDEP agrees with EPA's conclusion that the rat hepatocellular tumors caused by PFOS should be considered relevant to humans. Specifically, the USEPA (2023c) conclusions that PFOS is a relatively weak activator of peroxisome activated proliferator receptorα (PPARα) and that the primary mode of action for these tumors is not PPAR-alpha activation are consistent with the conclusions of earlier mode of action analyses by DWQI (2018) and NJDEP (2019). As stated in NJDEP (2019), "…carcinogenic and non-carcinogenic hepatic effects of PFOS have sometimes been assumed to occur through activation of PPARα. However, several lines of evidence do not support a conclusion that liver effects due to PFOS exposure are PPARα-dependent."

Additionally, USEPA (2023c) reports an increased incidence of an additional tumor type that was not considered in the DWQI (2018), NJDEP (2019) or USEPA (2016) PFOS evaluations. Specifically, the USEPA (2023c, Table 3-13) evaluation of tumor data from the chronic rat PFOS study (Thomford, 2002; Butenhoff et al., 2012) demonstrates a statistically significant dose-dependent positive trend for increased incidence of pancreatic islet cell carcinomas in males that was not reported by either Thomford (2002) or Butenhoff et al. (2012).

EPA Response: The comments provided by this commenter provide support for the final rule and toxicity assessments. The commenter agreed with the EPA's conclusions that current animal and human data indicate that PFOA should be categorized as *Likely to Be Carcinogenic to Humans* and noted that this is consistent with the New Jersey Drinking Water Quality Institute's (NJDWQIs) conclusions (NJDWQI, 2022). The commenter agreed that the studies by Shearer et al. (2021) and the National Toxicology Program (NTP) (2020), studies the EPA cited to support PFOA's cancer classification in the toxicity assessment (USEPA, 2024d), provide additional support for the cancer evidence database for PFOA,. The commenter similarly agreed that "the evidence for carcinogenicity of PFOS exceeds the criteria for *Suggestive Evidence of Carcinogenic Potential*" and that the rat hepatocellular tumors observed after PFOS exposure in rats should be considered relevant to humans. The commenter noted that the EPA's conclusions regarding the MOA for PFOS are consistent with similar analyses that were independently conducted by the NJDWQI (2018) and New Jersey Department of Environmental Protection (NJDEP) (2019).

PFAS Regulatory Coalition (Doc. #1761, SBC-053397)

As to the cancer endpoints that are discussed in the EPA Proposal, the studies that EPA cites did not adequately control for confounding factors. There are clear statements in those studies that PFOS effects were not separated from other cancer effects. For example, the effects of PFOS were not separated from the potential effects of PFOA.

EPA Response: The commenter states that the studies the EPA cites did not adequately control for confounding factors, particularly potential confounding by co-occurring PFAS. The EPA disagrees that confounding factors were not adequately addressed in the analysis of the epidemiological study data. Discussion of the results of the analyses of the epidemiological studies that support the cancer classifications for PFOA and PFOS and were considered for CSF derivation for PFOA address potential confounding was provided in the PFOA and PFOS draft toxicity assessments (USEPA, 2023f; USEPA, 2023a; Sec. 3.5 and 4.2.2). The EPA has provided further information on considerations for potential confounding by co-occurring PFAS in the EPA response to comment Doc.#1774, SBC-053428 in section 4.2.1.2 and comment Doc. #1774, SBC-053418 and SBC-045681 in section 4.1.2 in this *Response to Comments* document. Further, the cancer classifications for PFOA and PFOS are supported by *high* and *medium* confidence animal toxicological studies which demonstrate multi-site tumorigenesis for PFOA and PFOS (Butenhoff et al., 2012a; NTP, 2020; Biegel et al., 2001; Thomford, 2002; Butenhoff et al., 2012b). Since these animal toxicological studies only administered either PFOA or PFOS, there is no possibility of confounding by exposure to other PFAS.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045948)

Section 2: Maximum Contaminant Level Goal

EPA is proposing an individual Maximum Contaminant Level Goal (MCLG) for PFOA and PFOS and a separate MCLG for PFNA, PFHxS, GenX, and PFBS as a mixture. The MCLG is the level at which no known health effects are known to occur and allows for an adequate margin of safety. EPA conducted its analysis and consulted with the EPA Science Advisory Board (SAB) to determine the MCLGs for these chemicals.

Section 2.1: PFOA and PFOS

EPA is proposing MCLGs of zero for both PFOA and PFOS. These MCLGs stem from EPA designating PFOA and PFOS as "likely to be carcinogenic to humans," which historically has resulted in an MCLG of zero. The SAB supported this determination for PFOA, and EPA states that it "expects to conduct a final literature search update before the final rule is promulgated."

AMWA recommends one way to strengthen this determination would be for EPA to go further in its analysis to compare PFAS-linked health effect outcomes to population statistics. Such analysis should clearly present information to show the effects PFAS has on the national population by looking at health trends over time, particularly in relation to cancer rates.

EPA Response: The commenter suggested the EPA compare PFAS-related health outcomes to "population statistics" by looking at trends in cancer rates across time and that the EPA show evidence that geographic areas with relatively high PFAS concentrations show associations with health risks to strengthen its determinations that PFOA and PFOS are *Likely to Be Carcinogenic to Humans*. The commenter stated that there should be national trends of adverse health effects and potentially a decrease in life expectancy in areas of high PFAS exposure, due to their persistent and bioaccumulative properties. The EPA has concluded that there is sufficient information at this time to finalize this rulemaking using the best available, peer-reviewed science and supporting studies, as well as data collected by accepted methods or best available methods. Congress authorized the EPA to act when the agency has determined that it has sufficient information. As specified in SDWA Section 1412(b)(9), the agency addresses additional information that may be generated in the future in the six-year review.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045949)

This will serve to strengthen the MCLG analysis and would work to link PFAS exposure with certain health outcomes. Additionally, EPA should show that geographic areas with PFAS concentrations higher than the proposed MCLGs/MCLs see higher rates locally of certain PFAS-linked health risks.

This addition is important as it will affect the cost-benefit analysis. PFAS are persistent and bioaccumulative; therefore, one would expect to see national trends of associated adverse health conditions and potentially a steady decrease in life expectancy in areas of high PFAS exposure. There are, of course, other factors that would be associated with adverse health impacts and earlier life expectancy, specifically the COVID-19 pandemic and other events affecting the health of the public, but this analysis will strengthen the overall approach EPA has made in this determination.

EPA Response: The commenter suggested the EPA compare PFAS-related health outcomes to "population statistics" by looking at trends in cancer rates across time and that the EPA show evidence that geographic areas with relatively high PFAS concentrations show associations with health risks to strengthen its determinations that PFOA and PFOS are *Likely to Be Carcinogenic to Humans*. The commenter stated that there should be national trends of adverse health effects and potentially a decrease in life expectancy in areas of high PFAS exposure, due to their persistent and bioaccumulative properties. The EPA has concluded that there is sufficient information at this time to finalize this rulemaking using the best available, peer-reviewed science and supporting studies, as well as data collected by accepted methods or best available methods. Congress authorized the EPA to act when the agency has determined that it has sufficient information. As specified in SDWA Section 1412(b)(9), the agency addresses additional information that may be generated in the future in the six-year review.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044901)

Section 2: Maximum Contaminant Level Goal

EPA is proposing an individual Maximum Contaminant Level Goal (MCLG) for PFOA and PFOS and a separate MCLG for PFNA, PFHxS, GenX, and PFBS as a mixture. The MCLG is the level at which no known health effects are known to occur and allows for an adequate margin of safety. EPA conducted its own analysis and consulted with the EPA Science Advisory Board (SAB) to determine the MCLGs for these chemicals.

Section 2.1: PFOA and PFOS

EPA is proposing MCLGs of zero for each of PFOA and PFOS. These MCLGs stem from EPA designating PFOA and PFOS as "likely to be carcinogenic to humans," which historically results in an MCLG of zero. This determination for PFOA was supported by the SAB, and EPA states that it "expects to conduct a final literature search update before the final rule is promulgated."

Cleveland Water recommends one way to strengthen this determination would be for EPA to go further in its analysis to compare these health effects to population statistics. This will clearly present that information to show the effects PFAS have on the national population by looking at health trends over time, particularly in relation to cancer rates. This will serve to strengthen the MCLG analysis and link PFAS exposure with certain health outcomes. Additionally, EPA should show that areas with PFAS concentrations higher than the proposed MCLGs/MCLs see higher rates locally of certain PFAS-linked health risks.

This addition is important as it will impact the cost-benefit analysis. PFAS are persistent and bioaccumulative, therefore one would expect to see national trends of certain adverse health conditions increasing, and potentially a steady decrease in life expectancy. There are, of course, other factors that play in, specifically the COVID-19 pandemic and other events affecting the health of the public, but this analysis will strengthen the overall approach EPA has made in this determination.

EPA Response: The commenter suggested the EPA compare PFAS-related health outcomes to "population statistics" by looking at trends in cancer rates across time and that the EPA show evidence that geographic areas with relatively high PFAS concentrations show associations with health risks to strengthen its determinations that PFOA and PFOS are *Likely to Be Carcinogenic to Humans*. The commenter stated that there should be national trends of adverse health effects and potentially a decrease in life expectancy in areas of high PFAS exposure, due to their persistent and bioaccumulative properties. The EPA has concluded that there is sufficient information at this time to finalize this rulemaking using the best available, peer-reviewed science and supporting studies, as well as data collected by accepted methods or best available methods. Congress authorized the EPA to act when the agency has determined that it has sufficient information. As specified in SDWA Section 1412(b)(9), the agency addresses additional information that may be generated in the future in the six-year review.

As a result of the systematic review, the EPA determined that there is sufficient information to support these cancer classifications and the MCLGs of zero for PFOA and PFOS (see sections 4.1.4 and 4.1.5 of the EPA response in this *Response to Comments* document and section IV of the rulemaking preamble).

Studies that were identified in this effort and were determined to be of sufficient quality that analyzed the association between individual-level concentrations of PFOA or PFOS and measured health outcomes (adjusting for relevant, individual-level covariates) provide data to characterize the effects associated with PFOA or PFOS exposure. The EPA used these studies to determine the health hazards as part of the toxicity assessment development process and documented this process in the final toxicity assessments for PFOA and PFOS (USEPA 2024a, USEPA 2024b). The commenter notes that areas of high-PFAS exposure should show increased rates of PFAS-associated health effects and potentially decreases in life expectancy. The EPA identified multiple peer reviewed studies of the C8 Health Project, which focused on a high-exposure PFOA community in the United States, reported significantly increased risks of kidney and testicular cancers with elevated exposure to PFOA (Barry et al., 2013; Vieira et al., 2013). The EPA incorporated these studies into the cancer classification determination for PFOA (USEPA, 2024d). The results of these studies and others conducted in highly exposed communities are important because there may be increased certainty that observed health effects in individuals from high-exposure communities are not confounded by other contaminant exposures.

PFOA and PFOS are included in the suite of contaminants measured in blood samples from a national population collected as a part of the National Health and Examination Survey (https://www.cdc.gov/exposurereport/index.html). Due to the individual nature of the data collected, studies based on data from NHANES can provide individual-level risk estimates as described in the paragraph above. However, the currently available literature reporting associations between cancer outcomes and PFOA or PFOS in blood as reported by the NHANES or other national surveys is limited. Two studies examined cancer in NHANES populations, however, both studies relied on self-reported cancer outcomes which limits confidence in the studies' conclusions (Fry and Power, 2017; Omoike et al., 2021). Omoike et al. (2021) reported significantly increased odds of ovarian and breast cancer with elevated exposure to PFOA and PFOS in continuous analyses and comparing the highest exposure quartiles to the lowest. The other study reported non-significant associations between elevated exposure to PFOA or PFOS and cancer incidence for numerous cancer types (Fry and Power, 2017). The EPA also relied on studies reporting NHANES data and noncancer health outcomes to support evidence integration judgments, POD derivation, and RfD derivation (e.g., Dong et al., 2019).

American Chemistry Council (ACC) (Doc. #1841, SBC-044831)

The available data do not support the determination that PFOA, PFOS or any PFAS are likely human carcinogens, especially at low environmentally relevant levels. Moreover, there is no evidence that PFOA, PFOS, or any PFAS are directly genotoxic. Therefore, regulating PFOA and

PFOS as likely carcinogens and setting the MCL Goal at zero is inconsistent with the best available science. USEPA's findings are also inconsistent with other federal agencies' toxicity assessments worldwide. Most recently, the independent scientific committee that advises the United Kingdom's governmental agencies and health departments concluded that there is "no evidence for a link between exposure to PFASs and cancer risk." [FN41: Committee on Toxicity of Chemicals in Food, Consumer Products and the Environment. Statement on the EFSA Opinion on the Risks to Human Health Related to the Presence of Perfluoroalkyl Substances in Food. United Kingdom (2022). https://cot.food.gov.uk/Introduction%20-%20Statement%20on%20the%20EFSA%20Opinion%20on%20the%20risks%20of%20perfluoroalkyl%20substan ces%20in%20food (COT 2022)] The United Kingdom classifies long-chain perfluoroalkyl acids in their carcinogenicity "Category 2," which means that there is some evidence that exposures to these compounds causes cancer in laboratory animals, but that the information is insufficient to reach a conclusion related to human cancer risk. EPA should not regulate PFOA or PFOS as likely human carcinogens with an MCL Goal of zero, as this is unsupported by the available data.

EPA Response: The EPA disagrees with the comment that the available data do not support the determination that PFOA and PFOS are each *Likely to Be Carcinogenic to Humans*. Please see section 4.1.4 of the EPA response in this *Response to Comments* document regarding the EPA's determinations that PFOA and PFOS are *Likely to Be Carcinogenic to Humans* in accordance with the *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005) and see section 4.2.6 of the EPA response in this *Response to Comments* document regarding differences between the EPA's conclusions in the toxicity assessments for PFOA and PFOS and the conclusions of other health agencies. The information supporting the EPA's cancer classifications for PFOA and PFOS are described in Section 3.5.5 of the final toxicity assessments (USEPA, 2024d; USEPA, 2024c).
