WSSC	Washington Suburban Sanitary Commission
WTP	Willingness-to-Pay

Introduction and Overview

Background

The EPA is promulgating data-driven drinking water standards that are based on the best available, peer-reviewed science and meet the requirements of the Safe Drinking Water Act (SDWA). Under the *Administrative Procedure Act* notice-and-comment process for rulemakings, the EPA considers all relevant and timely-submitted comments and responds to all significant comments received during the public comment period. The EPA's final PFAS National Primary Drinking Water Regulation is based on the administrative record, including the EPA's consideration of these comments.

The U.S. Environmental Protection Agency (the EPA or "the agency") has the authority under SDWA to set enforceable National Primary Drinking Water Regulations (NPDWRs) for drinking water contaminants and require monitoring of public water supplies. The EPA is finalizing a NPDWR for per-and polyfluoroalkyl substances (PFAS) (EPA-HQ-OW-2022-0114). The agency initiated the process for developing a NPDWR for PFAS compounds in March 2021, when the EPA published the fourth regulatory determination for contaminants on the fourth Contaminant Candidate List (CCL), which included a final determination to regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) in drinking water. Additionally, in the EPA's final regulatory determination for PFOA and PFOS, as well as its PFAS Strategic Roadmap, the agency committed to evaluating additional PFAS beyond PFOA and PFOS and considering actions to address groups of PFAS (86 FR 12272; USEPA, 2021a). In March of 2023, the EPA made a preliminary regulatory determination for four additional PFAS and their mixtures: perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as GenX chemicals), perfluorohexanesulfonic acid (PFHxS), and perfluorobutanesulfonic acid (PFBS). Additionally, the EPA proposed a NPDWR and health-based Maximum Contaminant Level Goals (MCLG) for PFOA, PFOS and these four PFAS and their mixtures (88 FR 18638). The final NPDWR is one of several actions consistent with the agency's commitment to address these long-lasting "forever chemicals" that occur in drinking water supplies and impact communities across the U.S.

The EPA requested public comment on the proposed regulation. The public comment period ended on May 30, 2023. The EPA's proposed rule received over 120,000 public comments. The public docket can be accessed at www.regulations.gov under Docket ID: EPA-HQ-OW-2022-0114. The EPA also held an informational general overview webinar of the proposed PFAS NPDWR on March 16, 2023, and another informational webinar about the proposed PFAS NPDWR specifically for water utilities and the drinking water professional community on March 29, 2023. On May 4, 2023, the EPA held a public hearing on the proposed PFAS NPDWR. All original public submissions and supporting documents for the PFAS proposal and final NPDWR can be found at www.regulations.gov, under Docket ID EPA-HQ-OW-2022-0114.

EPA's Categorization of Public Comments and Document Organization

In March 2023, the Environmental Protection Agency (EPA) proposed and requested comment on the National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLGs) for six per- and polyfluoroalkyl substances (PFAS) including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), and perfluorobutane sulfonic acid (PFBS) (88 FR 18638; USEPA, 2023).

The data and information requested by the EPA include peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the review justifies use of the data).

The EPA specifically requested comment on all aspects of the rule and sought specific feedback on the following topics within each section of the proposed rule preamble.

Section III—Regulatory Determinations for Additional PFAS

- The EPA requests comment on its preliminary regulatory determination for PFHxS and its evaluation of the statutory criteria that supports the finding. The EPA also requests comment on if there are additional data or studies the EPA should consider that support or do not support the agency's preliminary regulatory determination for PFHxS, including additional health information and occurrence data.
- The EPA requests comment on its preliminary regulatory determination for HFPO–DA and its evaluation of the statutory criteria that supports the finding. The EPA also requests comment on if there are additional data or studies the EPA should consider that support or do not support the agency's preliminary regulatory determination for HFPO–DA, including additional health information and occurrence data.
- The EPA requests comment on its preliminary regulatory determination for PFNA and its evaluation of the statutory criteria that supports the finding. The EPA also requests comment on if there are additional data or studies the EPA should consider that support or do not support the agency's preliminary regulatory determination for PFNA, including additional health information and occurrence data.
- The EPA requests comment on its preliminary regulatory determination for PFBS and its evaluation of the statutory criteria that supports the finding. The EPA also requests comment on if there are additional data or studies the EPA should consider that support or do not support the agency's preliminary regulatory determination for PFBS, including additional health information and occurrence data.
- The EPA requests comment on whether there are other peer-reviewed health or toxicity assessments for other PFAS the agency should consider as a part of this action.

- The EPA requests comment on its evaluation that regulation of PFHxS, HFPO–DA, PFNA, PFBS, and their mixtures, in addition to PFOA and PFOS, will provide protection from PFAS that will not be regulated under this proposed rule.

Section V—Maximum Contaminant Level Goal

- The EPA requests comment on the derivation of the proposed MCLG for PFOA and its determination that PFOA is Likely to be Carcinogenic to Humans and whether the proposed MCLG is set at the level at which there are no adverse effects to the health of persons and which provides an adequate margin of safety. The EPA is also seeking comment on its assessment of the noncancer effects associated with exposure to PFOA and the toxicity values described in the support document on the proposed MCLG for PFOA.
- The EPA requests comment on the derivation of the proposed MCLG for PFOS, its determination that PFOS is Likely to be Carcinogenic to Humans and whether the proposed MCLG is set at the level at which there are no adverse effects to the health of persons and which provides an adequate margin of safety. The EPA is also seeking comment on its assessment of the noncancer effects associated with exposure to PFOS and the toxicity values described in the support document on the proposed MCLG for PFOS.
- The EPA requests comment on the general Hazard Index approach for the mixture of four PFAS.
- The EPA requests comment on the merits and drawbacks of the target- specific Hazard Index or RPF approach.
- The EPA requests comment on significant figure use when calculating both the Hazard Index MCLG and the MCL. The EPA has set the Hazard Index MCLG and MCL using two significant figures (i.e., 1.0). The EPA requests comment on the proposed use of two significant figures for the MCLG when considering underlying health information and for the MCL when considering the precision of the analytical methods.
- The EPA requests comment on the derivation of the HBWCs for each of the four PFAS considered as part of the Hazard Index.
- The EPA requests comment on whether the HBWCs should instead be proposed as stand-alone MCLGs in addition to or in lieu of the mixture MCLGs.

Section VI—Maximum Contaminant Level

- The EPA requests comment on its proposed determination to set MCLs at 4.0 ppt for PFOA and PFOS and whether 4.0 ppt is the lowest PQL that can be achieved by laboratories nationwide.
- The EPA seeks comment on its PFOA and PFOS evaluation of feasibility for the proposal, including analytical measurement and treatment capability, as well as reasonable costs, as defined by SDWA.
- The EPA seeks comment on its evaluation of feasibility for the proposed Hazard Index MCL finding, including analytical measurement and treatment capability, as well as reasonable costs, as defined by SDWA.

- The EPA requests comment on implementation challenges and considerations for setting the MCL at the PQLs for PFOA and PFOS, including on the costs and benefits related to this approach.
- The EPA requests comment on the underlying assumptions that sufficient laboratory capacity will be available with the proposed MCLs; that demand will be sufficiently distributed during rule implementation to allow for laboratory capacity; and on the cost estimates related to these assumptions.
- The EPA requests comment on its proposal of using an Hazard Index approach for PFHxS, HFPO–DA, PFNA, and PFBS, including whether it can be clearly implemented and achieves the goal of protecting against dose additive noncancer health effects.
- The EPA requests comment on its proposed decision to establish stand- alone MCLs for PFOA and PFOS in lieu of including them in the Hazard Index approach.
- The EPA requests comment on whether establishing a traditional MCLG and MCL for PFHxS, HFPO–DA, PFNA, and PFBS instead of, or in addition to, the Hazard Index approach would change public health protection, improve clarity of the rule, or change costs.

Section VII—Occurrence

- The EPA requests comment on the number of systems estimated to solely exceed the Hazard Index (but not the PFOA or PFOS MCLs) according to the approach outlined in USEPA (2023).

Section IX—Monitoring and Compliance Requirements

- The EPA requests comment on the proposed monitoring flexibility for groundwater systems serving 10,000 or fewer to only collect two samples at each EPTDS to satisfy initial monitoring requirements.
- The EPA requests comment on monitoring-related flexibilities that should be considered to further reduce burden while also maintaining public health protection including a rule trigger level at different values than the currently proposed values of 1.3 ppt for PFOA and PFOS and 0.33 for the Hazard Index PFAS (PFHxS, HFPO–DA, PFNA, and PFBS), specifically alternative values of 2.0 ppt for PFOA and PFOS and 0.50 for the Hazard Index PFAS. The EPA also requests comment other monitoring flexibilities identified by commenters.
- The EPA requests comment on the proposed allowance of a water system to potentially have each EPTDS on a different compliance monitoring schedule based on specific entry point sampling results (i.e., some EPTDS being sampled quarterly and other EPTDS sampled only once or twice during each three-year compliance period), or if compliance monitoring frequency should be consistent across all of the system's sampling points.
- The EPA requests comments on whether water systems should be permitted to apply to the primacy agency for monitoring waivers. Specifically, the EPA is requesting comment on the allowance of monitoring waivers of up to nine years if after at least one year of sampling results are below the proposed rule trigger level. Similarly, the EPA also requests comment on whether allowance of monitoring waivers of up to nine years should be permitted based on previously acquired monitoring data results that are below

the proposed rule trigger level. Additionally, the EPA is also requesting comment on the identification of possible alternatives to traditional vulnerability assessments that should be considered to identify systems as low risk and potentially eligible for monitoring waivers.

- The EPA requests comment on if all water systems, regardless of system size, be allowed to collect and analyze one sample per three-year compliance period if the system does not detect regulated PFAS in their system at or above the rule trigger level.
- The EPA requests comment on its proposal to allow the use of previously acquired monitoring data to satisfy initial monitoring requirements including the data collection timeframe requirements and if other QA requirements should be considered.
- The EPA requests comment on whether the EPA should consider an alternative approach to what is currently proposed when calculating compliance with proposed MCLs. Specifically, in the case where a regulated PFAS is detected but below its proposed PQL, rather than using zero for the measurement value of the specific PFAS in the running annual average compliance calculation, that the proposed rule trigger levels (1.3 ppt for PFOA and PFOS and 0.33 of each of the Hazard Index PFAS PQLs (i.e., PFHxS=1.0, HFPO– DA=1.7, PFNA=1.3, and PFBS=1.0)) be used as the values in calculating the running annual average for compliance purposes.
- The EPA requests comment on other monitoring related considerations including laboratory capacity and QA/ QC of drinking water sampling.
- The EPA seeks comment on the agency's proposed initial monitoring timeframe, particularly for NTNCWS or all systems serving 3,300 or fewer.

Section X—Safe Drinking Water Right to Know

- The EPA requests comment on its proposal to designate violations of the proposed MCLs as Tier 2.
- The EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

Section XI—Treatment Technologies

- The EPA requests comment on whether PWSs can feasibly treat to 4.0 ppt or below.
- The EPA requests additional information on PFAS removal treatment technologies not identified in the proposed rule that have been shown to reduce levels of PFAS to the proposed regulatory standard.
- The EPA requests comment on the co- removal of the Hazard Index chemicals (PFHxS, PFBS, PFNA, and HFPO–DA) when GAC, IX, or RO are used in the treatment of PFOA and/or PFOS.
- The EPA requests comment on whether there are additional technologies which are viable for PFAS removal to the proposed MCLs as well as any additional costs which may be associated with non-treatment options such as water rights procurement.
- The EPA estimates GAC treatment will be sufficiently available to support cost- effective compliance with this proposed regulation, and requests comment on whether additional guidance on applicable circumstances for GAC treatment is needed.

- The EPA is seeking comment on the benefits from using treatment technologies (such as reverse osmosis and GAC) that have been demonstrated to co-remove other types of contaminants found in drinking water and whether employing these treatment technologies are sound strategies to address PFAS and other regulated or unregulated contaminants that may co- occur in drinking water.
- The EPA requests comment on the estimates for disposing of drinking water treatment residuals or regenerating drinking water treatment media including assumptions related to the transport distance to disposal sites and other costs that arise out of disposal of PFAS contaminated drinking water treatment residuals.
- The EPA requests comment on the availability of facilities to dispose of or regenerate drinking water treatment media that contains PFAS. The EPA requests comment on whether there will be sufficient capacity to address the increased demand for disposal of drinking water treatment residuals or to regenerate media for reuse by drinking water treatment facilities.
- The EPA requests comment on the impacts that the disposal of PFAS contaminated treatment residuals may have in communities adjacent to the disposal facilities.
- The EPA requests comment on the type of assistance that would help small public water systems identify laboratories that can perform the required monitoring, evaluate treatment technologies and determine the most appropriate way to dispose of PFAS contaminated residuals and waste the systems may generate when implementing the rule.

Section XII—Rule Implementation and Enforcement

- The EPA is seeking comment as to whether there are specific conditions that should be mandated for systems to be eligible for exemptions under 1416 to ensure that they are only used in rare circumstances where there are no other viable alternatives and what those conditions would be.

Section XIII—HRRCA

- The EPA requests comment on all components of the HRRCA for the proposed NPDWR.
- In the Economic Analysis, the EPA presented estimated costs and benefits of regulatory alternatives for PFOA and PFOS if setting MCLs at 5.0 ppt and 10.0 ppt. The EPA is requesting comment on its evaluation of these alternatives within the Economic Analysis.
- The EPA requests comment on the methodology used to estimate national costs for the proposed rule and regulatory alternatives. The EPA's cost analysis can be found in Chapter 5 of the Economic Analysis.
- The EPA is requesting comment on the WBS models, including the range of component levels assumed in the input to the models, and the range of cost estimates for GAC, IX, and centralized RO.
- The EPA requests comment on Table 26 which provides the initial treatment technology compliance forecast, presented in percentages of systems adopting GAC, PFAS-selective IX, centralized RO, system interconnection, and use new wells across system design flows and TOC levels. This information is used in the EPA's cost and benefit modeling. Please also comment on the potential for point-of-use devices, including those using RO or activated carbon as a compliance option.

- The EPA requests comment on the cost of treatment when additional co- occurring but not targeted PFAS chemicals are found in source water.
- The EPA requests comment generally on its estimation of sampling costs. The agency is also specifically requesting comment on the ability of systems to demonstrate they are reliably and consistently below 1.3 ppt for PFOA and PFOS and 0.33 ppt for PFAS regulated by the Hazard Index in order to qualify for reduced monitoring.
- The EPA requests comment on the underlying assumptions that, under UCMR 5, individual water systems would be able to request the full release of data from the labs for use in determining their compliance monitoring frequency and that PWSs may be able to use these lab analyses to demonstrate a ''below trigger level'' concentration using the UCMR 5 analyses by following up with the lab for a more detailed results report.
- The EPA requests comment on the costs associated with the storage, transportation and underground injection of the brine concentrate residuals from the RO/NF process.
- The EPA requests comment on the small system affordability analysis, including both the national affordability determination using the EPA's existing 2.5% of median household income (MHI) methodology and the supplemental analyses using use of alternative metrics (i.e., expenditure margins at 1% of MHI and 2.5% of lowest quintile income). The EPA's national small system affordability determination can be found in Section 9.12.1 of the Economic Analysis. The EPA's supplementary affordability analyses can be found in Section 9.12.2 of the Economic Analysis.
- The EPA requests comment on the discussion of estimated PN costs provided in the proposed rule.
- The EPA requests comment on the assumption that exceedances of Hazard Index PFAS not included in the national cost analyses (HFPO–DA, PFBS, and PFNA) will not significantly impact overall compliance costs and national costs estimates are, therefore, unlikely to be substantially underestimated.
- The EPA requests comments on the approaches we used to estimate each of the health impacts of exposure to the PFAS chemicals covered in this proposed rule, including the transparency of the assumptions we made and the impact of these assumptions on the magnitude of the risks avoided by the proposed regulatory action.
- The EPA requests comment on whether factors such as anticipated Federal funding, the structure of PWSs relative to private enterprises, or the nature of the public health benefits should be further explored in the final rule analysis, including as it relates to the estimated range of impacts under the applied discount rates.

Section XV—Statutory and Executive Order Reviews

- The EPA requests comment on all aspects of its EJ analysis, particularly its choice of comparison groups to determine potential demographic disparities in anticipated PFAS exposure and its use of thresholds against which to examine anticipated exposures. For more information, please see section XV.J of this preamble.

The comments and responses presented in this document are organized first by the EPA Topic Code. Readers can first find the Topic Code of interest, and then find a brief summary of the public comments and the EPA's responses to the comments for each Topic Code. Individual comments (identified by unique identifiers, i.e., SBC codes) can be found within each Topic

Code along with the EPA's response. The commenter name, organization, Document ID, and commenter page numbers are also given for each comment. Any comment can be read as it appears within the commenter's original letter, e-mail, or posting by searching on the associated Document ID at www.regulations.gov (see explanation of Document IDs in the next section "Who Submitted Comments"). The Document ID can also be used to find additional information, such as tables or figures, which may be included within the context of comments or attachments in the commenter's original submission at www.regulations.gov.

Who Submitted Comments

The EPA received approximately 122,200 total comments (including in writing to the docket and orally during the public hearing) were received on the Proposed PFAS National Primary Drinking Water Regulation Rulemaking. Of those comments, approximately 120,500 were mass mailers from Clean Water Action, Slingshot, Green America, Environmental Working Group (EWG), National Wildlife Federation (NWF), Environment America Research and Policy Center, US Public Interest Research Group (PIRG) Education Fund, North Carolina (NC) Conservation Network, Great Lakes PFAS Action Network, National Caucus of Environmental Legislators, and Alliance for Risk Assessment. There were approximately 1,700 unique public comments. The vast majority of the comments were generally supportive of the EPA's efforts to regulate PFAS in drinking water and requested that the EPA expeditiously finalize the PFAS NPDWR.

1 General Information

1.1 SDWA Rulemaking Process

Summary of Major Public Comments and EPA Responses

The United States Environmental Protection Agency (EPA) received comments of both agreement and disagreement with the Safe Drinking Water Act (SDWA) process and the EPA's approach in establishing this final per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulation (NPDWR). Some commenters described their interpretation of the established rulemaking process and provided arguments that they believe demonstrate whether the EPA did or did not follow that process. Some comments noted how Maximum Contaminant Levels (MCLs) are required by SDWA and argued that the EPA has produced a factual and scientific record to support the MCLs, and that the proposed NPDWRs are protective, feasible, and cost-justified. Commenters highlight that NPDWRs should be based on science, and that they be considered as both feasible and justifiable. Some commenters contend that the EPA has not done as such. Other opposing commenters disagreed with the EPA's decision to make a preliminary regulatory determination and propose an NPDWR at the same time.

In promulgating this PFAS NPDWR, the EPA has met all requirements under SDWA. The EPA disagrees with comments that state or argue otherwise. The EPA disagrees with commenters that state that the final MCLs are not set at a feasible level. The EPA's final rule represents data-driven drinking water standards that are based on a thorough analysis of feasibility consistent with requirements under SDWA, as discussed in section V of the Federal Register Notice (FRN) and section 5 of the EPA response in this *Response to Comments* document. The EPA also disagrees with comments that oppose the EPA's decision to make a preliminary regulatory determination and propose an NPDWR at the same time. A preliminary regulatory determination allows the public to comment on the EPA's view about whether certain unregulated contaminants meet the three statutory criteria. The EPA can then issue a final regulatory determination after consideration of public comment. Section 1412(b)(1)(E) requires that the EPA propose an NPDWR no later than 24 months after a final determination to regulate. The statute also authorizes the EPA to issue a proposed rule concurrent with a preliminary determination to regulate. The EPA must then promulgate a final regulation within 18 months of the proposal (which may be extended by 9 additional months). For additional discussion on the regulatory determinations, please see section III of the final rule preamble and section 3 of the EPA response in this *Response to Comments* document.

For the EPA's responses to general and specific comments discussing SDWA requirements related to the NPDWR rulemaking process and the EPA's findings for the PFAS NPDWR consistent with those requirements, please see the following non-exhaustive list of key FRN and *Response to Comments* document sections. Some responses to comments in section 1.1 of this *Response to Comments* document may also be addressed in other topical sections in this

Response to Comments document. For relevant cross-references, please see the EPA's responses to individual comments.

- Section I of the FRN and section 1 of this *Response to Comments* document for the EPA's description of the PFAS final rule requirements for regulating six PFAS of concern in drinking water, along with a description for whom the requirements apply.
- Section II of the FRN and section 2.3 of this *Response to Comments* document for the EPA's statutory authority and statutory framework, including topics such as the Contaminant Candidate List (CCL), the Unregulated Contaminant Monitoring Rule (UCMR), and previous regulatory determinations for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS).
- Section III of the FRN and section 3 of this *Response to Comments* document for discussion of the EPA's updated regulatory determinations and evaluations of the three statutory criteria for the four additional PFAS following public comment, as well as the agency's authority to concurrently determine to preliminarily regulate a contaminant and propose that regulation.
- Section IV of the FRN and section 4 of this *Response to Comments* document for the EPA's finalization of the Maximum Contaminant Level Goals (MCLGs) and health determinations for PFOA, PFOS, and the four additional PFAS.
- Section V of the FRN and section 5 of this *Response to Comments* document for the EPA's feasibility analysis and finalization of the MCLs and the Hazard Index for mixtures of PFAS in drinking water.
- Section VI of the FRN and section 6 of this *Response to Comments* document for the EPA's sufficiently robust occurrence analyses that serve as the best available public health information in making a regulatory determination.
- Section VII of the FRN and section 7 of this *Response to Comments* document for the EPA's discussion of the analytical methods and the practical quantitation levels (PQLs) for the regulated PFAS.
- Section VIII of the FRN and section 8 of this *Response to Comments* document for the EPA's monitoring and reporting requirements for PWSs to comply with the NPDWR.
- Section IX of the FRN and section 9 of this *Response to Comments* document for the EPA's requirements for the Consumer Confidence Reports (CCRs) and Public Notification (PN) as it relates to this NPDWR.
- Section X of the FRN and section 10 of this *Response to Comments* document for the EPA's list of feasible technologies for public water systems that can be used to comply with the MCLs.
- Section XI of the FRN and sections 11 and 12 of this *Response to Comments* document for the EPA's rule implementation and enforcement requirements, including for primacy, record keeping, reporting, and exemptions and extensions.
- Section XII of the FRN and section 13 of this *Response to Comments* document for the EPA's evaluation of the quantifiable and nonquantifiable health risk reduction benefits and costs associated with the final NPDWR, as part of the *Health Risk Reduction and Cost Analysis* (HRRCA). These sections also affirm the EPA Administrator's determination, consistent with the determination made for the proposal, that the quantified and nonquantifiable benefits of the PFAS NPDWR justify the costs.

- Section XIII of the FRN and section 14 of this *Response to Comments* document for the EPA's actions under statutory and executive order reviews, which includes the various acts and executive orders, as well as consultations.

Individual Public Comments

San Antonio Water System (SAWS) (Doc. #1570, SBC-042469)

• EPA's established rulemaking process is well-documented but has not been followed in the case of this proposed regulation. SAWS urges EPA to follow its established rulemaking procedures.

Below are SAWS' specific concerns regarding the ad hoc approach being used by EPA.

o The EPA's established rulemaking process has generally followed the sequence below:

*A Contaminants Candidate List (CCL) is created and finalized;

*UCMR sampling is planned, implemented, and evaluated;

*Preliminary regulatory determinations or proposed rules are then created if warranted by UCMR data; and

*If more data is required, the contaminants are placed back on the CCL and another UCMR is scheduled.

EPA Response: The commenter mischaracterizes that a contaminant must be on the CCL prior to the agency making a regulatory determination; or that UCMR data must be collected prior to making a determination to regulate if the agency has sufficiently available information through other sources. The EPA has met all statutory requirements for establishing a PFAS NPDWR. Please see section 1.1 of the EPA response in this *Response to Comments* document that directs the commentor to the various *Response to Comments* document sections with the EPA's full response. Regarding whether the EPA must list a contaminant on the CCL prior to making a regulatory determination, SDWA 1412(b)(1)(B)(i)(III) specifically states that "The Administrator may make a determination to regulate a contaminant that does not appear" on the CCL. Regarding the sole use of UCMR data, please see sections 3.1.2 and 6.8 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044766)

Order of Regulatory Actions

EPA should approach regulation of PFAS under the SDWA strategically and incrementally to ensure successful implementation. For PFOA and PFOS, EPA waited two years between issuing its final determination to regulate and issuing a draft NPDW rule. For PFHxS, GenX, PFNA, and PFBS, EPA has both proposed to regulate and is finalizing regulation at the same time. In June 2022, EPA released final health advisories for GenX and PFBS and interim health advisories for

PFOA and PFOS. EPA has yet to propose interim or final health advisories for PFNA and PFHxS. Although WDEQ recognizes the challenges in establishing federal PFAS regulations as well as the urgency in addressing PFAS to best protect public health, we urge EPA to consider the following recommendations to make the proposed regulations more effective.

EPA Response: Please see section 1.1 of the EPA response in this *Response to Comments* document that directs the commentor to the various *Response to Comments* document sections with the EPA's full response. Health Advisories are not a pre-requisite for an NPDWR under SDWA and there is nothing in the statute or the EPA's historical regulatory practice that suggests that the agency must or should delay regulation of a contaminant to develop a health advisory (HA) first. Regarding the determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) (Gen-x Chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) concurrently with the proposed NPDWR, please see section 3.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045658)

II. LEGAL FRAMEWORK

The SDWA regulates public water systems by limiting the allowable level of substances in drinking water. [FN5: City of Portland, Oregon v. EPA, 507 F.3d 706 (2007).] Prior to promulgating an MCLG or MCL, EPA must (1) identify substances for listing on the Contaminant Candidate List ("CCL"), and (2) determine which of those substances it will regulate under the SDWA. [FN6: Id. [sec] 300g-1(b)(1)(B).] At each step, EPA must follow specific procedures, consider information prescribed by the SDWA, and offer opportunities for public engagement.

When considering which substances from the CCL to regulate, the SDWA requires EPA to consider:

(1) Whether the substance may have an adverse effect on the health of persons;

(2) Whether the substance is known to occur, or there is a substantial likelihood that the substance will occur, in public water systems with a frequency and at levels of public health concern; and

(3) Whether the regulation of such substance presents a meaningful opportunity for health risk reduction for persons served by public water systems. [FN7: 42 U.S.C.A. [sec] 300g-1(b)(1)(A).]

The decision to regulate "is the beginning of the Agency's regulatory development process, not the end." [FN8: 85 Fed. Reg. 14098, 14100 (Mar. 10, 2020).] As EPA continues the analyses required by the SDWA, it may determine that a chemical does not meet the statutory criteria for finalizing a NPDWR. [FN9: Id.] If EPA determines the three statutory criteria are met, it may make a final determination that an NPDWR is needed. That determination to regulate triggers a

24-month statutory period to publish a proposed MCLG and NPDWR, and 18 months after that to promulgate a final standard. [FN10: Id. [sec] 300g-1(b)(1)(E)I.] Importantly, EPA may only promulgate an NPDWR for a substance that it has determined to regulate through the public notice and comment process. [FN11: See 85 Fed. Reg. at 14100 ("The development of the CCL, regulatory determinations, and any subsequent rulemaking should be viewed as a progression where each process builds upon the previous process, including the collection of data and analyses conducted.").]

After determining to regulate a substance, EPA must set an MCLG for each identified substance at a level at which no known adverse health consequences will occur. [FN12: 42 U.S.C.A. [sec] 300g–1(b)(4)(A).] EPA must then set an MCL for each substance as close to the MCLG as is feasible. [FN13: Id. [sec] 300g–1(b)(4)(B).] Under the statute, "feasible" means "feasible with the use of the best technology, treatment techniques and other means which the Administrator finds ... are available (taking cost into consideration)." [FN14: Id. [sec] 300g–1(b)(4)(D).]

The SDWA requires that, when undertaking this process, EPA base its decisions on the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices, and data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data). [FN15: Id. at [sec] 300g-1(b)(3)(A)] The legislative history of the 1996 SDWA Amendments makes clear that Congress intended to ensure that drinking water standards regulations promulgated under the SDWA are meaningful and science-based:

Our intent was simple. Drinking water standards should not be set just because they are technologically feasible as they are under current law; they must also be justifiable. If we are going to demand that our states, counties and towns spend billions of dollars to comply with new chlorine standards, for example, at the very least, we owe them the assurance that these are dollars well spent. [FN16: Congressional Record Vol. 141, No. 189, Nov. 29, 1995; S177723; Statement of Sen. Kempthorne. See also Congressional Record Vol. 140, No. 62, May 18, 1994, S55929; Statement of Sen. Breaux ("…only contaminants which present a significant threat to public health will be regulated. EPA will also have to base its analysis on sound science and risk assessment when determining whether or not a contaminant poses a significant enough threat to merit regulation.").]

III. FACTUAL BACKGROUND

a. EPA Has a Clearly Established Process to Set a NPDWR

The process for setting an MCL begins with a determination of which chemicals should be considered for regulation. As discussed above, under the SDWA, EPA is required to publish a list of chemicals (the CCL) that are currently not subject to any proposed or promulgated NDPWRs but are known or anticipated to occur in public water systems. SDWA [sec]1412(b)(1)(B)(i). EPA must publish this list every five years. The list is used to identify priority chemicals for regulatory decision making and information collection.

During the regulatory determination process, EPA selects a minimum of five chemicals from the CCL to evaluate for regulation. [FN17: SDWA [sec] 1412(b)(1)(B)(ii)] Based on the criteria in [sec] 1412(b)(1)(A)(i)-(iii), EPA must make a regulatory determination for whether the chemical ought to be regulated under the SDWA. Once EPA makes a determination to regulate the chemical, EPA must then propose an MCLG and MCL or treatment technique.

The MCLG is the maximum level of a contaminant in drinking water at which no known or anticipated adverse effect on human health would occur, allowing an adequate margin of safety. [FN18: Id. [sec] 1412(b)(4)(A).] MCLGs are not enforceable but they are meant to guide public health goals. MCLGs do not take into consideration the limits of detection and treatment technology effectiveness; therefore, they are sometimes set at levels that water systems cannot meet. The way EPA determines MCLGs depends on the type of contaminant targeted for regulation. All microbial contaminants have an MCLG of zero because even one microbial contaminant can cause adverse health effects. The MCLG is also set at zero for chemicals where there is no dose at which the chemical is considered safe, including some chemicals that may cause cancer. Finally, for chemicals that are non-carcinogens but can cause adverse non-cancer health effects, the MCLG is based on a reference dose. [FN19: See https://www.epa.gov/sdwa/how-epa-regulates-drinking-water-contaminants.]

A reference dose (RfD) is defined as an estimate of human daily exposure that is likely to be without an appreciable risk of adverse effects during a lifetime. [FN20: See https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system] RfDs are derived using a point of departure (POD). The POD is a dose that represents the low or no effect level derived from dose-response relationships in experimental or observational studies. [FN21: See EPA's IRIS Program Glossary: https://sor.epa.gov/sor_internet/registry/termreg/searchandretrieve/glossariesandkeywordlists/search.do?details=&glossaryName=IRIS%20Glossary] The most common PODs used to derive RfDs are the no-observed-adverse-effect level (NOAEL), lowest-observed-adverse-effect level (LOAEL), or statistical benchmark dose (BMD). The BMD, currently EPA's preferred POD, is the dose or concentration that produces a predetermined change in the response rate of an adverse effect. [FN22: See https://www.epa.gov/sites/default/files/2015-01/documents/benchmark_dose_guidance.pdf at 6.] In other words, the BMD is the minimum dose expected to produce a low-level health impact. EPA takes the POD (typically the BMD) and divides that number by uncertainty factors, which are used to account for potential differences between the experimental data and real life (such as the existence of sensitive populations or lack of information). The RfD is then multiplied by body weight and divided by expected daily water consumption to provide a Drinking Water Equivalent Level (DWEL). The DWEL is then multiplied by the relative source contribution (also called the RSC), which is the portion of the total exposure that comes from the ingestion of water. The value at the end of those calculations is the MCLG.

EPA often uses several types of modeling to extrapolate from known data to support risk analyses. Physiologically Based Pharmacokinetic (PBPK) models are mathematical models that

can be used to predict absorption, distribution, metabolism, and excretion (ADME) of substances in humans or animal species. Models are built using compartments that correspond to different tissues in the body and describe the relationship between the external exposure dose and the internal plasma or tissue concentration of a compound over a period of time.

Once the MCLG is calculated, EPA then crafts an enforceable standard. Typically, and at issue here, that standard is the MCL. The MCL is the maximum amount of a chemical allowed in water delivered to any user of a public water system. MCLs are set as close to the MCLG as feasible. Feasible here means taking into consideration cost and the technical limitations of available treatments.

EPA must submit its draft MCLG and MCL for technical peer review to EPA's Science Advisory Board before they are proposed as regulations. [FN23: See SDWA [sec]1412(e)]

EPA Response: The commenter submitted background information in support of this comment. The EPA is not responding to background information in section 1.1 of the *Response to Comments* document. Instead, the EPA is addressing comments directly in other sections of the *Response to Comments* document organized by topic. Please see the applicable sections of the *Response to Comments* document responding to each detailed comment topic. For an overview of how the EPA has met the requirements under the SDWA to promulgate this PFAS NPDWR, please see section 1.1 of the EPA response in this *Response to Comments* document. Regarding the regulatory determination process, please see section 3 of the EPA response in this *Response to Comments* document, including section 3.3 pertaining to the EPA's concurrent preliminary regulatory determination and proposed NPDWR. Regarding the establishment of reference doses and modelling used for this regulation, please see section IV of the FRN, as well as sections 4.2.2, 4.3.1, and 4.3.3 of the EPA response in this *Response to Comments* document. Additionally, the EPA consulted with the Science Advisory Board (SAB) prior to its NPDWR proposal, fulfilling its statutory obligations under SDWA (see section XIII.K.1. of the final rule preamble and sections 4.3.2 and 14.11.1 of the EPA response in this *Response to Comments* document).

Bailey Smith (Doc. #1787, SBC-045809)

I. EPA's Proposed Rule Comports With SDWA: How Water Systems Can Convey This Information to the Public and Possible Future Challenges

This section briefly lays out SDWA's requirements and demonstrates that EPA has complied with it. This section will then address EPA's request for how water systems can effectively communicate information about the PFAS NPDWR to the public. Lastly, this section will provide two past cases in which the EPA successfully defended against challenges to drinking water standards it promulgated under SDWA, to exemplify that EPA's proposed rule is analogous to past action it has taken that survived legal challenges.

A. SDWA's Requirements and What EPA Has Found

SDWA Section 300g-1(b)(3)(A) states as follows:

• "In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use-- o (i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and

o (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data)." (italics added). [FN6: 42 U.S.C. § 300g-1(b)(3)(A)(i).]

EPA's "PFAS National Primary Drinking Water Regulation Rulemaking" is based on science. Thus, EPA is required to use the best available, peer-reviewed science in promulgating its regulations. [FN7: 42 U.S.C. § 300g-1(b)(3)(A)(i).] This comment argues that the EPA has achieved this statutory requirement.

The EPA has found that PFAS "can result in harmful health effects."[FN8: Proposed Rule, supra note 3 at 18638.] More specifically, EPA has found that PFAS can lead to "negative impacts on fetal growth after exposure during pregnancy, on other aspects of development, reproduction, liver, thyroid, immune function, and/or the nervous system; and increased risk of cardiovascular and/or certain types of cancers."[FN9: Id.] Equally devastating, EPA has found that PFOA and PFOS (two common PFAS),[FN10: Priscilla (Polly) E. Hampton et al., EPA Proposes Stringent National Drinking Water Standards for Six PFAS, PERKINSCOIE.COM (Mar. 16, 2023), https://www.perkinscoie.com/en/news-insights/epa-proposes-stringent-national-drinking-water-standards-for-six-pfas.html#a11.] are likely to cause cancer, and there is no ingestion level at which either chemical is safe. [FN11: Proposed Rule, supra note 3 at 18639.]

To support that EPA relied on the best available science in coming to these conclusions, EPA explains that it has consulted with the Science Advisory Board ("SAB") as well as the National Drinking Water Advisory Council ("NDWAC") in developing the proposed rule. [Fn12: Id. at 18640.] In addition to consulting with advisory boards, EPA continues to evaluate available scientific literature to ensure its proposed rule reflects the best available science. [Fn13: Id. at 18654.]

Furthermore, SAB provided input to the EPA which, in EPA's words, made its proposed rulemaking "more scientifically sound and [ensured] it reflected the best available science."[Fn14: Id. at 18652.] To prove that SAB was not beholden to EPA, it did more than simply agree with EPA's findings; it also identified areas where EPA could provide additional clarification and transparency. [Fn15: Id. at 18736.] As such, it seems clear that EPA took the requirements under SDWA seriously, and relied on the best available, peer-reviewed science.

EPA Response: The commenter submitted background information in support of this comment. The EPA is not responding to background information in section 1.1 of the *Response to Comments* document. Instead, the EPA is addressing comments directly in other sections of the *Response to Comments* document organized by topic. Please see the applicable sections of the *Response to Comments* document responding to each detailed comment topic. For an

overview of how the EPA has met the requirements under the SDWA to promulgate the PFAS NPDWR, please see section 1.1 of the EPA response in this *Response to Comments* document. Regarding the EPA's consultations with the SAB and National Drinking Water Advisory Council (NDWAC), please see sections XIII.K.1. and XIII.K.2. of the final rule preamble.

U.S. Environmental Protection Agency

EPA Docket Center, Office of Ground Water and Drinking Water Docket

Docket ID No. EPA–HQ– OW–2022–0114,

Mail Code 28221T

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Re: Comments on "PFAS National Primary Drinking Water Regulation Rulemaking" at Docket ID No. EPA–HQ–OW–2022–0114

To Whom it May Concern,

I appreciate the opportunity to comment on the Environmental Protection Agency's ("EPA") recently released, proposed rulemaking titled, "PFAS National Primary Drinking Water Regulation Rulemaking."

I agree with EPA's proposed rulemaking for two primary reasons. First, the Safe Drinking Water Act ("SDWA") requires the EPA to use the best available science,[FN1: 42 U.S.C. § 300g-1(b)(3)(A)(i).] which (in my view), the EPA has done.

EPA Response: The EPA acknowledges and agrees with the commenter. Please see section 1.1 of the EPA response in this *Response to Comments* document.

Bailey Smith (Doc. #1787, SBC-045811)

C. EPA Can Cogently Defend Against Potential Challenges to its Proposed Rule

According to "biglaw" firms who have written about EPA's proposed rule, industry and other stakeholders are expected to challenge the "PFAS National Primary Drinking Water Regulation Rulemaking" due to the costs they will incur in having to protect the public from toxic PFAS. [FN21: See Hampton et al., supra note 10; Paul D. Tanaka et al., PFAS Update: EPA Proposes National Standard to Regulate PFAS in Drinking Water, KIRKLAND.COM (Mar. 20, 2023), https://www.kirkland.com/publications/kirkland-alert/2023/03/epa-proposes-national-standard-to-regulate-pfas-in-drinking-water#fn21.] One common challenge to EPA rulemaking under

SDWA is that EPA did not use the best available science. [FN22: See e.g., City of Waukesha v. E.P.A., 320 F.3d 228, 247 (D.C. Cir. 2003); City of Portland, Oregon v. E.P.A., 507 F.3d 706, 708 (D.C. Cir. 2007).]

Therefore, this comment provides two brief summaries of cases in which EPA action under SDWA was challenged under the "best available science" standard. The EPA prevailed in both cases, and this comment believes the EPA action here aligns with its conduct in the two cases outlined here. Therefore, this comment argues that any challenges to EPA's science in its currently proposed rule would likely fail.

In City of Waukesha v. E.P.A., 320 F.3d 228 (D.C. Cir. 2003)., EPA issued regulations establishing standards governing radionuclide levels in public water systems. [FN23: City of Waukesha, 320 F.3d at 231.] Plaintiffs argued EPA did not use the best available science in setting the maximum contaminant level goal ("MCLG") and maximum contaminant level ("MCL") for radium-226 and radium-228. [Fn24: Id. at 247, 231.] Plaintiffs argued that EPA should have relied on particular data from dial painters' ingestion of luminescent paint brushes from the early 20th century. [Fn25: Id. at 247.] In rejecting this argument, the Court pointed out that the EPA had in fact relied on the "dial painter data" in part," and explained that to the extent the EPA did not rely on it, they explained their reasons for not using it. [Fn26: Id. at 247-48.] Thus, EPA considered and rejected Ps arguments and cited support for doing so, which is all the APA requires. [Fn27: Id. at 258.] Accordingly, the EPA did not fail to use the best available science. [FN28: See id.]

Regarding EPA's current proposed PFAS rule, if EPA declines to use particular datasets, so long as it provides legitimate reasons for declining to use them, challengers will likely not be able to dispute the EPA's decision.

The second case involving a similar challenge was City of Portland, Oregon v. E.P.A., 507 F.3d 706 (D.C. Cir. 2007). In City of Portland, EPA promulgated a rule regulating the microbial contaminant, Cryptosporidium, in drinking water. [FN29: City of Portland, Oregon v. E.P.A., 507 F.3d 706, 708 (D.C. Cir. 2007).] The proposed rule required the following three items:

"(1) it required all water systems to monitor their source water for Cryptosporidium;

(2) it required systems that do not filter their water, such as New York and Portland, to treat their source water for Cryptosporidium; and

(3) it imposed new requirements on existing uncovered reservoirs, giving cities with such reservoirs three options: covering their reservoirs, treating the water in them for viruses (but not Cryptosporidium), or implementing a state-approved risk mitigation plan."[Fn30: Id. at 709.]

The final rule was identical to the proposed rule, except that it eliminated the risk mitigation option, and required treatment for Cryptosporidium (as opposed to only viruses). [Fn31: Id. at 710.] In other words, the rule required Portland and New York to take steps to eliminate Cryptosporidium (a parasite that could lead to sickness or even death) from their drinking water. [FN32: See id. at 709.]

To prevent Cryptosporidium outbreaks, most cities run their source water through high-tech filters, however, Portland and New York did not. [Fn33: Id. at 708.] Instead, they tried to control the sources from which their water originated. [FN34: See id. at 709.] They argued that this was sufficient to meet EPA's requirements under its new rule, but the EPA disagreed, stating that Portland and New York (hereinafter "Cities") still needed to treat their water for Cryptosporidium. [FN35: City of Portland, 507 F.3d at 709.]

The Cities challenged the rule on many grounds, including that the EPA "failed to use the best available science."[Fn36: Id. at 710.] The Cities put forward multiple arguments, most pertinently, that the EPA ignored one of its comments that questioned EPA's rejection of an infectivity estimate developed by one of its scientists in a 2001 study. [Fn37: Id. at 714.]

The District Court rejected this argument. [FN38: Id.] First, the District Court reasoned that although the Cities cogently attacked the merits of the EPA's responses to their comments, "the Agency clearly thought about the cities' objections and provided reasoned replies—all the APA requires."[FN39: Id.] Ultimately, the Court held that "EPA used the best available science and provided ample evidence to support the rule, clear notice to the public about what it was considering, and adequate responses to comments."[Fn40: Id. at 716]

Regarding EPA's "PFAS National Primary Drinking Water Regulation Rulemaking," EPA has provided ample scientific evidence to support its proposed rule (indeed, the proposed rule is 117 pages). It has also provided clear notice to the public about the information EPA considered [FN41: See Proposed Rule, supra note 3 at 18645.] and has solicited the public's feedback as to various parts of the rule. [FN42: See id. at 18729.] Therefore, assuming that the EPA provides adequate responses to comments it receives about its proposed PFAS rule, it should survive a "best available science" challenge should one arise.

EPA Response: The commenter submitted background information in support of this comment. The EPA is not responding to background information in section 1.1 of the *Response to Comments* document. Instead, the EPA is addressing comments directly in other sections of the *Response to Comments* document organized by topic. Please see the applicable sections of the *Response to Comments* document responding to each detailed comment topic. For an overview of how the EPA has met the requirements under the SDWA to promulgate the PFAS NPDWR, please see section 1.1 of the EPA response in this *Response to Comments* document.

Earthjustice et al. (Doc. #1808, SBC-046100)

II. The Proposed MCLs are Required by the SDWA and Supported by an Extensive Factual and Scientific Record

A. Statutory and Regulatory Background

"The Safe Drinking Water Act … was enacted to ensure that public water supply systems meet minimum national standards for the protection of public health." [FN36: Nat'l Wildlife Fed'n v. EPA, 980 F.2d 765, 768 (D.C. Cir. 1992).] To prevent drinking water contamination, the SDWA

requires EPA to establish National Primary Drinking Water Regulations ("NPDWRs") that specify the "maximum levels for contaminants that may have an adverse effect on the health of consumers." [FN37: Id. (citing 42 U.S.C. § 300g-1).]

EPA's obligation to issue NPDWRs is triggered by the Administrator's determination that: (1) a contaminant "may have an adverse effect on the health of persons," (2) "the contaminant is known to occur or there is a substantial likelihood that the contaminant will occur in public water systems with a frequency and at levels of public health concern," and (3) "regulation of such contaminant presents a meaningful opportunity for health risk reduction for persons served by public water systems." [FN38: 42 U.S.C. § 300g-1(b)(1)(A).] EPA's regulatory determinations, and other science- based decisions under the SDWA, "shall use . . . the best available, peer-reviewed science and supporting studies." [FN39: Id. § 300g-1(b)(3)(A)(i).] Here, EPA made regulatory determinations for PFOA and PFOS in March 2021, and it made a preliminary regulatory determination for the HI PFAS in the Proposed Rule. [FN40: Proposed Rule, 88 Fed. Reg. at 18,638; see also 42 U.S.C. § 300g-1(b)(1)(E) (authorizing EPA to publish a proposed NPDWR "concurrent with the determination to regulate").]

An NPDWR must contain either a "maximum contaminant level" or a "treatment technique." [FN41: 42 U.S.C. § 300f(1)(C).] A maximum contaminant level, or "MCL," is "the maximum permissible level of a contaminant in water which is delivered to any user of a public water system." [FN42: Id. § 300f(3).] An MCL must be set at a level that is "as close . . . as is feasible" to the "level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety," also known as the Maximum Control Level Goal or "MCLG." [FN43: Id. § 300g–1(a)(4). The SDWA authorizes, but does not require, EPA to set an MCL above the most health-protective, feasible level if EPA determines that the "benefits of [the] maximum contaminant level … would not justify the costs of complying with the level." Id. § 300g– 1(b)(6)(A). EPA did not make such a finding in its proposed rule, and, as described in greater detail below, EPA's analysis of the rule's costs and benefits precludes such a finding. See pp. 18- 20 infra.] The analysis of feasibility "tak[es] costs into consideration," [FN44: 42 U.S.C. § 300g-1(a)(4)(D).] but it does not prioritize those considerations over public health protection or require EPA to find that the economic benefits of an MCL outweigh the costs. [FN45: See S. Rep. No. 104-169, at 33 (Nov. 7, 1995) ("The Administrator is not precluded from … set[ting] a maximum contaminant level as close to the maximum contaminant level goal as feasible, even if the Administrator determines that the benefits of the MCL at this level do not justify the costs."); see also 42 U.S.C. § 300g-1(b)(3)(C)(i) (requiring EPA to consider "nonquantifiable health risk reduction benefits" when establishing MCLs); City of Portland, Oregon v. EPA, 507 F.3d 706, 712 (D.C. Cir. 2007).]

EPA has broad authority under the SDWA to set MCLs for groups of related contaminants. The SDWA broadly defines "contaminant" as "any physical, chemical, biological, or radiological substance or matter in water," encompassing both individual chemicals and chemical mixtures that are found in the same water supplies. [FN46: 42 U.S.C. § 300f(6) (emphasis added).] EPA set, and the D.C. Circuit Court of Appeals upheld, a single MCL for combined levels of radium-

226 and radium-228 based on those substances' co-occurrence in drinking water and common carcinogenic effects. [FN47: See Final Rule, National Primary Drinking Water Regulations; Radionuclides, 65 Fed. Reg. 76,708, 76,718, 76,720 (Dec. 7, 2000); City of Waukesha v. E.P.A., 320 F.3d 228 (D.C. Cir. 2003).] Similarly, EPA's NPDWR for disinfectants and disinfection byproducts set combined MCLs for four different trihalomethanes ("THMs") and five different haloacetic acids ("HAA5"). [FN48: Final Rule, National Primary Drinking Water Regulations: Disinfectants and Disinfection Byproducts, 63 Fed. Reg. 69390 (Dec. 16, 1998).] In setting its original drinking water standards for THMs, EPA rejected calls to establish chemical- specific MCLs for individual THMs, such as chloroform, explaining that "as a family of compounds, the THMs are similar in chemical composition and nature" and are commonly found together in drinking water. [FN49: Final Rule, National Interim Primary Drinking Water Regulations; Control of Trihalomethanes in Drinking Water, 44 Fed. Reg. 68,624, 68,627 (Nov. 29, 1979).] As explained above, EPA's NPDWR for PCBs established a single MCL for "complex mixtures" of up to 209 possible PCB isomers. [FN50: 56 Fed. Reg. at 3,546.] In each of those rules, the use of a class-based MCL protects communities that are exposed to mixtures of related contaminants and furthers the SDWA's purpose of "prevent[ing] the harmful contamination of public water systems." [FN51: Int'l Fabricare Inst. v. EPA, 972 F.2d 384, 387 (D.C. Cir. 1992).]

EPA Response: The commenter submitted background information in support of this comment. The EPA is not responding to background information in section 1.1 of the *Response to Comments* document. Instead, the EPA is addressing comments directly in other sections of the *Response to Comments* document organized by topic. Please see the applicable sections of the *Response to Comments* document responding to each detailed comment topic. For an overview of how the EPA has met the requirements under the SDWA to promulgate the PFAS NPDWR, please see section 1.1 of the EPA response in this *Response to Comments* document.

Regarding the part of the comment on the EPA's authority under SDWA "to set an MCL above the most health-protective, feasible level if EPA determines that the 'benefits of [the] maximum contaminant level … would not justify the costs of complying with the level,'" the EPA notes that it did make a finding during the PFAS NPDWR proposal, as expressed through the Administrator's determination, that the benefits of the rule justify the costs. In the final NPDWR, considering both quantifiable and nonquantifiable costs and benefits of the rule, the EPA is reaffirming the Administrator's determination at the time of proposal, that the quantifiable and nonquantifiable benefits of the final rule justify the quantifiable and nonquantifiable costs. For additional cost considerations regarding the evaluation of the benefits and costs of regulatory alternatives associated with the final NPDWR, please see section 5.1.3 of the EPA response in this *Response to Comments* document. For additional discussion on the feasibility analysis and considerations for treatment capability of the best available technologies (BATs) to reach a PQL that is the closest to a feasible level, please see section 5.1.2 of the EPA response in this *Response to Comments* document. Regarding the Administrator's determination that the benefits of the rule justify the costs, please see section 13.8 of the EPA response in this *Response to Comments* document. Please see section 5 of the EPA response in this *Response to Comments* document for additional discussion regarding feasibility of the set MCLs, including the EPA

response to comment Doc. #1808, SBC-046103 in section 5.1.4 in this *Response to Comments* document.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045829)

II. EPA's Proposed NPDWRs for PFOS, PFOA, PFBS, GenX, PFNA, and PFHxS are Protective, Feasible, and Cost-Justified.

Commenters commend EPA for adhering to the standard-development process established by the SDWA to propose NPDWRs for the substances subject to this rulemaking. Section 1412 of the SDWA specifies the requirements EPA must follow to promulgate NPDWRs. Section 1412(b)(4)(A) requires that each Maximum Contaminant Level Goal (MCLG) "shall be set at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety. [FN17: 42 U.S.C. § 300g-1(b)(4)(A).] Section 1412(b)(4)(B) mandates that, except in limited circumstances, each NPDWR for a contaminant with an MCLG "shall specify a maximum contaminant level [(MCL)] for such contaminant which is as close to the [MCLG] as is feasible."[FN18: 42 U.S.C. § 300g-1(b)(4)(B).] Here, EPA followed the meticulous statutory process to derive MCLGs and MCLs for each of the PFAS subject to the rulemaking.

EPA Response: Please see section 1.1 of the EPA response in this *Response to Comments* document.

1.2 Communications

Summary of Major Public Comments and EPA Responses

In the proposed rule, the EPA requested comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public, among other topics. The EPA requested input on the types of guidance, training, and implementation support documents that may be beneficial in supporting utilities and communities in implementing the rule. In this section of this *Response to Comments* document, the EPA is responding to comments received in response to this specific request for comment. Most of the recommendations for communications materials that the EPA received are about materials that are not required by this final NPDWR, but could help states, Tribes, and utilities implement the rule and help the public understand the rule and its public health protections against some PFAS in drinking waters. Where there are NPDWR requirements related to communications materials, they are noted accordingly. For required rule communications materials, such as the CCR and the PN requirements, please see sections 9.1 and 9.2, respectively, of the EPA response in this *Response to Comments* document. The EPA received a large range of comments from various states, organizations, and industries with examples of the types of guidance they hope to see following final promulgation. The EPA acknowledges the requests for various communications, guidance, and training materials to be produced after finalization of this regulation.

Examples of some of the many recommended and requested guidance and training materials include (but are not limited to): staff education for understanding the NPDWR itself, risk communication guidance and trainings, PN templates and tools to communicate to the public, materials around other PFAS-related statutes, such as the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the Resource Conservation and Recovery Act (RCRA), sampling and data management tools, funding information, low income and/or small community and/or environmental justice (EJ)-specific materials and guidance, treatment technology and waste disposal guidance, NPDWR-specific guidance for the public, NPDWR-specific terminology explanatory materials for systems and primacy agencies such as for the Hazard Index and MCLs/MCLGs, targeted technical assistance, and general "safety of water" documents.

Although some communication materials requests are out of scope for this rulemaking, the EPA notes that the agency currently has resources available on its website regarding various PFAS and NPDWR topics that address some of the provided comments. The EPA has a website (https://www.epa.gov/pfas) dedicated to PFAS, including basic fact sheets about PFAS and its public health effects, actions the agency is taking to address PFAS, as well as resources and tools available to learn more about and take action against some PFAS. The website includes a four-page "PFAS Explained" document with basic information around PFAS and human health; see https://www.epa.gov/system/files/documents/2023-10/final-virtual-pfas-explainer-508.pdf. The EPA website (https://www.epa.gov/sdwa/sdwa-evaluation-and-rulemaking-process) also has a link to an EPA webpage that describes the SDWA rulemaking process and how the EPA regulates water to protect public health. For more information, please visit: https://www.epa.gov/pfas. Some commenters suggested that the EPA develop various communication, education, and outreach materials for the public, water utilities, and primacy agencies. The agency intends to produce implementation materials, including some recommended materials provided by commenters, during the implementation stage of this final PFAS NPDWR. The EPA notes that the scope of this NPDWR is to only account for PFAS exposure from drinking water contaminants in public water systems, and the implementation materials will be tailored to this rule. Communication materials to support a whole-of-government approach to PFAS reductions more broadly are outside the scope of this final rulemaking. However, as noted at the start of this paragraph, the EPA has already produced some communications materials that address PFAS contamination and remediation more broadly. The EPA may consider developing additional implementation communication materials and guidance that address communications challenges associated with different or multiple types of PFAS exposures beyond drinking water, as needed, as requested by many commentors.

Once the NPDWR is promulgated, the EPA anticipates developing a suite of implementation products, such as guidance documents, risk communication materials, and trainings, like those conducted for previous regulations, to assist primacy agencies and public water systems with implementing the PFAS NPDWR. The Small System Compliance Guide is one example of a document required upon rule effective date, per the Regulatory Flexibility Act (for more information, please see FRN section XIII.C or see https://advocacy.sba.gov/resources/the-

regulatory-flexibility-act/rfa-in-a-nutshell-a-condensed-guide-to-the-regulatory-flexibility-act/). Other common EPA documents that have followed new NPDWRs include Quick Reference Guides, Frequently Asked Questions support documents, and a State Implementation Guidance document. The Hazard Index Calculator is an example of a specific PFAS-focused tool that, once finalized, will support systems in calculating their individual Hazard Index. The Calculator is an informational technical assistance tool developed to assist drinking water systems and primacy agencies in calculating the Hazard Index. The calculator allows for entry of individual samples (based on the Health-Based Water Criteria for PFAS under the Hazard Index), along with a graphical layout to further clarify the Hazard Index outcome.

Some commenters oppose the rule because they believe the NPDWR is confusing, and they believe it will be difficult for the EPA to communicate and explain the rule. A few commentors believe the new NPDWR will cause the public to question drinking water safety and the agency will be unable to communicate otherwise. Therefore, these commenters oppose the NPDWR because they believe these negative communication tradeoffs, among other concerns, will together outweigh any public health benefits of the rule. The agency disagrees with commenters who believe that the agency should not promulgate this NPDWR to improve drinking water health risks from PFAS because some communication challenges may result. The EPA acknowledges there may be some communication challenges in implementing the PFAS NPDWR. However, the EPA disagrees with these commentors because the agency has found this NPDWR will result in public health benefits to reduce PFAS in drinking water. Further, the EPA believes that some communications challenges can be avoided or mitigated through targeted actions, such as the production of effective communication and outreach materials that will help support more effective implementation. As stated above, the agency plans to evaluate the development of materials explaining the rule and supporting implementation, among other things.

Commentors spoke to the importance of risk communication and the need for the EPA to take the lead in communicating about this new rule to the public and others. The EPA agrees with commenters that risk communication is important because providing meaningful, understandable, and actionable information to many audiences is a fundamental aspect of the work that the EPA does to meet the agency's mission to protect human health and the environment. As reiterated in IX.A.3 of the FRN, the EPA acknowledges the need to protect public health with clear and concise language that outlines the risks associated with exposures exceeding the MCLs and Hazard Index. Therefore, the agency plans to evaluate ways to support the production of targeted risk communication materials related to the rule. As discussed in the EPA PFAS Action Plan, the agency will also continue to take concrete steps, in cooperation with our federal, state, and Tribal partners, to communicate how the efforts of the EPA and other partners help to protect public health and the environment. For more information on federal agency efforts outlined in the EPA's PFAS Strategic Roadmap, please see section 15 of the EPA response in this *Response to Comments* document.

Additionally, the EPA received many comments on the required PN health effects language. The EPA agrees that additional explanation of the Hazard Index framework and health effects of PFAS exposure will more effectively communicate risk to consumers when they receive PN from their water system. The EPA has considered this input and has revised health effects language for the final rule to clarify the health effects associated with PFAS exposure, including language related to the Hazard Index. For discussion around these specific required communications through the CCR or PN requirements, please see section 9 of the EPA response in this *Response to Comments* document.

Regarding comments about targeted and/or enhanced PFAS-related technical assistance, commenters suggested that the EPA develop new programs for PFAS or enhance existing ones. The EPA agrees with this comment to support effective implementation of this NPDWR. One example of an existing technical assistance program that could be expanded to encompass PFAS is the EPA's free Water Technical Assistance (WaterTA), which supports communities to identify water challenges, develop plans, build technical, managerial, and financial capacity, and develop application materials to access water infrastructure funding. The EPA collaborates with states, Tribes, territories, community partners, and other key stakeholders to implement WaterTA efforts. The EPA has a history of providing WaterTA to support communities to build their capacity and address compliance challenges—and is expanding its technical assistance efforts to help more communities, including in response to new sources of federal funding. Notably, the Bipartisan Infrastructure Law (BIL) appropriated $50 billion in new funding, the largest federal investment in water in U.S. history. The EPA anticipates that new and existing EPA WaterTA programs will be utilized to support effective implementation of the BIL. The EPA anticipates some of these efforts will focus on identifying and addressing emerging contaminants, including for PFAS NPDWR implementation. For more information regarding BIL and other funding, particularly for small, underserved, or disadvantaged communities, please see section 2.4 of the EPA response in this *Response to Comments* document.

Individual Public Comments

Water Environment Federation (WEF) (Doc. #1529, SBC-043315)

Communication: Stakeholder communication throughout the process is critical to both proactively address concerns and correct misinformation.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Brooke Young (Doc. #1554, SBC-043971)

[Some actions the EPA can do to address these challenges as part of the proposed PFAS drinking water regulation include:]

• Require state and local authorities to more effectively communicate to the public the risks associated with exposure to PFAS compounds, identify which communities are more impacted than others by PFAS in drinking water, what is being done to limit exposure to those communities, and how maximum contaminant levels (MCLs) will be enforced.

EPA Response: Regarding the part of the comment about more effective communication to the public on the risks associated with exposure to PFAS compounds, please see section 1.2 of the EPA response in this *Response to Comments* document. This section reiterates that the EPA aims to consider these recommendations, among others, in developing optional guidance and other materials to support implementation of this NPDWR. Regarding the part of the comment about mandated utility communication about PFAS in drinking water, the EPA finds that the communication-related requirements in this final NPDWR are reasonable and sufficient for water systems to effectively communicate to the public. For more information on those requirements, please see sections 9.1 and 9.2 of the EPA response in this *Response to Comments* document. For specific information regarding the MCLs, please see section V of the FRN and section 5 of the EPA response in this *Response to Comments* document. For details regarding rule implementation and enforcement challenges, please see section XI of the FRN and section 11 of the EPA response in this *Response to Comments* document.

As for specific targeted communications materials for communities most impacted by PFAS, the agency intends to consider producing recommended materials during the implementation stage of this final PFAS NPDWR. The EPA disagrees with the commenter that the PFAS NPDWR should require state and local authorities to "identify which communities are more impacted than others" and "what is being done to limit exposures to those communities." None of these recommendations are included as requirements for the final NPDWR. However, the EPA notes that as part of its EJ analysis for this regulatory action, the agency evaluated the distribution of anticipated baseline PFAS exposure in drinking water across demographic groups. While the EPA's analysis does not identify impacts to specific localized communities, this national analysis provides information on which race/ethnicity and income groups are anticipated to be most impacted by PFAS exposure in drinking water. This analysis is consistent with the agency's *Technical Guidance for Assessing Environmental Justice in Regulatory Analysis* (USEPA, 2016e) and Executive Order 14096 by identifying and analyzing disproportionate and adverse human health or environmental effects of agency actions on communities with EJ concerns. For additional discussion on this topic, please see the EPA's EJ analysis in Chapter 8 of the Economic Analysis (USEPA, 2024a) and section 14.10 of the EPA response in this *Response to Comments* document.

Maine Water Utilities Association (MWUA) (Doc. #1567, SBC-042741)

It is imperative that EPA immediately develop an appropriate communication strategy so that water suppliers are not left on their own to individually figure out how to handle risk communication. Thus far, there have been many questions raised by residents at public forums in the communities grappling with PFAS contamination, especially about potential impacts to

health, with very few direct answers available from primacy and health agencies. EPA must be better prepared to answer questions and address mounting fears of residents, and to assist PWS which are often the first responders for questions from their customers. We also believe that there needs to be more communication by EPA to consumers regarding the other routes of exposure; it does a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g. consumer products, food). EPA must consult with risk communication professionals to develop the messaging as the materials EPA has made available thus far are not particularly helpful.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter's statements about environmental contributions of PFAS other than from drinking water are outside the scope of this NPDWR.

National Special Districts Coalition (NSDC) (Doc. #1571, SBC-043001)

This issue could be best met with technical assistance and training opportunities for agencies in need.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For a thorough response regarding the mentioned "issue" and "opportunities," please see the EPA response to comment Doc. #1571, SBC-043000 in section 2.4 in this *Response to Comments* document.

COMM Water Department (Doc. #1577, SBC-042437)

EPA and primacy states must ensure that PWS have training on proper sampling protocols and provide the appropriate technical assistance and outreach to PWS once the rule is implemented.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

COMM Water Department (Doc. #1577, SBC-042444)

EPA needs to ensure that any required educational statements have clear and appropriate messaging. EPA needs to revisit its proposed required Standard Health Language for Public Notice as it is not well written, nor easily understood by the lay person. EPA also needs to inform consumers about the other routes of exposure; it does a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g., consumer products, food). EPA must consult with risk communication professionals to develop the messaging, as the materials EPA has made available thus far are not particularly helpful.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Regarding mandated utility communication about PFAS in drinking water,

please see sections 9.1 and 9.2 of the EPA response in this *Response to Comments* document. The commenter's statements about environmental contributions of PFAS other than from drinking water are outside the scope of this NPDWR.

Association of State and Territorial Solid Waste Management Officials (ASTSWMO) (Doc. #1583, SBC-042406)

Finally, ASTSWMO recommends the development of guidance documents and training following the promulgation of the PFAS NPDWR, and to the extent possible, requests that some of the training modules provide a cross-walk between the SDWA rule and CERCLA and RCRA programs managed by our membership.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State and Territorial Solid Waste Management Officials (ASTSWMO) (Doc. #1583, SBC-042400)

Risk Communication: The proposed MCLGs are higher than EPA's 2022 Lifetime Health Advisories for the same PFAS contaminants. The proposed MCLGs are also considerably lower than the previous 2016 Health Advisory (still currently used as an action level by the Department of Defense), the May 2023 Regional Screening Levels (RSLs) used in the CERCLA program, and most of the drinking water standards promulgated by States. As such, we are extremely concerned about how to approach health risk communication with the public and stakeholders. ASTSWMO members face continual risk communication challenges, as they attempt to explain the myriad of different risk-based standards employed in different contexts to constituents who are justifiably concerned about PFAS concentrations in their drinking water. ASTSWMO requests a greater degree of consistency between the values issued by different offices of the EPA and more straightforward risk communication guidance. While this proposed drinking water rulemaking is extremely important to further the goal of regulating PFAS at a federal level, ASTSWMO recognizes that other regulatory programs (e.g., CERCLA, RCRA), and their respective decisions, rely on the science used to derive drinking water standards. ASTSWMO strongly urges more coordination across all EPA programs, particularly when developing other health-based standards in the future (e.g., soil, air).

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter is mistaken regarding their comment on the proposed MCLGs related to the 2022 Lifetime Health Advisories. The proposed and final MCLGs for PFOA and PFOS are zero, meaning that they are lower than the interim health advisories, which are based on noncancer health effects, as well as the Health Advisories published in 2016. For discussion on the final MCLGs, please see section 4 of the EPA response in this *Response to Comments* document. For additional discussion regarding the relationship between the interim Health Advisories for PFOA and PFOS and this rulemaking, please see the EPA response to

comment Doc. #1761, SBC-053404 in section 4.2.6 in this *Response to Comments* document. Please see section V of the FRN and section 5 of the EPA response in this *Response to Comments* document for the EPA's requirements under SDWA to set MCLs as close as feasible to the MCLGs.

As described in section 1.2 of the EPA response in this *Response to Comments* document, the agency will consider producing implementation materials, including some recommended materials provided by commenters, during the implementation stage of this final PFAS NPDWR. The EPA acknowledges the need to protect public health with clear and concise language that outlines the risks associated with exposures exceeding the MCLs and Hazard Index. The EPA agrees that additional explanation of the Hazard Index framework and health effects of PFAS exposure will more effectively communicate risk to consumers, especially when they receive PN from their water system. The EPA has considered commentor input and has revised health effects language for the final rule to clarify the health effects associated with PFAS exposure, including language related to the Hazard Index. The updated health effects language for the rule is outlined in section IX.A.3 of the preamble for this action. Further, the EPA remains coordinated across programs in efforts to implement the actions discussed under the PFAS Strategic Roadmap.

Although CERCLA and RCRA programs are outside the scope of this rule, the EPA notes that the agency continues to closely coordinate between its regulatory programs. See section 15 of this *Response to Comments* document for discussion on the agency's PFAS strategic roadmap and the whole of agency approach the EPA is taking to reduce PFAS exposure. The EPA's Office of Water coordinates closely with the EPA's Office of Land and Emergency Management (OLEM) on both its CERCLA and RCRA programs through the EPA Council on PFAS, among other ways. Please see section 10.4.2 of the EPA response in this *Response to Comments* document regarding disposal of drinking water materials in the context of future regulatory actions, such as those within OLEM.

American Public Works Association (APWA) (Doc. #1584, SBC-042395)

All of these requests have a common theme and at this time, we urge the EPA to proceed carefully so as to ensure personnel are appropriately educated with the adoption of new well-developed standards in an efficient manner that minimizes costly mistakes such as the acquisition of unnecessary or insufficient equipment or usage of improper procedures. We believe IIJA is a historic and comprehensive law that warrants thoughtful implementation in order to avoid disruptive and unintended consequences. APWA wants to ensure updates in standards not only strengthen public health protections and environmental safety but are enforced appropriately. We urge that the new rules harmonize with other related requirements and allow for a thorough plan for phased implementation.

It is imperative that actions taken by the government provide clarity and relief, and not contribute to uncertainty that threatens to stall necessary improvements to our communities. APWA places

a high priority on respecting and enhancing local control for infrastructure projects. This is especially pertinent at a time when the water sector is still overcoming the compounding difficulties caused by workforce shortages, lingering supply chain issues, and inflation. Public works professionals balance public health and environmental concerns with doing what is best in the communities where they live and serve.

APWA members pride themselves on being committed to public service by profession and being a trusted resource is another way we work to protect our communities. If APWA may be of further assistance, please contact Ryan McManus, APWA Government Affairs Manager, at rmcmanus@apwa.net or 202-218-6727.

Thank you for your time and consideration of these comments.

Sincerely,

Scott D. Grayson, CAE B. Keith Pugh, PE, PWLF

Chief Executive Officer APWA President

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Regarding implementation timeline of the rule, please see section 12.1 of the EPA response in this *Response to Comments* document.

American Public Works Association (APWA) (Doc. #1584, SBC-042393)

We urge the EPA, should it move forward with the levels as proposed, to communicate with states to work with water systems and support with resources along with time to adjust. While we understand that once a rule is finalized, water systems would have three years to be in compliance with the MCLs, there is variation in state assistance and enforcement. We also believe that it will be crucial for EPA to provide sufficient staffing for this process. Communities across the country will need technical assistance and will often need to rely upon the EPA to ensure the investments they are making will achieve compliance for the significantly foreseeable future and they are able to prove so.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. In addition to the three-year period for compliance, which the commenter noted, the EPA is exercising its authority under SDWA § 1412(b)(10) to implement a nationwide capital improvement extension to comply with the MCL. These additional two years can provide states and public water systems with more time to implement the applicable NPDWR requirements and seek potential opportunities for technical assistance, as needed. All systems must comply with other requirements of the NPDWR, including initial monitoring, three years following the promulgation date. For specific information regarding this extension, please see section XI.D.3 of the preamble and section 12 of the EPA response in this *Response to Comments* document.

Washington Suburban Sanitary Commission (WSSC Water) (Doc. #1585, SBC-042776)

Risk assessment:

PFAS are almost universally present in drinking water samples due to their widespread environmental presence. In many water systems, detected levels are only slightly below the MCL of 4 ppt, which leaves little margin for safety in maintaining compliance. This makes it challenging to make capital improvement decisions, as the risks primarily depend on future vulnerability, including changes in the regulatory landscape as new PFAS compounds are identified and regulated, and potential changes in certain PFAS levels as new variants are continuously produced and released into the environment without regulatory control. As such, we encourage the EPA to create risk assessment guidelines tailored specifically to PFAS, similar to EPA's PFAS Analytic Tools, and to make the necessary resources available to assist water systems in quantifying their PFAS risk levels and to inform future treatment and non-treatment mitigation measures.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042355)

And, more importantly, that funding and processes for remediation are clearly laid out so that local jurisdictions and the public can easily navigate the actions needed to rapidly address contaminated drinking water sources.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion regarding federal funding available for PFAS, please see section 2.4 of the EPA response in this *Response to Comments* document. The EPA is setting enforceable MCLs for six PFAS compounds, so that water systems nationwide can monitor and determine compliance to ensure they are ultimately delivering water that does not exceed the maximum permissible levels of the six PFAS to any user of their public water system. If any of the MCLs are violated, then the water system will need to take actions to reduce levels of the regulated PFAS to at or below the MCLs. Actions may include installation of treatment as a remediation measure for PFAS in drinking water. For more details on the MCLs, please see section V of the FRN.

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042994)

I. General Comments

Expanding regulatory implementation requirements is challenging for agencies and regulated entities. EPA should provide robust data management tools and guidance before the rules take

effect. Successful and consistent implementation of the rules will require a functional data management system and final data entry instructions prior to implementation.

Significant resource investment will be necessary for successful implementation of these regulations. EPA must commit to providing additional resources to regulating agencies in the form of federal funding for human resources, extensive guidance materials and training, and data management upgrades.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion regarding federal funding available for PFAS, please see section 2.4 of the EPA response in this *Response to Comments* document. For specific details regarding resources and affordability, please visit Section 9.13.2.2 of the EA document (USEPA, 2024a).

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042988)

In our experience, the need for PWS to effectively communicate information related to PFAS monitoring and compliance requirements is of utmost importance. EGLE DWEHD requests that in coordination with any final version of the proposed NPDWR, EPA provides clear and concise language for supplies to use in developing their communications, as well as for guiding PWS in the requirements around collection, interpretation, and submission of PFAS samples and sample results.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

National Tribal Water Council-Tribal PFAS Working Group (NTWCTPWG) (Doc. #1598, SBC-042341)

Standardized easily adapted reference materials for educating individuals and communities with accurate contemporary information about PFAS chemicals are needed. It is unrealistic to expect that each potentially impacted tribal community will have the resources necessary to create germane educational and informational materials. A case in point is that notification of the presence of PFAS in customers‘ drinking water needs to be accompanied by educational materials on what the number(s) mean, what actions the water utility will take, or is required to take, and when, and what community members, at their option, can do in the interim and going forward. For example, if there are ways to reduce PFAS to safe levels through point-of-use or home-based units, that information should be provided.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For required rule communications materials, such as the CCR and the PN requirements, please see sections 9.1 and 9.2, respectively, of the EPA response in this *Response to Comments* document.

Water Works Board of the City of Birmingham (BWWB) (Doc. #1602, SBC-043644)

C. Public communication of PFAS-related information while maintaining customer confidence will be significant challenges considering the nuanced technical /scientific detail relevant to the rule.

Educating the community on PFAS requires a tremendous amount of public communication effort, as PFAS awareness is very limited outside of the water industry. The regulation of PFAS compounds using a composite Hazard Index complicates the ability to communicate safe drinking water information to customers.

In addition, there are public notification requirements in the proposed rule for systems with certain violations, but public notification costs were not included in cost estimates. Nor was public education on rule compliance considered. While communication/outreach costs might not be a significant additional burden (relative to installation and operation of treatment, for instance), it could suggest that utilities will need additional support and resources to adequately perform these activities. It is recommended that USEPA provide additional guidance and perhaps develop community outreach tools and resources for utilities to be able to use, as needed.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For water system cost concerns, including administrative costs to water systems (such as PN costs), please see section 13.4.5 of the EPA response in this *Response to Comments* document.

Marlene Ladderbush (Doc. #1612, SBC-042920)

EPA also needs to inform consumers about the other routes of exposure; it does a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g., consumer products, food). EPA must consult with risk communication professionals to develop the messaging, as the materials EPA has made available thus far are not particularly helpful.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter's statements about environmental contributions of PFAS other than from drinking water are outside the scope of this NPDWR.

Marlene Ladderbush (Doc. #1612, SBC-042913)

EPA and primacy states must ensure that PWS have training on proper sampling protocols and provide the appropriate technical assistance and outreach to PWS once the rule is implemented.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Town of Lincoln Water Department (Doc. #1613, SBC-043025)

EPA and primacy states must ensure that PWS have training on proper sampling protocols and provide the appropriate technical assistance and outreach to PWS once the rule is implemented.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Oklahoma Department of Environmental Quality (DEQ) (Doc. #1616, SBC-043038)

DEQ recommends that in the development of risk communication materials, EPA should focus on providing further information as to what the Hazard Index is and how it relates to the MCLs.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Oklahoma Department of Environmental Quality (DEQ) (Doc. #1616, SBC-043052)

Guidance and Training Needed

DEQ recommends EPA prioritize the development of guidance, training, and implementation tools ahead of the promulgation of the final rule.

Guidance and training should include the following:

• Detailed information for water systems on the available PFAS mitigation strategies, including considerations for using an alternative water source, and best available technology (BAT) installation

• Updated guidance on simultaneous compliance, especially in consideration of chemical contaminants, lead, corrosion control, and disinfection byproducts

• Best practices for pilot testing the available treatment technologies, including examples of successful pilot test results

• Detailed information for state primacy agencies to aid in the review of PFAS treatment or alternative sources, including best practices for ensuring the long-term operation and maintenance of each strategy.

• Alternatives for testing the raw and finished water in water treatment plants that are treating for PFAS, to maintain and ensure process control

• Funding roadmap targeted at small and disadvantaged communities, outlining options across state and federal programs to ensure systems are funded in the most effective way possible

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Colorado Water Utility Council (CWUC) (Doc. #1622, SBC-044057)

35. General comment for consideration. It is important to relay to the public that PFAS are ubiquitous from the everyday products they use, and primarily enter the water systems through the use and disposal of consumer products. Diminishing PFAS levels in drinking water is typically only a small pathway of PFAS exposure that you are reducing your risk from. We do not want to give a false sense of security to the public that they are safe from PFAS because it is non-detect (or low detect) in their drinking water. Other more pertinent sources of PFAS (including bottled water) need to be relayed to the public as well.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter's statements about other contributions of PFAS other than from drinking water are outside the scope of this NPDWR. However, for discussion on relative source contributions, please see section 4.2.5 of the EPA response in this *Response to Comments* document for PFOA and PFOS, and section 4.3 of the EPA response in this *Response to Comments* document for the MCLG derivation for a PFAS mixture (Hazard Index) for one or more PFAS. For concerns regarding bottled water, please see section 1.4 of the EPA response in this *Response to Comments* document.

Colorado Water Utility Council (CWUC) (Doc. #1622, SBC-044044)

25. EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

a. Communications points and health language should be established by EPA, just like with every other regulated parameter. Also language to include in the CCR is needed by early 2024.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Please see section 9.1 of the EPA response in this *Response to Comments* document for discussion about the CCR.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043089)

Beyond the technical challenges of this aspect of the monitoring requirements, there are challenges with the risk communication of these results. As proposed, the EPA would require that PFAS monitoring levels be estimated in two different ways. This will create further risk communication challenges for water systems with data below the PQL, as they will have a reporting value based on the RAA for MCL compliance and a separate value for reduced monitoring eligibility. It is unclear if EPA has considered how this data would be reported and communicated to the public in a meaningful manner.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Please see section 9.1 of the EPA response in this *Response to Comments* document for discussion about the CCR. For the concerns regarding monitoring communication,

specifically related to the Running Annual Average (RAA) and PQL, please see section 8 of the EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1623, SBC-043082 in section 8.2 in this *Response to Comments* document.

WaterPIO (Doc. #1624, SBC-043466)

7. As the EPA's proposed regulations wreak havoc on the nation's public water systems, they will have to conduct public communication efforts they've never implemented before because they don't have the staff or resources to carry them out. As a result, public communication mistakes, like those made by CFPUA, will occur in hundreds of cities and towns, resulting in plummeting public confidence.

EPA Response: While some public water systems will have to make capital improvements to control for PFAS, the EPA has determined that this NPDWR is feasible for water systems and will result in public health benefits consistent with the SDWA, as described in detail throughout section V and XII.E-I of the FRN. Please see section 1.2 of the EPA response in this *Response to Comments* document regarding communication materials and the EPA's plan to support the development of risk communication materials related to this NPDWR.

WaterPIO (Doc. #1624, SBC-043468)

A strong case can even be made that the EPA wants the end of the public's confident use of its tap water, based on the clear, cumulative effect of:

• these proposed MCLs and Hazard Index;

EPA Response: The EPA disagrees with the commenter's statement. As described throughout the executive summary for this final rule, as well as sections I.A, I.E, V, and XII, the EPA has found that this regulatory action will improve drinking water quality and public health protection. Please see section 1.2 of the EPA response in this *Response to Comments* document. For information specifically on the final MCLs, please see section 5 of the EPA response in this *Response to Comments* document.

WaterPIO (Doc. #1624, SBC-043478)

Finally, we'll close with a "look ahead" into the world the EPA apparently wants to create, as evidenced by the proposed CCR Rule, the health advisories, the proposed MCLs, and the Hazard Index. A world where the people of the United States, en masse, will feel that they no longer trust their tap water AND will accuse the good, hard- working people who deliver it to their homes and businesses every day of poisoning them.

Once the proposed MCLs/HI are finalized, there will be an expectation set that current PFAS levels in drinking water are poisoning the public, even when water providers will have just over three to five years to comply with the new standards. Then, when the effective date kicks in, we

will see hundreds – if not thousands – of water systems receive Notices of Violation. This will undoubtedly impact how the nation views the safety of its drinking water.

As we stated at the start of this comment, it appears the EPA wants this collapse in public confidence to occur. However, one must ask why the EPA – which is so attuned to making sure EVERY American can afford clean drinking water – is instituting regulations, without settled science, that will devastate the affordability of drinking water.

These regulations will put even more pressure on people living in disadvantaged communities to move away from tap water to bottled water will be exponentially more expensive. (And when it is technically no safer, according to the EPA's PFAS health advisories.)

Heck, one can envision a world in the next few years where the public won't even want to use tap water for non-consumption uses because they'll be afraid of any exposure to it, let alone the risks they'll take if they consume it.

WaterPIO has heard people say, "Polluters will pay!" for years, even after PFAS discoveries where they haven't paid a dime to the water provider or their customers. And now activists will add, "These MCLs and the Hazard Index will guarantee polluters will be punished!" No, they won't. That's simply not true.

This is why we believe the EPA is seeking to punish public water systems. Wrecking the public's confidence in its drinking water is necessary for the EPA to get to where it wants to be, a place where people are so scared of their taps that the EPA will finally be able to attack corporations who have contaminated our source waters.

The problem is, eviscerating the public's confidence in its drinking water will have a destructive ripple effect on the country, and that is what a proper rulemaking process is designed to prevent. There's supposed to be a recognition that regulations will both properly protect public health and avoid establishing unattainable burdens on the entities being regulated, in this case, public water systems.

That is what makes the proposed MCLs and a new Hazard Index so frustrating for those of us who work closely with the good people in public water who work 24/7/365 to serve their communities every day. They haven't created ONE DROP of PFAS that has found its way into the nation's drinking water sources.

But that doesn't matter to the EPA. The thousands of public water systems will be harmed by these proposed MCLs and HI when they didn't have any role in causing this problem. Because of the past failures of the EPA and a variety of other state regulators, water providers are left to clean up a problem they didn't create. And now, they'll have to do so when they don't have the financial resources or personnel to pull it off, and all while they will be accused of poisoning their customers.

That's a position to fail.

That's what the EPA is putting public water systems in with its proposed MCLs and Hazard Index.

EPA Response: As discussed throughout the preamble of this regulatory action and this *Response to Comments* document, the EPA is finalizing MCLs that are feasible to implement, and which will substantially improve public health protection. Please see section 1.1 of this *Response to Comments* document for the EPA's responses to many topics across the rule that are raised in this comment, including (but not limited to) the feasibility of the MCLs, the use of the Hazard Index, the regulation's protection of public health, and the discussion of the impacts of the rule on disadvantaged communities.

The EPA disagrees with the commenter's statements regarding public health concerns about exposure to PFAS in drinking water and how the EPA, primacy agencies, and water systems will be required to communicate that risk in the final rule. The EPA disagrees with these statements because the EPA has met the requirements of SDWA to determine that the quantifiable and nonquantifiable benefits of the final rule justify the quantifiable and nonquantifiable costs, and once fully implemented, the EPA estimates that the rule will prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses (as highlighted in the executive summary of the preamble for this rule). As further described in section III of the FRN, individual regulation of PFHxS, PFNA, and HFPO-DA, and regulation of mixtures of these three PFAS and PFBS, presents a meaningful opportunity for health risk reduction for persons served by public water systems (PWSs). Regarding the communication of this public health risk, the implementation of this NPDWR includes public education and notification requirements, such as through the CCR or through PN, that will protect the public and communicate those risks to communities to mitigate PFAS exposure through drinking water. Please see section IX of the FRN and section 9 of the EPA response in this *Response to Comments* document for more information on these notification requirements. Please see section 1.2 of the EPA response in this *Response to Comments* document for further discussion on communications materials for this NPDWR.

For concerns regarding the sufficiency of the monitoring compliance dates, please see section 8.1 of the EPA response in this *Response to Comments* document.

While beyond the scope of this rulemaking, the EPA is also taking action in addition to this NPDWR to address PFAS, and these actions can be found in the EPA's Strategic Roadmap outlined in section II, part F of the FRN and section 15 of the EPA response in this *Response to Comments* document. The EPA disagrees with the commenter's statements that the PFAS NPDWR will make drinking water unaffordable, particularly for people in "disadvantaged communities." Under SDWA, affordability to smaller water systems is addressed through SDWA section 1412(b)(4)(E). If the EPA makes a finding that an MCL is not affordable for certain categories of water systems, the EPA can enable variances for those systems. For the PFAS NPDWR, the EPA has determined that there are several affordable treatment technologies for small systems in accordance with SDWA section 1412(b)(4)(E); therefore, variances are not triggered for this rule. For more information, see Chapter 9.13 of the EA. For the EPA's response

to comments on the EPA's affordability analysis for this rule, please see section 13.10 of the EPA response in this *Response to Comments* document. Additionally, in its EJ analysis for the final rule, the EPA has determined that cost differences across race/ethnicity and income groups are typically small, with no clear unidirectional trend in cost differences based on demographic group. The agency also found that communities of color are anticipated to experience the greatest quantified benefits associated with the final rule. For more information, see Chapter 8.4 of the EA. For the EPA's response to comments on the agency's EJ analysis for this rule, please see section 14.10 of the EPA response in this *Response to Comments* document. The EPA provides information and discussion regarding funding in relation to this rule in section II.E of the FRN and section 2.4 of the EPA response in this *Response to Comments* document, as well as across the cost and benefit analysis, found in section XII of the FRN and section 13 of the EPA response in this *Response to Comments* document. For water system cost concerns, including administrative costs to water systems, please see section 13.3.3-13.3.6 in this *Response to Comments* document.

Lastly, the EPA disagrees with the commenter's statements that the EPA is not using "settled science," and that the agency is not regulating to properly protect public health and avoid establishing unattainable burdens on the entities being regulated. The EPA's final rule represents data-driven drinking water standards that are based on a thorough analysis of feasibility consistent with requirements under SDWA, as discussed in section V of the FRN and section 5 of the EPA response in this *Response to Comments* document. Please see section IV of the FRN, as well as section 4 of the EPA response in this *Response to Comments* document, for further information and discussion regarding the MCLGs and the appropriate health information for the MCLG derivations. Specifically in section 4.2 of this *Response to Comments* document, please see the EPA response to comment Doc. #1761, SBC-053404 in section 4.2.6 in this *Response to Comments document* regarding the 2022 interim health advisories. Again, the EPA estimates that once fully implemented, the rule will prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses. Please see section 1.1 of the EPA response in this *Response to Comments* document for information about the SDWA requirements for a NPDWR and the EPA's findings for the PFAS NPDWR that met those requirements, and section 5.1.6 in this *Response to Comments* document on the use of pending and evolving science. For additional discussion on the MCLGs, please see section 4 of the EPA response in this *Response to Comments* document.

WaterPIO (Doc. #1624, SBC-047684)

[A strong case can even be made that the EPA wants the end of the public's confident use of its tap water, based on the clear, cumulative effect of:]

• and the PFAS health advisories, which were set in June 2022 at literally immeasurable parts-per-quadrillion levels. They enabled, by EPA's own admission, every public water system in the country to be accused of having unsafe PFAS levels in its drinking water. The EPA's website even states, "Based on current methods, the 2022 interim health advisory levels for PFOA and

PFOS are below the level of both detection (determining whether or not a substance is present) and quantitation (the ability to reliably determine how much of a substance is present). This means that it is possible for PFOA or PFOS to be present in drinking water at levels that exceed health advisories even if testing indicates no level of these chemicals."

EPA Response: Please see the EPA response to comment Doc. #1624, SBC-043478 in section 1.2 in this *Response to Comments* document regarding the EPA's response to the PFAS health advisories. While Health Advisories are beyond the scope of this regulatory action, the EPA disagrees with the commenter's statements about the PFAS health advisories. The EPA is not sure about the "admission" to which the commenter refers because no citation is provided. Hence, the EPA is unable to address that part of the comment. The EPA notes that this regulation does not require systems to detect to the 2022 EPA PFOA or PFOS HA levels; rather, this regulation requires systems use the EPA methods 533 or 537.1 for their monitoring. For additional discussion on laboratory considerations, please see section 5.1.2 of the EPA response in this *Response to Comments* document. For more discussion of communications for this PFAS NPDWR, please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044063)

3. ASDWA recommends that EPA work directly with ASDWA and its members on risk communication materials for the PFAS NPDWR before the rule's final publication. Materials from non-governmental organizations (NGOs) do not absolve EPA of its responsibility for developing robust risk communication resources. Resources from the Agency hold greater weight for the public and primacy agencies than from NGOs. Using EPA's materials ensures that everyone is communicating the same essential messages.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044061)

1. ASDWA recommends that EPA prioritize the development of robust guidance, training, and implementation tools ahead of promulgating the final rule. Timely and comprehensive guidance on rule implementation and simultaneous compliance, public notice templates, data management, and information on PFAS mitigation strategies and compliance timelines is necessary to ensure that primacy agencies and water systems can effectively implement the rule. ASDWA recommends that the Agency share these documents with primacy agencies in advance of the public release to allow for preparation for engagement with their water systems, the public, and the media.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044075)

Guidance and Training Needed

ASDWA recommends that EPA prioritize the development of robust guidance, training, and implementation tools as part of promulgating the final rule.

As the first newly regulated drinking water contaminant in over twenty years, primacy agencies and water systems must have timely, clear, and concise guidance from EPA on rule implementation. Guidance, training, and implementation tools should be developed with primacy agencies' input and released when the rule is finalized so that primacy agencies and water systems are prepared to effectively implement the rule upon the compliance date. ASDWA recommends that the Agency share these documents with primacy agencies in advance of the public release to allow them time to prepare to engage with their water systems, the public, and the media. Primacy agencies must be partners with EPA in developing guidance, training, and tools.

Guidance and training should include the following:

• Regulatory implementation guidance to ensure consistency across primacy agencies and EPA regions, including details on the waiver process, compliance determinations, data management and reporting requirements, the trigger level for reduced monitoring, and using previously collected data for monitoring determinations.

• Templates for public notice, including minimum required elements.

• Detailed information for water systems on the available PFAS mitigation strategies that consider scalability, including considerations for using an alternative water source, point-of-use (POU) and point-of-entry (POE) devices, and best available technology (BAT) installation.

• Updated guidance regarding residual waste handling and disposal, including

Resource Conservation and Recovery Act (RCRA) requirements and POU devices that have reached the end of their useful life.

• Detailed information for primacy agencies to aid in reviewing PFAS mitigation strategies (i.e., installation of BAT, use of POU/POE devices, or switching to an alternative source), including best practices for ensuring the long-term maintenance of each strategy. This information should include recommended sampling plans for each option to ensure efficacy.

• Best practices for pilot testing the available BATs, including examples of successful pilot test results. To the extent practical, baseline water quality should be considered to guide pilot testing and effective treatment.

• Protocols for testing the raw and finished water in water systems that are performing operational (process control) testing in-house to ensure their treatment is operating correctly. This guidance will help to maintain and ensure process control.

• Updated guidance on simultaneous compliance, especially considering chemical contaminants, lead, corrosion control, and disinfection byproducts.

• Information on the expected compliance timelines for mitigating a maximum contaminant level (MCL) exceedance.

• Funding roadmap targeted at small and disadvantaged communities, outlining options across state and federal programs to ensure systems are funded most effectively.

This list of needed guidance and training from EPA is extensive, and meeting these needs is essential and critical to support primacy agencies and water systems in meeting the rule requirements.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044107)

Primacy agencies have noted that the start-up of granular activated carbon (GAC) treatment may release arsenic at levels that may exceed the arsenic MCL. Regardless if the released arsenic exceeds the MCL, primacy agencies want to ensure that treatment for one contaminant does not pose exposure risks for other regulated contaminants. ASDWA recommends that EPA develop additional guidance on GAC start-up and conditions that may be utilized to ensure the safe start-up of GAC. Additionally, GAC is not optimal for the removal of every PFAS. EPA should continually release the most up-to-date guidance and research to primacy agencies that show what treatment media is most effective depending on what PFAS analytes are being addressed on an individual water system basis.

EPA Response: The EPA acknowledges the specific requests for granular activated carbon (GAC) and treatment guidance. For concerns around GAC itself, please see section X of the FRN. For additional discussion on treatment, particularly relating to concerns around arsenic, please see sections 10 and 10.1, respectively, of the EPA response in this *Response to Comments* document. For general communications concerns, please see section 1.2 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044109)

ASDWA recommends that EPA develop guidance for water systems considering their options to address the PFAS MCL, both treatment and non-treatment. EPA should include some of the above considerations in that guidance material to ensure systems fully evaluate their options and understand the challenges associated with the various options. EPA should include considerations for regionalization/consolidation and utilize the opportunity to encourage systems that are currently not viable to connect to viable water systems. Primacy agencies have noted that there are also corrosion control concerns when consolidating systems and changing sources.

Additionally, ASDWA recommends that EPA develop updated, in-depth simultaneous compliance guidance for primacy agencies. Simultaneous compliance guidance will help to ensure that compliance with one contaminant is not being traded for another, similar to the past water quality problems in Washington, DC, in which elevated lead levels were caused due to a change in disinfectant to address disinfection by-product concerns. Drinking water chemistry is very complex, and primacy agencies want to ensure treatment protects consumers from all NPDWR contaminants.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For the comment regarding corrosion control concerns, Sections 3.5.1 and 4.5.1 of the *Best Available Technologies and Small System Compliance for Per- and Polyfluoroalkyl Substances (PFAS) in Drinking Water* document (USEPA, 2024b) contain corrosion control and other process integration information for anion exchange resin (AIX) and nanofiltration/reverse osmosis (NF/RO) respectively. Regarding the commentor's request for "considerations for regionalization/consolidation" for systems, the EPA notes that creating water system partnerships may be a viable option for water systems seeking to address PFAS contamination in their drinking water and ensuring compliance with NPDWRs. For some general information about water system partnerships and building capacity of drinking water systems, please visit the EPA website at https://www.epa.gov/dwcapacity/learn-about-water-system-partnerships. The EPA also continues to host workshops regarding water system partnerships. For their most recent workshop, which includes a list of resources for systems, please visit the EPA website at https://www.epa.gov/dwcapacity/water-system-partnerships-workshop. Regarding the commenter's request for simultaneous compliance guidance, please see section 1.2 of the EPA response in this *Response to Comments* document. The agency will consider producing implementation materials, including the request for simultaneous compliance guidance, during the implementation stage of this final PFAS NPDWR.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044105)

Treatment Efficacy

ASDWA recommends that EPA develop guidance and in-depth training for primacy agencies and water systems on PFAS treatment technologies, including guidance that addresses simultaneous compliance concerns. ASDWA strongly recommends that EPA invest funding into evaluations of the PFAS treatment technologies (especially for small systems) to support primacy agencies.

As outlined in the rule proposal, each of the BAT, in most cases, has the technical capability of removing the target PFAS to below the detection limit for PFAS; however, some primacy agencies have limited experience with some of the BAT, and other agencies have not approved the use of some of the BAT for PFAS or other contaminants. In-depth training will help ensure primacy agencies are comfortable approving these technologies for the removal of PFAS at their water systems. Additionally, because each of the available treatment technologies may require a

pilot test to ensure treatment efficacy, ASDWA recommends that EPA develop specific guidance on what should be required and the ideal timeline for a pilot for each of the technologies at differently sized systems. This guidance should also include BAT design criteria recommendations and best practices (e.g., redundant treatment vessels, intermediate sample taps, etc.).

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on treatment, please see section 10 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044081)

Public Communication

Risk Communication

ASDWA recommends that EPA work directly with ASDWA and its members on the risk communication materials for the PFAS NPDWR. ASDWA recommends that EPA work with the primacy agencies ahead of the final rule publication to identify communication gaps that need to be addressed before the rule is final.

A substantial number of helpful risk communication resources, such as the Water Research Foundation's toolkit, have been developed and released over the past few years. These materials should not be seen as absolving EPA of its responsibility for developing its own risk communication resources for broad use across the water sector. The media and public's interest in PFAS has increased substantially over the past few years, with the term "forever chemicals" becoming commonplace in the press. The widespread use of this term creates risk communication challenges for the water sector. Resources with the gravitas of the Agency behind them hold greater weight to both the public and the primacy agencies in delivering the challenging risk communication messages surrounding PFAS. Using EPA's materials ensures that everyone is communicating the same essential messages.

ASDWA appreciates EPA's willingness to work with the primacy agencies on risk communication after the Agency's health advisories were released in 2022. ASDWA recommends that EPA continue to ask the primacy agencies for feedback on the materials released by the Agency to identify areas that require clarification or improvement. These opportunities allow ASDWA to engage with primacy agency staff with expertise in public communication and "bridge the gap" for public information sharing to substantially improve these materials. ASDWA recommends that EPA work directly with ASDWA and its members again on the risk communication materials for the PFAS NPDWR. ASDWA recommends that EPA work with the primacy agencies ahead of the publication of the final rule to identify communication gaps that need to be addressed before the rule is final. ASDWA recognizes that some materials will not be able to be publicly distributed ahead of time, but state staff can provide valuable insights into EPA's work.

To assist with the development of the risk communication materials, ASDWA's members have identified multiple focus areas for EPA's materials:

• Explain the differences, in plain language, between the health advisories, maximum contaminant level goal (MCLG), and Maximum Contaminant Level (MCL) and what they mean from the perspectives of human health and feasibility.

• Characterize the impact of drinking water versus all other exposure routes.

• Explain the differences between PQL, method detection limit (MDL), minimum reporting level (MRL), etc., and ensure this is consistent throughout EPA's materials, the rule language, and the preamble.

• Provide language for water systems to use when the results of PFAS testing are above detection and the health advisory but below the PQL.

• Further explain the logic behind the levels EPA has chosen for determining reduced monitoring. These levels are above the health advisories and will be a public communication challenge.

• Provide further information on the Hazard Index and how it relates to the MCLs.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Texas Commission on Environmental Quality (TCEQ) (Doc. #1632, SBC-044125)

TCEQ urges EPA to strengthen and develop additional risk communication materials prior to the final rule being promulgated. The public's awareness and concern over PFAS continues to grow so it is critical that primacy agencies, in coordination with EPA, communicate consistent messaging to the public. TCEQ recommends strengthening and developing additional risk communication materials for the following areas of concern:

• Characterize the impact of PFAS in drinking water versus all other exposure routes;

• Differentiate between health advisories, MCLGs, and MCLs;

• Differentiate between a practical quantitation limit (PQL), a detection limit, and the method reporting limit, and ensure consistency throughout the communication materials, rule language, and preamble;

• Provide template language for public water systems to use when the results of PFAS testing are above detection and the health advisory but below the PQL;

• Clarification and logic for determining reduced monitoring frequency, as these levels are above the health advisories and will be difficult to communicate to the public;

• Provide plain language for the public to understand what the HI is and how it relates to the MCLs; and

• How running annual and quarterly averages will be used to identify compliance and violations.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044141)

We urge EPA to provide additional guidance regarding testing and compliance options both to public water systems and Primacy agencies' staff, and to double down on the essential work that EPA is already doing to invest in the water workforce of the future. RCAP stands ready to partner with EPA on this and other matters as the Agency moves forward to implement and enforce these standards.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Town of Tewksbury, Massachusetts (Doc. #1637, SBC-043243)

EPA and primacy states must ensure that PWS have training on proper sampling protocols and provide the appropriate technical assistance and outreach to PWS once the rule is implemented.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New England Interstate Water Pollution Control Commission (NEIWPCC) (Doc. #1650, SBC-043153)

Our member state's reservations pertaining to the Hazard Index approach center on communication of the concept and the need to educate systems about how to interpret their analytical results. We are concerned that this burden will fall to local and state officials, leading to inconsistent interpretation regarding compliance. We, therefore, urge EPA to provide appropriate outreach materials to state and local officials and water suppliers.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New England Interstate Water Pollution Control Commission (NEIWPCC) (Doc. #1650, SBC-043147)

Communication

Effective communication and education will be vital to the success of the rule. This is true for both those water system professionals who will be responsible for implementing the rule, as well

as the public. Some of our member states will need to transition away from summing approaches under the rule. Our members states have concerns about how the public will perceive the change. For instance, our member states expect some members of the public to have concerns pertaining to past exposures that are currently allowed under state MCLs. Addressing these concerns will require thoughtful communication strategies. Our member states request EPA's assistance in communicating the health impact of such exposures.

Similarly, large portions of the northeast region currently rely on private wells for drinking water. In many cases, states and local boards of health will be asked to provide guidance and recommendations to private well owners and their tenants. While we do not expect EPA to devise solutions for private well owners under the rule, we urge EPA to consider private well users in devising EPA's communication strategies.

Likewise, our member states have various requirements for transient, non-community (TNC) systems, such as motels, churches, recreational facilities, food service establishments, and shelters. Many of those TNC systems are operated by small businesses or non-profit organizations and some may serve marginalized populations. We encourage EPA to consider including TNC systems in its communication strategies to further EPA's goal of prioritizing the protection of disadvantaged communities, a core principle under EPA's PFAS Strategic Roadmap. [FN6: https://www.epa.gov/pfas/pfas-strategic-roadmap-epas-commitments-action-2021-2024]

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion around private well owners and transient non-community water systems (TNCWS) systems, please see section 1.4 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044171)

B. Guidance and Training Needed

1. NCDEQ requests that EPA develop robust guidance, training, and implementation tools as soon as practicable upon the promulgation of the final rule.

As EPA takes action on the first newly regulated drinking water contaminant in over twenty years, North Carolina will need clear guidance from EPA on rule implementation. Guidance, training, and implementation tools should be released expeditiously so that NCDEQ is well positioned to effectively implement the rule. NCDEQ recommends that the Agency share these documents with states in advance of the public release to allow us time to prepare to engage with our water systems, the public, and the media. We want to be partners with EPA in developing guidance, training, and tools.

Factors to be considered in guidance and training include the following:

• Regulatory implementation guidance to ensure consistency across state agencies and EPA regions, including details on the waiver process, compliance determinations, the trigger level for reduced monitoring, and using previously collected data for monitoring schedule determinations.

• Templates for public notice, including minimum required elements.

• Detailed information for water systems on the available PFAS mitigation strategies that consider scalability, including considerations for using an alternative water source, point-of-use (POU) and point-of-entry (POE) devices, and best available technology (BAT) installation.

• Updated guidance regarding residual waste handling and disposal, including for POU devices.

• Detailed information for state agencies to aid in reviewing PFAS mitigation strategies (i.e., installation of BAT, use of POU/POE devices, or switching to an alternative source), including best practices for ensuring the long-term maintenance of each strategy. This information should include recommended sampling plans for each option to ensure efficacy.

• Best practices for pilot testing the available BATs, including examples of successful pilot test results. To the extent practical, baseline water quality should be considered to guide pilot testing and effective treatment.

• Protocols for testing the raw and finished water in water systems that are performing operational (process control) testing in-house to ensure their treatment is operating correctly.

• Updated guidance on simultaneous compliance, especially considering chemical contaminants, lead, corrosion control, and disinfection byproducts.

• Information on the expected compliance timelines for mitigating a MCL exceedance.

• Funding roadmap targeted at small and disadvantaged communities, outlining federal programs to ensure systems are funded in the most effective way possible.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044175)

E. Public Communication

1. NCDEQ recommends that EPA work directly with state agencies to develop risk communication materials for the PFAS NPDWR and identify communication gaps that need to be addressed before the rule is finalized.

A substantial number of helpful risk communication resources, such as the Water Research Foundation's toolkit, have been developed and released over the past few years. These materials should be supplemented with PFAS specific risk communication resources for broad use across the water sector. The media and public's interest in PFAS has increased substantially over the past few years, with the term "forever chemicals" becoming commonplace in the press. The

widespread use of this term creates risk communication challenges for the water sector. Using EPA's materials ensures that everyone is communicating the same essential messages.

NCDEQ appreciates EPA's willingness to work with state agencies on risk communication after the Agency's health advisories were released in 2022. NCDEQ recommends that EPA continue to seek feedback on the materials released by the Agency to identify areas that require clarification or improvement. We are available to work with EPA to identify any communication gaps that need to be addressed before the rule is final. NCDEQ recognizes that some materials will not be able to be publicly distributed ahead of me, but state staff can provide valuable insights into EPA's communication approaches.

To assist with the development of the risk communication materials, the following focus areas for EPA's materials should be considered:

• Explain the differences between the health advisories, MCLG, and MCL, and what they mean from the perspectives of human health and feasibility.

• Characterize the impact of drinking water versus all other exposure routes.

• Explain the differences between PQL, detection limit, minimum reporting level (MRL), etc., and ensure this is consistent throughout EPA's materials, the rule language, and the preamble.

• Provide language for water systems to use when the results of PFAS testing are above detection and the health advisory but below the PQL.

• Further explain the logic behind the levels EPA has chosen for determining reduced monitoring. These levels are above the health advisories and will prove to be a public communication challenge.

• Provide further Information as to what the Hazard Index is and how it relates to the MCLs.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion on the reduced monitoring, please see section 8.1.2 of the EPA response in this *Response to Comments* document, as well as section 8.8 of the EPA response in this *Response to Comments* document for the trigger level values.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044191)

NCDEQ staff and systems will also need in-depth guidance and training on PFAS mitigation techniques ahead of the compliance date for the final rule.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Blue Ridge Environmental Defense League (BREDL) (Doc. #1663, SBC-044384)

• EPA should direct federally funded state agencies to take all steps necessary to inform the public about PFAS in their drinking water.

• EPA should post federally funded state agencies' comments on these proposed regulations on an easily accessible web page so that impacted communities can determine if their state agency is protecting their health.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. All public comments on this regulatory action, including those from state regulatory agencies, are available at https://www.regulations.gov/docket/EPA-HQ-OW-2022-0114.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044390)

In the absence of adopted National Primary Drinking Water Standards for PFAS, DOH developed State Action Levels (SALs) for PFAS in drinking water. The Washington State Board of Health adopted SALs for 5 PFAS analytes on January 1, 2022 [FN1: PFAS in Drinking Water—Monitoring and Analysis | Washington State Department of Health (link: https://doh.wa.gov/community-and-environment/drinking-water/contaminants/pfas-drinking-water)]. DOH also developed informational materials, publications, fact sheets, and a PFAS dashboard to educate and communicate key information to drinking water consumers, local health departments, and public water systems.

We also needed to develop informational resources including PFAS exposure routes, clinician resources, home treatment devices and filter options, and accredited laboratories to perform drinking water sample analysis. Informational materials to address general questions and concerns about potential health effects of exposure to PFAS from the drinking water pathway were developed and posted on our website [FN2: PFAS in Drinking Water—Monitoring and Analysis | Washington State Department of Health (Link: https://doh.wa.gov/community-and-environment/drinking-water/contaminants/pfas-drinking-water)].

Under Washington State's rule, Group A Community, Non-Transient Non-Community and some Transient Non-Community water systems are required to monitor for PFAS beginning in January 2023 through December 2025. Systems must collect samples at the entry point to the distribution system and have them analyzed by EPA method 531.7 or 533 by a laboratory accredited for these analytes in Washington State. DOH sponsored a PFAS sampling project starting in early 2022 to allow public water systems to have their PFAS samples analyzed at no cost, and results satisfied state requirements that began in 2023. A total of 698 systems so far have actively participated in the PFAS monitoring project and approximately 1,136 system sources were sampled for PFAS.

A critical component to successful implementation of the proposed PFAS drinking water standards depends upon EPA providing additional clarification, guidance, and direction in

several areas that could represent significant implementation challenges. It is essential these resources are developed and made available prior to adoption of the rule.

The attached document contains comments grouped into two sections: (1) general comments, and (2) specific comments to questions posed in the proposed regulation.

Sincerely,

Lauren Jenks

Assistant Secretary, Environmental Public Health Washington State Department of Health

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter submitted background information from Washington State's experiences regulating PFAS in support of this comment. The EPA is not responding to background information nor the attached documents with "general comments" and "specific comments to questions posed in the proposed regulation" in the attached documents referenced in section 1.2 of the EPA response in this *Response to Comments* document. There is one exception to this, the EPA response to comment Doc. #1665, SBC-044427 in section 1.2 in this *Response to Comments* document, as that comment is the subject of section 1.2. Instead, the EPA is addressing those "general" and "specific" comments directly in other sections of the *Response to Comments* document organized by topic. Please see the applicable sections of the *Response to Comments* document responding to each detailed comment topic.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044427)

EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

• Please provide guidance for electronic delivery for public notice (PN), and include different methods of communication in consideration of cost reductions for regular PN. Alternating methods of communication in addition to providing language translation allows for a broader reach to diverse audiences. Electronic delivery is allowed for CCRs, for which EPA has provided guidelines, but not for tier 2 PN.

Be transparent in communication related to what is known and understood. This allows public water systems to communicate to their consumers with facts and resources when a PN is issued. DOH developed a historical PFAS timeline highlighting milestones from when PFAS substances were invented in 1938-present. [FN9: 334-488 PFAS Timeline (wa.gov) (Link: https://doh.wa.gov/sites/default/files/2023-03/334-488.pdf)] Informational materials to address general questions and concerns about potential health effects of exposure to PFAS via the drinking water pathway were developed and made available on our website. [FN10: Local Health Jurisdiction PFAS Resources | Washington State Department of Health (Link: https://doh.wa.gov/public-health-healthcare-providers/public-health-system-resources-and-services/local-health-resources-and-tools/pfas-resources)]

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on CCR and PN, please see sections 9.1 and 9.2, respectively, of the EPA response in this *Response to Comments* document.

Aurora Water, City of Aurora, Colorado (Doc. #1669, SBC-043730)

Aurora Water recommends EPA informs consumers that drinking water is just a fraction of PFAS exposure in their lives.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The EPA provides this information in the Hazard Index MCLG document and the PFOA and PFOS Toxicity Assessments when deriving the Relative Source Contributions (RSCs) for these chemicals.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-047691)

EPA is seeking comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public. We are aware that EPA's PFAS Action Plan includes an action to work "collaboratively to develop a risk communication toolbox that includes multi-media materials and messaging for federal, state, tribal, and local partners to...help ensure clear and consistent messages to the public..." Cleveland Water would like to emphasize critical need for these tools to be developed as soon as possible.

EPA should also be at the forefront of explaining the relative risk from drinking water compared to all PFAS exposure pathways. The public should be informed of the other sources of PFAS and how drinking water, if it contains PFAS, is only a small portion of the overall potential exposure pathways. This type of information helps the public make decisions that can limit their PFAS exposure from more than just drinking water, further protecting public health and not unduly placing the entirety of burdens and blame on PWSs. Water systems are just removing contaminants from drinking water that others put in source water. It is important for EPA and water systems to work together on messaging to inform the public, who is responsible for the contamination, what can be done to stop the contamination and what choices they can make as consumers to limit their exposure.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044900)

EPA and other agencies must work to reduce direct human exposures, and better communicate the risks associated with PFAS. Drinking water should only be one part of a larger, holistic approach to addressing the public's exposure to PFAS.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Arizona Corporation Commission (Doc. #1680, SBC-044217)

Comments

1. EPA should develop implementation guidance that includes a uniform approach to public notifications and communications to regulators.

It would be valuable to state regulators if the EPA published detailed implementation guidance before, or contemporaneous with, the final rule. Guidance from the EPA setting a uniform notification and customer communication standards would be particularly helpful to the ACC. The EPA should set the expectation for customers, companies, and enforcement agencies on how information is to be disseminated to the public regarding PFAS. This includes not only customer notifications when levels exceed the new MCLs, but also information regarding health risks and compliance timetables. Guidance should also be provided regarding information sharing between enforcement agencies and utility state reporting requirements.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New Hampshire Department of Environmental Services (NHDES) (Doc. #1690, SBC-044356)

c. Improved Risk Communication support. Currently, there is insufficient risk communication information for the EPA's proposed MCLs for PFOA, PFOS and the Hazard Index of 4 PFAS. Most of the information released has focused on the technical definitions of terminology, regulations and implications for water system operators and regulators, with minimal focus on clear and concise information for the general public about what these thresholds mean for risk to health. The EPA is obviously in a complicated position in proposing these thresholds and rules; however, given the widespread occurrence of PFAS and the potential for a significant number of communities to be notified about PFOA or PFOS presence, EPA should provide clear risk communication documents and guidance for states, local health districts and public water system operators. The current documents defer the responsibility to entities other than the EPA, even though EPA is the one repeatedly stating the urgent health risks of PFOA and PFOS as a part of this rulemaking process.

Deferring the interpretation and development of risk communication materials to local partners, without EPA providing adequate support to its partners, will lead to mixed and possibly conflicting messaging about public health risks. This has been an ongoing challenge for several years as different states have established MCLs in the absence of EPA's current leadership on this problem. Areas where risk communication could be improved include the following, with special attention given to a target audience of the general public and not water system operators or EPA's own technical/regulatory/legal staff:

i. Clarification if MCLs and health advisories are considered acute (i.e., do not drink immediately) or chronic guidance (i.e., personal risk management) for all or specific segments of the population. This has been unclear since the EPA issued the interim health advisories for PFOA and PFOS, with official documents conflicting (e.g., exposure reduction where possible) with public statements or presentations of EPA officials stating, "no safe level" and referencing sensitive populations such as infants. The nuances of risk assessment and regulatory jargon are poorly understood by the general public and EPA should approach this with its own guidance for Risk Communication or that of ATSDR.

ii. Clarification as to what are the specific risks to health at the detection levels for PFOA and PFOS that residents and their clinicians should be aware of, and what guidance is provided to healthcare providers or local public health agencies? This should be a part of the "whole of government approach" that is embodied in the PFAS Action Plan and the PFAS Strategic Roadmap, but the current supporting information is lopsided towards only addressing PFAS in water without consideration of how communities will respond.

iii. Development of risk communication materials that provide improved context of PFAS exposure and are adaptable for states that have led on the evaluation of PFAS in drinking water and other environmental media at the local level. As pointed out by several commenters, peer-reviewed scientific studies, investigations by multiple states, and EPA's own programs, PFAS exposure is complex and comes from multiple sources. While the currently proposed rule is specific to drinking water, the notion that managing drinking water alone is an adequate intervention to reduce PFAS exposure is an oversimplification that is not supported by the science and a source of contention that alienates certain groups that are a part of EPA's target audience for risk communication.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Regarding the commentor's first point of clarification, please see section 9.2 of the EPA response in this *Response to Comments* document and section IX of the FRN for discussion on PN requirements and its associated tiering.

Clean Water Action/Clean Water Fund (Doc. #1697, SBC-045005)

EPA should ensure that all guidance documents are comprehensive and clear and take innovative approaches to providing technical assistance, training and other support to water systems and to complement state agency implementation activities.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

State of Vermont Agency of Natural Resources and Department of Health (Doc. #1708, SBC-045110)

Discussion/information pertaining to "Safety" of the water – consistent and clear messaging are needed. PFOA and PFOS are identified in the proposed regulation as having a cancer endpoint, however PFAS is the only contaminant whereby the messaging around the MCL and health advisory is discussed as being "safe" or "not safe" or "no risk". MCLs for chronic contaminants are often set based on risk of 1 in some number of the population (such as 1 in 100,000 or 1 in 1,000,000), however, all the messaging and discussion to date regarding PFAS is "lowest point at which there are no health risks". This has created a difficult task for States to discuss and apply the MCLs. It is to the point where no one wants PFAS in their water due to any risk. While this sentiment is justified, it is not how the regulatory program has functioned historically.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For further discussion of the MCLs for PFOA and PFOS, please see section V of the FRN and section 5.1 of the EPA response in this *Response to Comments* document. For further information regarding required messaging to consumers, please see section IX of the FRN and section 9 of the EPA response in this *Response to Comments* document.

State of Vermont Agency of Natural Resources and Department of Health (Doc. #1708, SBC-045112)

2) Assistance to help small systems ID labs, evaluate treatment, and determine best ways to dispose of residuals.

As identified above, small systems need detailed information about where, when and why to sample and what those results mean when compared with the MCL. No information is provided and the 3- year sampling that will ensue following treatment installation is not sufficient.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Citizens Campaign for the Environment (CCE) (Doc. #1710, SBC-045137)

Recommendations for next steps:

• EPA should be prepared with accurate educational information and language to assist local water suppliers and health departments when local water supplies are exceeding MCLs. In New York State, which has adopted MCL's for PFAS, we have seen that many water suppliers, particularly from smaller, low-income communities, don't have the capacity, resources, or know-how to effectively communicate health risks associated with MCL violations to the public. In fact, if communities are left to their own devices, they may misinform the public, unnecessarily putting their health at risk.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044747)

General Comments

1. EPA Should Publish Accessible Guidance on How the Proposed PFAS NPDW Rule Was Developed

EPA should develop guidance on how the NPDW rule for PFAS was developed to provide clarity and regulatory certainty on the approach for deriving MCLs and MCLGs, including the six PFAS contemplated under the proposal as well as those that may be regulated in the future. WDEQ understands that EPA relied on existing EPA guidance and policy to derive the proposed MCLs and MCLGs, that the Scientific Advisory Board was generally supportive of EPA's approach, and that EPA provided justification for the approach and rationale in the preamble. However, given the volume of PFAS compounds (some estimates at more than 12,000) that may need to be regulated, the variability in health effects of these compounds, the rapidity with which scientific data and information are becoming available, and the novelty of using a HI for a NPDW rule, it is important that EPA provide clarity on the approach for deriving MCLs and MCLGs for PFAS under the proposed NPDW rule through written guidance.

WDEQ recommends that EPA provide guidance to describe: (1) the use of human versus animal endpoints in derivation of health endpoints; (2) replication requirements for studies to derive human health effects endpoints; (3) how to combine the results of studies to derive an MCLG; (4) consideration of cancer versus noncancer human health effects; (5) circumstances under which PFAS compounds would be combined in a HI; (6) circumstances where compounds would not be combined in a HI; (7) how to address instances where the health advisory or Health Based Water Concentrations are below reporting limits; (8) approaches for deriving relative source contribution; and (9) how to derive MCLs from MCLGs.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For information on the use of human versus animal endpoints to derive health endpoints (1), please see sections 4.3.1 and 4.3.2 of the EPA response in this *Response to Comments* document. For information on replication requirements for studies to derive human health endpoints (2), how to combine results of studies to derive an MCLG (3), the consideration of cancer versus noncancer human health effects (4), and the approaches for deriving relative source contributions (8), please see the Toxicity Assessments (USEPA, 2024c; USEPA, 2024d) and the PFOA/PFOS and Hazard Index MCLG supporting documents (USEPA, 2024e; USEPA, 2024f). For additional discussion on circumstances under which PFAS compounds would be and would not be combined in a Hazard Index (5, 6), please see section 4.3.5 of the EPA response in this *Response to Comments* document, as well as the Mixtures Framework supporting document. For additional discussion on instances where the Health Based Water Concentrations are below

reporting limits (7) or how to derive MCLs from MCLGs (9), please see section V of the FRN and section 5 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044764)

13. EPA Should Provide Training and Guidance on the Health Risk Reduction and Cost Analysis Regarding Establishing PFAS MCLs and MCLGs

EPA has specifically requested comment on the Health Risk Reduction and Cost Analysis for the proposed MCLs and MCLGs, including the quantifiable and nonquantifiable health risk reduction benefits, the incremental costs and benefits of alternative MCL concentrations, and other factors such as data quality and uncertainty. Where states do not have the technical staff ability or capacity to provide a comprehensive review and provide comments, EPA should provide accessible guidance and training to assist states with providing the requested information, particularly for states without staff positions dedicated to addressing PFAS and other emerging contaminants.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on the HRRCA, please see section 13 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044777)

In addition, EPA should provide clarity, through the development of guidance, on the use of the HI approach for PFAS, including how His might be modified should additional data and information become available.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion on incorporating additional PFAS into the Hazard Index in the future, please see section 4.3.5 of the EPA response in this *Response to Comments* document.

Massachusetts Department of Environmental Protection (MassDEP) (Doc. #1726, SBC-045144)

2. Guidance and Training Needed

MassDEP recommends EPA prioritize the development of robust guidance, training, and implementation tools as part of the promulgation of the final rule.

PFAS will be the first new nationally regulated drinking water contaminant in over twenty years. State agencies and water systems should have clear guidance from EPA on rule implementation. Guidance, training, and implementation tools should be released when the rule is finalized, or as soon thereafter as feasible, so that all stakeholders are able to effectively implement the rule ahead of the compliance date. EPA should partner with the states in the development of guidance, training, and tools, which should include the following:

• Regulatory implementation guidance to ensure consistency across primacy agencies and EPA regions, including details on initial monitoring, compliance determinations, the trigger level for reduced monitoring, and using previously collected data for monitoring determinations.

• Templates for public notice, including minimum required elements.

• Detailed information for water systems on the available PFAS mitigation strategies that consider scalability, including considerations for using an alternative water source, POU and POE devices, and BAT installation.

• Updated guidance regarding residual waste handling and disposal, ideally including for POU devices.

• Detailed information for primacy agencies to aid in the review of PFAS mitigation strategies (i.e., installation of BAT, use of POU/POE devices, or switching to an alternative source), including best practices for ensuring the long-term maintenance of each strategy. This information should include recommended sampling plans for each option to ensure efficacy.

• Best practices for pilot testing BATs, including examples of successful pilot test results. To the extent practical, baseline water quality should be considered to guide pilot testing and effective treatment.

• Updated guidance on simultaneous compliance, especially in consideration of chemical contaminants, lead, corrosion control, and disinfection byproducts.

• Information on the expected compliance timelines for mitigating an MCL violation.

• Funding roadmap targeted at small and disadvantaged communities, outlining options across state and federal programs to ensure systems are funded in the most effective way possible.

• Guidance for water systems considering their treatment and non-treatment options to address the PFAS MCLs. EPA should include considerations such as the necessary operator skill level, the fraction of water wasted, waste disposal, maintenance and O&M costs in that guidance to ensure systems fully evaluate their options and understand the challenges associated with the various options.

• Updated in-depth simultaneous compliance guidance to help ensure that compliance with one contaminant is not being traded for another. Drinking water chemistry is very complex and we want to ensure treatment is protecting consumers from all NPDWR contaminants.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Massachusetts Department of Environmental Protection (MassDEP) (Doc. #1726, SBC-045147)

5. Public Communication

Risk communication

MassDEP recommends that EPA work directly with the Association of State Drinking Water Administrators (ASDWA) and its members as well as other stakeholders on developing risk communication materials for the PFAS NPDWR before the rule is final, including identifying and addressing gaps in currently available materials.

A substantial number of helpful risk communication resources, such as the Water Research Foundation's toolkit, as well as state-specific fact sheets and web pages, have been developed and released over the past few years. While these materials are helpful, EPA should provide additional risk communication resources for broad use across the water sector.

MassDEP appreciates EPA's willingness to work with the primacy agencies on risk communication after the Agency's health advisories were released in 2022. MassDEP recommends that EPA continue to ask the primacy agencies for feedback on the materials released by the Agency to identify areas that require clarification or improvement. These opportunities allow for engagement with primacy agency staff with expertise in public communication to substantially improve these materials. MassDEP recommends that EPA work directly with ASDWA and its members as well as other stakeholders on the risk communication materials for the PFAS NPDWR. Further, MassDEP recommends that EPA work with the primacy agencies prior to publication of the final rule to identify and address communication gaps. MassDEP recognizes that some materials will not be able to be publicly distributed ahead of time, but state staff can provide valuable insights to help improve EPA's communications materials.

To assist with the development of the risk communication materials, we've identified the following focus areas for EPA's materials:

• Explain the differences between the 2022 health advisories, the Maximum Contaminant Level Goal (MCLG), and the MCL, and what they mean from the perspectives of human health and feasibility.

• Explain the differences between Practical Quantitation Limit (PQL), Method Detection Limit (MDL), MRL, etc., and ensure that this explanation is consistently applied throughout EPA's materials, the rule language, and the preamble.

• Provide language for water systems to use when the results of PFAS testing are above detection and the health advisory but below the PQL.

• Further explain the rationale behind the trigger levels EPA has chosen for determining reduced monitoring. These levels are above the health advisories and therefore might require a more detailed explanation to the public.

• Provide further information as to what the Hazard Index (HI) is and how it relates to the MCLs.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Thurston Public Utility District (PUD), WA (Doc. #1729, SBC-043580)

I want to urge the EPA to proceed carefully so as to ensure personnel are appropriately educated with the adoption of new well-developed standards in an efficient manner that minimizes costly mistakes such as the acquisition of unnecessary or insufficient equipment or usage of improper procedures. We want to ensure updates in standards not only strengthen public health protections and environmental safety but are enforced appropriately. We advise that new rules harmonize with other related requirements and allow for a thorough plan for phased implementation.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. With regard to additional time for meeting MCLs (and therefore providing regulated PWSs more time to acquire necessary equipment and develop effective procedures), please see section 12.1 of the EPA response in this *Response to Comments* document.

U.S Conference of Mayors, National League of Cities and National Association of Counties (Doc. #1733, SBC-043894)

This discrepancy also makes it difficult for local leaders to effectively communicate the risk associated with PFAS to the public and will likely lead to confusion among residents as they seek to determine if their water is safe to drink. EPA should work with local governments and water utilities to collaboratively develop a risk communication toolkit that explains the relative public health risks and clarifies why additional measures are necessary despite higher current state and international standards. Importantly, this language and toolkit should be voluntary for local governments to use, rather than mandatory.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Michigan Section American Water Works Association (MI-AWWA) (Doc. #1734, SBC-044479)

Communication

The proposed rule would introduce yet another hazard index, further complicating an already difficult communication issue. To the lay person, any exceedance, whether regulatory or advisory, is deemed "unsafe." Communicating clearly and effectively the nuance associated with MCLs and how they relate to MRLs that perhaps change over time would be difficult for communication professionals. There are many water systems in Michigan that do not have communication professionals on staff and so their challenge would be even greater. Poor communication would at best confuse the public and erode their trust. At the worst, it could incite panic. Customers will be less inclined to use and pay for water, which exacerbates the financial burden of treating for PFAS.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. As mentioned in the EPA's response, the EPA will be releasing the Hazard

Index Calculator, which will support systems in calculating their individual Hazard Index. The Calculator is an informational technical assistance tool developed to assist drinking water systems and primacy agencies in calculating the Hazard Index, which should also help with communicating results of the calculation. For concerns regarding rule implementation and enforcement by primacy agencies, particularly related to record keeping, reporting, and enforcement, please see section XI in the FRN and section 11 of the EPA response in this *Response to Comments* document. For additional discussing the MRLs, please see section 5.1.2 of the EPA response in this *Response to Comments* document.

Arizona Corporation Commission (ACC) (Doc. #1735, SBC-045184)

Finally, the ACC believes the EPA should provide guidance on how small water utilities with insufficient operating revenues to service loans for FCRT can fund the addition of FCRT once federal funding at the state level is depleted.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The EPA notes there may be opportunities for many communities to utilize external funding streams to address such challenges. The BIL, the Low-Income Water Household Assistance Program through the American Rescue Plan, and other funding sources may be able to provide financial assistance for addressing emerging contaminants. In particular, the BIL funding has specific allocations for disadvantaged and/or small communities to address emerging contaminants, including PFAS. For example, the *Emerging Contaminants in Small or Disadvantaged Communities grant program* will provide states and territories with $5 billion to provide grants to public water systems in small or disadvantaged communities to address emerging contaminants, including PFAS. Grants will be awarded non-competitively to states and territories. For more on this, please see section XIII.J of the FRN. For additional discussion around federal funding, please see section 2.4 of the EPA response in this *Response to Comments* document.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045975)

Section 6.2: Communication

EPA is seeking comments on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public. AMWA is aware that EPA's PFAS Action Plan includes an action to work "collaboratively to develop a risk communication toolbox that includes multi-media materials and messaging for federal, state, tribal, and local partners to...help ensure clear and consistent messages to the public." The association would like to emphasize the critical need for these tools to be developed as soon as possible and asks EPA to include AMWA in the collaboration to work with the agency to develop useful and timely communication material that will help water systems explain EPA's decisions to the public.

EPA should also be at the forefront of explaining the relative risk from drinking water compared to all PFAS exposure pathways. The public should be informed of the other sources of PFAS and

how drinking water is only a portion of that. This helps the public make decisions that can limit their PFAS exposure from more than just drinking water, which further protects public health, and does not place the entirety of blame on PWSs. Water systems are removing contaminants from drinking water that other parties put in, so EPA and water systems need to work together on messaging to inform the public about who is responsible for contamination, what can be done to lessen or stop it, and what choices consumers can make to limit their exposure.

An important message that has been made difficult to communicate to the public is letting customers know that their water is safe to drink, even when PFAS concentrations are below detection limits. EPA's announcements of health advisories that are in the parts per quadrillion realm made it difficult to say that the water was safe to drink because water systems cannot detect the presence of contaminants at those levels – and therefore cannot tell customers whether their water meets EPA's health advisory. Additionally, EPA had proposed using drinking water health advisory levels for HBWCs in this NPDWR rulemaking. Questions will arise on why the health advisories are used for some PFAS but not others, and the public will lose trust in drinking water if these inconsistencies are not effectively communicated. EPA made these decisions based on its analysis, and, therefore, should be the leader in these communication efforts.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The commenter incorrectly stated that the EPA has proposed using drinking water health advisories as health-based water concentrations (HBWCs) under this rulemaking. The EPA's previous issuance of the PFAS health advisories is outside the scope of this action. Drinking water health advisories are distinct from MCLs and MCLGs, including the HBWCs that were derived as part of the Hazard Index MCLG, as each serves a different purpose. Health advisories provide technical information on chemical and microbial contaminants that can cause human health effects and are known or anticipated to occur in drinking water. Health advisories primarily serve to provide information to drinking water systems and officials responsible for protecting public health when emergency spills or other contamination events occur. The health advisories help Tribes, states, and local governments inform the public and determine whether local actions are needed to address public health impacts in affected communities. The EPA's HA documents describe information about health effects, analytical methodologies, and treatment technologies. HAs are not legally enforceable federal standards and are subject to change as new information becomes available.

As mandated by SDWA, MCLGs are proposed and finalized when promulgating NPDWRs. The EPA proposed and is now finalizing the Hazard Index MCLG as part of this rulemaking. The agency documented the derivation of the HBWCs for each of the four PFAS considered in the Hazard Index MCLG in the document titled "Maximum Contaminant Level Goals (MCLGs) for Three Individual Per- and Polyfluoroalkyl Substances (PFAS) and a Mixture of Four PFAS" (USEPA, 2024e). This derivation was independent of the publication of the health advisories for HFPO-DA and PFBS in 2022, though the HBWCs cite to the same toxicity assessments for these two chemicals (USEPA, 2021a; USEPA, 2021b) as the previously published health advisories.

Please see section 4.3 of the EPA response in this *Response to Comments* document for how the EPA set the Hazard Index MCLG.

Association of Metropolitan Water Agencies (AMWA) (Doc. #1738, SBC-045976)

This communication would be helpful for utilities to use in their CCRs. AMWA would like to stress that not all communication techniques work for every utility, so it is important any EPA language be guidance, not required CCR language, for water systems. AMWA welcomes the opportunity to partner on PFAS communication efforts but believes EPA should be the leader in developing and disseminating communication on PFAS health advisories, MCLs, and all information related to the PFAS NPDWR to the public.

EPA Response: Please see the EPA's response regarding "this communication" in the EPA response to comment Doc. #1738, SBC-045975 in section 1.2 in this *Response to Comments* document. For additional communications and guidance concerns, please see section 1.2 of the EPA response in this *Response to Comments* document. For discussion regarding required communications, such as CCRs and PN, please see section 9 of the EPA response in this *Response to Comments* document, particularly the EPA response to comments Doc. #1738, SBC-045971 and Doc. #1738, SBC-045974 in sections 9.1 and 9.2, respectively, in this *Response to Comments* document. Health advisories are outside the scope of this rulemaking. For discussion on the individual MCLs, including risk communication and feasibility concerns, please see section 5.3.1 of the EPA response in this *Response to Comments* document.

Del-Co Water Company, Inc. (Doc. #1744, SBC-043618)

Many questions have been raised in communities dealing with PFAS contamination, especially about potential impacts to health, with very few direct answers available from primacy and health agencies. EPA must be better prepared to answer questions and address mounting concerns of residents, and to assist PWS which are often the first responders for questions from their customers. We also believe that there needs to be more communication by EPA to consumers regarding the other routes of exposure; it does a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g. consumer products, food). EPA must consult with risk communication professionals to develop more meaningful messaging.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Connecticut Department of Public Health (CT DPH) (Doc. #1745, SBC-045204)

5. CT DPH recommends EPA provide public communication materials. Consistent messaging regarding PFAS risks from an authoritative federal source can help alleviate confusion, foster trust, facilitate awareness and promote compliance. Adaptable and customizable public notice

templates for public water systems to notify their customers of various monitoring and occurrence outcomes could help ensure consistent and timely communications.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Connecticut Department of Public Health (CT DPH) (Doc. #1745, SBC-045238)

2. EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

It is essential that risk communication resources and materials come directly from EPA. States and water systems need tools to communicate the health and environmental risks from PFAS to their residents and customers. While PFAS risk communication resources are available from various sources (states, agencies, organizations, etc), EPA needs to set the standard for the states and the water utility sector. This is an opportunity for EPA to define the overall risk communication messaging and language, define the national context, and establish consistency across the nation. Consistent messaging regarding PFAS risks coming from an authoritative federal source can help alleviate confusion, foster trust, facilitate awareness and promote compliance. Adaptable and customizable public notice templates for public water systems to notify their customers of various monitoring and occurrence outcomes could help ensure consistent and timely communications.

Resources developed and disseminated by EPA need to clearly explain the key concepts of the NPDWR in plain, consistent language the general population can understand. Specifically, Health Advisories, Maximum Contaminant Level Goals, and Maximum Contaminant Level need to be explicitly described and their differences clarified. Furthermore, these concepts need to be examined from a human health feasibility perspective and their implications need to be expounded upon.

Since drinking water is only one means of exposure for PFAS, other exposure routes need to be mentioned without confusing or negating the importance of this rule. These routes need to be considered, placed in context, and characterized with respect to PFAS sources in drinking water.

While the concept of the Hazard Index may be familiar to some, it is probably a new concept for the general public that needs to be clearly spelled out. How the Hazard Index works, why it is useful, how it relates to the Maximum Contaminant Levels, and the assumptions of the "PFAS Mixtures Framework" need to be addressed. Furthermore, the utility of dealing with PFAS as a class or group of chemicals using the Hazard Index also needs to be pointed out.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Connecticut Department of Public Health (CT DPH) (Doc. #1745, SBC-045215)

EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

Because the HI approach is new to drinking water regulation, EPA should define "Hazard Index" or "HI" in all publications or communications by providing the HI formula to avoid misinterpretation that the number "1.0" represents a water concentration. EPA should also develop risk communication messages to help water systems interpret HI for the reasons mentioned in Comment 3.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Connecticut Department of Public Health (CT DPH) (Doc. #1745, SBC-045239)

Under the Safe Drinking Water Act "Right to Know" community water systems would be required to report detected PFAS in their annual Consumer Confidence Reports. This would require the reporting detections of PFAS in the NPDWR; specifically, individual concentrations for PFOA and PFOS, and concentrations and Hazard Index for mixtures of PFHxS, HFPO–DA (GenX), PFNA, and PFBS. While many of the larger public water systems in Connecticut that voluntarily tested for PFAS are already reporting PFAS results in their Consumer Confidence Reports, smaller systems may require technical assistance and could benefit from EPA guidance. Therefore, we urge EPA to set the standard, provide clear and understandable messaging, and provide effective resources all public water systems can use.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on SDWA Right to Know, please see section 9 of the EPA response in this *Response to Comments* document.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045253)

Lastly, more specific implementation guidance is needed for non-transient non-community water systems that will be subject to the rule, such as schools and hospitals.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional information on which entities the rule applies to, please see section 1.4 of the EPA response in this *Response to Comments* document.

Harris County Attorney's Office (HCA) (Doc. #1751, SBC-045263)

EPA should provide robust guidance and assistance to water systems, especially those in EJ and low-resource areas, on pathways to avoid shifting the cost of PFAS cleanup onto overburdened communities.

HCA requests EPA develop guidance on 1) applying for and navigating grant funding, 2) other potential funding sources 3) recommended technologies, 4) best practices to ensure sufficient notice is given to residents on PFAS should be provided to water systems, with a particularized guidance to aiding small, rural, and EJ communities. This guidance should be easily accessible to water systems and should be made available online or through request. EPA should make efforts to communicate the availability of this guidance to all regualted entities and the public.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. The EPA acknowledges the potential for implementation challenges for overburdened communities; however, to help address the challenge of funding availability particularly in low-resource areas, there may be opportunities for many communities to utilize external funding streams to address such challenges. The BIL, the Low-Income Water Household Assistance Program through the American Rescue Plan, and other funding sources

may be able to provide financial assistance for addressing emerging contaminants. In particular, the BIL funding has specific allocations for disadvantaged and/or small communities to address emerging contaminants, including PFAS. For example, the *Emerging Contaminants in Small or Disadvantaged Communities grant program* will provide states and territories with $5 billion to provide grants to public water systems in small or disadvantaged communities to address emerging contaminants, including PFAS. Grants will be awarded non-competitively to states and territories. For more information, please see section XIII.J in the FRN. For additional discussion federal funding programs, please see section 2.4 of the EPA response in this *Response to Comments* document.

Environmental Council of the States (ECOS) (Doc. #1752, SBC-044502)

Risk Communication

ECOS appreciates EPA's work to coordinate with states on risk communication activities around PFAS and encourages EPA to continue to work with states to develop risk communication materials related to the NPDWR before rule finalization. As public awareness and concern over PFAS has grown, the ability for states in coordination with EPA to communicate consistent messages to the public using EPA risk communication materials has only become more critical. Some areas that would benefit from additional risk communication materials include information on the differences between health advisories, Maximum Contaminant Levels (MCL), and Maximum Contaminant Levels Goals (MCLG); the meaning of a hazard index approach to capture risk from four PFAS chemicals together; the difference between chronic and sub-chronic exposure and clarity around developmental endpoints; and how running annual and quarterly averages will be used to identify compliance and violations. Strong centralized messaging and risk communication materials will help states better communicate with the public and facilitate the successful implementation of the PFAS rule.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

El Paso Water (Doc. #1757, SBC-044520)

EPA role to identify sources of PFAS exposure

It is to the benefit of the EPA and all water suppliers that the public be made aware that PWSs are not the primary or only source of PFAS exposure. The revision's requirements for testing put much of the responsibility for PFAS detection and removal on PWSs, which could create the perception among consumers that their drinking water suppliers are the main source of PFAS exposure. However, with PFAS exposure stemming from contact with many everyday items such as household cleaners, personal care products, fire extinguishing foam and fire retardants as well as food and food packaging, it is important for EPA to increase understanding of the harmful effects of a customer's exposure from these items. This information will help influence consumer behavior and put more of a burden on manufacturers to find PFAS-free alternatives.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

El Paso Water (Doc. #1757, SBC-044531)

And we must examine the requirements for additional public notification when there is no need and when the public at large has little context on the complicated issue of PF AS.

Thank you for taking these considerations under advisement as you deliberate the NPDWR revisions.

Sincerely,

Gilbert Trejo, P.E.

Vice President – Operations & Technical Services

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on PN, please see section 9.2 of the EPA response in this *Response to Comments* document.

Arizona Water Company (Doc. #1758, SBC-044532)

May 30, 2023

United States Environmental Protection Agency Office of Groundwater and Drinking Water
1200 Pennsylvania Ave NW

Washington, DC 20460

Re: EPA PFAS Rule

To Whom It May Concern:

Introduction and Background

Arizona Water Company ("Company") is a privately owned water utility that serves over 29 communities throughout the state of Arizona. Like many other water utilities, the Company is impacted by the proposed new per- and polyfluoroalkyl substances ("PFAS") rule issued by the Environmental Protection Agency ("EPA"). The Company compiled comments on the proposed PFAS rule, stated below.

PFAS Removal Costs and Funding

PFAS removal facilities are completely new to operators and management and will require training and demonstration facilities. While the EPA's three currently known treatment technologies of granular activated carbon (GAC), ion exchange (IX), and reverse osmosis and nanofiltration (RO/NF) are similar to existing treatment technologies, the Company does not

operate any current treatment facilities to remove PFAS in its water systems. It will be helpful for operators and management to gain experience and training with treatment facilities using these technologies in a demonstration setting. The Company recommends the EPA fund training and demonstration facilities as they will be helpful for numerous private and public water utilities. The Company participated in two arsenic treatment facilities demonstrations and would like to participate in similar demonstrations for PFAS treatment facilities.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion around treatment, please see section 10.1 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045628)

Beyond the technical challenges of this aspect of the proposed monitoring requirements, there are challenges with the risk communication of associated results it would produce. As proposed, EPA would require that PFAS monitoring levels be described in two different ways. Risk communication will be especially challenging for water systems with observed values below the PQL, as they will have a reporting PFAS values based on the RAA for MCL compliance and a separate value for reduced monitoring eligibility. It is unclear if EPA has considered how these data would be reported and communicated to the public in a meaningful manner.

Analytical results below the PQL should not be used, rather the rule requirements should use 0 ppt for all analytical results below the PQL. Consistent with previous AWWA comments, AWWA recommends that one-half the MCL be used to determine if PFAS levels at an entry point are reliably below the MCL.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion around the PQL, as well as monitoring and reporting, please see sections 5.1.2 and 8.2 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-047694)

EPA's proposed use of the general hazard index combining risks across multiple health outcomes prevents water systems from having a effective risk communication strategy. If EPA moves forward with any rule using the hazard index, risk communication should be considered more carefully.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Connecticut Section of the AWWA (CTAWWA) and Connecticut Water Works Association (CWWA) (Doc. #1763, SBC-044238)

• Communication

As utilities and water industry professionals, we have communicated directly with customers and stakeholders since 2013 when the UCMR3 monitoring period commenced. Although the PFAS topic is challenging and complex to understand, communication materials from regulators have been limited. Consequently, we have consistently observed misunderstanding amongst customers and inconsistency in messaging amongst utilities. Further compounding this issue are the existing regulatory differences between states, many of whom have varying enforceable MCLs, and the EPA. We encourage EPA to share communication materials and guidance immediately upon finalizing the PFAS Rule. Delays in these materials impact both the primacy agency and CTAWWA and CWWA members, who are compelled to individually and inefficiently develop their own materials to address customer concerns.

Thank you for carefully considering our comments on the proposed PFAS Rule. We would be pleased to discuss these comments and any resulting questions with you and your team, as well as collaborate with your agency to address the concerns we have pointed out.

Sincerely,

Daniel Lawrence, P.E.

President, CWWA

Alexander M. Cosentino , P.E., BCEE, CCM

Chair, CTAWWA

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044250)

Guidance and Training

EPA must develop a robust guidance, training, and implementation plan that includes tools for assisting public water systems and state primacy agencies for achieving and maintaining compliance with these proposed regulations, including solids generated during the treatment process. NMED also believes that these guidance, training, and implementation materials must be developed in a manner that allows small and underserved community water systems to easily understand and effectively implement the proposed regulations. The development of these materials should be completed prior to the promulgation of the final rule. This is the first newly regulated drinking water contaminant in over twenty years. States and water systems need clear guidance from EPA on implementing the new rule.

Risk Communication

As a result of several highly publicized drinking water contamination events across the country, the general public appears to be increasingly skeptical about the safety of community drinking water supplies. NMED believes that EPA has a responsibility to work with state primacy agencies ahead of final rule publication to develop and disseminate risk communication materials to the public and water systems and their customers. NMED recommends that EPA work with state primacy agencies, state departments of health, and organizations such as ASDWA to develop robust risk communication materials to ensure that public water systems and their customers fully understand the health impacts of PFAS and other drinking water contaminants in their drinking water supply. This should include easily understood public notice templates that public water systems and state primacy agencies can use to communicate information to public water system consumers.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044256)

Other Concerns

NMED strongly encourages EPA to directly engage with states and organizations to develop guidance on treatment technologies and invest funding into evaluations of these treatment technologies to support state programs.

NMED recommends that EPA develop guidance for water systems considering their options to address the PFAS MCL, both treatment and non-treatment. EPA should include some of the above considerations in that guidance material to ensure systems fully evaluate their options and understand the challenges associated with the various options. EPA should include considerations for regionalization/consolidation and utilize the opportunity to encourage systems that are currently not viable to connect to viable water systems.

EPA should prioritize research on waste disposal methods and move to address PFAS waste disposal utilizing a regulatory mechanism as soon as possible to ensure that PFAS contamination isn't being moved from one media type to another. ASDWA recommends that EPA finalize the Agency's Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances ahead of the final rule.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For additional discussion on treatment and waste disposal, please see section 10 of the EPA response in this *Response to Comments* document, particularly sections 10.1 and 10.4. For the remainder of concerns brought up in this comment, please see the EPA response to comment Doc. #1628, SBC-044109 in section 1.2 in this *Response to Comments* document.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044248)

EPA, like states, must continue to move quickly to protect communities from these toxic chemicals. This rulemaking and the many other actions underway by EPA are necessary to ensure federal, state, tribal and local governments have the regulatory framework, tools, and resources needed to protect human health and the environment. Throughout development and implementation of the final rule, EPA must lead the way for states, tribes, and local governments with strong risk communication resources and tools. Federal support for effective risk communication about PFAS contamination and cleanup must address the needs of minority and disadvantaged communities and support environmental justice and equity across all communities impacted by PFAS.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Council of State and Territorial Epidemiologists (CSTE) (Doc. #1770, SBC-044261)

2. Epidemiological Assessments: The proposed new testing standards are expected to necessitate additional epidemiologic assessments to evaluate a variety of health effects. While these epidemiological assessments will result in a better understanding of population exposure levels and serum concentrations and the results would help inform prioritization of high-risk groups and outreach efforts it is anticipated that epidemiological programs will require additional resources to assess potential health impacts of PFAS at the proposed levels, and especially for several PFAS which have not yet been researched thoroughly for their impact on health. As discussed in the rule, epidemiological studies on the impact of the proposed MCLs on varying ethnic groups and disadvantaged communities will also be necessary. Public health agencies will need dedicated resources to support analytic requests and CSTE recommends support for responding to underserved or resourced areas. CSTE supports development of guidelines, similar to the development of the cancer cluster guidelines to respond to the increase in requests for a wide range of epidemiologic assessments to assess health effects.

3. Risk Communication Needs: Given the magnitude and scope of proposed changes it is anticipated risk communication materials will be needed to inform various audiences such as the general public, clinicians, business, community groups, water operators, and private well owners. Risk Communication materials are needed for the general public on the Hazardous Index. Consistent public messaging for when PFAS levels are slightly above the MCL, communication to health care providers to promote awareness, communication for health care providers on how to counsel their patients, communication packages that can assist water companies, as well as communication materials for private well owners are anticipated. Further, public health agencies are expected to need to consult on what actions will need to be taken by consumers, especially as testing results will likely change over time. It is anticipated private companies may offer testing and having clear recommendations on the effectiveness of testing practices as well as effective

remediation actions and the length of time necessary for improvements will be part of what public health agencies will be asked to consult on.

EPA Response: Regarding risk communication, please see section 1.2 of the EPA response in this *Response to Comments* document. While beyond the scope of this rulemaking, the EPA acknowledges the commenter's statements on the importance of additional epidemiological programs and research to evaluate a variety of health effects from PFAS. In response to the commenter's mention of "epidemiological studies on the impact of the proposed MCLs on varying ethnic groups and disadvantaged communities", the agency notes as part of its EJ analysis for the final rule, the EPA conducted a literature review that includes discussion of available literature that identify demographic disparities in adverse health outcomes. For more information, including the findings and limitations of these studies, please see Section 8.2 of the EA.

Council of State and Territorial Epidemiologists (CSTE) (Doc. #1770, SBC-044258)

Public Health Agencies (PHAs) across the U.S. face many challenges in their efforts to collect and provide complete, timely and accurate information for decision- making, and in communicating the risks and response to communities related to PFAS, PFOA and PFOS. The availability of feasible, effective guidelines to regulate PFAS levels in drinking water is crucial to assisting PHAs with reducing PFAS pollution, protecting public health, and delivering safe drinking water.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Bailey Smith (Doc. #1787, SBC-045810)

B. How Water Systems Can Communicate EPA's Science to the Public

EPA seeks comment on how water systems can effectively communication information about the EPA's proposed rule to the public. [FN16: Proposed Rule, supra note 3 at 18731.]

A study from the PEW Research Center indicates that eight in ten Americans receive their news from digital devices. [FN17: Elisa Shearer, More than eight-in-ten Americans get news from digital devices, PEWRESEARCH.ORG (Jan. 12, 2021), https://www.pewresearch.org/short-reads/2021/01/12/more-than-eight-in-ten-americans-get-news-from-digital-devices/.] More specifically, most Americans get their news from news websites or apps. [FN18: Id.] The second most common method of news consumption is through search engines, and the third most common is by social media. [FN19: Id.] As such, one option that public water systems ("PWS") can explore in communicating information about EPA's proposed rule (and its subsequent impacts on the PWS) to the public is to engage with local news outlets who publish their news on smartphone applications. Because this is the most common method of news consumption among American adults,[FN20:Id.] this may be the best way to reach a widespread audience.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Fairfax Water (Doc. #1789, SBC-045297)

Utilities rely on EPA to be able to effectively communicate the rationale and health implications of drinking water rules since EPA is the entity that undertakes the scientific analysis. This information should be easy for the public to understand and address the risk of PFAS in drinking water relative to other exposure routes such as food and consumer products. EPA should provide water utilities with communication materials, including factsheets and text for use on websites, Consumer Confidence Reports, and Frequently Asked Questions that explain the health risks from PFAS in drinking water relative to other exposure routes.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Fairfax Water (Doc. #1789, SBC-045317)

7. Utilities need a comprehensive understanding of EPA's proposed regulatory framework for PFAS from drinking water sources of supply to water treatment plant residuals in order to make cost effective decisions and reduce rate impacts to our customers.

Fairfax Water appreciates the opportunity to comment on EPA's proposed PFAS National Primary Drinking Water Regulations. Please let me know ifwe can provide any additional information or share our utility operating expertise to inform improvements to the proposed rule with the goal of ensuring its successful implementation.

Sincerely,

Jamie Bain Hedges,

P.E. General Manager

Attachment: Illustrative Schedule to Implement PFAS Treatment

Representative Gerry Connolly

Representative Don Beyer

Representative Jennifer Wexton

[Attachment 1: see docket ID EPA-HQ-OW-2022-0114-1789]

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Safe Drinking Water Branch, Hawaii Department of Hawaii (Doc. #1801, SBC-043756)

Other PFAS Contaminants and the Health Language

As more than 14,000 PFAS contaminants have been found in the environment and 29 PFASs are under study in UCMR5, can EPA provide more thoroughly health language? It will provide the state agency, and water purveyors a valid and authoritative source to address the detection of PFASs in press release and CCR. Furthermore, it will avoid the confusion among the public.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Please see section 9.1 of the EPA response in this *Response to Comments* document for discussion of the CCR.

Millie Garcia-Serrano (Doc. #1803, SBC-044288)

4. Risk Communication: The proposed MCLGs are higher than EPA's 2022 Lifetime Health Advisories for the same PFAS contaminants. The proposed MCLGs are also considerably lower than the previous 2016 Health Advisory (still currently used as an action level by the Department of Defense), the May 2023 Regional Screening Levels (RSLs) used in the CERCLA program, and most of the drinking water standards promulgated by States. As such, we are extremely concerned about how to approach health risk communication with the public and stakeholders. ASTSWMO members face continual risk communication challenges, as they attempt to explain the myriad of different risk-based standards employed in different contexts to constituents who are justifiably concerned about PFAS concentrations in their drinking water. ASTSWMO requests a greater degree of consistency between the values issued by different offices of the EPA and more straightforward risk communication guidance. While this proposed drinking water rulemaking is extremely important to further the goal of regulating PFAS at a federal level, ASTSWMO recognizes that other regulatory programs (e.g., CERCLA, RCRA), and their respective decisions, rely on the science used to derive drinking water standards. ASTSWMO strongly urges more coordination across all EPA programs, particularly when developing other health-based standards in the future (e.g., soil, air).

EPA Response: Please see the EPA response to comment Doc. #1583, SBC-042400 in section 1.2 in this *Response to Comments* document.

Millie Garcia-Serrano (Doc. #1803, SBC-044294)

Finally, ASTSWMO recommends the development of guidance documents and training following the promulgation of the PFAS NPDWR, and to the extent possible, requests that some of the training modules provide a crosswalk between the SDWA rule and CERCLA and RCRA programs managed by our membership.

ASTSWMO appreciates EPA's efforts to address PFAS contamination through this rulemaking and looks forward to participating in the continuing development of an effective national

regulatory framework for PFAS contaminants in the environment. If you have any questions about these comments, please contact me at millie.garcia-serrano@mass.gov or (508) 946-2727.

Sincerely,

Millie Garcia-Serrano (MA)

ASTSWMO President

cc: Dania Rodriguez, ASTSWMO

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. Although out of scope of this rulemaking, for additional discussion on possible future regulatory actions through CERCLA and RCRA, please see section 10.4.2 of the EPA response in this *Response to Comments* document.

National Ground Water Association (NGWA) (Doc. #1804, SBC-045457)

EPA should support an education and outreach effort to assure proper sampling techniques are followed. Consideration of strategic partnerships with approved water-related groups such as NGWA, will help facilitate the timeline and efficacy of the education.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

National Ground Water Association (NGWA) (Doc. #1804, SBC-045463)

Communication - Technical and risk communication to water supply customers will be critical. Since PFAS is widely reported in the media, clear, specific information that tells the public how to respond is important, rather than to report that it is found and is a potential problem. Clearly communicating when a problem is more likely is more useful.

In cases of small water systems and private well owners, the best relationships may be between water contractors and their customers rather than regulatory agencies and small and private system consumers. EPA should focus on what information water contractors could usefully communicate to their customers regarding PFAS and meeting health protective requirements. A significant education and outreach program to reach water consumers in meaningful ways should be implemented.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Florida Rural Water Association (FRWA) (Doc. #1806, SBC-044699)

Messaging to customers needs to be careful not to scare the public and lose confidence in drinking water and driving them to alternatives to public supply that are much more costly and often not as regulated.

Another concern with the promulgation of this proposed PFAS regulation is that it is not accompanied by guidance regarding public messaging.

For these reasons, on behalf of Florida's drinking water systems, we urge you to carefully consider the economic and social impacts of federal PFAS regulation. Thank you for considering these comments.

EPA Response: Regarding risk communication and guidance, please see section 1.2 of the EPA response in this *Response to Comments* document. Please see section 13 of the EPA response in this *Response to Comments* document for discussion of economic impacts. Regarding the social impacts of the NPDWR, the EPA anticipates that once implemented, the regulation will improve drinking water quality and ultimately improve public confidence in the safety of their drinking water.

Wisconsin Department of Health Services (Doc. #1823, SBC-044282)

Transparent, prompt communication about contaminant levels can build confidence in drinking water and reduce risk to human health. There is significant community and media interest in PFAS, and there is widespread contamination at low levels throughout the environment: 34% of public water systems that participated in a recent voluntary sampling project in Wisconsin had detectable levels of any of the six PFAS with proposed MCLs. Prompt, responsive, and thoughtful risk communication can provide people with the information they need to make decisions while avoiding the risk of creating undue concern by leading people to think information has been hidden from them.

We look forward to continued dialogue and engagement between EPA and the states about these important steps to protect public health from unsafe exposures to PFAS in drinking water. We are encouraged by action taken to date and expect that a continued emphasis on protecting those at greatest risk will be valuable. If you have questions or would like to discuss these comments further, please contact me at mark.werner@dhs.wisconsin.gov or 608-264-9880.

Sincerely,

Mark A. Werner, PhD

Director, Bureau of Environmental and Occupational Health

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

New England Water Works Association (Doc. #1836, SBC-045393)

It is imperative that EPA immediately develop an appropriate communication strategy so that water suppliers are not left on their own to individually figure out how to handle risk communication. Thus far, there have been many questions raised by residents at public forums in the communities grappling with PFAS contamination, especially about potential impacts to health, with very few direct answers available from primacy and health agencies. EPA must be better prepared to answer questions and address mounting fears of residents, and to assist PWS which are often the first responders to questions from their customers. We also believe that there needs to be more communication by EPA to consumers regarding the other routes of exposure; it does a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g., consumer products, food). EPA must consult with risk communication professionals to develop the messaging as the materials EPA has made available thus far are not particularly helpful.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Citizens Energy Group (Doc. #1838, SBC-044869)

Section X – Safe Drinking Water Right to Know

EPA requests comment on what may be needed for water systems to effectively communicate information about the PFAS NPDWR to the public.

Community water systems are not the experts in the health effects of PFAS compounds, nor in the toxicity of individual compounds or the mixtures seen in the environment, or on the potential sources of PFAS in the environment. Ensuring that water systems and the state and tribal agencies have communication messages and tools from the EPA will help ensure consistent communication across the U.S.

EPA Response: Regarding communication and tools, please see section 1.2 of the EPA response in this *Response to Comments* document.

Alexa Sofia Mendoza (Doc. #1966, SBC-046307)

We as the people have a right to know about the things that are put in our water. Water is important for all forms of life. Having these things reported and known to the public will make people reduce the hazardous amounts of these PFAS in our drinking water. *especially HFPO-DA (commonly referred to as GenX Chemicals* That can even have hazardous levels for us to drink. This would limit the number of deaths and can also reduce many of these water borne illnesses! As a young person I would like to be notified of the things in my water, and I want the population to know when these levels get out of hand and to force the govenemernment and

other compaines to make a change if the population knows about these awful levels of chemicals in our water, FORCE THEM TO CHANGE THESE LEVELS BY TELLING US THE TRUTH!

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Tor Olsson (Doc. #3041, SBC-047329)

We must also focus on education and publicity as well. People should know what they are being exposed to, and the potential acute or chronic effects that can come from these chemicals. If people understood the full scale of the consequences of PFAS exposure, it could potentially lead to them becoming more involved in the policy process if they knew how it could affect them. We can no longer let profits get in the way of our lives. The time for regulation is now.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Kimley Horn & Associates (Doc. #3072-23, SBC-046352)

Hi, this is Tanya Miro, and I work actually as a consultant with municipalities in the water and wastewater industry. And as this, I think it's great that we're finally looking at these chemicals in our water. However, as I'm working with municipalities, there is strong and great concern in regard to how they are going to manage public outreach, and the perception that they are the ones who have contaminated their water. How do we put programs in place to mitigate their industrial users is also a strong concern. As they're coming to us, we are collaborating with our water boards and TCEQ just to get feedback in regard to how we're going to manage the efforts of these new regulations and policies and be able to manage things with the lack of resources within all of the organizations. So, recognizing that this is going to overload our labs, and also put a strong restraint on our municipal operations teams, really we are looking to see what kind of programs are going to be provided from EPA to help enhance those elements, and educate both the public and operations for water operations how they need to mitigate and manage this element. Really, I'm glad that we've finally started looking at these chemicals, but it is going to really call for a holistic view between water and wastewater, as well as all of the lab services and other industrial users. So really, coming at this with a holistic approach, and feel like EPA needs to help with putting some guidelines in place that will really help to bring that kind of circular concept in place, so that PFAS can be addressed in all areas, not just one.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Gina Hara (Doc. #3072-69, SBC-046383)

Hello, my name is Gina Hara. I'm from Oahu, Hawaii. My background is that for the past eight years I have been going to every single meeting regarding the Red Hill oil spill. Actually, there's

so many oil spills, but it's 27,000 initial gallons in 2014 and a total of, by the time 2021, maybe 180,000 gallons. More than ever though, we are more afraid now of the PFAS that we found out is in the water aquifer and the water that we drink here is with your new standard. Actually, it makes ours dangerous and we didn't know. We didn't know we had been drinking that and it was only in 2021 that we were notified. So, what I want to suggest is that one, you need to stop the flow of PFAS, so we need to stop the PFAS from even being produced. I think that the EPA needs to clarify your verbiage to the state departments because they are testing for PFAS, but then they say it doesn't match your MCL description, so then they are unable to tell us that it's safe or not. So there needs to be coordination on all these forever chemicals. And secondly, I would like to suggest that the remediation we also encouraged in terms of bioremediation, that is multifaceted. That means using indigenous microbes that have been attenuated with the PFAS eating microbes. This is based on Korean natural farming practices where with indigenous microbes you can make friends with those that eat either oil or those that eat PFAS. This would rapidly help solve everybody's problems as every single military base seems to have been contaminated, at least their aquifer has. Thank you for your time and allowing me to speak.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. In response to the commentor's request to "stop the flow of PFAS," please see section 15 of the EPA response in this *Response to Comments* document, which discusses the EPA's efforts under the PFAS Strategic Roadmap to address PFAS with a whole-of-agency approach. Please see this same section for topics outside the scope of the final NPDWR, including non-drinking water sources of PFAS and bioremediation. The EPA acknowledges the commenter's suggestion on bioremediation. The EPA notes that the agency and others are researching the potential of different destruction technologies for PFAS, including bioremediation.

Citizens Campaign for the Environment (Doc. #3072-64, SBC-047394)

Also, we recommend EPA be prepared with accurate educational information to assist communities and water suppliers that are exceeding MCLs. We've seen here in New York State that many water suppliers don't have the knowledge or capacity to effectively communicate these risks to the public.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042892)

We want to caution EPA that any required educational statements must have clear and appropriate messaging. MWWA believes EPA must revisit its proposed required Standard Health Language for Public Notice, as it is not well written, nor easily understood by the lay person. While by no means perfect, MassDEP's language is more easily understood than EPAs: "Some people who drink water containing these PFAS in excess of the MCL may experience

certain adverse effects. These could include effects on the liver, blood, immune system, thyroid, and fetal development. These PFAS may also elevate the risk of certain cancers."

In Massachusetts, the notices MassDEP requires suggest that consumers in sensitive populations use alternative sources of water, yet there is very little guidance given as to what alternatives are guaranteed to be "PFAS-free." The guidance on MassDEP's own website regarding Point of Use filters states "Treatment systems and devices are not specifically designed to meet Massachusetts' drinking water standard for PFAS6. There are systems that have been designed to reduce the sum of PFOS and PFOA to below EPA's former Health Advisory of 70 ng/L. Any treatment device you use should be certified to meet the National Sanitation Foundation (NSF) standards to remove PFOS and PFOA compounds so that the sum of their concentrations is below 70 ng/L. Please be aware that 70 ng/L is significantly greater than the MassDEP's drinking water standard of 20 ng/L for the PFAS6 compounds. Many of these treatment devices certified to meet NSF standards will likely be able to reduce PFAS6 levels to well below 70 ng/L, but there are no federal or state testing requirements for these treatment devices. If you choose to install a treatment device, you should check to see if the manufacturer has independently verifiable PFAS6 monitoring results demonstrating that the device can reduce PFAS below 20 ng/L." It is very confusing for the public to be instructed to seek alternative supplies, yet not be provided with definitive information on what those alternatives are. EPA should concurrently encourage NSF to begin a process to certify Point of Use filters for PFAS removal to the levels of the proposed MCL if EPA is going to suggest this approach as an alternative. The public deserves to have the information necessary to make informed decisions and not be at the mercy of the water filter dealers. Since EPA issued interim Health Advisories for PFOA and PFOS stating that there are health effects at levels thousands of times lower than current lab detection limits, suggesting alternative compounds the problem. No water source (PWS, private well, bottled water) or treatment technology can claim to achieve full protection from health impacts of PFOA and PFOS since laboratories cannot come close to detecting these contaminants anywhere near the purported Health Advisory level.

It is imperative that EPA immediately develop an appropriate communication strategy so that water suppliers are not left to individually figure out how to handle risk communication. Thus far, there have been many questions raised by residents at public forums in the communities in Massachusetts that are grappling with PFAS contamination, especially about potential impacts to health, with very few direct answers from MassDEP and the Massachusetts Department of Public Health available. EPA must be better prepared to answer questions and address mounting fears of residents, and to assist PWS which are often the first responders to questions from their customers. As stated before, MWWA believes that there needs to be more communication by EPA to consumers regarding the other routes of exposure. It is a disservice to the public if the EPA and the states focus on drinking water to the exclusion of other, perhaps more significant PFAS contributions to one's body burden (e.g., consumer products, food). EPA must consult with risk communication professionals to develop the messaging, as the materials EPA has made available thus far are not particularly helpful.

EPA Response: Please see section 1.2 of the EPA response in this *Response to Comments* document. For more information on laboratory considerations, including capacity and capability, as well as practical quantitation limits in setting the MCL, please see section 5.1.2 of the EPA response in this *Response to Comments* document. For information about required education statements and communication, such as the CCR and PN, please see sections 9.1 and 9.2 of the EPA response in this *Response to Comments* document. For discussion on small system compliance technologies, such as point of use (POU) filters, please see section X.D of the FRN and section 10.5 of the EPA response in this *Response to Comments* document. Certification of filters is outside the scope of this rulemaking.

1.3 Other General Information

Summary of Major Public Comments and EPA Responses

This *Response to Comments* document section contains comments which generally support, oppose, or suggest modifications to the EPA's PFAS NPDWR. Comments in support of the NPDWR stress the need for health-protective standards for the nation's drinking water. Many commenters share their stories of PFAS contamination in their houses and communities, describing the experiences of family members, friends, and loved ones and the impact that PFAS contamination has had on their lives. The EPA appreciates this information and agrees with many of the comments that summarize the characteristics of PFAS, their persistence in the environment, their impacts on human health, and the importance of the EPA's role in protecting human health and the environment. As many commenters highlight, the NPDWR will save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. Many commenters support the agency's decision to set the MCLGs at zero and to regulate six PFAS via individual MCLs and/or the Hazard Index for mixtures and view the NPDWR as feasible and justified. Many commenters discuss the amounts of PFAS exposure in drinking water compared to other sources; some highlight that the NPDWR, while only providing protection from one source of exposure, is an important step in improving public health protection.

As described in the EPA's PFAS Strategic Roadmap, the agency is committed to addressing PFAS contamination, including through the development of this final PFAS NPDWR. The science is clear that long-term exposure to certain PFAS, including those proposed for regulation in this action, is linked to significant health risks, and when drinking water is contaminated it can form a significant portion of a person's total PFAS exposure. As the lead federal agency responsible for ensuring safe drinking water for Americans, the EPA is following the process outlined in the SDWA and is regulating PFAS in drinking water as a significant step toward protecting the health of hundreds of millions of people. Again, the EPA anticipates that over many years, this action will save thousands of lives and prevent tens of thousands of serious illnesses that would otherwise result from long-term exposure to PFAS in drinking water. The agency denied requests for extending the comment period to move as swiftly as reasonable to finalize this rule to protect the American people. For additional discussion regarding the timeline

for the comment period, please see sections 2.3 and 17 of the EPA response in this *Response to Comments* document.

Many comments explicitly ask the EPA to keep PFAS and other harmful chemicals out of the drinking water supply. Finalizing this PFAS NPDWR addresses these requests and is a crucial step in ensuring safe drinking water for all Americans. The EPA is doing this by using the best available science for setting health-based standards. Many commenters also stress the need for the EPA to protect the environment, and to protect all waters and communities. The EPA believes this rule will protect the American people directly from potential PFAS exposures that might otherwise occur from PFAS-contaminated drinking water.

Many commenters, while expressing support for the new NPDWR, note that this rule is long overdue and that this rule should just one of numerous actions the agency should take to protect Americans from PFAS. This final PFAS NPDWR achieves one of many key goals for protecting Americans from PFAS. While non-SDWA actions are beyond the scope of this rulemaking, it is important to note that the EPA is initiating other important actions under other statutes to address PFAS in the environment, such as through the RCRA, Toxic Substances Control Act (TSCA), Clean Water Act (CWA), SDWA and CERCLA. For example, under the CWA, the EPA is using the National Pollutant Discharge Elimination System (NPDES) program to protect against PFAS through point source discharges; under TSCA, data on PFAS manufactured and used in the United States must be reported to the EPA to better understand the PFAS lifecycle; and under CERCLA, in 2022 the EPA issued a proposal to designate two of the most widely used PFAS as hazardous substances. Tackling and reducing PFAS contamination continues to be a significant priority for the EPA. The EPA continues to work with its federal, state, and Tribal regulatory partners to protect human health and the environment by ensuring that the regulated community complies with environmental laws and regulations. To learn more about these important actions, please see the summary of the EPA's PFAS Strategic Roadmap in section II.F of the preamble for this regulation, as well as section 15 of the EPA response in this *Response to Comments* document for further discussion on out-of-scope topics.

Some commenters ask the EPA to address additional PFAS in this NPDWR or following promulgation. For discussion as to why the EPA is only regulating six specific PFAS through this final NPDWR, please see section 2.2 of the EPA response in this *Response to Comments* document. For additional discussion on potential future regulation of additional PFAS, please see sections 2.2, 3.1, 4.3.5, and 10.3 of the EPA response in this *Response to Comments* document. Many commenters stress the need to stop PFAS upstream, such as by banning its use in manufacturing processes or addressing discharges and other exposure pathways. Some commenters argue that a "preventive approach" would be more effective and less costly than treating drinking water downstream. While this NPDWR was developed pursuant to the SDWA, which does not generally regulate the use of chemicals in consumer and industrial products or regulate the remediation of contaminated sites, the EPA is taking action under other statutory authorities to reduce PFAS exposure and risk. Please see the previous paragraph discussing the EPA's PFAS Strategic Roadmap for further information.

Some commenters requested that the EPA not only address PFAS contamination, but also reduce contamination from other drinking water contaminants. A few commenters urge EPA to act under the CWA. These topics are outside the scope of the PFAS NPDWR; please see section 15 of the EPA response in this *Response to Comments* document for further discussion. For specific discussion about fluoride as a chemical in drinking water, please see section 10.3 of the EPA response in this *Response to Comments* document. For general concerns about treatment discharges and waste residuals, as well as concerns about water recovery or water reuse applications, please see section 10.4 of the EPA response in this *Response to Comments* document. For discussions of the impacts of climate change and water scarcity as it relates to treatment options, please see the EPA response to comment Doc. #1929, SBC-047449 in section 1.3 in this *Response to Comments* document.

Some commenters stated that while they agreed with establishing the drinking water regulation, they view the rule as insufficient and think more stringent or broader requirements should be established. The EPA disagrees with the view that the rule is insufficient. The EPA has set the MCLGs, MCLs, and other rule requirements consistent with the statutory standards established in the SDWA using best available science. The PFAS NPDWR is an implementable regulation that will significantly improve public health protection.

Some commenters supported the general premise of the rule but provided significant comments for consideration prior to rule finalization. Others opposed the NPDWR in its entirety. Some commenters who opposed the rule argued that EPA failed to comply with legal and procedural requirements to justify the rule, and that the process that the EPA followed is arbitrary, capricious, an abuse of discretion or otherwise not in accordance with the law. Commenters in opposition also asserted that the evidence provided by the EPA cannot be validated and lack merit, and that existing health and occurrence data does not support the preliminary determination to regulate PFNA, PFHxS, PFBS and HFPO-DA both individually and as part of mixture combinations. Some argued that the EPA improperly proposes MCLGs and MCLs for these substances together with the preliminary determination to regulate, that the studies provided show abnormal or inconsistent data, and/or that the occurrence data are not nationally representative. Commenters suggested that the EPA did not comply with the SDWA or agency guidance, including those for good data and statistical analysis practice, consistency for methods and models, and ability to replicate analytical results. Like the comments provided under section 1.1 of this *Response to Comments* document, some comments critical of the EPA's approach argued that the rule is inappropriate, not based on the best available, peer-reviewed, or sound science, is unreasonable and unachievable, is too extreme, reactionary, or may cause unintended harm. Some commenters suggest this NPDWR has excessive negative impacts on small businesses and low income and environmental justice communities.

The EPA disagrees with these comments. As described in section I of the preamble as well as section 1.1 of the EPA response in this *Response to Comments* document, the agency has followed all statutory requirements under the SDWA to promulgate the PFAS NPDWR. The SDWA states that the EPA must evaluate the best available information when making a

regulatory determination and developing an NPDWR. The EPA disagrees with the comments stating that existing health and occurrence data does not support the proposed determination to individually regulate PFHxS, PFNA, HFPO-DA and to regulate mixtures of these three PFAS and PFBS. The agency used a health-based approach with the best available science and conducted a robust analysis of PFAS health and occurrence information for the six PFAS included in the regulation, as required under the SDWA. This information provides support for the final determination to individually regulate PFHxS, PFNA, HFPO-DA and to regulate mixtures of these three PFAS and PFBS, as well as the individual NPDWRs for PFHxS, PFNA, HFPO-DA, PFOS and PFOA, and the NPDWR for mixtures of PFHxS, PFNA, HFPO-DA, and PFBS. Please see section III.B and IV of the final rule preamble and sections 3.1.1, 3.2.1, and 4 of the EPA response in this *Response to Comments* document for discussion and documentation of the EPA's evaluation of existing health information. Taking public comment into consideration, the EPA updated sampling information to evaluate PFAS occurrence in drinking water and has included updated information in its occurrence analyses. Please see sections III.C and VI of the FRN, sections 3.1.2, 3.2.2, and 6 of the EPA response in this *Response to Comments* document, as well as the *Occurrence Technical Support Document* (USEPA, 2024g), for thorough discussion of the occurrence evaluations to support this rulemaking. The EPA disagrees that the agency did not use appropriate data and statistical analyses to support the development of this NPDWR. As discussed throughout this *Response to Comments* document and multiple technical support documents, the agency provided robust quality assurance (QA) of data, used commonly accepted statistical methods, and used robust and comprehensive datasets. For example, see discussion on the use of state occurrence data in sections 3.1.2, 3.2.2, and 6.2 of the EPA response in this *Response to Comments* document, discussion of the national statistical occurrence model in section 6.5 of the EPA response in this *Response to Comments* document, or the physiologically-based pharmacokinetic (PBPK) model in section 4.2.4 of the EPA response in this *Response to Comments* document. Please see the EPA responses to the following comments in this section for additional defense of the methods used for setting an MCLG and MCL, health effects evidence for setting the MCLGs, evidence of toxicity for these six PFAS, all in support of the MCLGs and MCLs outlined in this NPDWR: Doc. #2324, SBC-046269; Doc. #2589, SBC-047310; Doc. #2946, SBC-046559; Doc. #1873, SBC-046592. For additional responses regarding the use of UCMR 5 for the occurrence model, as well as other questions about the Hazard Index and health assessments, please see the EPA response to comment Doc. #1714, SBC-045945 in section 1.3 in this *Response to Comments* document.

Some commenters highlight components of the rule that they believe are confusing and will make the rule difficult to implement. Most comments opposed to the rule request that the EPA withdraw the NPDWR or not regulate these six PFAS at this time. For discussion about how EPA is communicating about this rule to help clarify and facilitate implementation, please see section 1.2 of the EPA response in this *Response to Comments* document. The EPA disagrees that the rule will be difficult to implement, as it has clear MCL values (see section V of the preamble), clear monitoring requirements (see section VIII of the preamble), and a clear path forward to compliance like other NPDWRs. Furthermore, the EPA disagrees with the request to

withdraw this NPDWR. This is because, among other things, as discussed in sections III, IV, and XIII of the preamble, PFAS are harmful and have a significant public health impact; moreover, PFOA and PFOS have already been determined to meet the statutory criteria for regulation and the EPA is making a determination in this action that PFHxS, PFNA, HFPO-DA, and PFBS (and their mixtures) also meet that same statutory criteria (as described in section III of the FRN). Given they meet the statutory requirements, it is the EPA's obligation to move forward with developing an NPDWR. As discussed in section V of the preamble, the EPA has identified a feasible MCL that can significantly reduce the public health risk, and as discussed in section XIII of the preamble, the Administrator has reaffirmed his determination from the proposed PFAS NPDWR that the costs of the rule are justified by the benefits.

Some commenters ask the EPA to comprehensively evaluate the implementation challenges of this rule, and a few suggested the agency needs more time to do so. The EPA disagrees with delaying the official promulgation of the NPDWR for the reasons noted earlier in this *Response to Comment* and because it has already undertaken a robust process to consider implementation challenges. Through the regulatory development process, the EPA has considered all factors and comments in establishing the final NPDWRs consistent with the SDWA, including implementation concerns. The EPA plans to develop and disseminate materials that will support the needs of water systems and primacy agencies associated with rule implementation, as well as public education. To aid in planning and developing materials to support implementation of the final rule, the EPA has consolidated suggestions for topics and considerations to include in guidance, training, and tools, including suggestions communicated in public comments, in relevant *Response to Comments* document section. For discussion of considerations related to Consumer Confidence Reports and public notifications regarding detections of PFAS, see section 9 of the EPA response in this *Response to Comments* document. As noted there and in section 1.2 of the EPA response in this *Response to Comments* document, the agency intends to produce communications materials related to risks related to PFAS in drinking water that can be used by utilities and others as they deem appropriate. For discussion of potential implementation concerns with laboratory and sampling methods, monitoring, and compliance, please see section 8 of the EPA response in this *Response to Comments* document. For a discussion of laboratory availability and capability, see section 5.1.2 of the EPA response in this *Response to Comments* document. For discussion of potential implementation concerns related to treatment technologies and waste disposal, please see section 10 of the EPA response in this *Response to Comments* document. For further discussion of rule implementation considerations (primarily for primacy agencies) and enforcement, please see section 11 of the EPA response in this *Response to Comments* document; for example, section 11.2 of the EPA response in this *Response to Comments* document addresses potential data management considerations. Finally, in addition to developing and disseminating materials referenced above, the EPA is offering an unprecedented amount of funding and WaterTA, in close collaboration with states, to support communities, small systems, and others, including to address PFAS and other emerging contaminants, identify water challenges and solutions, build capacity, and develop application materials to access water infrastructure funding. The EPA's WaterTA efforts are focused on disadvantaged and

underserved communities, communities that have never accessed State Revolving Fund (SRF) funding before, and communities that are not currently receiving an equivalent kind of technical assistance. Please see further discussion in section II.E of the preamble to the final rule and section 2.4 of the EPA response in this *Response to Comments* document.

A few opposing commenters say the rule puts too much burden onto the water industry, with what they describe as both aggressive MCLs and harsh timelines. Some noted that public utilities are already working to characterize and reduce PFAS levels in finished drinking water, wastewater, and stormwater, including rebalancing water sources to reduce PFAS levels, working with upstream dischargers to reduce their loadings, and evaluating available technologies should PFAS barrier technology become necessary. The EPA acknowledges and appreciates existing efforts utilities are making to reduce PFAS levels in drinking water, wastewater, and stormwater. These efforts do not obviate the EPA's statutory obligations to regulate PFAS. Moreover, the EPA disagrees that the MCLs are aggressive, as the EPA has followed the process and requirements outlined in the SDWA and found them to be feasible, taking cost into consideration. Regarding the implementation timelines, based on public comment, the EPA extended the compliance timeline by two years to allow for capital improvements (see discussion below and in section XI.D of the FRN and section 12 of this *Response to Comments* document). The EPA also disagrees that this rule puts too much burden on the water industry. First, the EPA has conducted a robust national level cost analysis using the best available data and considering all public comments received on the proposed rule. For more information, see sections 13.3 of the EPA response in this *Response to Comments* document and Chapter 5 of the Economic Analysis (USEPA, 2024a) for a detailed description of the EPA's cost analysis. Additionally, the EPA determined that there are several affordable treatment technologies for small systems; for more information on this determination, see Chapter 9.13 of the Economic Analysis (USEPA, 2024a). Second, while this regulatory action is important for protecting public health from PFAS contaminated drinking water, as previously described, this NPDWR is just one key goal within the EPA's PFAS Strategic Roadmap for addressing PFAS from all sources. Other actions will reduce PFAS in the environment, which over time, may reduce PFAS in source water (thereby reducing treatment needs in the long-term). This NPDWR will directly protect the American people every day from PFAS exposures that might otherwise occur from PFAS-contaminated drinking water in the short to medium term. While all actions not included in this final NPDWR are beyond the scope of this regulatory action, the finalization of the NPDWR action complements many other actions in the PFAS Strategic Roadmap to protect public health and the environment from PFAS.

Some comments suggest that the EPA must consider the cost impacts, sampling detection, and disposal challenges prior to finalization. The EPA has considered these factors. As discussed in section 13 of the EPA response in this *Response to Comments* document, the EPA has considered cost impacts. As discussed in sections 5.1.2 and 7 of the EPA response in this *Response to Comments* document, the EPA has considered analytical detection and quantitation issues, among other topics related to analytical methods and monitoring. As discussed in sections 10 and

13 of the EPA response in this *Response to Comments* document, the EPA has considered media disposal as part of this regulation.

Many comments opposing the NPDWR express concerns about the general cost burden of the NPDWR. These commenters are concerned that it imposes high costs on utilities and that the rule is not economically feasible or achievable. Some commenters also express concerns that the rule will have the most significant cost impacts on already overburdened communities and on what commenters consider higher-risk water systems. Some commenters ask who will pay for the implementation and clean-up of the PFAS, suggesting that PFAS manufacturers and those discharging into our waters should pay for removing PFAS. Some commenters state they are concerned that all costs will fall on water utilities and/or rate paying customers, especially those in low-income or overburdened communities. The EPA acknowledges that the final NPDWR will have costs associated with implementation, and after consideration of all public comments on the proposal, the EPA is reaffirming the Administrator's determination at proposal that the quantified and nonquantifiable benefits of the PFAS NPDWR justify the quantified and nonquantifiable costs. As discussed in sections 13 and 14.10 of the EPA response in this *Response to Comments* document, the EPA has thoroughly evaluated the costs, benefits, and affordability of the rule, as well as its impacts on disadvantaged communities. These analyses demonstrate that while the rule will increase costs for impacted communities, there are several affordable treatment technologies that will allow small systems to comply with the rule. In addition, disadvantaged communities will also realize significant benefits of reduced illness and deaths. Please see section 13 of the EPA response in this *Response to Comments* document for further discussion of the EPA's benefit and cost analysis, section 10.4 for more information on handling PFAS laden treatment residuals, and section 10.4.2 for more information on the potential future regulatory actions involving RCRA. For more information on the HRRCA itself, please see section XII of the FRN and the Economic Analysis (USEPA, 2024a) supporting document. For a specific response regarding concerns to small businesses, low-income or environmental justice communities, please see the EPA response to comment Doc. #1644, SBC-043423 in this section of this *Response to Comments* document.

To help communities on the frontlines of PFAS contamination, federal funding is available to support water utilities via the Infrastructure Investment and Jobs Act (IIJA), also referred to as BIL. BIL invests over $11.7 billion in the Drinking Water State Revolving Fund (DWSRF) General Supplemental; $4 billion to the Drinking Water SRF for Emerging Contaminants; and $5 billion in grants to the Emerging Contaminants in Small or Disadvantaged Communities. These funds will assist many disadvantaged communities, small systems, and others with the costs of treatment installation when it might otherwise be cost-challenging. Discussion about this can be found in section 2.4 of the EPA response in this *Response to Comments* document.

Some commenters explicitly outline challenges of what they describe as the very low MCLs. As discussed in section 5 of the EPA response in this *Response to Comments* document, the EPA has found the MCLs to be feasible, consistent with the SDWA. Some commenters state the proposed MCLs are not based on reliable data, and for this reason ask the EPA to consider

further analyses prior to finalization. The EPA disagrees that the MCLs are not based on reliable data. The EPA's final rule represents data-driven drinking water standards that are based on the best available science and meet the requirements of the SDWA. The agency has provided adequate data and evidence of PFAS toxicity and public health risks in the Toxicity Assessments supporting documents (USEPA, 2024c; USEPA, 2024d), as well as the PFOA, PFOS, and Hazard Index MCLG supporting documents (USEPA, 2024e; USEPA, 2024f). The EPA has also outlined its methodology for setting the MCLs, consistent with the SDWA, in section V of the FRN. Additional discussion on determining the MCLs is included in section 5 of the EPA response in this *Response to Comments* document. As discussed in sections III, IV, V, VI, X, and XIII of this preamble, the EPA has a high degree of confidence in its health, occurrence, cost, benefit, and engineering analyses, among other analyses. All these analyses included significant Quality Assurance of data when collecting and analyzing datasets. See sections 3.1.2, 3.2.2, 4.1.2, 6.2, 13.1, and 13.3.3 of the EPA response in this *Response to Comments* document for further discussion. Please see the EPA response to comments Doc. #1713, SBC-045926 and Doc. #1714, SBC-045945 in section 1.3 in this *Response to Comments* document for the EPA's response to the following critiques of the NPDWR as a whole: allegations that steps were skipped during the SDWA NPDWR development process, the EPA lacks evidence to warrant regulatory determinations of four PFAS in mixtures (PFHxS, PFNA, HFPO-DA, and PFBS) and three PFAS individually (PFHxS, PFNA, and HFPO-DA), that the EPA should abandon the Hazard Index, the EPA should wait until UCMR 5 is complete, that the PFOA and PFOS MCLs of 4.0 ppt are not justified, analytical detection reliability and reduced monitoring rule trigger levels are flawed, the rule's cost and benefits analysis is flawed, that the NPDWR should be postponed until the EPA updates and releases its *Interim Guidance on the Destruction and Disposal of Perfluoroalkyl and Polyfluoroalkyl Substances and Materials Containing Perfluoroalkyl and Polyfluoroalkyl Substances*, and that the EPA must finalize its toxicity assessments, health advisories, and reference doses prior to promulgation of the MCLs for three PFAS (PFHxS, PFNA, and HFPO-DA).

Some commenters expressed concern over the compliance timeline of this NPDWR and contended that limited time would impede implementation. Based on public comments, the EPA is exercising its authority under SDWA 1412(b)(10) to implement a two-year nationwide capital improvement extension to comply with the MCL. For additional discussion on the extensions and exemptions, please see section XII of the FRN and section 12 of the EPA response in this *Response to Comments* document.

Lastly, some commenters questioned the EPA's authority or ability to regulate any contaminants, or expressed distrust in the agency generally, Congress, or the current administrative branch of government. These comments are out of scope. Please see section 15 of the EPA response in this *Response to Comments* document for responses to these out of scope comments.

Brian Hackman (Doc. #1539, SBC-042898)

USEPA has not done the level, or quality, of studies required to eliminate the potential that the PFAS compounds proposed for regulation could initiate a synergistic hormesis effect that could be a benefit to people. Given the recent development of the testing methods to measure at 4 ppt concentrations, USEPA is assuming all PFAS is bad without true epidemiological data, using the National Institutes of Health gold standard methods to verify the reported dated in USEPA's initial determination.

EPA Response: The EPA disagrees with the commenter: the agency has conducted extensive analyses demonstrating that the rule will produce significant human health benefits. See section XII of the preamble of this action for discussion of benefits. The EPA is not aware of any data that support the commenter's hypothesis that PFAS can initiate a synergistic hormesis effect which would benefit people, and the commenter does not provide any scientific studies to support this claim. In fact, the EPA has demonstrated that PFOA and PFOS are dose additive (Conley et al., 2022; USEPA, 2024h) and the SAB PFAS review panel supported the assumption of dose additivity for PFAS (USEPA, 2022). Additionally, the EPA is regulating six PFAS at this time; not all PFAS. This NPDWR covers six PFAS that all have assessments showing and quantifying adverse effects resulting from exposure. For PFOA and PFOS, many of those quantified adverse effects are from epidemiological data (USEPA, 2024c; USEPA, 2024d). See section IV of the preamble of this action for why the EPA set the PFOA and PFOS MCLs at 4.0 ppt. The EPA did not set the MCLs for the other four regulated PFAS (or all PFAS) at 4.0 ppt. No citations are provided on what is the National Institutes of Health gold standard method. For additional information on the MCLGs, please see section IV of the FRN and section 4 of the *Response to Comments* document.

Sophia Milone (Doc. #1487, SBC-042703)

This proposed rule would take steps in the right direction by establishing the National Primary Drinking Water Regulation and Maximum Contaminant Level Goals. Because there is no safe exposure to PFAS or other similar chemicals, it is appropriate that the safe levels are set to zero so that ensure that drinking water, bottled water, and groundwater are safe for human and animal consumption.

EPA Response: The EPA acknowledges and appreciates this comment in support of the proposed NPDWR and the MCLG. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA does not have the authority to directly regulate bottled water: bottled water is regulated by the Food and Drug Administration. Please see section 1.4 of the EPA response in the *Response to Comments* document for more information concerning bottled water.

Anonymous (Doc. #1506, SBC-042574)

PFAS are perfluoroalkyl/polyfluoroalkyl substances used for manufacturing purposes in consumer products (EPA). They exist for a long duration of time due to their inability to decompose in the environment (EPA). Meaning, these chemicals build up in our bodies and ecosystems over time (EPA). More specifically, they weaken immune systems, increase risk of cancers, cause liver damage, and elevate cholesterol levels (EPA). This is especially true for pregnant women, babies, and poor individuals who may not be able to afford clean water. PFAS are ingested through drinking water, making the sanitation and filtration of water highly important (CDC, 2022). With EPA's new proposed rule alone, we would see improvements in many different health sectors (EPA). However, we would argue that these drinking regulations are still not enough.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. The EPA agrees with the commenter that PFAS have adverse health effects. The EPA disagrees with the commenter that the "rules are not enough". The EPA has set the MCLGs, MCLs, and other rule requirements consistent with the statutory standards established in the SDWA. Please see section 1.3 of the EPA response in this *Response to Comments* document for further discussion.

Liliana Salcido (Doc. #1509, SBC-042583)

The regulation the EPA is proposing will help further research. For now, focusing on these six specific PFAS (PFOA, PFOS, GenX, PFBS, PFNA and PFHxS) is a good approach for two reasons: 1) they are the most researched PFAS and we know their danger to the human population, and 2) this regulation will also lead to the regulation of over 29 different PFAS in water (Amarelo, 2023).

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Liliana Salcido (Doc. #1509, SBC-042581)

"Forever Chemicals" Water Regulation

To whom it may concern,

The EPA's new rule on regulating six specific PFAS would significantly improve the well-being of every single human on Earth. This regulation will be historic and it will pave a path for future regulation and further research on other "forever chemicals" in the U.S and other countries that have subsequently been affected.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kaden Heldt (Doc. #1510, SBC-042591)

The general public obviously has a stake in the outcome of this decision as public health is at harm, but also, chemical companies and manufacturers of anything with PFASs in them certainly have a stake in this outcome as well because it will affect the chemicals they can produce and put in products, potentially decreasing profits. There is also a chance that some of these companies are held responsible for damages. Options for acting are few, however, advocacy and using PFAS free products are the best options to help the overall cause. These new regulations are helpful. Undoubtedly. However, they are extremely lacking in scope. Not everything is known about PFASs, sure, however we do know that some of them are harmful and that an educated guess can be made on many others, not just the six being regulated. The government and those creating these regulations must take into account the greater good of public health and the potential dangers of harmful chemicals.

A challenge that I had while working through these steps was finding solid information because not very much is known about these chemicals other than the simple fact that they are dangerous. These steps were very insightful for my thought and research process overall however, and it was a very useful experience. My decision was different from what I thought it would be going into the assignment. I thought that the EPA had made a good and final decision, but I was incorrect in that assumption. The EPA could use some updates to their decisions in order to properly protect citizens from the dangers of PFASs. Recommendations could possibly be implemented with care and attention to the concerns of all stakeholders, however, there is a chance that some stakeholders could be to blame. Chemical companies and companies who manufacture products with PFASs could potentially be at fault for harming and endangering citizens. If that is the case, then I don't think their wants should entirely be taken into consideration.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kaden Heldt (Doc. #1510, SBC-042588)

I believe this ruling is a good idea, however, more needs to be done. There are still many questions and concerns surrounding PFASs, many of which cannot yet be answered, but to only ban six of these chemicals is not enough to adequately address the situation. I believe this opinion would be popular among those who are well educated on this topic on concerned for the common goal of protecting public health.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. The EPA disagrees with the commenter that the "rules are not enough". The EPA has set the MCLGs, MCLs, and other rule requirements consistent with the statutory standards established in the SDWA. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jon Raclin (Doc. #1511, SBC-042594)

The groups that have an important stake in the outcome are the citizens of the U.S.. Not only are the common lower middle class working citizens exposed, but also the very high up positions in the government. This is a widespread issue for all people in the country and will presumably turn into a global issue since the science of these forever chemicals is used, as similar products are made and traded across the globe.

The damage to health is the primary concern, and from my perspective understanding this issue, it is also and enviromental conflict as the forever chemicals don't break down, under mother earth's natural causes and climates.

The health and life preservation is the most important, because without a definitive human health, nothing about our loves matter. If we make ourselves subject to diseases left and right without care we will erase our species. Understanding that this is a health issue is the first concern.

The tradeoffs involved in the EPAs new regulations are that the changes would cause the cost of living to increase, per person, however it would result in a smaller chance of developing a disease or illness in older age in the U.S. The investment in our future life is more valuable than anything we could say. The bare bones of this issue is that the health regulations of the EPA need to protect the three hundred million U.S. citizens that rely on the products being sold and given.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Southern Methodist University Dedman School of Law (Doc. #1512, SBC-042601)

3. Conclusion

In conclusion, I would like to express may gratitude to the EPA for its commitment to ensuring safe drinking water standards and reducing PFAS exposure. I believe that the proposed NPDWR rules are a crucial part of this effort, and will have a significant impact on the health and safety of our communities. I look forward to seeing additional rules proposed under the EPA's PFAS Strategic Roadmap in the months and years to come.

With Best Regards,

Whitney Bosch

Washington DC 20460

RE: Docket No. EPA-HQ-OW-2022-0114: PFAS National Primary Drinking Water Regulation Rulemaking

Dear Dr. McLain:

Thank you for the opportunity to provide comment on the proposed National Primary Drinking Water Regulation (NPDWR) rulemaking regarding per- and polyfluoroalkyl substances (PFAS). I am a second year law student at the SMU Dedman School of Law with an interest in environmental law. To start, I would like to express my appreciation to the EPA for taking action on the PFAS issue. These chemicals are an underrated threat to public health, and it is time to address the threats posed by their presence in our Nation's drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

April 21, 2023

Dr. Jennifer L. McLain

Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1200 Pennsylvania Ave NW

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Comments on the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Dr. McLain,

Thank you for the opportunity to provide comment on proposed per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulations (NPDWR). I am a third-year law student at Southern Methodist University. As a law student, I have studied various aspects of environmental law and the EPA's role in proposing and enforcing regulations. In my environmental law class, we had the unique privilege of visiting with the EPA's legal team at their Region 6 office, which has encouraged me to take an active rule in the EPA's rulemaking process. I appreciate the EPA's efforts to engage with stakeholders and consider the perspectives and concerns of all stakeholders when developing regulations. As such, I am writing to express my strong support for the proposed NPDWR for six PFAS, including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS).

The EPA is taking a critical step to protect public health by proposing to establish legally enforceable levels for PFAS found in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Christian Garcia (Doc. #1513, SBC-042604)

Accordingly, the EPA is taking a monumental step towards developing a strong regulatory framework to protect public health and ensure that everyone has access to clean drinking water. Specifically, the EPA is proposing to regulate PFOA and PFOS at a level they can be reliably measured, which is 4 parts per trillion (4.0 nanograms/Liter). [FN11: U.S. ENVIRONMENTAL PROTECTION AGENCY, EPA's Proposal to Limit PFAS in Drinking Water (March 2023), https://www.epa.gov/system/files/documents/2023-04/Fact%20Sheet_PFAS_NPWDR_Final_4.4.23.pdf (last visited Apr. 21, 2023).] It would place limits on any mixture containing one or more of PFNA, PFHxS, PFBS, and/or GenX Chemicals by using a hazard index, which is employed to determine if the combined levels of these PFAS pose a potential risk. [FN12: Id.] Using the hazard index would protect communities from the additive effects of multiple PFAS when they occur together. [FN13: Id.] Part of this regulation would include regular testing and establishing monitoring systems to ensure compliance. [FN14: Id.] Further, public water systems would be required to notify the public if monitoring detects these PFAS at levels that exceed the proposed regulatory standards. Such notifications would make people aware of the risks they are assuming when they drink water. Finally, for public water systems that have PFAS levels that exceed regulatory standards, including removing the chemicals through various types of treatment or switching to an alternative water supply that meet the standard. [FN15: Id.]

Indeed, the proposed NPDWR for regulating PFAS in drinking water is a significant step towards protecting public health. However, it is essential to recognize that this is only the beginning, and much more must be done to ensure the safety of our drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Christian Garcia (Doc. #1513, SBC-042606)

Finally, I commend the EPA for its efforts to address the issue of PFAS in drinking water and engaging stakeholders throughout the rulemaking process. Collaborating with environmental groups and affected communities provide valuable insights into the impacts of contamination on public health. By engaging with all stakeholders, the EPA can continue developing regulations that are informed by diverse perspectives and are more likely to be effective in protecting public health and ensuring access to safe drinking water for all Americans. I fully support the proposed National Primary Drinking Water Regulation for PFAS and am grateful for the opportunity to participate in the rulemaking process.

Sincerely,

Christian Garcia

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cayro Bustos (Doc. #1517, SBC-042717)

April 21, 2023

Mr. Michael S. Regan

Environmental Protection Agency

Mail Code 1101A

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Dear Mr. Regan,

My name is Cayro Bustos, and I am a current third-year student at the SMU Dedman School of law. I am writing to express my strong support for the proposed PFAS National Primary Drinking Water Regulation. This represents what I believe is a right of every citizen of this country: to have access to healthy drinking water. As a concerned citizen, I believe that it is crucial for our government to take action to protect public health from the potential harms of PFAS exposure.

PFAS, or per- and polyfluoroalkyl substances, are a group of chemicals that have been widely used in a variety of consumer and industrial products for decades. ASTHO Statement on U.S. EPA's Proposed PFAS National Primary Drinking Water Regulation, Association of State and Territorial Health Officials (March 22, 2023) https://www.astho.org/communications/newsroom/2023/astho-statement-on-epas-proposed-pfas-national-primary-drinking-water-regulation/. These chemicals are highly persistent in the environment and can accumulate in the bodies of humans and animals, leading to potential health effects such as cancer, thyroid disease, and developmental effects in fetuses and infants. What are the health effects of PFAS?, Agency for Toxic Substances and Disease Registry (last visited April 14, 2023) https://www.atsdr.cdc.gov/pfas/health-effects/index.html.

While PFOS are no longer manufactured in the United States, they continue to persist in the environment and have been detected in soil, surface water, groundwater and public water supplies in numerous locations. Still, there are currently no federal regulations in place to limit PFAS levels in drinking water. This is in spite of the European Union (EU) regulating these chemicals since many years ago and despite the many calls for federal action to limit and

regulate these "forever chemicals," which are now detected in the blood of nearly all Americans because they don't break down in the body. Karen Feldscher, Why more stringent regulation is needed for 'forever chemicals', Harvard (Jan. 4, 2022), https://www.hsph.harvard.edu/news/features/why-more-stringent-regulation-is-needed-for-forever-chemicals/.

The proposed PFAS National Primary Drinking Water Regulation would establish a maximum contaminant level (MCL) for two of the most common PFAS chemicals, PFOA and PFOS, at 10 parts per trillion (ppt) each. While this level is not as strict as some experts recommend, it would still represent a major step forward in protecting public health and ensuring access to safe, clean drinking water. The EU, for example, regulates four of the most common PFAS chemicals, and the U.S. proposed PFAS limits are more than 30 times higher than the European limit. Id.

It is well past due that the U.S. catches up with our peers, and this is a step in the right direction. I urge the Environmental Protection Agency to move forward with the proposed regulation without delay. This legislation is far less strict with PFAS than it ought to be; the current regulations only target drinking water and only target two PFAS. Nevertheless, as with global warming and many other issues, small actions can accumulate to big impacts. As such, I also urge the EPA to consider even stricter limits on PFAS levels in the future and ban PFAS entirely—not just the two most common kinds of PFAS. This agency has long recognized the importance of access to clean drinking water, and we need to limit and rid the health risks associated with PFAS exposure. Factsheet Clean Water Rule, EPA (last visited April 15, 2023), https://www.epa.gov/sites/default/files/2016-02/documents/cleanwaterrulefactsheet.pdf. The dangers of PFAS as discussed are too great to ignore, and we must take action to protect the most vulnerable members of our communities, including the impoverished, the elderly, children, and pregnant women.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cayro Bustos (Doc. #1517, SBC-042719)

Given all of the above, there is no legitimate argument for not adopting this regulation for limiting PFAS in our drinking water. Not only does the EPA need to adopt this regulation expeditiously, but it is also imperative that it is implemented effectively. This means providing adequate resources and support to local water systems to comply with the new standards, and monitoring and enforcing compliance to ensure that all Americans have access to safe drinking water. We must ensure that this regulation is properly in effect as soon as possible.

In addition, the EPA should take a comprehensive approach to addressing PFAS contamination, including efforts to reduce and eliminate the use of these chemicals in consumer and industrial products, as well as remediation of contaminated sites. It is essential that we take a holistic

approach to addressing the PFAS crisis, rather than simply treating the symptoms of a much larger problem.

Finally, I urge the EPA to prioritize transparency and public engagement throughout the rulemaking process. The public has a right to know about the potential health risks associated with PFAS exposure, as well as the steps being taken to address these risks. The EPA should provide regular updates and opportunities for public comment and input and should make all relevant information and data available to the public.

In conclusion, I strongly support the proposed PFAS National Primary Drinking Water Regulation and urge the EPA to take swift action to implement this important public health protection. With millions of Americans at risk of exposure to these harmful chemicals, we cannot afford to wait any longer. It is time to prioritize the health and well-being of our communities and take decisive action to address the PFAS crisis.

Thank you for your consideration.

Sincerely,

Cayro Bustos

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For discussion of implementation and enforcement, please see section 11 of this document. For additional discussion on other ways the EPA can address PFAS contamination, please see section 15 for topics that are out of scope for this rulemaking.

Daniel Varon (Doc. #1518, SBC-042720)

21 April 2023

Michael S. Regan

Environmental Protection Agency EPA H.Q.

1200 Pennsylvania Avenue NW Washington, DC 20004

Dear Director Regan,

I am pleased to have the opportunity to provide comment on the EPA's Proposed Per- and Polyfluoroalkyl Substance (PFAS) National Primary Drinking Water Regulation. I am a 2L in law school, and my environmental law class has sparked my interest in becoming more active in proposed EPA legislation. As a concerned citizen, while I agree that maintaining clean water is an important priority, I believe the government should do so in the most cost-effective matter.

As is stands, there are many unknowns surrounding PFAS and their health consequences. The studies the EPA has conducted show abnormal circumstances. Further, these studies are not applicable to the majority of the Country. For this reason, I call for the EPA to investigate PFAS

solutions further. I believe that we can be more efficient with how we allocate resources meant to better citizen's and environmental health. Whether it be adjusting the MCL level, exploring alternative PFAS sources or solutions, or putting this money towards entirely different environmental projects, I think we can do better.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the method in which the agency is implementing this final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

The Garden Club of America (GCA) (Doc. #1519, SBC-042608)

April 24, 2023

Michael S. Regan

Administrator, U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW Washington, DC 20460

Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Regan,

The Garden Club of America (GCA) is a national organization founded in 1913, comprising 199 member clubs and representing approximately 18,000 citizens across the United States. The GCA actively seeks to restore, improve, and protect the quality of the environment through programs and action in the fields of conservation, civic improvements and education. We appreciate the opportunity to comment on the regulation of PFAS chemicals.

On behalf of the Conservation Committee and the National Affairs and Legislation Committee of the Garden Club of America, we write to commend your proposed National Drinking Water Standards for six PFAS chemicals. These include legally enforceable Maximum Contaminant Levels for the legacy chemicals PFOA and PFOS as individual contaminants. Also included are the regulation of the Genx chemicals PFHxS, PFNA, PFB, and HFBO-DA as a PFAS mixture with health based, non-enforceable Maximum Contaminant Level Goals.

The GCA is concerned about PFAS chemicals because they have a chain of linked carbon and fluorine atoms. Because the carbon-fluorine bond is one of the strongest molecular bonds found, these chemicals do not degrade in the environment. Outside of industry, contaminated food and water is the way most people are exposed to these chemicals, and since PFAS chemicals don't break down, blood levels of PFAS will increase over time. Indeed, the Center for Disease Control has found that 97 percent of Americans have PFAS in their blood.

PFAS chemicals have been shown in scientific studies to increase the incidence of a wide array of health problems, including liver toxicity, endocrine, immunologic, and neurologic abnormalities. They have been shown to increase the incidence of kidney cancer, and testicular cancer.

The GCA encourages all efforts to improve water quality and protect the health of Americans. Plants and animals (which play critical roles in the food web) will also be protected from exposure to these persistent chemicals with these proposed measures. EPA regulations are crucial because it is impossible for individual consumers to protect themselves from these chemicals through personal actions. To meet the standards you are proposing, the water utilities will be correctly held responsible for testing and removal of these toxic chemicals and industries will have to stop discharging these chemicals into waterways.

The GCA has supported the Clean Water Act and the Safe Drinking Water Act (SDWA) since their inception. The SDWA gives the EPA the ability and obligation to update standards to address new contaminants. Regulating these six PFAS chemicals meets those obligations.

Sincerely,

Karen Gilhuly

Chair

National Affairs and Legislation Committee

The Garden Club of America

Cayce McAlister

Chair

Conservation Committee

The Garden Club of America

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ruoyu Zhang (Doc. #1520, SBC-042746)

Public Comment

To Whom It May Concern:

I am a student in Mount Holyoke College. I really apricate EPA putting resources and labors into making our drinking water safer. Ensuring the safety of drinking water is a crucial measure in safeguarding public health.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

City of Alexandria, Virginia (Doc. #1523, SBC-042611)

Please see the pdf file here, as submitted by Mayor Justin M. Wilson, Mayor of City of Alexandria, Va.

Thank you,

Mark McHugh

(Aide to Mayor of Alexandria, Va., mark.mchugh@alexandriava.gov)

April 24, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Docket ID: EPA-HQ-OW-2022-Ol 14

Mail Code 28221 T

1200 Pennsylvania Avenue, NW

Washington, DC 20460-6629

To Whom It May Concern:

I write on behalf of the Alexandria City Council and the residents that we are privileged to serve. The

City of Alexandria is pleased to endorse the proposed PFAS National Primary Drinking Water Regulation [FN1: https://www.epa.gov/sdwa/and-polyfluoroalkyl-substances-pfas] (Docket ID: EPA-HQ-OW-2022-0114) that has been promulgated by the Environmental Protection Agency, as published in the Federal Register on March 29, 2023.

As detailed in the proposed regulation, PFAS, the so-called "forever chemicals" have been proven to have negative impacts of the health of those who receive long-term exposure, including:

• Negative impacts on pregnant women and in their developing babies

• Weakening immune response

• An increased risk of cancers and liver damage

• Elevated cholesterol levels and the concomitant risk for heart attack or stroke

The regulations will propose new Maximum Contaminant Level Goals (MCLG) and enforceable

Maximum Contaminant Levels (MCL) for these chemicals in our drinking water. As detailed by the EPA's analysis, full implementation of these new standards will prevent tens of thousands of illnesses and deaths.

Alexandria is a community of 160,000 residents in 15.5 square miles in Northern Virginia. The City of Alexandria's 75,000 households receive drinking water from the Virginia-American Water Company, a waterworks owned by the publicly-traded American Water Works Company, Inc. Alexandria's waterworks is one of the thousands of systems nationally that currently exceed the MCL that the EPA has proposed.

According to the 2022 Water Quality Report provided by Virginia-American Water Company [FN2: https://www.amwater.com/ccr/alexandria.pdf], our drinking water contains levels of several PFAS that would be actionable under the proposed regulations, including:

• Perfluorooctanoic Acid (PFOA): Range Detected 2.8 — 4.5/ppt

• Perfluorooctanesulfonic Acid (PFOS): Range Detected 3.2 — 4.0/ppt

• Perfluorohexanesulfonate (PhHxS): Range Detected 0.0 — 2.3/ppt

• Perfluorobutanesulfonic Acid (PFBS): Range Detected 0.0 — 4.7/ppt

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Orange Water and Sewer Authority (OWASA) (Doc. #1524, SBC-042613)

See attached file from Orange Water and Sewer Authority in Carrboro, NC. Thank you.

OWASA

Orange Water and Sewer Authority (OWASA) provides water, wastewater and reclaimed water services to the Chapel Hill and Carrboro communities in Orange County North Carolina. OWASA’s vision is to be our community’s trusted partner for clean water and environmental protection and our mission is that our dedicated team delivers valuable water and sewer services that are essential to our community’s health, environment, and economy through the stewardship of infrastructure and natural resources.

OWASA began proactive quarterly testing of raw water samples and treated drinking water samples for PFAS in 2018. Once we understood that PFAS could be a potential concern for us we began a more robust monitoring program and had engaged consultant assistance prior to the MCLs being released. OWASA supports the rule with regards to highlighting the importance of protecting our customers health.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Isabelle Dominguez (Doc. #1525, SBC-042628)

Opponents lay out several arguments against the proposed regulation. For one, PFAS come from other sources that would not be regulated by this rule, such as cookware and food packaging. However, there are some rules limiting the use of PFAS in other contexts. For example, the FDA has established limits on PFAS levels in such products, demonstrating concern of exposure. [FN18: Per- and Polyfluoroalkyl Substances (PFAS), FDA (Jul. 6, 2022), https://www.fda.gov/food/environmental-contaminants-food/and-polyfluoroalkyl-substances-pfas.] Like the FDA regulation, the proposed rule does not seek to eliminate all PFAS exposure; instead, it sets standards to limit exposure and mitigate the cumulative effects of PFAS exposure. This proposed rule would completest the existing FDA regulation.

Another counterargument is that PFAS regulation should be left to the state. It is true that as of the end of 2022, nine states have enacted laws setting similar limits to PFAS levels in drinking water. [FN19: Per- and Polyfluoroalkyl Substances (PFAS): State Legislation and Federal Action, NAT'L CONF. OF STATE LEGS., https://www.ncsl.org/environment-and-naturalresources/per-and-polyfluoroalkyl-substances (updated Mar. 23, 2023).] However, some states may not prioritize safe drinking water and will fail to pass legislation setting limits of PFAS levels. In some instances, these states are the states that have the most vulnerable populations that require protection. Moreover, as stated above, many communities cannot afford to upgrade their water systems to limit PFAS exposure. The funds granted by the Bipartisan Infrastructure Law and other federal aid monies would support these underdeveloped communities by allocating to them funds specifically for upgrading water systems to conform with the proposed rule.

There is no denying that this rule will require costly and labor-intensive upgrades and maintenance to new water systems. However, the human benefit for the rule greatly outweighs any economic cost. With so many environmental issues affecting our society, the EPA's bold new rule addresses one that affects all individuals in the United States. We all have a right to safe drinking water, [FN20: G.A. Res. 64/292 (Jul. 28, 2010).] and the EPA's rule is one step forward to ensuring that right is protected.

Thank you for your consideration,

Isabelle Dominguez

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Isabelle Dominguez (Doc. #1525, SBC-042624)

April 18, 2023

Michael S. Regan, Administrator

Environmental Protection Agency 1200 Pennsylvania Ave., N.W.

Washington, D.C. 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Comment in Support of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan,

My name is Isabelle Dominguez, and I am a third-year law student located in Dallas, TX. I write in my capacity as private citizen to express support for the EPA's proposed rule regulating the amount of PFAS in our drinking water. The scientific evidence is clear that it is highly probable that PFAS exposure through drinking water (and other means) can have devastating impacts on human health. Moreover, other studies demonstrate that some of our most vulnerable populations are at the highest risk of PFAS exposure. These considerations warrant the EPA stepping in to work with local water providers to preserve our water and protect our communities.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Samantha Deem (Doc. #1526, SBC-045707)

Civic Engagement - Sam Deem

Within the last century, a category of manufactured chemicals called PFAS have caused a lot of damage to not only the environment but also the general population. Recently in the last month, the Environmental Protection Agency (EPA), has proposed the PFAS National Primary Drinking Water Regulation in order to regulate the usage, disposal and information released to the public about these toxic chemicals in water sources. This ruling would force city and state water systems to monitor, notify and reduce the PFAS in the water sources. After doing research about the effects of PFAS and what is known about their long term effects on humans, I have come to the conclusion that these regulations are not enough. There are too many loopholes that many large corporations can exploit in order to save money that are harmful to many populations and the environment.

PFAS are a replacement for their predecessor, the PFOAs, since most companies like DuPont stop producing those in 2013. Companies claim that these PFASs are more easily biodegradable and can be used safely unlike the PFOAs. That being said, with the secrecy and the fact that many of the PFASs are not regulated by EPA as seen in the case of DuPont, I don't trust that

only regulating 6, as proposed in this new rule, is enough to keep us and the environment safe. The EPA has determined that the safety regulations for the amount of PFAS consumed is 4 parts per trillion and for short term exposure it's 0.4 parts per billion. With this level confirmed by the EPA, we as a community now have a way to hold these companies accountable but, even then I'm not sure it's enough.

After reading Rob Bilott's story about his fight against DuPont and their lack of care for the environment and the general population, I believe more is needed in this fight against PFASs. DuPont used their own scientists and corporate funded studies to "prove and support" anything they needed in order to continue to process and use the PFOAs and PFASs. They also had multiple studies that showed that these chemicals were toxic and caused health concerns for workers and their families but withheld this information so they could blame these concerns elsewhere and remain using what was convenient for them. If the EPA has delegated 9 and 12 billion to helping make water safer through water systems, I believe we also need to fund jobs of auditors paid by EPA to ensure that these rules are actually being followed and that there are smoke screens of lies hiding the truths that companies are not. In the Tennant's case, they were lucky that a family friend lawyer was willing to take their case because in the poorer/underserved communities, there's no one to fight these battles if we leave it up to the companies to "ensure the safety of the people and their environment.

Overall, I know that fixing this problem is going to require a lot of funding as there are many studies that need to be conducted about the effects of the PFASs past the 6 on the proposed rule, to help eliminate the already circulating chemicals and the monitor the future chemicals. However, I believe that if the public knew about the negative health effects of these chemicals and understood that their taxes would help go towards making themselves and the environment, I believe we could increases taxing to help fund these needs.

Reflection – Sam Deem

After reading the article about the DuPont incident and the other sources alongside the new proposed rule, I was shocked. I did not think the rule was anywhere close to being enough to make an effective change. The DuPont article talked about how most of the PFASs haven't even really been researched enough to make the EPA cautious and that scared me a lot. It also scares me that these companies can hire a scientist and fund a study to the point where the results say their chemicals aren't harmful when they know that they are but choose to lie to the public. That's why I strongly suggest that many jobs are funded to make sure that companies can't do this and that water sources are actually being regulated like how this rule declares it needs to be. Maybe by fining the companies for not following the rules and using that money for funding initially might help alongside taxing but either way, I think the public needs to be made fully aware of everything that goes on with PFASs and their harmful effects. I would feel comfortable knowing that my taxes are going into something beneficial towards my health and the health of the environment.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for protecting human and environmental health against PFAS. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see section 15 of the *Response to Comments* document for topics that are out of scope of this rule, such as PFAS manufacturing.

Samantha Matterson (Doc. #1527, SBC-042629)

Proposed Action for the PFAS NPDWR Review

After reviewing the Proposed Action for the PFAS NPDWR, I would like to share my opinion. I believe that the proposed action is a good start, with the expectation that there will be further legislation in the future. I agree that reducing the amount of PFAS chemicals in drinking water is of upmost importance, especially given that drinking water is where most people are exposed to these chemicals, however I do feel that this action has limitations that must be addressed, and this action cannot be a fix-all solution especially given that over 180 countries globally have moved to ban the PFOA chemical from production (Hogue, 2019). I appreciate that this action moves the safe limit of pfas from 70ppt to 4ppt, and that the public must be notified of the levels of PFAS in their drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Water Environment Federation (WEF) (Doc. #1529, SBC-043303)

Please find attached comments from the Water Environment Federation.

April 28, 2023

Michael S. Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW Mail Code: 4607M

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Comments on the Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan,

The Water Environment Federation (WEF) thanks the US EPA for the opportunity to provide comments on the proposed per- and polyfluoroalkyl substances (PFAS) National Drinking Water Regulations (NPDWR). WEF is a nonprofit association that provides technical education and training for tens of thousands of water quality professionals who clean water and return it safely to the environment. WEF members have proudly protected public health, served their local communities, and supported clean water worldwide since 1928.

WEF stands with EPA in its goal to utilize the best available science to stop PFAS pollution, protect human health, and harmonize policies that strengthen public health protections with infrastructure funding to help communities, especially disadvantaged communities, deliver safe drinking water. WEF understands the critical need in providing clean drinking water and the importance of this proposed rule. We also see the unintentional impacts the proposed regulation will have on the water resource recovery facilities (WRRFs) that modern society has come to rely upon since the promulgation of the Clean Water Act of 1972. Some of these impacts are described below and include the eventual discharge to WRRFs of residuals from water treatment operations.

EPA Response: The EPA acknowledges this comment. Please section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion regarding residuals and discharges, please see section 10.4 of the *Response to Comments* document.

Robert Adamski (Doc. #1530, SBC-043337)

Worldwide," According to the UN, approximately 5 billion people worldwide [Link: https://www.unwater.org/publications/world-water-development-report-2018] will be impacted by increasingly limited access to clean water by 2050, making it a core focus of sustainable development and a fundamental underpinning for all SDGs [Link: https://sdgs.un.org/goals]. Although the UN has long recognized clean water and sanitation as a human right [Link: https://www.un.org/waterforlifedecade/human_right_to_water.shtml], the UN Secretary-General has acknowledged [Link: https://www.un.org/development/desa/en/news/sustainable/sdg6-global-acceleration-framework.html] that we are alarmingly off track on water-related SDGs.

Without access to clean, healthy, and abundant water, the global community will not make tangible progress on climate change, poverty, hunger, equality, peace, or any of the other laudable goals."

Given the lack of sufficient evidence of health effects, the lack of capacity to implement the rule and the need for expenditures in more urgent areas like lead service lines, I urge the rule not be implemented and instead additional monitoring and research be carried out

Sincerely,

Robert E. Adamski

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

HNOJ Laudato Si' Circle (Doc. #1532, SBC-042635)

We suggest the proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS be implemented as a starting point. This action alone could prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses, especially in under-resourced communities.

EPA act now. Make states responsible for keeping their constituents as healthy as possible, using policies based on credible scientific research. Perhaps science can bring us to: "Single use" means "made from 100% biodegradable components." Now that truly is healthy!

• HNOJ Laudato Si' Circle is part of a Catholic international and national network LAUDATO SI' CIRCLES - Laudato Si' Movement (laudatosimovement.org). We hail from many different communities, but we all want the best for ourselves and for future generations, as we live on our common home, Earth.

Sincerely, Monica K, (author), Jeffrey E (editor), Barbara Q (editor), Patrick I, Pat K, Paul K ("our family in Wilmington NC have been especially impacted."), Stephen K and Patty O from NC. Julia SM from NH. Marilyn W. from OH. Brigid B from OR.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Re: Per and-polyfluoroalkyl Substances (PFAS) Proposed National Drinking Water Regulations (Docket ID: EPA-HQ-OW-2022-0114)

Dear Administrator Regan, Assistant Administrator for Water Fox, and Office of Ground & Drinking Water Director McCain,

My name is Linda Shosie (aka Linda Robles), I am the owner and founder of the Environmental Justice Task Force- a grassroots community-based organization (CBO) supported by a committee of concerned citizens advocating for environmental justice (EJ) and health equity (HE) for all in Tucson, Arizona. I am writing to express my strong support for the establishment of the new Maximum Contaminant Levels (MCLs) for per-and polyfluoroalkyl substances (PFAS) in drinking water. There is growing scientific evidence describing the toxic effects of PFAS, in people, that even at the lowest levels of exposure to PFAS can cause very large and varying sets of serious health effects, including on the growth and development of children, dangers for pregnant woman and threaten the developing fetus, and damages of the liver, immune system disfunction and increases the risk for cancer. The establishment of new MCLs will help protect our communities from the harmful effects of these chemicals.

The EJTF is dedicated to protecting its members and others in the Tucson community from the harms caused by toxic chemicals, including Per-and polyfluoroalkyl Substances ("PFAS") such as perfluorooctanoic acid ("PFOA") and perfluorooctanesulfonic acid ("PFOS"). To inform the public and educate policy makers about our knowledge of, and awareness efforts on, PFAS and its health effects, to help impacted individuals reduce the negative health risks that they face, the EJTF relies on EPAs proposed MCL's for PFOA and PFOS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Re: Per and-polyfluoroalkyl Substances (PFAS) Proposed National Drinking Water Regulations (Docket ID: EPA-HQ-OW-2022-0114)

Dear Administrator Regan, Assistant Administrator for Water Fox, and Office of Ground & Drinking Water Director McCain,

The Environmental Justice Task Force- a grassroots community-based organization, advocating for citizens of Tucson, affected by PFAS contamination from multiple sources and we strongly believe that everyone deserves clean, safe, healthy and sustainable drinking water supplies. We are writing to express our strong support for the establishment of new Maximum Contaminant Levels (MCLs) for per-and polyfluoroalkyl substances (PFAS) in drinking water. As you are aware, PFAS are toxic, harmful to human health, and extremely persistent in the environment. We have experienced these effects firsthand and know the cost, not just physically, but financially and emotionally as well. The establishment of new MCLs will help protect our communities from the harmful effects of these chemicals.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Shosie (Doc. #1533, SBC-043961)

The National standards to limit the contamination of PFAS in drinking water are long overdue.

For years, impacted communities like mine lacked reliable guidance from EPA about the hazards posed by PFOA and PFOS in drinking water, because there were no federal National Drinking Water Standards for PFAS set by EPA. By regulating six dangerous PFAS in drinking water, EPA proposal helps us reduce overall PFAS exposure, and improve drinking water safety in thousands of communities like mine, and across the country.

But Enough is Enough! All people deserve to have the human right to clean, safe, healthy and sustainable drinking water supplies.

For the last six years, I have strongly persuaded EPA to set strong federal drinking water standards for PFAS, to avoid putting people like my daughter at risk, and to prevent environmental disasters like this from happening again.

Today, we are so overwhelmed with joy at the EPAs federal Drinking Water Standards for PFAS, but it comes to many residents whose health has already been disproportionately impacted by all these toxins.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

The Democratic Party of Hawai'i (Doc. #1536, SBC-042642)

Comments for the Proposed PFAS National Primary Drinking Water Regulation

POSITION: STRONG SUPPORT

PFAS are known to cause kidney cancers, liver damage, heart attacks, strokes, and developmental (birth weight) effects. PFAS have been detected in Kunia, Waipio, Honolulu and Kahului airports, and eight Hawaii military sites, including the Navy's Pearl Harbor drinking water. This liquid cancer is ingested through drinking water, breathing, and eating fish, animal, and agricultural products. It is absorbed through cosmetics, personal items, clothing, carpets, linen, and bedding.

Given the gravity of the adverse health effects from long-term PFAS exposure, the 7500-member DPH Environmental Caucus strongly supports the proposed Rules. The NPDWR establishes MCLs at 4 ppt for PFOA and PFOS, and 1.0 ppt Hazard Index for combined GenX chemicals.

With these Rules come uniformity, nationally, and statewide. Hawaii is a highly militarized state where the PFAS EALs do not follow the EPA's Science Advisory Board but rather follow military requests for increased EALs upon releases of the contaminants to relieve it of notice requirements and remediation duties.

In Hawaii, on Dec. 2022, PFOA EAL was at 6 ppt; last month it was increased to 12 ppt. PFOS EAL was at 4 ppt, then increased to 7.7 ppt last month. Combined GenX Chemicals EALs were at 652 ppt, then increased to 1801 ppt.

The Hawaii Dept. of Health, rather than reducing the PFAS EALs, increased them to greater unsafe levels. Adopting the NPDWR would create national uniformity, bringing Hawaii closer to a safe measurable drinking water standard.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce (Doc. #1537, SBC-042644)

Our coalition supports a national drinking water standard for PFOA and PFOS based on the best science and risk -- as opposed to the current patchwork of state requirements.

EPA Response: The EPA has used best available science in developing the final PFAS NPDWR. The EPA has also made appropriate risk management decisions, considering health effects, treatment technologies, costs, benefits, feasibility, and other factors discussed throughout the administrative record for this action. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kevin Korro (Doc. #1538, SBC-042657)

In conclusion, I support the national primary drinking water regulation that has been suggested for PFAS, and I strongly encourage the Environmental Protection Agency (EPA) to enforce rigorous MCLGs to safeguard the general public's health. I am thankful for your careful examination of the points I made in my notes.

Sincerely,

Kevin

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kevin Korro (Doc. #1538, SBC-042653)

Water Regulation

Greetings, EPA!

This is to express support for the proposed national primary drinking water rule for per- and polyfluoroalkyl chemicals, most often referred to as PFAS. Per- and polyfluoroalkyl compounds are what are referred to as PFAS. As a concerned citizen, I believe guaranteeing the safety of our drinking water is of the utmost importance and that the regulation of these potentially harmful compounds is an essential step in the process of reaching that objective. In addition, I believe regulating these potentially hazardous substances is a vital step in the process of attaining that objective.

PFAS have been associated with a wide range of adverse consequences for human health, some of which include impaired function of the immune system, cancer, and difficulties in both development and reproduction. A proposed regulation to regulate perfluorohexanesulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA), and its ammonium salt; perfluoro nonanoic acid (PFNA); and perfluorobutanesulfonic acid (PFBS); and mixtures of these PFAS is

a necessary step to protect the public's health in accordance with the Safe Drinking Water Act (SDWA).

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Brian Hackman (Doc. #1539, SBC-042882)

See attached file statement. My statement is in objection to the current PFAS proposed MCLs and HIs being discussed as part of the USEPA (United States Environmental Protection Agency) Docket EPA-HQ-OW-2022-0114.

This statement is in objection to the current PFAS proposed MCLs and HIs being discussed as part of the USEPA (United States Environmental Protection Agency) Docket EPA-HQ-OW-2022-0114.

The presence of organics in water does not necessarily require regulation in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For discussion of the MCLs and the Hazard Index, please see section V of the FRN and section 5 of the *Response to Comments* document.

Brian Hackman (Doc. #1539, SBC-042909)

In summary, the PFAS MCL and HI proposal for the six PFAS components is myopically being shoved onto the American people based on an emotional response without reasonable logic or basis in regards to the scientific method demonstrated through third party independent verification, financial boundaries and budgets and demonstrated return on investment, and sense of reasonableness to the risk vs. benefit approach of living life when so much of the exposure routes are not protected and may exist beyond the Agency’s control.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. The EPA disagrees with the commenter on the methods the agency has used to develop this PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hufsa Ahmed (Doc. #1540, SBC-042658)

Comment submitted by Hufsa Ahmed

Posted by EPA on May 9, 2023

To Whom It May Concern,

I am writing in regards to the proposed rule for Per- and Polyfluoroalkyl Substances (PFAS) to be included into the National Primary Drinking Water Regulations. As stated on your website, "EPA expects that if fully implemented, the rule will prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses." I agree with this statement wholeheartedly because PFAS are quite literally killing individuals in my community of Saint Paul, Minnesota. Just this week, I read an article (attached) about a push in the Minnesota legislature to regulate PFAS after a 20 year old student died in April from a rare for of cancer this year. The suspected source of this cancer: a 3M PFAS plant miles from this student's high school that releases toxic waste into the community. High rates of cancer in this suburb of Saint Paul is no coincidence: PFAS takes lives. It is unacceptable and abhorrent that corporations can continue to engage in actions that cost people their lives. Regulations are necessary to prevent further harm, damage, and deaths.

[Attachment 1: see docket ID EPA-HQ-OW-2022-0114-1540].

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alliance of Nurses for Healthy Environments (Doc. #1544, SBC-042665)

Per- and Polyfluoroalkyl Substances (PFAS): Proposed National Primary Drinking Water Regulations

The Alliance of Nurses for Healthy Environments (ANHE) is the only national nursing organization focused solely on the intersection of health and the environment. One of our roles as nurses is to create healthy environments in which individuals, families, groups and communities cannot just survive but thrive. [FN1: American Nurses Association (2020). Nursing: Scope and standards of practice, (4th ed.). ANA: Silver Spring, MD.] Nurses have been ranked the most trusted profession for 20 consecutive years [FN2: Yale School of Nursing. (2022, February 7). Gallup: Nurses are Most Trusted Profession for 20th Straight Year.https://nursing.yale.edu/news/gallup-nurses-are-most-trusted-profession-20th-straight-year] and we are led by our professional obligations [FN3: American Nurses Association. (2020). Nursing: Scope and Standards of Practice (4th ed.). Standard 18: Environmental Health. ANA: Silver Spring, MD.] which make addressing health, environment and safety a professional focus of ours. The Alliance of Nurses for Healthy Environments supports EPA's proposed regulation of per- and polyfluoroalkyl substances (PFAS) in drinking water under the federal Safe Drinking Water Act.

EPA's proposed rule to set strong, scientifically supported drinking water standards for six PFAS is an important step toward fulfilling the Biden Administration's commitment to tackle these toxic forever chemicals. We thank EPA for the opportunity to comment and applaud EPA's recognition that both individual PFAS and chemical mixtures of PFAS can threaten human health. EPA's proposed rule would provide safer drinking water for communities from coast to

coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alliance of Nurses for Healthy Environments (Doc. #1544, SBC-042667)

National standards to limit the concentration of PFAS in drinking water are long overdue. For decades, PFAS have been used in thousands of applications, and a peer-reviewed study estimates that PFAS may be present in the drinking water of more than 200 million Americans. EPA's proposal for six PFAS would set the national standard for PFOA and PFOS at the lowest detection level approved by the agency, and would establish limits on GenX, PFBS, PFNA, and PFHxS using a hazard index. EPA estimates that 94 million Americans currently receive drinking water contaminated by one or more these PFAS chemicals at levels above the limits proposed by EPA. The regulation of PFAS will improve drinking water safety for millions of Americans.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lawrence and Penelope Higgins (Doc. #1545, SBC-042862)

Dear Administration Regan, Assistant Administrator for Water Fox and Office of Ground & Drinking Water Director McClain,

My name is Lawrence Higgins and I live in Fairfield Maine with my wife Penny, and I am one of the leaders of the community group Fairfield Water Concerned Citizens. I'm writing in support of a strong national drinking water standard for PFAS. National drinking water standards for PFAS have been long overdue and essential for ensuring safe and clean water for all Americans.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lawrence and Penelope Higgins (Doc. #1545, SBC-042864)

The EPA's proposed rule reflects what communities across the country already know to be true: There is no safe level of PFAS in our water. For too many Americans, especially those of us who live every day in the shadow of environmental pollution, enough is enough.

We have lived here going on 29 years where we raised our kids and grandchildren. We built a barn for our alpacas, mini horse, mini mule, and mini donkey. We have always had chickens to supply our whole family and neighbors with eggs which now we were told are full of PFAS from the water and soil, which is why we support strong national drinking water standards to protect our communities from toxic forever chemicals.

October of 2020, we found out that our well water was contaminated from the sludge that had been spread in the fields across the road from our house. DEP came out and took samples of our water. Three weeks later we got a phone call from the DEP saying to stop drinking, cooking, bathing, or giving your water to your animals. This phone call knocked the wind right out of us and made us sick to our stomach. We have worked our whole lives raising our family, providing for them and trying our best to protect them in every way possible. We have invested over $200,000.00 over the past ten years building our new retirement house and a new barn for all our animals so that we could enjoy our golden retirement years. Now we find out that all of us including our animals have been poisoned with the PFAS chemicals in our water, soil, and chicken eggs from the sludge that the State of Maine allowed to be spread. We never even thought that one water test would change our lives forever. We still have a mortgage on our new house so if we wanted to sell our home right now, we could not even give it away. We are living in limbo and just waiting to see which one of our organs are going to shut down from this PFAS through no fault of our own. Nobody can even imagine what it is like sitting here knowing that these forever chemicals will one day kills us.

We have (8) alpacas, a mini-horse, a mini-Mule, a mini-Donkey, chickens, ducks, 2 dogs and 2 cats. Our local Vet does not know how much this PFAS has or will affect our animals. Now we have found out that the deer in Fairfield are contaminated with PFAS. I am sure that all the wild life in this area is also. So, you tell me what all of this has done to the value of our properties. What do you think it is doing to our physical and mental well-being? Our water is testing at around 5,690 ppt. Both mine and my Wife's PFAS levels in our blood is over 350. This is why we support strong national drinking water standards to protect our communities from toxic forever chemicals.

A strong national standard is necessary to protect public health and ensure consistent regulation across the country. It would also provide certainty and clarity for water utilities, industries, and consumers to keep our water sources free of PFAS. It encourages research to develop safer alternatives to PFAS and improve methods for detecting and removing them from our water systems.

I urge the EPA to finalize this rule as soon as possible and to continue working on developing standards for regulating PFAS together as a class of chemicals.

Thank You,

Lawrence and Penelope Higgins

4 Currier Road

Fairfield, Me. 04937

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dylan Pilger (Doc. #1546, SBC-042679)

In summary, I STRONGLY SUPPORT [with amendments] the development of federal regulations of PFAS in public water systems by the EPA. PFAS is a real and pressing danger in my community and nationwide which requires immediate action. To enhance this regulation, particularly with regards to the health of Indigenous communities, I put forth the following three recommendations: 1) The EPA must consider possible synergistic effects of PFAS and adjust monitoring guidelines accordingly. 2) The EPA must comply with OMB Statistical Directive 15 and disaggregate Asian and Pacific Islander data. 3) The National Drinking Water Advisory Council must include Indigenous representation.

With the addition of these recommendations we can protect the safety of our communities.

Thank you kindly for your time and consideration.

Sincerely,

Dylan Pilger

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the synergistic effects of PFAS, specific discussion on dose additivity and aggregate health effects is included in section IV of the FRN. For a response on the disaggregation of Asian and Pacific Islander data, please see the EPA response to comment Doc. #1546, SBC-042677 in section 14.10 in this *Response to Comments* document. For a response to indigenous representation within the NDWAC, please see the EPA response to comment Doc. #1546, SBC-042678 in section 14.11.2 in this *Response to Comments* document.

Dylan Pilger (Doc. #1546, SBC-042675)

Mr. Michael S. Regan

Environmental Protection Agency

Mail Code 1101A

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Dear Director Regan,

My name is Dylan Pilger. I was born and raised on the island of Oʻahu, Hawaiʻi, and am a 5th generation descendant of Chinese and Okinawan laborers who migrated to Hawaiʻi to work on plantations in Hawaiʻi. I currently reside in Honolulu, Hawaiʻi with my wife and four-year-old son. I possess a Bachelor of Science in Biochemistry, and am currently pursuing a Master of Public Health specializing in Native Hawaiian and Indigenous Health. I have a strong interest in this regulation due to its relevance to the health and well-being of not only my own family, but also the broader community here in Hawaiʻi and future generations to come. This issue was brought to my attention through learning about the disastrous impacts PFAS has had on the water systems in Okinawa (Mitchell, 2020) and recent discoveries of PFAS in the local environment in Hawaiʻi (Jedra, 2022).

I STRONGLY SUPPORT [with the following amendments] the development of federal regulations of PFAS in public water systems and believe it is in line with the Environmental Protection Agency's (EPA) mission to ensure that "Americans have clean air, land and water" and "contaminated lands and toxic sites are cleaned up by potentially responsible parties and revitalized." Per- and polyfluoroalkyl substances (PFAS) pose a real and pressing danger to the health of our communities as evidenced by a number of recent studies (Langenbach & Wilson, 2021; Ojo et al., 2021; Zuzelo, 2020). Action must be taken to protect the health of waterways and the people which rely on them.

This regulation may have additional benefits to Indigenous communities, which should be strengthened. Water is important to many Indigenous cultures. Water is of special importance in Hawaiian culture and in ancient Hawai'i complex systems of water management were created to manage this precious resource (Ho'okano, 2020; Sproat, 2020). Wai or water was not only important for daily survival, but also the embodiment of the god Kāne. Therefore, water was sacred and continues to be sacred for Native Hawaiians today. This further reinforces the need for strong regulations for protecting water.

Although this rule is a good first step, the following three amendments must be made in order for the rulemaking to reach its full potential, especially for Indigneous communities. The first recommendation is that the EPA further investigate the synergistic effects of different PFAS compounds and their impacts on human health and adjust monitoring guidelines accordingly. The second recommendation is that the EPA comply with OMB Statistical Directive 15 and disaggregate Asian and Pacific Islander data for conducting their environmental justice analysis. The third recommendation is that the National Drinking Water Advisory Council include representation from Indigenous communities.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the synergistic effects of PFAS, specific discussion on dose additivity and aggregate health effects is included in section IV of the FRN. For a response on the disaggregation of Asian and Pacific Islander data, please see the EPA response to comment Doc. #1546, SBC-042677 in section 14.10 in this *Response to Comments* document. For a response to indigenous representation within the NDWAC, please see the EPA response to comment Doc. #1546, SBC-042678 in section 14.11.2 in this *Response to Comments* document.

Washington, DC 20460

Re: Expressing Support and Requesting Reform for Increased Regulation of Per- and Polyfluoroalkyl Substances (Docket ID No. EPA-HQ-OW-2022-0114 [Link: https://www.regulations.gov/document/EPA-HQ-OW-2022-0114-0027])

Administrator Regan,

Background Summary

The presence of per- and poly-fluoroalkyl substances (PFAS) in drinking water is a serious threat to human health, as empirical evidence has proven the multitude of adverse effects PFAS can have on the human body. [REF1: Panieri E, Baralic K, Djukic-Cosic D, Djordjevic AB, Saso L. PFAS Molecules: A Major Concern for the Human Health and the Environment. Toxics 2022, Vol 10, Page 44. 2022;10(2):44. doi:10.3390/TOXICS10020044; REF2: Fenton SE, Ducatman A, Boobis A, et al. Per- and Polyfluoroalkyl Substance Toxicity and Human Health Review: Current State of Knowledge and Strategies for Informing Future Research. Environ Toxicol Chem. 2021;40(3):606-630. doi:10.1002/ETC.4890] This new proposal of the EPA to regulate four more types of PFAS under the Safe Drinking Water Act (SDWA) with a new National Primary Drinking Water Regulation (NPDWR), and to enforce lower Maximum Contaminant Level Goals (MCLG) of PFAS in public drinking water, is an inspiring effort to ensure that our public drinking water is becoming safer. I strongly support the approval of the proposal and respectfully propose a reform toward the ideal goal of someday eliminating all PFAS from our public drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Washington, DC 20460

RE: EPA's Proposed PFAS National Primary Drinking Water Regulation Rulemaking Docket ID No. EPA-HQ-OW-2022-0114

Dear Ms. Lan,

PFAS compounds have been utilized for many years and pose several risks to public health across our nation. Therefore, more must be done to prevent public exposure to the contamination of PFAS compounds in our drinking water. Consequently, I support the EPA's proposed PFAS National Primary Drinking Water Regulation rulemaking (docket ID number EPA-HQ-OW-2022-0114).

As a resident of Colorado, my community has challenges related to PFAS in our drinking water. The more I learned about the exposure risks from PFAS compounds, the more I was compelled to understand the common sources in my community and know what is being done at a federal, state, and local level to prevent harmful exposure to the public. The origins and levels of contamination vary throughout the state. However, some common sources of PFAS contamination in Colorado water sources include firefighting foams, mining and extraction activities, industrial discharges, agricultural runoff, and landfill leachate.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Shelley V.L. (Doc. #1555, SBC-042559)

Federal, state, and local governments need to work together to address the risk from PFAS. The dangers are known, and perhaps when more research is conducted, the findings will be more severe than current scientific research suggests. This issue is no longer an innocent case of not understanding the dangers of the contaminants. The EPA has authority through the Safe Drinking Water Act (SDWA) to act on this issue. The SDWA provides the EPA with the authority to set national drinking water at the federal and state level standards, specifically over the maximum level of contaminant (MCLs), annual contaminant reporting requirements, as well as maximum contaminant level goals (MCLGs) for water utilities. The EPA is well within its authority to establish this regulation on behalf of the safety and health of the nation.

I support the EPA's proposal and I urge legislation to take the necessary steps to protect our drinking water from the harmful effects of these chemicals.

Thank you,

Shelley VL.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Virginia Health Catalyst (Doc. #1556, SBC-042865)

May 30, 2023

The Honorable Michael S. Regan

United States Environmental Protection Agency

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Submitted via www.regulations.gov

Re: EPA-HQ-OW-2022-0114, PFAS National Primary Drinking Water Regulation Rulemaking.

Administrator Regan:

I am pleased to provide a comment on behalf of Virginia Health Catalyst in response to the Environmental Protection Agency's (EPA's) proposed rule: PFAS National Primary Drinking Water Regulation Rulemaking.

Virginia Health Catalyst (Catalyst) is a public health nonprofit organization that ensures all Virginians have equitable access to comprehensive health care, including oral health. Catalyst meets this mission through advocacy and programmatic initiatives anchored by our four pillars: policy, public awareness, community and clinical care, and public health.

Founded in 2010, Catalyst's roots are in oral health advocacy and education. Catalyst has also long worked to ensure Virginia's public drinking water is properly fluoridated so everyone can access this affordable and effective intervention. Since 2019, we have broadened our efforts to ensure equitable access to safe, affordable, and fluoridated drinking water that is trusted and preferred by all Virginians.

We applaud EPA's proposal to reduce per- and polyfluoroalkyl substances (PFAS) in the nation's water supply. This historic rule – if finalized – will protect the environment and strengthen the nation's public health.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Great Lakes Water Authority (GLWA) (Doc. #1558, SBC-042545)

May 12, 2023

The Honorable Michael Regan

Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N. W.

Washington, D.C. 20460

Re: DOCKET ID NO: EPA-HQ-OW-2022-0114

Proposed Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan:

The Great Lakes Water Authority ("GLWA") appreciates the opportunity to submit comments on the U.S. Environmental Protection Agency's ("EPA") Proposed Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking. GLWA is encouraged that EPA is working to address per- and polyfluoroalkyl (PFAS) substances and shares the concerns regarding the presence of these chemicals in the environment and our collective source waters.

GLWA provides water and wastewater services to 112 member communities in southeast Michigan. This represents 3.8 million Michigan residents, including large numbers of people with difficulty affording their current water and sewerage charges. GLWA's main areas of concern with the proposed regulations include:

• Financial implications of long-term waste stream disposal options if treatment is required;

• Sampling clarifications for consecutive systems; and

• Reduction/Elimination of PFAS.

Following this discussion, GLWA addresses some specific questions posed by EPA.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion around waste stream disposal options, please see section 10.4 of the *Response to Comments* document. For additional discussion around consecutive systems, please see section 1.4 of the EPA response in this *Response to Comments* document.

From: Lecsy Gonzalez, Master of Public Health Candidate from Cornell University

Re: Docket ID No. EPA-HQ-OW-2022-0114, Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

I am pleased to have the opportunity to comment on the health equity aspect of the per- and polyfluoroalkyl substances (PFAS) national primary drinking water regulation, mainly as it concerns indigenous populations. PFAS contamination is a serious health concern that has been linked to several birth complications and thyroid issues, [REF1: Stoiber, T., Evans, S., Temkin, A.M., Andrews, D.Q. and Naidenko, O.V., 2020. PFAS in drinking water: an emergent water quality threat. Water Solutions, 1(40), p.e49.; REF2: Kazwini, T., Yadav, S., Ibrar, I., Al-Juboori, R.A., Singh, L., Ganbat, N., Karbassiyazdi, E., Samal, A.K., Subbiah, S. and Altaee, A., 2022. Updated review on emerging technologies for PFAS contaminated water treatment. Chemical Engineering Research and Design.] and it is, therefore, essential to regulate its pollution in drinking water sources.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan Farm Bureau (MFB) (Doc. #1562, SBC-043363)

Conclusion

Michigan Farm Bureau's grass roots member-developed policy supports funding for research and collaboration between agencies, universities, and the public and private sector to evaluate health risks and mitigation/destruction technologies for emerging contaminants like PFAS, and using sound science to determine the level of impact of emerging contaminants and determining financial impact to the regulated community before regulations are established. [FN24: Michigan Farm Bureau. 2023. Michigan Farm Bureau 2023 Policy Book, Adopted by the Delegates to the 103rd Annual Meeting. Retrieved from: https://www.michfb.com/sites/default/files/2023-01/michigan-farm-bureau-policy-book.pdf.] The American Farm Bureau Federation, of which Michigan Farm Bureau is a member, additionally calls for using the best available science and appropriate risk assessment for establishing health goals and regulatory standards that are feasible to achieve. [FN25: American Farm Bureau Federation. 2023. Farm Bureau National Policies 2023: Resolutions on National Issues Adopted by the Voting Delegates of the Member State Farm Bureaus to the 104th Annual Meeting of the American Farm Bureau Federation. Retrieved from: https://www.michfb.com/sites/default/files/2023-01/afbf-policy-book.pdf.] Farmers not only have the potential to be exposed to PFAS through drinking water, surface and groundwaters, air, and soil amendments, but have the additional responsibility to produce a safe, abundant, and affordable food supply for our nation and people around the world.

We support that EPA is strategically working to reduce the risks of exposure to PFAS. However, we urge EPA to:

1) Consider and include research, quality assurance, consistency, and transparency in its review and selection of research on health impacts of PFAS chemicals to ensure it is appropriately assigning risk based on real world results.

2) Consider the work of other agencies and organizations also collecting data and performing research on impacts and harmful concentrations of PFAS exposure to ensure there is alignment in determining health impacts based on the best quality research.

3) Proactively seek accurate cost information and acknowledge impacts and challenges of implementation for the regulated community, to not only perform the best possible economic cost-benefit analysis, but also to inform funding and technical assistance needs of regulated facilities and suppliers.

4) Work closely within its departments and with other agencies to ensure studies, research, regulatory standards, and water quality values are of the highest quality, most transparent analysis and development, and most rigorously analyzed as the information collected to develop MCLs will inform and influence subsequent regulations including those under the Clean Water Act, which will also have profound impacts on the regulated community.

We appreciate the opportunity to provide comments and look forward to working with EPA to ensure that final PFAS MCLs reflect the best research and data, have support for implementation and compliance, and meet the need of communities of all sizes – especially small, rural, and impoverished communities who will endure the most disproportionate impacts from the requirements for meeting these regulatory standards. These MCLs will set the precedent for

regulation of other PFAS as well as other emerging contaminants. It is therefore crucial for EPA to conduct this regulatory process in a way that will provide a good example for future regulations as well.

Thank you for your attention. Please feel free to contact me with any questions.

Sincerely,

Laura A. Campbell

Senior Conservation and Regulatory Relations Specialist

Michigan Farm Bureau

Office: 517-679-5332; Cell: 517-420-7936

lcampbe@michfb.com

www.michiganfarmbureau.com

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for a PFAS NPDWR, with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has considered and included the best available research on health impacts. Additional discussion on the scientific evidence for health effects is described in section 4 of the *Response to Comments* document. Specifically for discussion on how the agency followed the 2005 Guidelines for Carcinogen Risk Assessment and the scientific evidence supporting the cancer classifications, please see section 4.1.

The EPA has incorporated all available data and used the best available data whether it originated inside or outside of the agency. The EPA used data from other entities for occurrence and concentration levels, as well as for the health information, which are outlined in section IV and VI of the FRN. For additional discussion on the data sources that the EPA used for PFAS occurrence, please see section 6 of the *Response to Comments* document.

The EPA has provided clarity in the final rule based on public comments surrounding implementation and monitoring. For additional discussion on implementation guidance and monitoring requirements, please see sections 1.2 and 8.

The EPA conducted a thorough economic analysis that considered implementation, technical assistance, and funding for systems, described in the HRRCA in section XII of the FRN, as well as the Economic Analysis (USEPA, 2024a). The EPA used the most accurate cost information available at the time of the rule proposal and finalization. Please see section 13.3 of the *Response to Comments* document for additional discussion of EPA's methods on estimating costs.

The EPA's final rule represents data-driven drinking water standards that are based on the best available science, meet the requirements of SDWA, and that regulation of the PFAS covered by the NPDWR is vital toward protecting public health by removing these contaminants from our

nation's drinking water. After finalization of the PFAS NPDWR, the EPA also intends to provide support to utilities, primacy agencies, and other interested parties to ensure successful rule implementation. For additional discussion on how the agency considers analytic feasibility when establishing the MCL, please see section 5.1.2 of the EPA response in this *Response to Comments* document.

Missouri Department of Natural Resources (Doc. #1563, SBC-042506)

May 19, 2023

Honorable Radhika Fox

Assistant Administrator Radhika Fox

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, DC 20460

RE: Proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulations Docket ID No. EPA-HQ-OW-2022-0114

Dear Assistant Administrator Fox:

The Missouri Department of Natural Resources recognizes the considerable effort the United States Environmental Protection Agency (EPA) has taken to develop the proposed rule, Proposed PFAS National Primary Drinking Water Regulations. The proposal is a substantial undertaking and it will have a significant impact on public water systems, state primacy agencies, and public health. We recognize the importance of our shared responsibility to protect public health, and appreciate the opportunity to provide comments on the proposal.

In general, the Department agrees with most of the comments submitted by the Association of State Drinking Water Administrators (ASDWA) pertaining to this proposed rule. However, there are areas where the Department has a different opinion, which we detail in this letter. Please find the Department's comments and recommendations for improvement of the proposed rule outlined below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Provencher Engineering, LLC (Doc. #1564, SBC-042505)

While the 4 ng/L MCL will require more PFAS treatment, it is important to understand the importance of the chemical industry's lobby and manipulation against these PFAS MCLs. They claim there is no evidence about the cancers, sicknesses, and harm caused by PFAS. But their

opinions can not be believed because they are biased by their drive for profits! The chemical inductry has lied all laong, even since 1950's. It's time for the chemical inductry to prove the converse, that PFAS is safe for human consumption! It really is all as simple and strainght-forward as I describe above. Time for public health and protection of American citizens to take priority over the chemical industry's lies and deception it has propagated since the 1950's.

Based on the above, I am fully on board and in favor, with my personal opinion being that the new PFAS MCLs proposed by the EPA must be adopted as proposed.

[Attachment 1: See Docket ID: EPA-HQ-OW-2022-0114-1564]

[Attachment 2: See Docket ID: EPA-HQ-OW-2022-0114-1564]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Provencher Engineering, LLC (Doc. #1564, SBC-042503)

I am Donald A. Provencher, P.E., professional civil engineer and business owner of Provencher Engineering, LLC in Merrimack, NH. I am also chair of the Merrimack Village District (MVD), which is a non-profit comminuty public water supply water district funded entirely by its rate payers to provide drinking water to over 20,000 people throughout most of the town of Merrimack, NH. MVD's peak day demand is as high as 5 million gallons per day. In 2019, MVD customers voted 92% in favor to spend $14.5 million to construct two PFAS treatment plants, in addition to one other PFAS plant that was partially funded by a PFAS polluter in Merrimack. MVD represented to its customers that the treatment goal was to have no detecteable PFAS of any kind in their drinking water. With that vote, MVD customers believe that there is no level of safe PFAS in drinking water! This belief was essentially confirmed in June 2022 by EPA's PFAS health advisories which included PFOA at 0.004 ng/L. That health advisory is already 1,000 times lower as compared to EPA's proposed MCL of 4 ng/L for PFOA.

I also own and operate my own engineering company, Provencher Engineering, LLC, and provide drinking water engineering servicies to small public water systems in NH & MA, including PFAS treatment design. Most of my clients also do not want any PFAS in their drinking water. This is because the public has become aware that no level of PFAS can be considered safe based on the track record of certain PFAS, which since the 1950's has been known to cause certain sicknesses in tests conducted by PFAS manufacturers.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Minnesota Pollution Control Agency (MPCA) (Doc. #1569, SBC-042488)

May 25, 2023

Sent Via Regulations.gov

U.S. Environmental Protection Agency

Mail Code: 28221T

1200 Pennsylvania Ave. NW

Washington, D.C. 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan:

The Minnesota Pollution Control Agency (MPCA) commends the U. S. Environmental Protection Agency (EPA) for taking substantive action and proposing Maximum Contaminant Levels (MCLs) for PFOS and PFOA as well as incorporating a hazard index (HI)-based PFAS MCL for PFHxS, HFPO-DA, PFNA, PFBS (HI-based PFAS MCL). These are the first regulatory values proposed by EPA to address PFAS in drinking water and will provide Safe Drinking Water Act (SDWA) administrators with critically needed regulations to ensure drinking water is protected for these PFAS chemicals. The proposed MCLs are greatly needed to begin systematically evaluating and treating the nation's drinking water, given that exposure to PFAS in drinking water has been shown to substantially increase human body burdens of PFAS even at low levels. The increased body burden can persist for many years after exposure ends (Post GB et al. 2017). The establishment of federal MCLs means that SDWA-regulated facilities in all states will be required to test, inform, and treat for PFAS in supplied drinking water – a critical outcome of this federal regulatory action.

Though the MPCA does not administer the SDWA (that responsibility is held by the Minnesota Department of Health or MDH), the MCLs are cited in Minnesota rules as Class 1 water quality standards (WQS), which protect source waters with the domestic consumption use (i.e. drinking water, food processing and similar uses) pursuant to the federal Clean Water Act. Federally established MCLs also are utilized by the MPCA as applicable standards in situations where a more restrictive state standard has not been promulgated for contaminated sites managed under the Minnesota Environmental Response and Liability Act (MERLA), the federal Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and the Petroleum Tank Cleanup Act.

For the reasons stated above, MPCA supports EPA's development and adoption of MCLs for PFOS, PFOA and the HI-based PFAS MCL. Moreover, research taking place around the world continues to generate evidence of new impacts to people's health that are associated with PFAS

exposure. The need for promulgation of the proposed MCLs, as well as the urgent need to prevent further contamination of people and the environment by PFAS, is very clear.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Minnesota Pollution Control Agency (MPCA) (Doc. #1569, SBC-042498)

In conclusion, MPCA supports EPA's proposed action to promulgate MCLs for PFOS, PFOA and the HI-based PFAS MCL. Promulgation of the proposed MCLs will provide a measure of fairness and equity across states regarding exposure to these specific PFAS chemicals in drinking water. Promulgation will also assist MPCA in advancing other initiatives as outlined in MPCA's PFAS Blueprint, including establishing WQS for source water protection and addressing sites contaminated with PFAS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sammamish Plateau Water and Sewer District (Doc. #1573, SBC-042459)

VIA (PDF) FEDERAL ERULEMAKING PORTAL REGULATIONS.GOV

May 24, 2023

United States Environmental Protection Agency (USEPA)

Re: Comments on Proposed Rule: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation [Federal Register Docket ID EPA-HQ-OW-2022-0114-0027]

On behalf of the Sammamish Plateau Water and Sewer District, please accept the following comments regarding the proposed rules related to regulating Per- and Polyfluoroalkyl Substances (PFAS) under the National Primary Drinking Water Regulations. The proposed rules would require public water systems to:

• Monitor for PFAS;

• Provide public notification of the levels of PFAS in drinking water; and

• Reduce the levels of PFAS in drinking water if they exceed the proposed Maximum Contaminant Levels (MCLs).

The Sammamish Plateau Water and Sewer District (District) first detected PFAS in three of its potable groundwater wells as an outcome of UCMR3 testing in 2016. PFAS was detected in three additional wells in 2021. As a result, the District has been conducting extensive testing and monitoring for PFAS. Since PFAS is an unregulated contaminant, the District has been eagerly

awaiting USEPA or the Washington State Department of Health to establish formal drink water limits/MCLs so that the District can mitigate PFAS in its potable groundwater based upon an official regulatory standard. As such we commend and support USEPA's effort to implement formal MCLs.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Endocrine Society (Doc. #1579, SBC-042424)

Submission by the Endocrine Society to the U.S. Environmental Protection Agency regarding proposed rule "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation" to regulations.gov docket EPA-HQ-OW-2022-0114-0027.

May 25, 2023

See attached file(s)

The Endocrine Society appreciates the opportunity to comment on the proposed National Primary Drinking Water Regulation for Per- and Polyfluoroalkyl Substances (PFAS). Founded in 1916, the Endocrine Society is the world's oldest, largest, and most active organization of scientists and healthcare professionals dedicated to research on hormones and the clinical treatment of patients with endocrine diseases. Our membership includes 18,000 clinicians and scientists from over 120 countries, including many researchers engaged in the study of the adverse effects of per- and polyfluoroalkyl substances (PFAS) on endocrine systems.

In general, we are encouraged by the strong standards for the six PFAS established by this new regulation. We welcome and support the proposed maximum contaminant level goal (MCLG) of zero, as well as the enforceable maximum contaminant level (MCL) standards of 4.0 ng/L for PFOA and PFOS. We also support the approach for the other PFAS covered by the regulation based on the limits proposed. We commend EPA for recognizing the effects of these persistent and bioaccumulative chemicals on endocrine systems at biologically relevant levels of exposure, with adverse effects on thyroid hormone levels, metabolic systems, reproduction, development, and others. We also appreciate the agency's recognition of the effects of mixtures of these chemicals.The proposed regulation represents an important step towards more comprehensive protections addressing PFAS, which as described in the supporting documentation for the regulation are an increasingly large class of chemicals with preliminary data indicating similar hazards across many members of this class.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of State and Territorial Solid Waste Management Officials (ASTSWMO) (Doc. #1583, SBC-042407)

ASTSWMO appreciates EPA's efforts to address PFAS contamination through this rulemaking and looks forward to participating in the continuing development of an effective national regulatory framework for PFAS contaminants in the environment. If you have any questions about these comments, please contact me at millie.garcia-serrano@mass.gov or (508) 9462727.

Sincerely,

Millie Garcia-Serrano (MA)

ASTSWMO President

cc: Dania Rodriguez, ASTSWMO

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Washington Suburban Sanitary Commission (WSSC Water) (Doc. #1585, SBC-042766)

May 25, 2023

Michael S. Regan

Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Re: Docket ID: EPA-HQ-OW-2022-0114, PFAS National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan,

Washington Suburban Sanitary Commission (or WSSC Water) appreciates the opportunity to provide comments on EPA's PFAS National Primary Drinking Water Regulation Rulemaking. WSSC Water is a public water system (PWS ID: MDOI 50005) serving 1.9 million customers in Montgomery County and Prince George's County in Maryland. In 105 years of service, WSSC Water has never had a Safe Drinking Water Act violation. This is a track record we are working diligently to continue to safeguard the health of our customers.

WSSC Water commends EPA's dedication to safeguarding public health against PFAS contamination through its PFAS Action Plan. Considering the relatively brief history of PFAS as an emerging contaminant, the advancements made in science, regulatory initiatives, and public awareness have been remarkable. WSSC Water is equally concerned about this issue, and our

efforts to address PFAS in our drinking water surpass the requirements of regulatory measures. We have been voluntarily monitoring PFAS at our Potomac and Patuxent Water Filtration Plants since January 2020, using the latest EPA-approved analytical methods. In 2020, we conducted an initial source water risk assessment on PFAS, and more recently, we are collaborating with other water systems in the National Capital Region to conduct source water assessments and developing plans to update our risk assessment to inform future mitigation measures.

While we appreciate EPA's efforts to establish regulatory measures to combat PFAS contamination in drinking water, wastewater, and biosolids, we are concerned that regulating PFAS under the SDWA and CWA framework, as well as designating PFOA and PFOS in municipal treatment works discharges as hazardous substances under CERCLA, ultimately places the cost burden on the public, despite the limited availability of supporting funds. Within this framework, the public is responsible for demonstrating the harm to public health after PFAS has been discharged and is also responsible for remediation. Therefore, we strongly urge EPA to consider altering its regulatory approach to regulate PFAS at the source, placing the burden of proof that the products are safe for consumers and the environment on those who manufacture and utilize PFAS products before they are manufactured. This preventive approach aligns with environmental justice and equity from a broader perspective, shifting the cost burden from the public, especially disadvantaged communities, to the polluters. We recognize EPA's proposed Significant New Use Rule on several products containing PFAS and encourage the agency to continue expanding and strengthening these efforts to eventually eliminate all PFAS chemicals from our everyday products.

WSSC Water believes that the regulation of PFAS in drinking water can be achieved through the SDWA's multi-step rulemaking process, which includes contaminant identification and occurrence via CCL and UCMR processes, risk assessment, preliminary and final regulatory determinations, proposed and final MCLs, and a six-year review process. We observe that the proposed MCLs for PFOA and PFOS, as well as the preliminary regulatory determinations for four PFAS compounds released concurrently with their proposed MCLs, do not adequately meet the statutory criteria for proving adverse health effects, occurrence, and meaningful opportunities for public health protection. We urge EPA to adhere to these mandates and ensure that future regulatory actions are based on sound science, conclusive evidence, and accurate analysis of cost and health risk reduction.

We offer our comments based on decades of successful compliance with Safe Drinking Water Act regulations, and many other voluntary steps that we have taken to protect the safety of our customers. We hope that our comments help EPA develop a final rule that is practical, implementable, and yet still provides meaningful opportunities for public health protection. We thank you in advance for your consideration.

If you have any questions regarding our comments, please contact me or Jin Shin at jin.shin@wsscwater.com.

Sincerely,

Kishia L. Powell,

General Manager / CEO

Washington Suburban Sanitary Commission

(301) 206-8500 kishia.powell@wsscwater.com

Attachment (1)

Cc: Radhika Fox, Assistant Administrator for the Office of Water, U.S. EPA

Aklile Tesfaye, Deputy General Manager of Operations, WSSC Water

James "J.C." Langley, Director of Production, WSSC Water

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Regarding the commenter's suggestion that the PFAS be regulated "at the source," please see the discussion of the statutory framework found in section 2.3 of the *Response to Comments* document. Regarding the statutory criteria, the EPA disagrees that the statutory criteria were not adequately met for the six PFAS. Please see sections 1.1 and 1.3 of the EPA response in this *Response to Comments* document.

Center for American Progress (CAP) (Doc. #1586, SBC-042384)

May 26, 2023

The Honorable Michael S. Regan

Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Washington, D.C. 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Public Health Considerations for the Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Mr. Regan,

The Center for American Progress (CAP) is an independent, nonpartisan policy institute dedicated to improving the lives of all Americans, and committed to advancing policies and practices that strengthen health and tackle environmental injustice. We are submitting these comments in response to the proposed rule to create a new National Primary Drinking Water Regulation (NPDWR) for six types of per- and polyfluoroalkyl substances (PFAS): perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX

Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS).

We applaud the Environmental Protection Agency's (EPA) efforts to limit exposure to PFAS, otherwise known as forever chemicals, after years of inaction at the federal level. Combined with the funding made available by the Infrastructure Investment and Jobs Act to help local drinking water systems monitor and remove forever chemicals and other emerging contaminants from the drinking water supply, this rule will protect Americans from these dangerous chemicals and invest in and improve their drinking water systems.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Center for American Progress (CAP) (Doc. #1586, SBC-042386)

Since the passage of the 1996 Safe Drinking Water Act (SDWA), the EPA has issued regulations on over 90 contaminants to protect the public from the danger of water contaminants to human health—including disease-causing pathogens, heavy metals, and radioactive particles— but up until now, has not acted on forever chemicals. In proposing a strict new NPDWR for forever chemicals, the EPA is taking an important step to protect public health against PFAS. The rule would set legally enforceable Maximum Contaminant Levels (MCLs) at four parts per trillion for both PFOA and PFOS, while HFPO-DA, PFBS, PFHxS, and PFNA would be regulated together as a mixture using a "Hazard Index" method. At those levels, the NPDWR would be the strictest PFAS standard ever imposed in the United States, including at the state level. These standards would further protect individuals in states with existing standards as well as individuals in states that have not taken action against PFAS. All Americans, but particularly communities overburdened by exposure to dangerous chemicals, stand to benefit. Thousands of public drinking-water systems across the United States are not being tested regularly for PFAS, and no nationwide system dedicated to tracking the proliferation of forever chemicals or their impact on communities exists. Numerous studies, however, have documented the inequitable distribution of PFAS concentration and exposure; across the United States, low-income communities and communities of color are far more likely to live near PFAS-contaminated areas [FN5: Anita Desikan and others, "Abandoned Science, Broken Promises: How the Trump Administration's Neglect of Science Is Leaving Marginalized Communities Further Behind" (Cambridge, MA: Center for Science and Democracy at the Union of Concerned Scientists, 2019) available at https://www.ucsusa.org/sites/default/files/2019-10/abandoned-science-broken-promises-web-final.pdf; Susan Lee and others, "Dirty Water: Toxic 'Forever' PFAS Chemicals are Prevalent in the Drinking Water of Environmental Justice Communities" (New York, NY: Natural Resources Defense Council, 2021) available at https://www.nrdc.org/sites/default/files/dirty-water-pfas-ej-communities-report.pdf].

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cape Fear Public Utility Authority (CFPUA) (Doc. #1588, SBC-042379)

An important step toward regulatory guidance for PFAS

CFPUA and our community made the journey from the discovery of PFAS contamination in our source water to implementation of effective treatment in finished drinking water in the absence of federal or state drinking water regulations for PFAS. This critical gap poses significant challenges to setting contaminant-level treatment goals and communicating the new filters' treatment efficacy to customers. CFPUA believes the PFAS National Primary Drinking Water Regulation (NPDWR) proposed by the U.S. Environmental Protection Agency (EPA) includes important steps to begin eliminating this gap.

CFPUA supports adoption of the Maximum Contaminant Levels (MCLs) as proposed for PFOA and PFOS in drinking water. The MCLs are both needed to protect human health and achievable by currently available treatment technologies. We are proud to say that PFOA and PFOS are consistently not detected in the finished drinking water treated by CFPUA's new GAC filters.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Suffolk County Water Authority (SCWA) (Doc. #1589, SBC-043364)

VIA: regulations.gov

May 26, 2023

Jennifer McLain, Director

Office of Ground Water and Drinking Water

United States Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Mail Code 4601M

Washington, DC 20460

Re: Docket ID: EPA-HQ-OW-2022-0114

Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Director McLain:

Please accept these comments from the Suffolk County Water Authority (SCWA) regarding the establishment of a National Primary Drinking Water Regulation for six per- and polyfluoroalkyl substances (PFAS). The SCWA commends the Environmental Protection Agency (EPA) for proposing a National Primary Drinking Water Regulation for these PFAS because it will improve the health of public water supply customers across the nation. The SCWA has substantial experience implementing new PFAS drinking water regulations of the State of New York, and it offers these comments to enhance the feasibility and effectiveness of EPA's proposed PFAS regulation.

1. Background and Experience

The SCWA is an independent public benefit corporation operating pursuant to New York Public Authorities Law Article 5, Title 4 (Section 1074, et seq.), with its principal place of business located at 4060 Sunrise Highway, Oakdale, New York. As a public benefit corporation, SCWA does not make a profit. All revenues received by the SCWA must be used for operating expenses, construction costs, and paying outstanding debts related to the operation of its public water supply system. The SCWA and the carrying out of its powers, purposes and duties are in all respects for the benefit of the people of the County of Suffolk and State of New York, for the improvement of their health, welfare and prosperity. Pursuant to its statute, the SCWA's purposes are public purposes, and it performs an essential governmental function.

The SCWA is one of the largest groundwater suppliers in the nation and the largest in New York State serving approximately 1.2 million Suffolk County residents. The SCWA has 242 pump stations with approximately 600 wells in its distribution system located throughout Suffolk County. The SCWA currently has approximately 169 granular activated carbon (GAC) treatment systems, 29 iron removal systems, four resin treatment systems, two packed tower aeration treatment systems, one reverse osmosis treatment system, and 17 advanced oxidation process (AOP) treatment systems. The SCWA distribution system includes approximately 6,053 miles of water main, 36,193 fire hydrants, 48 booster stations, and 69 water storage facilities with the capacity to store nearly 73.6 million gallons of potable drinking water. To meet the demands of its customers, the SCWA pumped 71.9 billion gallons of water in the calendar year 2022.

The SCWA also has its own state-of-the-art drinking water testing laboratory that analyzes more than 91,000 samples per year to produce over 190,000 tests and more than 1.7 million test results for more than 400 different chemical constituents. The SCWA's laboratory is approved for testing constituents identified under the federal Unregulated Contaminants Monitoring Rules (UCMR) 1, 2, 3, 4 and 5, and it is approved to monitor for the subject PFAS using EPA Method 533.

In August 2020, New York State adopted contaminant specific maximum contaminant levels (MCLs) for PFOA and PFOA of 10 parts per trillion (ppt), respectively. The SCWA installed GAC filters to provide treatment for wells where PFOA and PFOS have been detected above the New York MCLs, and it can reliably treat these PFAS to non-detectable levels. For over two years, the SCWA has had a full-scale pilot of an ion exchange resin for PFAS removal to

determine the efficacy of this treatment technology as compared to GAC filter media. So far, the SCWA installed more than 25 GAC filtration systems in order to meet the New York MCLs over a four to five year period, and additional systems are being purchased as fast as they can be manufactured. Thus, SCWA has substantial experience with the implementation of new PFAS drinking water regulations.

In light of this background and experience, the SCWA offers the following comments in an effort to enhance the feasibility and effectiveness of EPA's proposed PFAS regulations.

EPA Response: The EPA appreciates this information about the commenters' experience in addressing PFAS in drinking water regulations.

New York Section American Water Works Association (NYSAWWA) (Doc. #1591, SBC-042377)

We appreciate your attention to these important matters and the opportunity to provide our input. As a water supplier dedicated to the well-being of our community, we strongly believe that the final regulations should strike a balance between protecting public health and considering the practical challenges faced by water suppliers.

Thank you for your time and consideration. We look forward to continued collaboration and the opportunity to contribute to the development of effective and scientifically sound PFAS regulations.

Sincerely,

David A. Rowley, PE

NYSAWWA Regulatory Review Chair

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pennsylvania Chamber of Business and Industry (Doc. #1592, SBC-042799)

For These Reasons, We Request EPA Withdraw This Rulemaking for Future Consideration

As we noted in joint comment letter co-signed by 21 other state chambers of commerce and business groups, a durable, workable national framework on this issue can avoid a costly and complicated patchwork of state-level regulatory approaches. However, the rules as proposed will impose substantial costs and challenges to the regulated community, and we urge a withdrawal of this rule for further consideration on these issues.

On behalf of the Pennsylvania Chamber of Business and Industry, thank you for the opportunity to comment on this matter.

Sincerely,

Kevin Sunday

Director, Government Affairs

EPA Response: The EPA disagrees with this commenter's request for withdrawal of the final PFAS NPDWR due to what they believe to be substantial costs and challenges to the regulated community. The EPA acknowledges the commenter's support for a workable national framework on this issue. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on costs, please see section XII of the FRN, as well as additional discussion in section 13.3 of the *Response to Comments* document. For additional responses made to the U.S. Chamber of Commerce's comment letter, especially relating to the costs and challenges of the rule, please see the EPA response to comments Doc. #1713, SBC-045874 and Doc. #1713, SBC-045926 in section 1.3 in this *Response to Comments* document.

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042352)

Administrator Regan

Attention: Alexis Lan

Office of Ground Water and Drinking Water,

Standards and Risk Management Division (Mail Code 4607M),

Environmental Protection Agency,

1200 Pennsylvania Avenue NW,

Washington, DC 20460; Telephone: 202-564-0841

email: PFASNPDWR@epa.gov

Re: Proposed PFAS National Primary Drinking Water Regulation; Docket ID: EPA-HQ-OW-2022-0114 May 26, 2023

Dear Administrator Regan:

Public Health – Seattle & King County (PHSKC) is grateful for the opportunity to comment on the proposed PFAS National Primary Drinking Water Regulation; Docket ID: EPA-HQ-OW-2022-0114.

King County is the 13th largest county in the United States, and our local health department serves over 2.2 million residents. A number of Cities in King County have PFAS contaminated drinking water identified through EPA's Unregulated Contaminant Monitoring Rule 3 (UCMR 3) or through testing for Washington State's PFAS drinking water standards, or State Action Levels (SALs). PHSKC has concerns about PFAS in drinking water sources in King County, and

expect the number of utilities identified with PFAS contaminated drinking water to increase when testing and regulation are required. King County thanks EPA for their actions in issuing a final regulatory determination for PFOS and PFOA, and for developing Maximum Contaminant Levels (MCLs) and Maximum Contaminant Level Goals (MCLGs) for PFOS, PFOA, GenX, PFBS, PFNA, and PFHxS. PHSKC feels the approach and levels set by EPA are strong and will better protect the health and lives of residents in our county.

PHSKC appreciates EPA's approach, which includes identifying specific MCLs and MCLGs for chemicals that are well characterized for their significant health impacts, like PFOS and PFOA.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Public Health, Seattle & King County (PHSKC) (Doc. #1594, SBC-042364)

Again, PHSKC thanks EPA for the opportunity to comment and for the proposed actions to ensure drinking water in the US is healthy and safe from PFAS contamination. Please do not hesitate to reach out to PHSKC's senior toxicologist, Dr. Shirlee Tan (shirlee.tan@kingcounty.gov) with any follow-up questions.

Respectfully,

Faisal Khan, MBBS, MPH

Director, Public Health – Seattle and King County401 5th Ave, 13th Floor, Seattle, WA 98104
Tel: (206) 848-0331

E-mail: fakhan@kingcounty.gov

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR.

Alameda County Water District (ACWD) (Doc. #1595, SBC-042345)

The Alameda County Water District (ACWD) appreciates the opportunity to submit comments on Environmental Protection Agency's (EPA) proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulations (NPDWR). The EPA is proposing the NPDWR to strengthen public health protection. As a public water utility that serves water to approximately 350,000 people in the cities of Fremont, Newark, and Union City in the San Francisco Bay Area, ACWD has a strong commitment to the protection of public health through the development of more stringent drinking water regulations.

On March 29, 2023, EPA announced in the Federal Registry the availability for public comment of the proposed PFAS NPDWR.

ACWD supports the development of EPA's PFAS NPDWR to protect public health, and requests consideration of the comments that are noted in the letter uploaded to this portal.

Thank you for your consideration.

May 26, 2023

Mr. Michael Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue. NW

Washington, DC 20460

Dear Mr. Regan,

Subject: Comments on Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking

Water Regulations, Docket ID No. EPA-HQ-OW-2022-0114

The Alameda County Water District (ACWD) appreciates the opportunity to submit comments on Environmental Protection Agency's (EPA) proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulations (NPDWR). The EPA is proposing the NPDWR to strengthen public health protection. As a public water utility that serves water to approximately 350,000 people in the cities of Fremont, Newark, and Union City in the San Francisco Bay Area, ACWD has a strong commitment to the protection of public health through the development of more stringent drinking water regulations.

On March 29, 2023, EPA announced in the Federal Registry the availability for public comment of the proposed PFAS NPDWR.

ACWD supports the development of EPA's PFAS NPDWR to protect public health, and requests consideration of the following comments:

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR.

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042970)

To: Office of Ground Water and Drinking Water U.S. Environmental Protection Agency

From: Drinking Water and Environmental Health Division

Michigan Department of Environment, Great Lakes, and Energy

Date: May 26, 2023

Subject: Comments on Proposed PFAS National Primary Drinking Water Regulation; Docket No. EPA-HQ-OW-2022-0114

The Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) appreciates the opportunity to review and provide comment on the Environmental Protection Agency PFAS National Primary Drinking Water Regulation Rulemaking, as published in the Federal Register on March 29, 2023 (Vol. 88, No. 60, Wednesday, March 29, 2023).

EGLE DWEHD stands in support of the effort to establish a National Primary Drinking Water Regulation (NPDWR) for per- and polyfluoroalkyl substances (PFAS) based on the best available peer-reviewed scientific study, as outlined in the aforementioned publication. EGLE DWEHD respectfully provides the following comments for EPA's consideration.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan Department of Environment, Great Lakes, and Energy (EGLE) Drinking Water and Environmental Health Division (DWEHD) (Doc. #1597, SBC-042974)

B. Maximum Contaminant Level Goals/Maximum Contaminant Levels for 6 PFAS

Having reviewed Sections V and VI of the proposed NPDWR, EGLE DWEHD generally agrees with EPA's proposed maximum contaminant level goals (MCLGs) and maximum contaminant levels (MCLs) for four of the six PFAS compounds, (PFOA, PFOS, HFPO-DA, PFHxS) based on the best available peer-reviewed scientific study.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Tribal Water Council-Tribal PFAS Working Group (NTWCTPWG) (Doc. #1598, SBC-042344)

Conclusion

PFAS are known as "forever chemicals" that persist in the environment, bioaccumulate in plants and throughout the food chain into animals (e.g., Stahl et al., 2023; Zhang et al., 2022; Andvik et al., 2022) and that are important to tribal subsistence, cultural, and ceremonial practices. It cannot be overstated that tribal people have no alternatives when it comes to their environmental exposures to PFAS. The NTWC-TPWG supports the adoption of primary drinking water regulations for PFAS chemicals.

On behalf of the NTWC-TPWG, we thank you for the opportunity to comment on the proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS chemicals.. Should you or

your staff have questions or comments regarding our letter, please contact Page Hingst, TSC at (402) 8573347 or Dianne Barton, NTTC Chair, at (503) 887-5370. You may also contact Elaine Wilson, NTWC Project Manager, at Elaine.Wilson@nau.edu for any questions regarding the NTWC-TPWG.

Sincerely,

Ken Norton, Chair Page Hingst, Vice Chair

National Tribal Water Council Tribal Science Council

Dianne Barton, Chair Mark Junker, Chair

National Tribal Toxics Council Tribal Waste & Response Steering Committee

Cc: Karen Gude, US EPA Office of Water

First Focus on Children (Doc. #1599, SBC-042333)

Submitted via www.regulations.gov

May 22, 2023

Dr. Jennifer L. McLain

Director, Office of Ground Water and Drinking Water U.S. Environmental Protection Agency

1201 Constitution Ave NW Washington, DC 20004

Re: Docket No. EPA-HQ-OW-2022-0114, "Per- and polyfluoroalkyl substances (PFAS):

Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

On behalf of First Focus on Children, thank you for the opportunity to comment on the proposed rule concerning Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking. First Focus on Children is a bipartisan children's advocacy organization dedicated to ensuring children and families are a priority in federal policy and budget decisions. We commend the U.S. Environmental Protection Agency (EPA) for putting children's health and well-being at the forefront of their policy making. Under the proposed rule, EPA thoughtfully advances its commitment to ensuring children have access to clean, safe drinking water as they develop. We further applaud EPA for implementing enforceable limits on PFAS levels in our drinking water.

EPA's proposal takes much needed steps to reduce our children's exposure to PFAS. This rule creates a National Primary Drinking Water Regulation (NPDWR) that would establish Maximum Contaminant Levels (MCLs) for six types PFAS in drinking water, as well as Maximum Contaminant Level Goals MCLGs). These MCLs are legally enforceable and will apply to perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) as individual chemicals and perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, or GenX Chemicals), perfluorohexane sulfonic acid PFHxS), and perfluorobutane sulfonic acid (PFBS) as a combined mixture. Additionally the MCLGs, while not legally enforceable, require that municipalities alert the public if PFAS levels are above the required threshold.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lehigh County Authority (LCA) (Doc. #1600, SBC-042806)

May 26, 2023

Michael Regan

Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Mail Code: 1309

Washington, DC 20004

SUBMITTED ELECTRONICALLY

RE: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking, Docket No. (Docket ID: EPA-HW-OW-2022-0114)

Dear Administrator Regan,

Lehigh County Authority (LCA) is a medium sized water utility serving approximately 200,000 people in the City of Allentown and surrounding communities in eastern Pennsylvania. We appreciate the opportunity to comment on the Environmental Protection Agency's proposed rule, PFAS National Primary Drinking Water Regulation Rulemaking – EPA-HQ-OW-2022-0114.

Per- and Polyfluoroalkyl Substances (PFAS) have gained public attention over the past several years; however, the chemical class has been in production since the 1940s. LCA supports EPA's efforts to ensure safe drinking water for all citizens by establishing national primary drinking water regulations for perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS).

Due to the importance of this rulemaking, LCA has reviewed the proposed rule and offers the following comments for your consideration.

EPA Response: The EPA appreciates this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lehigh County Authority (LCA) (Doc. #1600, SBC-042812)

PFOA and PFOS are the most common PFAS compounds found in the nation's drinking water. Based on the effectiveness of treatment methods available for PFOA and PFOS, which will also be effective in removing other per- and polyfluoroalkyl substances, we believe the establishment of regulatory standards for PFOA and PFOS will provide significant public health protections from PFAS compounds.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lehigh County Authority (LCA) (Doc. #1600, SBC-042826)

Summary

LCA's mission is to protect public health and the environment by providing high-quality, safe and reliable water services to the communities that we serve. We support the establishment of national primary drinking water standards for PFAS, and applaud EPA's efforts to address this important public health issue. However, it is important for EPA to consider the burden on utilities, which translates to a rate impact to our customers. The comments provided in this submission are intended to offer reasonable refinements to the approaches EPA has developed, to ensure utilities can achieve compliance while navigating the many challenges we face.

Thank you for the opportunity to comment on this important regulatory change. Please contact me at lieselgross@lehighcountyauthority.org or 610-398-2503 if you wish to discuss the comments and concerns expressed in this submission.

Sincerely,

Liesel M. Gross

Chief Executive Officer

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042876)

MWWA's comments to EPA draw on our actual experiences in complying with PFAS drinking water standards, as Massachusetts set drinking water and groundwater cleanup standards prior to the release of EPA's proposed PFAS standards. In October 2020, the Massachusetts Department of Environmental Protection (MassDEP) promulgated a Massachusetts Maximum Contaminant Level (MMCL) of 20 ppt for any one, or the sum, of six PFAS compounds: perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS), perfluorononanoic acid (PFNA), perfluorohexanesulfonic acid (PFHxS), perfluoroheptanoic acid (PFHpA), and perfluorodecanoic acid (PFDA), hereafter referred to as PFAS6.

EPA needs to carefully consider the implementation challenges for PWS caused by regulatory efforts related to PFAS which we will outline below. MWWA is not sure that EPA has put enough time into this effort before moving forward with the proposed drinking water regulations. Without adequate consideration regarding these implementation challenges, public confidence in drinking water could be further jeopardized. EPA must address these challenges before finalizing the rule. We hope that EPA will fully consider the information we are providing on behalf of Massachusetts PWS and will craft a final rule that is reasonable in its expectations of implementation and schedule.

EPA Response: The EPA acknowledges and appreciates this comment expressing concerns about the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For responses to concerns about implementation, please see section 11 of the *Response to Comments* document. Also note that the EPA has provided clarity on monitoring requirements in the final rule based on public comments and is summarized in section VIII of the FRN. For concerns about public confidence in drinking water, please see section 1.2 of the EPA response in this *Response to Comments* document.

Massachusetts Water Works Association (MWWA) (Doc. #1601, SBC-042872)

May 26, 2023

Mr. Michael S. Regan, Administrator

U.S. Environmental Protection Agency

EPA Docket Center, OLEM Docket, Mail Code 28221T

1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114 – National Primary Drinking

Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS)

Dear Administrator Regan:

The Massachusetts Water Works Association (MWWA) is a non-profit organization representing more than 1,400 water supply professionals across Massachusetts. Let us state unequivocally for the record that public health protection is the primary mission and goal of all Public Water Systems (PWS). This role is taken very seriously and PWS work diligently to ensure that the water provided to our residents and businesses meets all Safe Drinking Water Act (SDWA) standards. In Massachusetts, we take great pride in the fact that according to the Environmental Protection Agency's (EPA) own statistics for Quarter 1 of 2023, 96% of community water systems met all applicable health-based standards and 91% of the population served by community water systems received drinking water which met all applicable health-based drinking water standards.

We are providing the following comments on EPA's proposed National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS). We note that EPA has engaged in rulemaking on several major rules impacting the water sector concurrently. With public comments all due within the past month, it is challenging to give each rule the thorough review it requires. This regulation is complicated, with new concepts not well understood by the drinking water profession. We are discouraged that EPA denied our request to extend the public comment period to give more time for thoughtful review on a regulation that will have substantial impact on our industry, management of our water resources, and the customers we serve. We fully support efforts to expand verified public health protections, but EPA needs to consider the challenges associated with implementation of the proposed PFAS rule before finalizing these standards.

General Comments:

MWWA and its members are very comfortable offering our expertise and opinions as they relate to the very real impact that the proposed drinking water standards will have on our operations and related services. However, our ability to offer comments and opinions on more nuanced toxicological principles is well beyond our area of expertise. We are not toxicologists, nor epidemiologists, so we will leave it to other experts to comment on the appropriateness of the standards from a public health protection standpoint. We do know that while EPA is moving

forward with drinking water standards, health studies and exposure assessments are still ongoing [FN1: https://www.atsdr.cdc.gov/pfas/activities/studies.html] by the Centers for Disease Control and the Agency for Toxic Substances and Disease Registry to "provide a better scientific understanding about the relationships between PFAS exposure and certain health outcomes and help people understand their risk for health effects." [FN2: https://www.atsdr.cdc.gov/pfas/activities/pease.html#anchor_45429]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for public health protections, while offering concerns for the PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For responses to concerns about the lack of extension of the comment period, please see section 2.3 and 17 of the *Response to Comments* document; this is also addressed in section 1.3 of the EPA response in this *Response to Comments* document. While some health studies and exposure assessments may be ongoing for other PFAS, the EPA has used the best available peer reviewed science to set the MCLs and Hazard Index approach. For more information, please see sections 3.1.1 and 3.2.1 of the *Response to Comments* document. Sections III.B and IV of the FRN, as well as sections 4.1, 4.2, and 4.3.3 of the *Response to Comments* document, describe the EPA's health-based approach using the best available science for the toxicity assessments of the six PFAS, providing sufficient evidence of the health effects of these six PFAS.

Arlington County Virginia (Doc. #1603, SBC-043021)

Conclusion

For the reasons described herein, we are not supportive of the proposed regulations at the levels being set. We understand both the public interest in, and justification for, regulating these chemicals. However, we believe that focusing the regulatory burden predominantly upon the water industry is misguided. Further, we believe that the remarkably aggressive stance – in terms of MCL levels and timeline – is unwarranted and misleading for consumers. PFAS will continue to exist in the products which our customers purchase and in the environments they inhabit at levels hundreds and thousands of times higher than the levels which are being established for drinking water. In fact, absent complex producer regulations, of which we are unaware, PFAS presence in products and the environment will likely continue to increase even while drinking water levels are driven to the limits of measurable technology.

We would recommend a more measured approach where resources are directed to the pathways which do exhibit exceptionally high levels of PFAS. This should include restrictions on introduction of additional harmful chemicals to the consumer product stream, as well as a more measured approach to regulation in the drinking water industry. Such a regulatory framework in the drinking water industry should focus the limited resources available upon drinking water systems with excessive levels of PFAS, and MCL levels should be increased to focus investments in these communities while studies proceed to better understand the relative impact of PFAS ingestion in humans amongst the many pathways that have been identified. It is also

recommended that we continue the UCMR5 monitoring requirements for PFAS elements to gather data from water systems which will provide better insight into the characteristics of PFAS in our water infrastructure.

Such a graduated approach would allow for more intelligent and effective utilization of limited resources in research, engineering, construction, equipment, manufacturing, regulatory capacity, and public and private funding.

Sincerely,

Greg Emanuel, P.E.

Director, Department of Environmental Services

Arlington County

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For a response to the suggested approach of restricting harmful chemicals instead of regulations for drinking water, please see section 2.3 of the *Response to Comments* document. The EPA believes there are sufficient studies to understand the relative impact of PFAS ingestion in humans based on the SDWA requirements. Please see section 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document for more information. The EPA does not agree that MCL levels should be increased. Please see sections 5.1.1, 5.2 and 5.3 of the EPA response in this *Response to Comments* document. The EPA does not believe that the MCL levels and timeline are misleading to consumers. Please see section 1.2 of the EPA response in this *Response to Comments* document for comments regarding communication of the NPDWR. Lastly, the EPA does not believe that UCMR 5 is necessary to gather data from water systems to provide better insight into PFAS characteristics for this rule action. The EPA is not obligated to use UCMR prior to finalization of the rule, but did include preliminary data for discussion. For further discussion of UCMR 5 data, please see section 6.8 of the *Response to Comments* document, as well as the EPA response to comment Doc. #1714, SBC-045945 in section 1.3 in this *Response to Comments* document.

Arlington County Virginia (Doc. #1603, SBC-043004)

While we understand the value in regulating these chemicals, the proposed regulations do not target the polluters where investment would most likely be effective for the public and drive the right behaviors to reduce PFAS which have become ubiquitous in most environments in many forms. Instead, they target all water consumers where the inevitable significant resulting rate increases will disproportionately affect low-income citizens. The proposed limits are set far too low without a sufficient basis in logic, and we believe the costs and impacts are significantly understated. Finally, the implementation schedule is unrealistic and will lead to poor decisions that affect all rate payers. These concerns are laid out in greater detail in the attached letter. We

do appreciate the opportunity to comment on EPA's proposed PFAS National Primary Drinking Water Regulations, and strongly urge the EPA to reconsider its approach.

Washington, D.C. 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

Dear Assistant Administrator Fox:

Arlington County operates a public water and sewer utility that serves daily 230,000 residents, 160,000 workers, tens of thousands of visitors, and some of the Federal Government's most critical facilities to include the National Foreign Affairs Training Center, Joint Base Myer Henderson Hall, and Arlington National Cemetery. We purchase our drinking water from the Washington Aqueduct Division (WAD)of the Army Corps of Engineers. Along with our partners, DC Water and Fairfax Water, we serve on the wholesale Customer Board which is responsible for providing and allocating all operational and capital costs at the WAD. In addition to the important customers described previously, the WAD is the sole or primary provider for the White House, Pentagon, Reagan National Airport, US Capitol grounds, Central Intelligence Agency, and every other Federal installation in Washington DC, Arlington, and much of Fairfax County.

Arlington County understands and fundamentally supports the EPA's interest in regulating this family of chemical compounds. However, we believe that there are numerous challenges with the proposed NPDWR regulations which will not further our shared goals of protecting public welfare.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For a response to the concern that the regulations do not target polluters, please see section 2.3 of the *Response to Comments* document. For a response to the concern that there will be significant rate increases and that the regulations will disproportionally

impact low-income residents, please see section 14.10 of the *Response to Comments* document. For a response to the concern that the regulation imposes limits that are too low without justification, please see section 5.1.1, 5.2 and 5.3 of the *Response to Comments* document. The EPA disagrees that the costs are understated. Please see sections XII.A.2.b, XII.A.3.b and XII.A.4.b of the FRN for this rule for responses to comments about the analyzed costs.

Mass Comment Campaign sponsored by National Caucus of Environmental Legislators (NCEL) (Doc. #1605, SBC-042332)

May 25, 2023

Administrator Michael S. Regan

U.S. Environmental Protection Agency

EPA Docket Center, OW Docket

Mail Code 28221T

1200 Pennsylvania Avenue NW Washington, DC 20460

Dear Administrator Regan,

Re: Per- and Polyfluoroalkyl Substances (PFAS): Proposed National Primary Drinking Water Regulations (Docket ID: EPA-HQ-OW-2022-0114)

The undersigned 278 state legislators strongly support the regulation of per- and polyfluoroalkyl substances (PFAS) in drinking water under the authority of the federal Safe Drinking Water Act, as proposed by the Environmental Protection Agency (EPA) and published in the Federal Register on March 29, 2023. EPA's proposal to set strong, scientifically supported drinking water standards for six PFAS is an important step toward fulfilling the Biden Administration's commitment to tackle these toxic forever chemicals. We commend EPA's recognition that both individual PFAS and chemical mixtures of PFAS can threaten human health. We urge you to finalize the standards as quickly as possible.

National standards to limit the concentration of PFAS in drinking water are long overdue. For decades, PFAS have been used in thousands of applications, and a peer-reviewed study estimates that PFAS may be present in the drinking water of more than 200 million people across the country. EPA's proposal for six PFAS would set the national standard for PFOA and PFOS at a level of four parts per trillion and would establish limits on GenX, PFBS, PFNA, and PFHxS using a hazard index. EPA estimates that 94 million people currently receive drinking water contaminated by one or more of these PFAS chemicals at levels above the limits proposed by EPA. The regulation of PFAS will improve drinking water safety for millions of residents we serve.

Due to drinking water being a significant pathway of PFAS exposure, addressing contamination before it reaches our taps is key to reducing associated health problems. The Safe Drinking

Water Act requires that national drinking water standards present a meaningful opportunity to reduce health risks. EPA's proposal would significantly reduce exposure to PFAS in drinking water and as a result, lower risks of related health impacts.

The PFAS addressed by EPA's proposal are among a class of thousands of forever chemicals. EPA's proposal to use a hazard index to address multiple co-occurring PFAS recognizes the risks associated with harmful chemical mixtures. Like many members of the PFAS class, PFBS, PFNA, GenX, and PFHxS have similar chemical structures and cause similar health effects. Many of the communities we represent are exposed and harmed by mixtures of those PFAS in their drinking water. EPA's approach provides a framework for addressing additional PFAS and mixtures of chemicals in the future, which would allow the Agency to move more rapidly to protect public health.

Under EPA's proposal, drinking water utilities will be required to test water for PFOA, PFOS, GenX, PFBS, PFNA, and PFHxS and install treatment technologies to reduce the concentrations of these chemicals to the level of EPA's proposed "maximum contaminant levels" or lower. Fortunately, proven technology is available that will not only reduce the presence of the six PFAS in EPA's proposal, but will also improve protection against other PFAS compounds and common contaminants.

While some water utilities have already installed water treatment technology capable of reducing PFAS, many are not yet equipped to do so. To help communities, Congress passed the Bipartisan Infrastructure Law which provides $9 billion in funding for drinking water treatment upgrades, and an additional $11.7 billion for other necessary drinking water infrastructure needs. This funding will aid utilities in meeting EPA's proposed drinking water standards and improve drinking water safety.

As state legislators, we are well aware of the prevalent nature of PFAS contamination and the need to curb all pathways of PFAS exposure and sources of pollution. National standards for PFAS in drinking water is an important step for urgently needed action to address PFAS contamination and exposure.

Thank you for your consideration.

[Table 1 - List of signatories: See Docket ID EPA-HQ-OW-2022-0114-1605]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

American Water Works Company Inc. (Doc. #1608, SBC-043980)

In conclusion, providing safe, reliable, and affordable water is American Water's business, and we look forward to working cooperatively and collaboratively with the U.S. EPA, Congress,

regulators, and policymakers so that the implementation of these proposed water standards protects customers, communities, and the general public.

Please direct any questions regarding these comments to my attention at 856-676-5799 or Lynda.DiMenna@amwater.com.

Sincerely,

Lynda DiMenna

VP Chief Environmental and Safety Officer

Detailed American Water Comments on

Proposed PFAS National Primary Drinking Water Regulation

Docket ID No. EPA-HQ-OW-2022-0114

May 24, 2023

American Water Works Company, Inc. (American Water) appreciates the opportunity to provide comment to the U.S. Environmental Protection Agency (U.S. EPA) regarding your preliminary regulatory determinations and proposed national primary drinking water regulation for certain per- and polyfluoroalkyl substances (PFAS) as described in the March 29, 2023, Federal Register (88 FR 18638). American Water provides drinking water and wastewater service to an estimated 14 million people in 24 states, including more than 300 public water drinking water systems. In addition to our regulated operations, we also provide water and wastewater services to various military installations across the country through our regulated-like business, Military Services Group. We currently operate 50-year contracts at 18 military installations across the nation as part of the U.S. Government's Utilities Privatization Program. Our comments are based on our extensive experience in designing and installing treatment for groundwater and surface water, including treatment for PFAS that allows us to meet state standards, and implementing drinking water regulations across our footprint.

EPA Response: The EPA appreciates this comment.

American Water Works Company Inc. (Doc. #1608, SBC-043974)

May 24, 2023

Water Docket

Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114

Comment Clerk:

American Water Works Company, Inc. (American Water) appreciates the opportunity to provide comment to the U.S. Environmental Protection Agency (U.S. EPA) regarding your preliminary regulatory determinations and proposed national primary drinking water regulation for certain per- and polyfluoroalkyl substances (PFAS) as described in the March 29, 2023, Federal Register (88 FR 18638). American Water provides drinking water and wastewater service to an estimated 14 million people in 24 states, including more than 300 public water drinking water systems. In addition to our regulated operations, we also provide water and wastewater services to various military installations across the country through our regulated-like business, Military Services Group. We currently operate 50-year contracts at 18 military installations across the nation as part of the U.S. Government's Utilities Privatization Program. Our comments are based on our extensive experience in designing and installing treatment for groundwater and surface water, including treatment for PFAS that allows us to meet state standards, and implementing drinking water regulations across our footprint.

American Water supports the U.S. EPA's efforts to protect public health by proposing national drinking water standards for PFAS. These contaminants are among the multiple challenges the water industry faces regarding water quality, quantity, and reliability. That is why American Water remains committed to being a leader in the U.S. water and wastewater industry and a provider of solutions to these challenges.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR.

Prince William County Service Authority (Doc. #1609, SBC-042829)

May 25, 2023

Ms. Radhika Fox

EPA Docket Center

Office of Ground and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue

Washington, D.C. 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

Dear Assistant Administrator Fox:

The Prince William County Service Authority (Service Authority) is a not-for-profit utility that proudly provides high quality drinking water to over 380,000 residents in Prince William County, Virginia. We purchase water from two purveyors; Fairfax Water and the City of Manassas.

The Service Authority supports the development of primary drinking water standards for PFAS compounds based on the best available science and understanding of risk. A national standard which provides clarity for both water utilities and the public we serve is preferable to the current patchwork of differing state standards that exist. However, we have significant concerns with EPA's proposed regulations.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR, as well as the expression of concerns.

Prince William County Service Authority (Doc. #1609, SBC-042841)

In closing:

1. The Service Authority supports the development of primary drinking water standards for PFAS compounds based on the best available science and understanding of risk.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR.

Wisconsin Conservation Voters (Doc. #1611, SBC-042861)

PFAS are already presenting well-known health risks in Wisconsin communities like Campbell, Eau Claire, La Crosse, Madison, Marinette, Peshtigo, Rhinelander, Stella, and Wausau. Other Wisconsin communities are just beginning to learn about the potential impact of these chemicals. Since testing Wisconsin drinking water systems began in 2022, PFAS have been detected in over 70 communities, impacting the drinking water of more than 2.2 million Wisconsinites – more than one third of our state.

We need help from the federal government. Our current standards for PFOA and PFOS are not protective of public health, and local leaders are looking for guidance on how to protect their constituents. By finalizing the NPDWR and MCLG, we can finally deliver clear guidance to our communities and begin protecting Wisconsin families from these dangerous forever chemicals. We urge you to finalize the proposed NPDWR and MCLG as expeditiously as possible.

Thank you for your time,

Peter Burress

Government Affairs Manager

Wisconsin Conservation Voters

Washington, DC 20004

Support for PFAS National Primary Drinking Water Regulation [Docket No. EPA-HQ-OW-2022-0114]

Dear Administrator Regan,

We are writing today to show our strong support for the proposed National Primary Drinking Water Regulations (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for PFOA, PFOS, PFHxS, PFNA, PFBS, and GenX chemicals. This is a critical step in addressing contamination associated with all dangerous chemicals in the PFAS family.

Wisconsin Conservation Voters is a nonpartisan, nonprofit organization dedicated to engaging Wisconsinites to protect our environment. We have offices in Green Bay, Madison, and Milwaukee. We build relationships with impacted community members, local elected officials, coalitions partners, and our network of over 40,000 members and supporters to fight for a future where every Wisconsin community has equitable access to clean drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marlene Ladderbush (Doc. #1612, SBC-042911)

May 26, 2023

Mr. Michael S. Regan, Administrator

U.S. Environmental Protection Agency

EPA Docket Center, OLEM Docket, Mail Code 28221T

1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114 - National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS)

Dear Administrator Regan:

I am writing to provide comments on the Environmental Protection Agency's (EPA) proposed National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS). The drinking water sector fully supports efforts to expand verified public health protections, but EPA needs to consider the challenges associated with its proposed rulemaking and address the water sectors' implementation concerns before finalizing any standards.

I work for Georgetown Water Department; we provide drinking water to 8500 residents. I am a member of the Massachusetts Water Works Association; I am aware that they, and other water works organizations, are submitting more comprehensive comments. I would urge EPA to pay close attention to the points raised by these associations as they are comprised of individuals and companies with expertise in designing and operating Public Water Systems (PWS) and they have

the best understanding of the challenges which will be associated with implementing any final rule EPA adopts. My major concerns are as follows:

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the protection of public health from PFAS.

Marlene Ladderbush (Doc. #1612, SBC-042923)

Thank you for the opportunity to provide these comments. As a water professional, I work hard to always follow the laws and regulations put forth by our regulatory agencies. I am sounding the alarm that I do not think this rule is reasonable, nor easily achievable. EPA has an obligation to address the water sector's implementation concerns and craft a final rule that is more realistic in its expectations of implementation and schedule and comes with the requisite funding to ensure PWS can comply.

Sincerely,

Marlene Ladderbush

Utility Director

Georgetown Water Department

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Town of Lincoln Water Department (Doc. #1613, SBC-043035)

Thank you for the opportunity to provide these comments. As a water professional, I work hard to always follow the laws and regulations put forth by our regulatory agencies. I am sounding the alarm that I do not think this rule is reasonable, nor easily achievable. EPA has an obligation to address the water sector's implementation concerns and craft a final rule that is more realistic in its expectations of implementation and schedule and comes with the requisite funding to ensure PWS can comply.

Sincerely,

Darin LaFalam

Water Superintendent

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Oakland County Water Resources Commissioner (WRC) (Doc. #1615, SBC-042925)

May 25, 2023

The Honorable Michael Regan, Administrator U.S. Environmental Protection Agency 1200 Pennsylvania Ave., N.W.

Washington, D.C. 20460

Re: Docket ID No.: EPA-HQ-OW-2022-0114

Proposed Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan:

My office operates and maintains 22 local water systems that service over 175,000 people and protects public health and safety through the delivery of safe, clean, and affordable drinking water. I appreciate the actions of the Environmental Protection Agency (EPA) to further protect public health by proposing a National Primary Drinking Water Regulation to establish legally enforceable Maximum Contaminant Levels for six PFAS known to occur in drinking water but submit comments to highlight two significant concerns with the proposed regulations.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR, while suggesting some changes can be made. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Oklahoma Department of Environmental Quality (DEQ) (Doc. #1616, SBC-043036)

May 26, 2023

Michael S. Regan, Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Mail Code: 4607M

Washington, DC 20460

Re: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation, Docket ID No. EPA-HQ-OW-2022-0114

Administrator Regan:

The Oklahoma Department of Environmental Quality (DEQ) appreciates the opportunity to comment on the proposed "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation" (PFAS NPDWR). DEQ has primacy in the State of Oklahoma for

administering the drinking water program and other provisions of the Safe Drinking Water Act (SDWA). DEQ staff are active members of the Association of State Drinking Water Administrators (ASDWA), the Association of Clean Water Administrators (ACWA), and the Environmental Council of the States (ECOS).

DEQ asks that the following comments be taken into consideration relative to the proposed Personal and Polyfluoroalkyl Substances National Primary Drinking Water Regulation.

EPA Response: The EPA acknowledges this comment.

Aquarion Water Company (Doc. #1617, SBC-043371)

U.S. Environmental Protection Agency

May 26, 2023

EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

Aquarion Water Company respectfully provides the following comments on EPA's proposed PFAS National Primary Drinking Water Regulation (NPDWR), as described in the Federal Register / Vol. 88, No. 60 / Wednesday, March 29, 2023 / Proposed Rules.

Aquarion Water Company is an investor-owned water utility that serves a population of more than 700,000 people in 72 cities and towns in Connecticut, Massachusetts, and New Hampshire. Across its operations, the company has 10 reservoir systems and more than 300 wells.

It should first be stated that we recognize and respect the significant effort that has been put forth by EPA and other contributors to develop the proposed PFAS regulation. We appreciate the opportunity to offer comments on the regulation. Our goal is to provide meaningful input to the regulatory process to assist in making the final regulation effective for protecting public health.

Aquarion shares EPA's desire to keep harmful levels of PFAS out of the nation's drinking water. Providing safe, high quality drinking water to our customers is Aquarion's top priority, which is why since 2019 we have undertaken a voluntary program to test for and manage PFAS in our water systems. Aquarion has shared all point-of-entry PFAS testing results on our website at aquarionwater.com/pfas and shares PFAS results in its annual Consumer Confidence Reports (CCRs) available at aquarionwater.com/wqr.

EPA Response: The EPA appreciates the information provided to inform the final PFAS NPDWR.

Colorado Water Utility Council (CWUC) (Doc. #1622, SBC-044016)

May 29, 2023

Docket Id No. EPA-HQ-OW-2022-0114

Environmental Protection Agency EPA Docket Center

Mail code: 28221T

1200 Pennsylvania Avenue NW Washington, DC 20460

Via Federal eRulemaking Portal: https://www.regulations.gov/

RE: National Primary Drinking Water Regulations: PFAS Rule (EPA-HQ-OW-2022-0114).

The purpose of the Colorado Water Utility Council is to initiate, evaluate, respond, and comment, within the policy framework of RMSAWWA, on legislative, regulatory, and other matters which directly affect water utilities in Colorado, and to encourage provision of better water service to the consuming public.

Thank you for the opportunity to provide comments on the proposed PFAS MCL determinations. PFAS are a great health concern and as water professionals we care deeply about this subject. Please keep in mind that these regulations must include a balanced and appropriate approach that requires reduction of the chemicals at their source. Water and wastewater treatment facilities are not creating these chemicals and cannot bear the full burden of removing them from the environment. Further, the astronomical costs to remove PFAS in water and wastewater are borne by rate-paying customers, and these regulations (along with a multitude of others) may eventually cause water and sewer rates to become unreasonable, particularly for low-income residents. The comments below are select responses at EPA's request, followed by general comments for consideration.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For responses to comments about reduction of chemicals at the source, please see sections 2.3 and 15 of the *Response to Comments* document. For a response to the concerns about costs for low-income residents, please see section 14.10 of the *Response to Comments* document.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043092)

Summary of Key Recommendations

Aqua appreciates the Agency's interest in preparing a thoughtful, thoroughly crafted proposal to establish national primary drinking water regulations for PFOA, PFOS, and additional PFAS. As EPA demonstrates in its health risk reduction analysis, the potential health benefits of a drinking water standard for PFAS could be significant. Advancing public health is a shared goal between

drinking water systems and EPA. Aqua believes addressing PFAS in drinking water will require multiple stages and continuous efforts as additional information on PFAS toxicity and innovative technologies for PFAS treatment are developed. Thus, Aqua advocates that the regulation EPA promulgates focus on achieving the best initial step in reducing PFAS risks (verses addressing all PFAS risks before adequate data is available).

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the method in which the agency is addressing PFAS via an NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA believes that current information on PFAS toxicity and innovative technologies is sufficient to implement this rule based on SDWA requirements. For a response about toxicity information, including the toxicity assessments, please see sections 3.1.1, 3.2.1, 4.3.1, and 4.3.3 of the *Response to Comments* document. For a response about treatment technologies, please see sections 5.1.4 and 10.1 of the *Response to Comments* document, as well as section X.A of the FRN.

Aqua America, an Essential Utilities Company (Doc. #1623, SBC-043102)

In summary, EPA is strongly encouraged to consider the impacts of this rule carefully and to ensure that, if finalized, the regulations are feasible. While the Agency has a strong interest in expeditious action, it is important to move actions forward meaningfully and in a way that avoids consequences that could be avoidable. The recommended approach would ensure that high- risk water systems are prioritized while also providing EPA with additional time to get better data and improve the science.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the method in which the agency is addressing PFAS via an NPDWR. The EPA disagrees that better data are needed to support the regulation. Please see section 1.3 of the EPA response in this *Response to Comments* document.

RE: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking, Docket No. EPA–HQ–OW-2022-0114 [Link: https://www.regulations.gov/docket/EPA-HQ-OW-2022-0114]

Dear Administrator Regan,

Aqua, an Essential Utilities Company, appreciates the U.S. Environmental Protection Agency's (EPA) efforts to propose national primary drinking water regulations for per- and polyfluoroalkyl substances (PFAS), including perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS). Aqua operates approximately 1,500 water systems covering eight states and three million people. Aqua believes in efforts to strengthen regulations and improve drinking water quality. The proposed regulation includes standards for both PFOA and PFOS as well as regulatory determinations and a standard for four other PFAS

Aqua supports the development of standards for PFOA and PFOS and the Agency's interest in proposing regulatory determinations for additional PFAS. Aqua was the first private utility to establish its own companywide standard for PFOA, PFOS, and PFNA of 13 parts per trillion individually across its eight states in 2020. A standard that is both equally protective and consistently enforced for all affected drinking water customers across the United States is especially important.

Aqua believes that EPA has put forward a rule framework that begins to address several concerns. The proposal serves as a good starting point for finalizing a rule that address PFAS compounds in drinking water. Attached are detailed comments on the proposed rule preamble, supporting documentation, and draft regulatory text. We hope that these comments will help EPA finalize the rule effectively leveraging the science and the authorities of the Safe Drinking Water Act. Within these comments there are several high priority recommendations for the final rule.

Aqua appreciates the opportunity to provide comments regarding the proposed changes to the Proposed PFAS NPDWR Rulemaking.

Sincerely,

Christopher S. Crockett, Ph.D., P.E.

Vice President - Chief Environmental, Safety and Sustainability Officer

EPA Response: The EPA acknowledges and appreciates this comment in general support for the agency's approach in this rulemaking, as well as the recommendations provided. Please see section 1.3 of the EPA response in this *Response to Comments* document.

WaterPIO (Doc. #1624, SBC-043459)

By Electronic Submission: Docket EPA-HQ-OW-2022-0114

U.S. Environmental Protection Agency EPA Docket Center

PFAS: PFOA and PFOS National Primary Drinking Water Regulation Rulemaking Mail Code 28221T

1200 Pennsylvania Avenue, NW Washington, DC 20460

To Whom It May Concern:

WaterPIO greatly appreciates the opportunity to submit our comments about USEPA's proposed National Primary Drinking Water Regulation (NPDWR), which includes Maximum Contaminant Levels (MCLs), a "Hazard Index" ("HI"), and Maximum Contaminant Level Goals (MCLGs) for six PFAS compounds.

EPA Response: The EPA acknowledges this comment.

Environmental Monitoring Coalition (EMC) (Doc. #1625, SBC-043104)

Comments on PFAS National Primary Drinking Water Regulation Rulemaking

May 26, 2023

The Environmental Monitoring Coalition (EMC) was created in 2020 to address a void created by the dissolution of EPA's Environmental Laboratory Advisory Board. The following EMC organizations represent private and government laboratories from state and local governments and drinking and wastewater utilities:

• American Council of Independent Laboratories,

• American Water Works Association,

• Association of Public Health Laboratories,

• The NELAC Institute, and

• Water Environment Federation.

The EMC was established in response to the need for the environmental monitoring community to have a mechanism to develop consensus opinions on issues affecting environmental monitoring.

The EMC supports EPA's efforts to provide clear and uniform requirements for monitoring of the specific PFAS in drinking water nationally, especially since many states are developing their own programs and standards.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Water One - Water District No. 1 of Johnson County, Kansas (Doc. #1627, SBC-042323)

May 19, 2023

Mr. Michael S. Regan,

Administrator Office of Ground Water and Drinking Water, Standards and Risk Management Division, U.S. Environmental Protection Agency

1200 Pennsylvania Avenue Northwest,

Mail Code: 4670M, Washington, D.C. 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Regan:

Water District No. 1 of Johnson County, Kansas (WaterOne) appreciates the opportunity to submit comments regarding the proposed "Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation (NPDWR)". WaterOne is an independent, quasi-municipal public water utility serving 475,000 people across 17 cities throughout Johnson County, Kansas. WaterOne is dedicated to providing safe and clean drinking water that keeps pace with the cutting edge of science and technology. We commend the U.S. Environmental Protection Agency (EPA) for their efforts to address public health and advocate for safe and clean drinking water across the county. WaterOne acknowledges that the proposed PFAS regulation is a positive effort in protecting water quality through science-based regulations. However, water utilities across the U.S. are being disproportionately targeted as polluters by this proposed regulation and direct polluters of consumer and industry products containing PFAS are not being held responsible. Moreover, the proposed regulation is not based upon a deliberate and thorough analysis of data that is normally applied to the regulatory process. WaterOne would like to highlight several concerns for the EPA to consider including the premature regulatory process, implications to water utility operations, laboratory science and technology challenges, residuals disposal, permitting implications, cost and logistical consequences, and supply chain difficulties.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. The EPA disagrees that the regulation is not based upon a deliberate and thorough analysis of data and that the regulatory process is premature. Please see section 1.3 of the EPA response in this *Response to Comments* document. For responses to comments about reduction of chemicals at the source, please see sections 2.3 and 15 of the *Response to Comments* document. For concerns about the regulatory process, please see sections 1.1 and 3 of the EPA response in this *Response to Comments* document, as well as section III of the FRN. For challenges with laboratories, please see sections 5.1.2 (specifically, the EPA

response to comment Doc. #1627, SBC-042326 in section 5.1.2 in this *Response to Comments* document) and section 8.7 of the EPA response in this *Response to Comments* document. For residuals disposal discussion, please see section 10.4 of the *Response to Comments* document, specifically, the EPA response to comment Doc. #1627, SBC-042331 in section 10.4.2 in this *Response to Comments* document. For potential permitting implications, please see section 5.1.2 and 10.4.1 of the *Response to Comments* document. For comments on costs and logistical consequences, including supply chain difficulties, please see sections 10.6 (specifically, the EPA response to comment Doc. #1627, SBC-042329 in section 10.6 in this *Response to Comments* document) and section 13.3 of the *Response to Comments* document (specifically, the EPA response to comment Doc. #1627, SBC-042328 in section 13.3.3 in this *Response to Comments* document).

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044068)

Addressing these recommendations and our detailed comments will optimize implementation of this regulation and improve public health protection by reducing PFAS levels in drinking water. Addressing ASDWA's recommendations will help states effectively implement this rule and ensure that water systems have achievable paths to compliance. ASDWA recommends that EPA continue to engage the primacy agencies as the Agency works to finalize this rule. A coordinated effort will help ensure that public communication is effective and that primacy agencies are prepared to engage with their water systems as soon as the final rule is published. As partners with EPA, ASDWA is ready to coordinate meetings between the primacy agencies and EPA as needed to ensure the successful implementation of the NPDWR.

EPA Response: The EPA acknowledges these comments. As partners in the implementation of the SDWA, the EPA will coordinate with primacy agencies to ensure successful rule implementation. For additional responses on communications, please see section 1.2 of the EPA response in this *Response to Comments* document, including the EPA response to comment Doc. #1628, SBC-044063; SBC-044061; SBC-044075; SBC-044107; SBC-044109; SBC-044105; and SBC-044081 in section 1.2 in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044071)

Comments by the Association of State Drinking Water Administrators (ASDWA) for the Proposed PFAS National Primary Drinking Water Regulations Docket ID No. EPA-HQ-OW-2022-0114

Introduction

The Association of State Drinking Water Administrators (ASDWA) appreciates the opportunity to provide comments on the Environmental Protection Agency's (EPA) proposed PFAS National Primary Drinking Water Regulation (NPWDR). ASDWA is the professional association that serves the individuals (and their staff) who lead and implement the 57 state, territorial, and tribal drinking water programs (hereinafter "primacy agencies"). Formed in 1984 to address a growing

need for drinking water administrators to have national representation, ASDWA is a respected voice for primacy agencies with Congress, EPA, and other professional organizations.

ASDWA supports EPA's proposed regulation which provides national leadership and consistency for assessing and addressing PFAS in drinking water. These comments focused on topics significantly impacting primacy agencies and where ASDWA's members could provide the most robust feedback. As co-regulators, these comments offer a unique perspective given ASDWA's members' collective experience implementing the Safe Drinking Water Act. The input provided in this letter will help ensure that the final rule is feasible and effectively implemented and, therefore, results in increased public health protection. It should be noted, however, that these comments do not necessarily represent the specific comments and concerns of individual primacy agencies. ASDWA's comments also do not represent a consensus from all members. We encourage EPA to consider all individual primacy agency comments, in addition to ASDWA's, to gain further perspective.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR and has considered all comments submitted in the finalization of this rule. For responses on issues concerning feasibility and implementation, please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044060)

May 30, 2023

Honorable Radhika Fox

Assistant Administrator Radhika Fox

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking (EPA-HQ-OW2022-0114)

Dear Assistant Administrator Fox,

The Association of State Drinking Water Administrators (ASDWA) appreciates the opportunity to comment on EPA's proposed PFAS National Primary Drinking Water Regulation. ASDWA is the professional association that serves the individuals (and their staff) who lead and implement the 57 state, territorial, and tribal drinking water programs (hereinafter "primacy agencies").

ASDWA would like to thank the Office of Ground Water and Drinking Water (OGWDW) for its continued engagement on this critical rulemaking. ASDWA supports EPA's proposed regulation as it provides national leadership and consistency for addressing PFAS in drinking water. In the

absence of a National Primary Drinking Water Regulation (NPDWR), some primacy agencies have been struggling to appropriately use EPA's health advisory levels for perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as GenX chemicals), and perfluorobutane sulfonic acid (PFBS) or have moved ahead to set their own state-level standards.

As co-regulators with EPA, ASDWA has a unique role with the Agency on rule development and implementation. ASDWA collaborated with primacy agency staff across the country to develop these comments on PFAS treatment, monitoring, laboratory analysis, and communication. However, these comments do not necessarily represent the specific comments of individual primacy agencies, and ASDWA's comments also do not represent a consensus, as perspectives can diverge on specific issues. ASDWA encourages EPA to consider all individual primacy agency comments in addition to these comments.

The attached detailed comments address specific components of the proposed rule and highlight several critical feasibility issues that warrant a thoughtful response. ASDWA supports the proposed rule, with the caveat that the seven critical recommendations below warrant the Agency's consideration for inclusion in the final rule:

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. For general responses on feasibility, please see section 1.3 of the EPA response in this *Response to Comments* document. For responses to the specific feasibility issues raised, please see the applicable sections of this *Response to Comments* document that address each of the issues, which are located in section 1.3 of this *Response to Comments* document. For concerns about communication, please see section 1.2 of the EPA response in this *Response to Comments* document, including the EPA response to comment Doc. #1628, SBC-044063; SBC-044061; SBC-044075; SBC-044107; SBC-044109; SBC-044105; and SBC-044081. For concerns around monitoring and laboratory analysis, please see the EPA response to comment Doc. #1628, SBC-044088 in section 5.1.2, as well as the EPA response to comment Doc. #1628, SBC-044098; SBC-044089; SBC-044096; SBC-044093; SBC-044099; SBC-044065; SBC-044097; SBC-044095; SBC-044094; SBC-044066; and SBC-044102 found across topics in section 8 of the *Response to Comments* document. For concerns around treatment, please see the EPA response to comment Doc. #1628, SBC-044118; SBC-044108; SBC-044111; SBC-044110; and SBC-044112 found across topics in section 10 of the *Response to Comments* document.

Association of State Drinking Water Administrators (ASDWA) (Doc. #1628, SBC-044119)

Conclusion

Primacy agencies and water systems will face significant feasibility challenges implementing the proposed PFAS NPDWR. This rule will require significant additional resources from primacy agencies beyond the additional resources for SDWIS modernization, lead service line inventories, cybersecurity, and BIL funding. EPA must address the numerous feasibility

concerns in these comments to ensure this public health measure is achievable and effective. However, ASDWA's members remain dedicated to partnering with EPA and their water systems to reduce PFAS levels and improve public health protection by complying with this rule. ASDWA recommends that EPA continue its engagement with primacy agencies as the Agency finalizes this rule. A coordinated effort will help ensure that public communication is effective and that primacy agencies are prepared to engage with their water systems and the public with the promulgation of the final rule. ASDWA is prepared to help coordinate meetings between its members and EPA as needed to ensure the successful implementation of the final rule over the next decade.

EPA Response: As partners in the implementation of the SDWA, the EPA will coordinate with primacy agencies to ensure successful rule implementation. For responses on issues concerning feasibility, implementation, and primacy agencies, please see section 1.3 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1628, SBC-044078; SBC-044100; and SBC-044079 in section 11 in this *Response to Comments* document. For responses on issues concerning communication, please see section 1.2 of the EPA response in this *Response to Comments* document.

Illinois Farm Bureau (IFB) (Doc. #1630, SBC-043133)

May 30, 2023

Submitted via www.regulations.gov

Ms. Radhika Fox

Assistant Administrator

Office of Water

Environmental Protection Agency 1200 Pennsylvania Avenue, N. W.

Washington, DC 20460

Re: Comments regarding Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation, Docket ID No. EPA-HQ-OW-2022-0114

Dear Ms. Fox:

The Illinois Farm Bureau® ("IFB") appreciates to opportunity to submit comments to the U.S. Environmental Protection Agency ("EPA") in response to the proposed rule to set National Primary Drinking Water Regulations (NPDWR) for six PFAS chemicals, including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS). IFB is a member of the American Farm Bureau Federation® ("AFBF"), a national organization of farmers and ranchers. Founded in 1916, IFB is a non-profit, membership organization directed by farmers who join through their county Farm Bureau ("CFBs"). IFB has a voting membership of more than 74,000.

Our organization represents Illinois farm families working together to build a sustainable future of safe and abundant food, fiber and renewable fuel for our nation and the world. We support EPA's underlying goal of addressing widespread contamination of the environment caused by historic use of PFOA and PFOS. Unfortunately, EPA's proposed Maximum Contaminant Level (MCLs) of 4 ppt for PFOA and PFOS and the designation of a hazard index for perfluorononanoic acid (PFNA), PF perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid and its ammonium salt (also known as Gen X chemicals), and perfluorobutane sulfonic acid (PFBS) overlooks the many challenges that will be placed on farm families in Illinois and around the country.

Illinois farmers share concerns regarding the health impacts of PFAS exposure; however, research to prove causation is still under development. We encourage this work to continue as there are many factors that must be considered when developing regulatory limits.

EPA Response: The EPA acknowledges these concerns regarding the proposed rule. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on the set MCL levels for the final PFAS NPDWR, please see section 5 of the *Response to Comments* document.

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043431)

SSP and RCAP support the development of PFAS drinking water regulations developed in compliance with the SDWA, protective of human health, based in sound science and fiscally responsible. The Proposal, however, falls short.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see the EPA response to comment Doc. #1631, SBC-043427 in section 1.3 in this *Response to Comments* document.

Superfund Settlements Project (SSP) and RCRA Corrective Action Project (RCAP) (Doc. #1631, SBC-043427)

Re: Comments on Proposed PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638 (Mar. 29, 2023)

Dear Administrator Fox and Ms. Lan:

On behalf of the Superfund Settlements Project ("SSP") and RCRA Corrective Action Project ("RCAP") [FN1: SSP and RCAP are associations of major companies from many different sectors of American industry. SSP was organized in 1986 to help improve the effectiveness of the Superfund program by encouraging settlements and processes that would result in the Superfund program operating efficiently and rationally, achieving site closures with a minimum of expense and delay. RCAP was established in 1988 in the wake of EPA's earliest draft corrective action regulatory proposals with a goal to encourage cleanup standards and procedures that achieve environmental benefits in a risk-based and cost-effective manner. Since their formation, SSP and RCAP have provided constructive input to EPA, other regulatory agencies and Congress on critical policy issues affecting the cleanup of contaminated sites.], I submit these comments on the United States Environmental Protection Agency's ("EPA's") proposed PFAS National Primary Drinking Water Regulation Rulemaking, (the "Proposed Rule" or "the Proposal") [FN2: 88 Fed. Reg. 18638 (Mar. 29, 2023)] under the Safe Drinking Water Act ("SDWA"). [FN3: 42 U.S.C. §§ 300f et seq]. The Proposed Rule proposes maximum contaminant level goals ("MCLGs") and national primary drinking water regulations ("NPDWRs") in the form of maximum contaminant levels ("MCLs") for perfluorooctanoic acid ("PFOA") and perfluorooctane sulfonic acid ("PFOS"). EPA also published its preliminary determination to regulate four other per- and polyfluoroalkyl substances ("PFAS") — perfluorononanoic acid ("PFNA"), perfluorohexanesulfonic acid ("PFHxS"), perfluorobutane sulfonic acid ("PFBS"), and hexafluoropropylene oxide dimer acid and its ammonium salt ("GenX") — and simultaneously proposes MCLGs and MCLs for those substances as a mixture through the novel use of a Hazard Index ("HI") calculation.

The Proposal suffers from several defects that, should it be finalized, would result in the final rule being arbitrary, capricious, an abuse of discretion or otherwise not in accordance with the law. Existing health and occurrence data do not support the proposed determination to regulate PFNA, PFHxS, PFBS and GenX, and EPA improperly proposes MCLGs and MCLs for these substances together with the proposal to regulate.

EPA Response: The EPA does not agree that the rule is arbitrary, capricious, an abuse of discretion or otherwise not in accordance with the law. Please see section 1.3 of the EPA response in this *Response to Comments* document.

The EPA believes that health and occurrence data support the regulation of PFNA, PFHxS, PFBS and HFPO-DA based on SDWA requirements. Please see sections 3.2.1 and 3.2.2 of the EPA response in this *Response to Comments* document, specifically the EPA response to comment Doc. #1631, SBC-043435; SBC-043436; SBC-043437; SBC-043441; and SBC-043432 in section 3 in this *Response to Comments* document. See sections 4.3.2 and 5.2.1 (specifically, the EPA response to comment Doc. #1631, SBC-052848 in section 5.2.1 in this *Response to Comments* document) of the EPA response in this *Response to Comments* document for responses to concerns that MCLGs and MCLs were improperly imposed. The EPA disagrees that its preliminary determination to regulate PFHxS, HFPO-DA, PFNA, and PFBS does not follow SDWA criteria, and also disagrees that the EPA's proposal of a preliminary determination for PFHxS, HFPO-DA, PFNA, and PFBS simultaneously with its proposed MCL and MCLG is inconsistent with SDWA. The EPA has thoroughly responded to these concerns in section 3 of the EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1713, SBC-045875; SBC-045894; and SBC-045897.

Rural Community Assistance Partnership Incorporated (RCAP) (Doc. #1633, SBC-044138)

May 30, 2023

U.S. Environmental Protection Agency

1200 Pennsylvania Ave NW

Washington, D.C. 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114 – Per- and polyfluoroalkyl substances (PFAS):

Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

Since 1973, the Rural Community Assistance Partnership Incorporated (RCAP) has helped build capacity for and facilitated access to the most basic necessities in rural communities: clean, safe, and affordable drinking water and wastewater services. RCAP uses a locally driven approach in every state and territory to address various needs in rural and tribal communities, driven by a network of regional non-profit partners, who provide hands-on technical assistance under the

Safe Drinking Water Act (SDWA) and conduct in-person training on a variety of technical and regulatory topics as it relates to safe drinking water and sanitary wastewater disposal.

RCAP appreciates the opportunity to provide comment to the Environmental Protection Agency (EPA) on the Per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Rulemaking (NPDWR) announced on March 29, 2023.

RCAP commends EPA for proposing NPDWRs for these 6 PFAS contaminants. RCAP stands ready to help small, rural, and tribal communities finally remove these harmful carcinogens from drinking water in their communities.

RCAP believes that the proposed MCLs of 4.0 parts per trillion (ppt) also expressed as nanograms per liter (ng/L) for PFOA and PFOS as individual contaminants, and PFHxS, PFNA, PFBS, and HFPO-DA (commonly referred to as GenX Chemicals) as a PFAS mixture regulated using a Hazard Index formula are protective of public health. RCAP agrees with EPA that--when fully implemented--the PFAS Rule will prevent tens of thousands of PFAS-related illnesses or deaths. Additionally, while other PFAS compounds that are not targeted through the Proposed Action may still have negative impacts on health, treatment for these six compounds will also reduce the potential amount of other PFAS compounds in the drinking water, which often appear as several compounds together, and lower human exposure to this class of chemicals in general.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Orange County Water District (OCWD), California (Doc. #1634, SBC-043228)

May 30, 2023

Michael Regan

Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Mail Code: 1309

Washington, DC 20004

TRANSMITTED ELECTRONICALLY

Subject: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking, Docket No. EPA-HQ-OW-2022-0114

Dear Administrator Reagan,

The Orange County Water District (OCWD) appreciates the opportunity to comment on the United States Environmental Protection Agency's (EPA) proposed national primary drinking water regulations for per- and polyfluoroalkyl substances (PFAS) under the Safe Drinking Water Act (SDWA). The current above-referenced proposal includes standards for both perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS), as well as regulatory determinations and a combined standard for four other PFAS. OCWD shares EPA's goal of protecting public health via the provision of clean, safe, and affordable drinking water and supports the development of national standards for PFOA and PFOS, while also sharing EPA's interest in proposing regulatory determinations for additional PEAS.

OCWD is a groundwater management agency located in southern California, serving a population of 2.5 million. We work closely with 19 large public water systems that obtain 85% of their water supply from the OCWD-managed groundwater basin and collectively own and operate more than 200 large system drinking water production wells across our 350 square mile service area. These 19 public water systems (Groundwater Producers) include, for example, the cities of Anaheim, Santa Ana, Fullerton, and Orange, as well as independent special water districts such as the Irvine Ranch Water District and Yorba Linda Water District.

EPA Response: The EPA acknowledges and appreciates this comment and its general agreement with the final PFAS NPDWR.

Orange County Water District (OCWD), California (Doc. #1634, SBC-043240)

Conclusion

OCWD believes that EPA has put forward a PFAS rule framework that begins to address several stakeholder concerns. The proposal serves as a good starting point for finalizing a rule that addresses PFAS compounds in drinking water. We hope that our comments will help EPA finalize the rule, effectively leveraging the underlying science and the authorities of the SDWA.

Sincerely,

Michael R. Markus, P.E., D.WRE, BCEE, F.ASCE

General Manager

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of Environmental Authorities (AEA) (Doc. #1635, SBC-042960)

May 30, 2023

Michael S. Regan, Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Mail Code: 4607M

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Comments on the Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan:

The Association of Environmental Authorities (AEA) appreciates the opportunity to comment on the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (NPDWR). AEA represents New Jersey government providers of drinking water, wastewater, and solid waste services. Our municipal, regional, county, and state agency members, mainly authorities, provide one or more of these services to most of New Jersey's population. In some cases, AEA government utility members manage water reuse/recycling; some partner with municipal partners to manage storm water. AEA is a member of the National Association of Clean Water Agencies (NACWA).

AEA fully supports the EPA goal to eliminate PFAS pollution to protect public health and the environment. Our 50-year-old association has consistently supported water quality regulations at the state and federal levels that rely on science. AEA member water utilities already subject to New Jersey's PFAS chemical regulations are sampling and reporting PFAS in drinking water. Wastewater utilities are voluntarily sampling wastewater and biosolids. AEA members are working with the New Jersey Department of Environmental Protection to profile PFAS chemicals in New Jersey wastewater.

EPA Response: The EPA acknowledges and appreciates this comment and its general support for the goal of the final PFAS NPDWR.

American Association for Justice (AAJ) (Doc. #1636, SBC-042967)

May 30, 2023

Administrator Michael Regan

Environmental Protection Agency

1200 Pennsylvania Ave. N.W.

Washington, D.C. 20004

Re: [Docket No. EPA-HQ-OW-2022-0114] Comments Regarding PFAS National Primary Drinking Water Regulation Rulemaking

Dear Administrator Regan:

The American Association for Justice (AAJ), formerly known as the Association of Trial Lawyers of America (ATLA), hereby submits comments in response to the Environmental Protection Agency's (EPA) proposed rules to create a Maximum Contaminant Level Goal (MCLG) and Maximum Contaminant Level (MCL) for Per- and Polyfluorinated Substances (PFAS) in drinking water. Specifically, AAJ strongly supports EPA's proposal to create an MCLG and MCL for PFAS in drinking water. This is a necessary and critical step in protecting human health and the environment from these dangerous chemicals. The significant body of research and scientific findings on these chemicals demonstrate that they pose a clear and present danger to human health even at extremely low levels.

AAJ, the world's largest plaintiffs trial bar with members in the U.S., Canada, and abroad, was established to safeguard victims' rights, strengthen the civil justice system, promote injury prevention, and foster transparency. And as representatives for those injured, and those who may be injured, we submit these comments. This proposed rule will help protect individuals from the devastating consequences of PFAS exposure.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Town of Tewksbury, Massachusetts (Doc. #1637, SBC-043252)

Thank you for the opportunity to provide these comments. As a water professional, I work hard to always follow the laws and regulations put forth by our regulatory agencies. I am sounding the alarm that I do not think this rule is reasonable, nor easily achievable. EPA has an obligation to address the water sector's implementation concerns and craft a final rule that is more realistic in its expectations of implementation and schedule and comes with the requisite funding to ensure PWS can comply.

Sincerely,

Kevin Hardiman, P. E. Director of Public Works

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Citizens Against Ruining the Environment (CARE) (Doc. #1638, SBC-043445)

With that background in mind, CARE makes the following public comments:

CARE Comment 1- There Is A Legally and Factually Well-Established Basis for EPA's Proposed Maximum Contaminant Levels for PFOA and PFOS and EPA's Proposed Maximum Contaminant Level for the Mixture of PFNA, GenX Chemicals, PFHxS, and PFBS Under a Hazard Index

EPA's proposed regulation to the six highly toxic PFAS chemicals is a critical step towards protecting our communities. EPA's move in regulating four PFAS as a class in its proposed hazardous index is a welcome change. The myriad of harmful health effects, including cancer, immune suppression, and developmental harms, linked to extremely low levels of exposure warrants these novel and aggressive PFAS MCLs. CARE fully supports the MCLs proposed by EPA and believes the strong standards will help ensure safe drinking water across the country.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Citizens Against Ruining the Environment (CARE) (Doc. #1638, SBC-043442)

Please be advised that I represent Citizens Against Ruining the Environment, a Will County Illinois-based environmental advocacy organization whose members are directly affected by endangering levels of PFAS in drinking water supplies. CARE's comments on U.S. EPA's proposed regulations are in the attached document.

May 30, 2023

United States Environmental Protection Agency

Via: regulations.gov

Re: Docket ID: EPA-HQ-OW-2022-0114-0027, Per- and Polyfluoroalkyl National Primary Drinking Water Regulations for PFOA, PFOS PFNA, GenX Chemicals, PFHxS, and PFBS

To Whom It May Concern:

Please be advised that I represent Citizens Against Ruining the Environment ("CARE"). CARE is a not-for-profit environmental education organization based in Will County, Illinois. CARE members live in several Will County communities including Lockport, Joliet, Crest Hill, Rockdale, and others. These communities depend on groundwater resources for their drinking water. Residents either receive their drinking water from municipal water suppliers or, in many cases, private wells. Will County communities have faced years of environmental injustice. For example, 11 of the 12 EJScreen environmental justice indices for Rockdale (where there is extensive, documented PFAS-contaminated drinking water) are in the top quartile when compared to the U.S. as a whole.

For more than 30 years, CARE's mission has been to educate Will County residents about the cumulative environmental and public health issues they face. PFAS contamination is now CARE's highest priority due to the widespread presence of PFAS across all environmental media, including extensive Will County drinking water contamination, and an increasing awareness of the harmful health effects of PFAS.

Will County's drinking water contains concentrations of PFOA that are up to 3,750 times higher than what the best available science indicates is safe for human consumption. Concentrations of PFOS in Will County drinking water are up to 365 times higher than what is safe. Four other PFAS were also detected. In total, 20 different Will County community water supplies contain PFAS, with some public water supplies containing six different PFAS at the same time. [FN1: Illinois EPA, PFAS Sampling Network, available at https://www.arcgis.com/apps/dashboards/bd611162a7f74cfe88b6928c926416c3.] Though private wells were not part of Illinois's PFAS sampling initiative (samples were not taken from private wells in the U.S. EPA's Third Unregulated Contaminant Monitoring Rule PFAS sampling effort either), given the widespread contamination found in public water supplies sourced from groundwater, CARE believes it is highly probable that private wells are contaminated.

EPA Response: The EPA appreciates this information. This rule was developed using the authorities of the SDWA, which does not authorize regulation of the use of chemicals in consumer and industrial products, the remediation of contaminated sites or private wells. Please see section 15 of the EPA response in this *Response to Comments* document that discusses topics that are out of scope for this rulemaking. For specifics on private wells, please see section 1.4 of the EPA response in this *Response to Comments* document.

California Municipal Utilities Association (CMUA) (Doc. #1639, SBC-043258)

All these unintended consequences would add costs and concern for public water agencies and should be thoroughly addressed prior to EPA's adoption of the Regulation. CMUA urges the EPA to take the necessary time to work through the issues iterated in this letter prior to making a final determination on the proposed PFAS MCLs.

Thank you for the opportunity to provide these comments. Should you have any questions about the contents of this letter, please contact Andrea Abergel at aabergel@cmua.org.

Sincerely,

Andrea Abergel Manager of Water Policy

California Municipal Utilities Association

EPA Response: The EPA acknowledges the commenter's general disagreement with the final PFAS NPDWR. The EPA has addressed each specific individual detailed comment raised by the commenter individually where raised. For more information on financial assistance, please see section 2.4 (specifically, the EPA response to comment Doc. #1639, SBC-043254) of the *Response to Comments* document. For more discussion on timeline for MCL compliance, please see section 12.1 (specifically, the EPA response to comment Doc. #1639, SBC-043255) of the *Response to Comments* document. For more information on treatment considerations, please see section 8.9 (specifically, the EPA response to comment Doc. #1639, SBC-043256) of the *Response to Comments* document. For additional discussion on hazardous substances disposal,

please see section 10.4.2 (specifically, the EPA response to comment Doc. #1639, SBC-043257) of the *Response to Comments* document.

American Farm Bureau Federation et al. (Doc. #1642, SBC-043488)

There are a number of other issues associated with the proposed MCLs that deserve in-depth discussion, including the benefits identified by the agency, the health end points, and the possible conflict between other Administration policies. We hope that the EPA will consider all of these factors before finalizing this rule.

EPA Response: The EPA's final rule represents data-driven drinking water standards that use the best available science and meet the requirements of SDWA. The PFAS regulation is vital to protecting public health. For additional discussion around the MCLs, please see section 5 of the EPA response in this *Response to Comments* document. The EPA reviewed the best available science on health effects associated with exposure to the PFAS considered in the rulemaking. The EPA's quantification of health benefits resulting from reduced PFAS exposure in drinking water was driven by the availability of PFAS related occurrence estimates, pharmacokinetic (PK) models, information on exposure-response relationships, and economic data to monetize the impacts. For information on the benefits of the PFAS NPDWR, please see section 13.5 of the *Response to Comments* document.

For the health endpoints from PFAS exposure, the EPA used a systematic literature review approach to determine the strength of evidence. Additional discussion of the PFOA and PFOS literature review can be found in section 4.1.1 of the *Response to Comments* document and in section IV of the FRN.

The PFAS NPDWR has gone through an interagency review process to reduce conflict between administration policies. For concerns with the Administration and its policies, please see section 15 of the *Response to Comments* document for topics out of scope of this NPDWR.

Raptor Pharm & Tox, Ltd (Doc. #1644, SBC-043423)

Conclusion

Raptor has concluded that the US EPA's safe drinking water standards for these PFAS chemicals to be inappropriate. The proposed standards are not based on sound science, they will impact small businesses, they will impact the poor, and they will have negative and unstudied impacts on environmental justice.

EPA Response: The EPA disagrees that the standards are not based on sound science. The EPA's final rule represents data-driven drinking water standards that are based on the best available science and meet the requirements of SDWA. Please see sections 1.1 and 1.3 of the EPA response in this *Response to Comments* document, as well as section I of the FRN concerning the EPA's assessment of best available science to support the rulemaking.

The EPA disagrees that the standards will have negative and unstudied impacts on low income and environmental justice communities. Contrary to the commenter's assertion, the EPA has evaluated the rule's impacts on environmental justice communities. For discussion of how EPA considered environmental justice communities, please see section 14.10 of the EPA response in this *Response to Comments* document, as well as section XIII.J of the FRN that supports the EPA's assessments of impacts on low-income populations and environmental justice communities.

The EPA disagrees with the commenter's assertion that the rule will negatively impact the small business community. The EPA has met all the requirements of the Regulatory Flexibility Act (RFA), including seeking the input of small entities through a Small Business Advocacy Review (SBAR) Panel. In the final rule, the EPA has included a number of burden-reducing flexibilities to decrease significant impacts to small entities while also ensuring adequate public health protection. For more information, please see section XIII.C of the FRN and section 14.3 of this document.

Massachusetts Water Resources Authority (Doc. #1645, SBC-043281)

May 30, 2023

VIA Federal eRulemaking Portal: https://www.regulations.gov

U.S. Environmental Protection Agency EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking, Docket ID No. EPA–HQ–OW-2022-0114

To Whom It May Concern:

On March 29, 2023, the U.S. Environmental Protection Agency (EPA) published a preliminary regulatory determination and proposed rule regarding per- and polyfluoroalkyl substances (PFAS) under the Safe Drinking Water Act (SDWA). 88 Fed. Reg. 18638 (March 29, 2023). EPA's current actions are twofold and follow a March 2021 final regulatory determination to regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) as contaminants under the SDWA. First, EPA is issuing a preliminary regulatory determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS as contaminants under SDWA. Second, EPA is proposing a National Primary Drinking Water Regulation (NPDWR) and health- based Maximum Contaminant Level Goals (MCLG) for these four PFAS and their mixtures, as well as for PFOA and PFOS.

In particular, EPA is proposing to set the MCLG for PFOA and PFOS at zero and individual maximum contaminant levels (MCLs) of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt) for PFOA and PFOS. Further, with respect to PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS, EPA is proposing to: (1) use a Hazard Index (HI) approach; (2) use a HI of 1.0 as the MCLGs for these four PFAS and any mixture containing one or more of them; and (3) set the MCLs for these four PFAS and for a mixture containing one or more of PFHxS, HFPO–DA and its ammonium salt, PFNA, PFBS as a unitless HI of 1.0. The Massachusetts Water Resources Authority (MWRA) respectfully submits these comments regarding EPA's actions, including the proposed rule.

1. MWRA Overview

MWRA provides wholesale water and wastewater services to 3.1 million people and more than 5,500 businesses in 61 communities in eastern and central Massachusetts. On a daily basis, MWRA provides 200 million gallons of water to 2.5 million people in 53 communities across the greater Boston area.

MWRA's source water originates from two highly protected reservoirs, the Quabbin and Wachusett reservoirs. Eighty-five percent of the watersheds of these reservoirs are comprised of forested landscapes and wetlands. The high quality of MWRA's source water equates to limited treatment requirements. MWRA's John J. Carroll Treatment Plant has the capacity to treat up to 405 million gallons per day. Treatment at the facility includes ozone and ultraviolet disinfection and chemical additions to buffer the finished water and ensure adequate residual disinfection in the drinking water as it travels through MWRA's transmission system to our customers.

EPA Response: The EPA acknowledges this comment.

Association of Public Health Laboratories (APHL) (Doc. #1646, SBC-043297)

May 30, 2023

US Environmental Protection Agency

Re: APHL's comments on EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation

The Association of Public Health Laboratories (APHL) appreciates the opportunity to comment on the proposed PFAS National Primary Drinking Water Regulation. APHL works to strengthen laboratory systems serving the public's health in the United States and globally. The organization represents state and local public health, environmental, and agricultural laboratories in the United States. Our members [Link: https://www.aphl.org/membership/Pages/memberlabs.aspx] monitor, detect and respond to health threats.

We agree with the United States Environmental Protection Agency (US EPA) that per- and polyfluoroalkyl substances (PFAS) are nearly ubiquitous anthropogenic compounds that have

been shown to be harmful to public health. We support EPA actions to establish health advisory levels (HALs), maximum contaminant levels (MCLs), and maximum contaminant level goals (MCLGs) for two PFAS Compounds (PFOA, PFOS) and a hazard index (HI) for four additional (GenX, PFBS, PFNA, and PFHxS). Establishing consistent national standards will aid states and businesses in developing long-term strategies that further protect public health and the environment, aiming to improve health equity and environmental justice outcomes.

APHL provided technical comments to the proposed rule through our participation in the Environmental Monitoring Coalition [Link: https://envmoncoalition.org/](EMC). This group represents environmental laboratory perspectives of APHL members, as well as the American Council of Independent Laboratories, American Water Works Association, The NELAC Institute, and Water Environment Federation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR and appreciates the technical comments provided. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of Public Health Laboratories (APHL) (Doc. #1646, SBC-043301)

Comments on PFAS National Primary Drinking Water Regulation Rulemaking

May 26, 2023

The Environmental Monitoring Coalition (EMC) was created in 2020 to address a void created by the dissolution of EPA's Environmental Laboratory Advisory Board. The following EMC organizations represent private and government laboratories from state and local governments and drinking and wastewater utilities:

• American Council of Independent Laboratories,

• American Water Works Association,

• Association of Public Health Laboratories,

• The NELAC Institute, and

• Water Environment Federation.

The EMC was established in response to the need for the environmental monitoring community to have a mechanism to develop consensus opinions on issues affecting environmental monitoring.

The EMC supports EPA's efforts to provide clear and uniform requirements for monitoring of the specific PFAS in drinking water nationally, especially since many states are developing their own programs and standards.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR.

New England Interstate Water Pollution Control Commission (NEIWPCC) (Doc. #1650, SBC-043136)

May 30, 2023 Michael S. Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Mail Code: 4607M

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, NEIWPCC Comments in response to the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan:

The New England Interstate Water Pollution Control Commission (NEIWPCC) appreciates the opportunity to comment on behalf of our member States' Health Commissioners [FN1: 35 commissioners—five from each member state—oversee NEIWPCC. Each commissioner is appointed by their state governor. A state's delegation typically consists of the heads of its environmental and health agencies, who generally designate representatives to attend NEIWPCC meetings on their behalf, supplemented by three highly experienced individuals from outside state government. The Health Commissioner meetings are a subset of the Commissioners which consists of the heads of our member states' health agencies or their representatives] on the U.S. Environmental Protection Agency's (EPA) proposal to regulate six per- and polyfluoroalkyl substances (PFAS) under the Safe Drinking Water Act through issuance of a proposed National Primary Drinking Water Regulation (NPDWR). NEIWPCC is providing higher-level perspectives below. NEIWPCC urges EPA to consider the comments of our member states that, especially for this proposed rule, have concerns uniquely applicable to their states.

NEIWPCC was established by an act of the United States Congress which ratified the New England Interstate Water Pollution Control Compact in 1947. NEIWPCC is a regional commission that helps Northeast states preserve and advance water quality. [FN2: NEIWPCC member states include the six New England states and the State of New York.] We engage and convene water quality professionals and other interested parties from New England and New York to collaborate on drinking water, wastewater, and environmental science challenges across shared regions and ecosystems.

NEIWPCC commends the EPA's effort to establish Maximum Contaminant Levels for six per- and polyfluoroalkyl substances. Our member states are fundamentally supportive of the intent and spirit of the proposed rule. Our members have targeted PFAS substances with a variety of approaches. In recent years, our members have enacted laws restricting PFAS in firefighting foam; regulating the presence of PFAS in drinking water, food packaging and consumer

products; and allocating funds for cleanup and remediation; among other measures. All our member states have addressed PFAS through agency rulemaking, including adopting standards for PFAS levels in drinking water supplies. NEIWPCC offers the following high-level comments on their behalf for EPA's consideration in developing a final rule.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

NCASI (Doc. #1651, SBC-043159)

TO: Ms. Alexis Lan

Office of Ground Water and Drinking Water

Standards and Risk Management Division U.S. Environmental Protection Agency 1200 N. Pennsylvania Avenue, N.W.

Washington, D.C. 20460

Docket: EPA-HQ-OW-2022-0114

Submitted through the Federal eRulemaking Portal

May 30, 2023

RE: "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation Rulemaking"

NCASI conducts research and technical studies on behalf of forest products companies across the US, and its members represent more than 80% of pulp and paper and two-thirds of wood panels produced nationwide. NCASI has been an active participant at the state and federal levels in technical and scientific aspects of risk assessment, water quality criteria development for many years and, more recently, has collaborated with other researchers to consider approaches to the systematic review of toxicological and epidemiological information when estimating toxicity factors for environmental contaminants.

NCASI appreciates the opportunity to provide technical comments regarding the "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation". Our technical analysis of the proposed rulemaking has identified a number of scientific issues, including:

• A classification of PFOS as a likely carcinogen without a scientifically defensible evidence base.

• Potential implementation challenges due to laboratory limitations for an MCL of 4 ppt and an action level of 1.3 ppt for PFOA and PFOS.

• The inappropriate application of the Hazard Index approach for additionally listed PFAS under The MCL framework.

EPA Response: The EPA acknowledges these comments of concern in the proposed rule. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that the classification of PFOS as a likely carcinogen lacks a scientific basis. Please see section 4.1.4 of the EPA response in this *Response to Comments* document. Please see section 5.1.2 of the EPA response in this *Response to Comments* document (specifically, the EPA response to comment Doc. #1651, SBC-043226) for concerns about laboratory limitations related to the MCL. The EPA does not agree that the Hazard Index approach was inappropriately applied. Please see sections 4.3.2 and 5.2.1 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044168)

May 30, 2023

Honorable Radhika Fox

Assistant Administrator Radhika Fox

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking (EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox,

The North Carolina Division of Water Resources (DWR), within the Department of Environmental Quality (DEQ), appreciates the opportunity to provide comments on the U.S. Environmental Protection Agency's (EPA), proposed PFAS National Primary Drinking Water Regulation published in the Federal Register on March 29, 2023 (FR Vol. 88, No. 60).

Please find our detailed comments attached. We appreciate your consideration of these comments. If we can be of assistance regarding these comments, please contact Dr. Rebecca Sadosky, Chief of the Public Water Supply Section at 919-707-9096 or at Rebecca.Sadosky@deq.nc.gov.

Sincerely,

Richard E. Rogers, Jr., Director

Division of Water Resources,

Department of Environmental Quality

Enclosure

Comments by North Carolina Department of Environmental Quality (NCDEQ) for the Proposed PFAS National Primary Drinking Water Regulations Docket ID No. EPA-HQ-OW-2022-0114

Introduction

NC Department of Environmental Quality (NCDEQ) appreciates the opportunity to provide comments on the Environmental Protection Agency's (EPA or Agency) proposed per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulation (NPDWR). NCDEQ applauds EPA for taking this important step towards developing enforceable limits under the Safe Drinking Water Act. We support EPA's efforts to provide national leadership and consistency for assessing and addressing PFAS in drinking water.

NCDEQ's comments below focus on topics related to North Carolina's role in the implementation of the regulation where we could provide the most robust feedback in support of expeditious and increased public health protection for our residents. Our comments are grouped into the following topics:

A. General Comments

B. Guidance and Training Needed

C. State Agency Staff and Resource Needs

D. Data Management

E. Public Communication

F. Laboratory Readiness

G. Monitoring Requirements

H. PFAS Treatment

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

North Carolina Division of Water Resources (NCDEQ) (Doc. #1652, SBC-044200)

Conclusion

In conclusion, NCDEQ commends EPA for taking an important step to propose first-ever science based drinking water standards for PFAS. NCDEQ is committed to working in partnership with EPA and other federal agencies to prevent PFAS pollution and protect our drinking water supplies from toxic chemicals. We recognize that there are numerous technical, feasibility, and resource challenges in implementing this rule. We request that EPA address the recommendations described above to the extent possible as it finalizes the rule and continue

needed investments to respond to the remaining comments going forward. As co-regulators, state agencies must work closely with EPA throughout all stages of rule development and implementation. A coordinated effort will help ensure that public communication is effective and that state agencies are prepared to engage with their water systems and the public with the promulgation of the final rule. North Carolina looks forward to continued collaboration with EPA to protect our communities and the environment from PFAS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Association of Manufacturers (NAM) (Doc. #1655, SBC-043197)

Conclusion

The NAM's members want to ensure they continue to be excellent environmental stewards but also want to make sure that any regulations are achievable. When regulations are set near zero, that is not something manufacturers or water systems can economically achieve. Regulations that are not economically achievable will lead to critical substances being manufactured outside of the U.S. where environmental protections are often less stringent. EPA should set the cleanup standards at a level that provides appropriate health and safety benefits while making cleanup for affected communities economically feasible.

Sincerely, Brandon Farris

VP, Energy and Resources Policy

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA believes that it is feasible to achieve the MCLs established in this regulation. Please see sections 5.1.3 and 5.1.4 of the EPA response in this *Response to Comments* document for feasibility and cost considerations, as well as section 13.3 (specifically, the EPA response to comment Doc. #1655, SBC-043195) regarding cost estimates for the rule. The manufacturing of substances is out of scope for this NPWDR. Please see section 15.1 of the EPA response in this *Response to Comments* document for topics that are out of scope.

National Association of Manufacturers (NAM) (Doc. #1655, SBC-043194)

The NAM supports commonsense regulations on PFAS that ensure that manufacturers continue to be excellent environmental stewards while recognizing that in many cases we will need to continue to use these chemicals for the foreseeable future. However, the EPA's proposed regulations under the Safe Drinking Water Act (SDWA) on six per- and polyfluoroalkyl substances fail to meet the commonsense test as they are set at cleanup levels that are near zero.

Furthermore, EPA failed to go through the required legal and procedural requirements to justify the proposed rule for the mixture of four of the six PFAS.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. The EPA notes that it is not directly setting clean up levels with this action; rather, the agency is directly setting national primary drinking water regulations through this action. The EPA has conducted all necessary scientific, economic, and other required analyses. The EPA disagrees that it failed to go through the required legal and procedural requirements for this NPDWR. Please see sections 1.1 and 1.3 of the EPA response in this *Response to Comments* document. Please see SDWA 1412(b)(3)(C)(iii) for the requirements that the EPA must only consider the impacts and costs directly imposed by this NPDWR. Specifically, that section of SDWA requires that the EPA include quantifiable and non-quantifiable costs that are likely to occur solely because of compliance with the rule including monitoring, treatment and other costs and excluding costs resulting from compliance with other proposed or promulgated regulations.

Consumer Reports (Doc. #1656, SBC-043179)

May 30, 2023

Docket Clerk

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket, Mail Code 2822IT

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Docket No. EPA-HQ-OW-2022-0114; PFAS National Primary Drinking Water Regulation Rulemaking

To Whom it May Concern:

Thank you for the opportunity to submit comments on the Environmental Protection Agency's (EPA's) determinations to regulate six per- and poly-fluoroalkyl substances (PFAS) as contaminants under the Safe Drinking Water Act (SDWA) and set regulatory limits for these PFAS in drinking water.

Founded in 1936, Consumer Reports (CR) is an independent, nonprofit and nonpartisan organization that works with consumers to create a fair and just marketplace. Known for its rigorous testing and ratings of products, CR advocates for laws and company practices that put consumers first. CR is dedicated to amplifying the voices of consumers to promote safety, digital rights, financial fairness, and sustainability. The organization surveys millions of Americans

every year, reports extensively on the challenges and opportunities for today's consumers, and provides ad-free content and tools to 6 million members across the U.S.

In March 2021, EPA made a final regulatory determination to regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) under the SDWA. With this notice, EPA is issuing a preliminary regulatory determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salts (aka GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) and mixtures of these PFAS as contaminants under SDWA.

We agree with EPA's preliminary determination to regulate these 4 PFAS and their mixtures as contaminants under SDWA. We also agree with EPA's proposed National Primary Drinking Water Regulation (NPDWR) and health-based maximum contaminant level goals (MCLGs) for these 4 PFAS and their mixtures as well as PFOA and PFOS. In addition, we support MCLGs of zero for PFOA and PFOS and enforceable maximum contaminant levels (MCLs) for PFOA and PFOS in drinking water at 4.0 parts per trillion (ppt). We agree with EPA's proposal to use a Hazard Index (HI) approach to protecting public health from mixtures of PFHxS, HFPO-DA, PFNA and PFBS. We also support EPA's proposal to set a Hazard Index (HI) of 1.0 as the MCLGs and for the enforceable MCLs for these 4 PFAS and any mixture containing one or more of them.

More detailed comments are below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Virginia Municipal Drinking Water Association (VMDWA) (Doc. #1657, SBC-043174)

Eighth, we are concerned that the proposed regulation will lead to a loss of public confidence in the safety of public water, when implementation activities unavoidably extend past regulatory deadlines due to the types of real world conditions and challenges discussed in this comment letter.

For all of the above reasons, EPA should provide for a health-based phased approach, as discussed in the next section.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For concerns with public confidence, please see section 1.2 of the EPA response in this *Response to Comments* document.

Virginia Municipal Drinking Water Association (VMDWA) (Doc. #1657, SBC-043160)

May 30, 2023

By Electronic Submission: Docket EPA–HQ–OW–2022–0114

U.S. Environmental Protection Agency

EPA Docket Center

PFAS: PFOA and PFOS National Primary

Drinking Water Regulation Rulemaking,

Mail Code 28221T

1200 Pennsylvania Avenue NW

Washington, DC 20460

Dear Sir/Madam:

The Virginia Municipal Drinking Water Association, Inc. (VMDWA) appreciates the opportunity to comment on U.S. EPA's PFAS National Primary Drinking Water Regulation Rulemaking, including the proposed Maximum Contaminant Levels and implementation procedures for PFOA, for PFOS, and for PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS and their mixtures.

Below we present our comments organized in six parts:

Part 1 Support for Safe and Affordable Water Generally

Part 2 Whether Proposed MCLs Are Set at Appropriate Levels

Part 3 Actual Compliance Costs Are Likely to Be Much Higher Than EPA Estimates

Part 4 The Unrealistically Short Schedule For Compliance Will Cause Harm to the Nation and Local Communities and Should Be Replaced With a Health-Based Phased Approach

Part 5 Recommendation

Part 6 Conclusion

1. SUPPORT FOR SAFE AND AFFORDABLE WATER GENERALLY

VMDWA is a non-profit membership association comprised of 42 local governments and local water authorities that provide the essential public service of supplying the vast majority of Virginians with safe drinking water. VMDWA's purpose is to advocate for science-based, sensible, and sustainable laws and policies to help ensure safe and affordable water for Virginians. VMDWA supports safe water as well as overall vibrant and healthy communities. This includes making prudent investments and operational enhancements in public water systems to continue delivering safe water to the public based on the current scientific research. VMDWA Members do this and do this well.

As public water utilities, VMDWA Members do not manufacture or use PFAS chemicals in their water (or wastewater) treatment processes. Rather, when PFAS chemicals are found in their systems, it is due to the manufacture and use of PFAS chemicals by various other actors in society. The proposed regulations target public water systems, however, with a massive new regulatory burden and tremendous compliance costs that will necessarily be passed on to families and businesses in the form of higher water rates and charges.

Based on VMDWA's experience, EPA's proposed regulations appear to have the potential to impose the greatest compliance costs in the history of the Safe Drinking Water Act considering capital and ongoing operation and maintenance costs discussed below. In addition, EPA's rulemaking will impose a major opportunity cost on local communities and families, insofar as the resources required for compliance with this regulation will simply be unavailable to spend on other personal/business (ratepayer) or utility/governmental (water system owner) objectives in the future.

Again, as mentioned above, VMDWA supports safe water and vibrant, healthy communities. It is out of deep commitment to the public interest that VMDWA brings the following issues, concerns, and recommendations to EPA's attention for further consideration as EPA works to adopt a final regulation.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns of the rule. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has addressed the cost concerns described here, all of which can be found within the responses and throughout sections 5.1, 5.3, 13.3 and 13.3.3 of the *Response to Comments* document. Responses to the costs for PFAS removal can be found in section 10.4.1 of the EPA response in this *Response to Comments* document (specifically, the EPA response to comment Doc. #1657, SBC-043166).

Virginia Municipal Drinking Water Association (VMDWA) (Doc. #1657, SBC-043178)

6. CONCLUSION

VMDWA supports safe water and certainly does not oppose necessary and appropriate public health-related requirements. To better serve the public health, local communities, and the Nation as a whole, VMDWA respectfully submits that certain material aspects of the proposed regulation and its real world implementation infeasibility should be considered further and restructured to better serve the public interest as described above.

Sincerely,

VMDWA BOARD OF DIRECTORS

Copy to:

VMDWA Members

Christopher D. Pomeroy, Esq., AquaLaw

Justin W. Curtis, Esq., AquaLaw

EPA Response: The EPA has determined that this final PFAS NPDWR is both implementable and feasible. The EPA has identified feasible MCLs, taking costs into consideration, that can significantly reduce public health risks related to PFAS, as outlined in section 5 of the EPA response in this *Response to Comments* document and section V of the FRN. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maryland Association of Municipal Wastewater Agencies (MAMWA) (Doc. #1658, SBC-043409)

Eighth, we are concerned that the proposed regulation will lead to a loss of public confidence in the safety of public water, when implementation activities unavoidably extend past regulatory deadlines due to the types of real world conditions and challenges discussed in this comment letter.

For all of the above reasons, EPA should provide for a health-based phased approach, as discussed in the next section.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. This PFAS NPDWR follows a health-based approach, as outlined in section 1.3 of the EPA response in this *Response to Comments* document. For concerns with public confidence, please see section 1.2 of the EPA response in this *Response to Comments* document.

Maryland Association of Municipal Wastewater Agencies (MAMWA) (Doc. #1658, SBC-043413)

CONCLUSION

MAMWA supports safe water and certainly does not oppose necessary and appropriate public health-related requirements. To better serve the public health, local communities, and the Nation as a whole, MAMWA respectfully submits that certain material aspects of the proposed regulation and its real world implementation infeasibility should be considered further and restructured to better serve the public interest as described above.

Sincerely,

MAMWA BOARD OF DIRECTORS

Copy to:

MAMWA Members

Christopher D. Pomeroy, Esq., AquaLaw

Lisa M. Ochsenhirt, Esq., AquaLaw

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR as it is. Please see section 1.3 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1657, SBC-043178 in section 1.3 in this *Response to Comment* document regarding implementation and feasibility of this rule.

Maryland Association of Municipal Wastewater Agencies (MAMWA) (Doc. #1658, SBC-043395)

By Electronic Submission: Docket EPA–HQ–OW–2022–0114

U.S. Environmental Protection Agency

EPA Docket Center

PFAS: PFOA and PFOS National Primary

Drinking Water Regulation Rulemaking,

Mail Code 28221T

1200 Pennsylvania Avenue NW

Washington, DC 20460

Dear Sir/Madam:

The Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA) appreciates the opportunity to comment on U.S. EPA's PFAS National Primary Drinking Water Regulation Rulemaking, including the proposed Maximum Contaminant Levels and implementation procedures for PFOA, for PFOS, and for PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS and their mixtures. The Association has been supporting clean water, vibrant communities, and a strong state economy for nearly 20 years by seeking to align clean water goals, smart management practices, and affordable technology and infrastructure. In promoting abundant clean water in this manner, MAMWA helps support a strong economy and a high quality of life in local communities.

Below we present our comments organized in six parts:

[Table 1: See Docket ID EPA-HQ-OW-2022-0114-1658]

1. SUPPORT FOR SAFE AND AFFORDABLE WATER GENERALLY

MAMWA is a non-profit membership association comprised of 22 local governments and local water and wastewater authorities, most of which provide the essential public service of supplying Marylanders with safe drinking water in addition to treating their wastewater to high standards. MAMWA advocates for science-based, sensible, and sustainable laws and policies to help ensure clean, safe, and affordable water for Marylanders. MAMWA supports clean and safe water as well as overall vibrant and healthy communities. MAMWA appreciates that clean and safe water sometimes requires making prudent investments and operational enhancements in public infrastructure based on the current scientific research. When necessary, MAMWA Members do this and do this well.

Of course, MAMWA Members do not manufacture or use PFAS chemicals in their water or wastewater treatment processes. Rather, when PFAS chemicals are found in their systems, it is due to the manufacture and use of PFAS chemicals by various other actors in society. The proposed regulations target public water systems, however, with a massive new regulatory burden and tremendous compliance costs that will necessarily be passed on to families and businesses in the form of higher water rates and charges.

EPA's proposed regulations appear to have the potential to impose the greatest compliance costs in the history of the Safe Drinking Water Act considering capital and ongoing operation and maintenance costs discussed below. In addition, EPA's rulemaking will impose a major opportunity cost on local communities and families, insofar as the rule's compliance costs will require resources that will simply be unavailable to spend on other personal/business (ratepayer) or utility/governmental (water system owner) objectives in the future. Therefore, it is important to protect public health in a cost-effective manner in finalizing and implementing this regulation.

Again, as mentioned above, MAMWA supports clean and safe water and vibrant, healthy communities. It is out of deep commitment to the public interest that MAMWA brings the following issues, concerns, and recommendations to EPA's attention for further consideration as EPA works to adopt a final regulation.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document, as well as the EPA response to comment Doc. #1657, SBC-043160 in this *Response to Comments* document. For more discussion on costs, please see section XII of the FRN for this rule.

National Association of Clean Water Agencies (NACWA) (Doc. #1659, SBC-043131)

NACWA's comments, outlined in more detail below, include concerns over EPA's severe underestimation of cost impacts to public water systems (PWSs), EPA's shortsightedness in not fully considering laboratory capacity and the guaranteed backlog that will occur when tens of thousands of PWSs and clean water utilities are trying to monitor and comply simultaneously, the likelihood of treatment equipment and carbon supply shortages, and, lastly, the potential impacts on greenhouse gas emissions due to energy consumption at PWSs and clean water utilities.

EPA Response: The EPA disagrees that the topics listed were not fully considered. Please see section 1.3 of the EPA response in this *Response to Comments* document. Please see the EPA response in this *Response to Comments* document for responses to the following: section 5.1.2 (specifically, the EPA response to comment Doc. #1659, SBC-043155) for laboratory capacity, availability, and capability; and section 10.6 (specifically, the EPA response to comment Doc. #1659, SBC-043156) and section 5.1.4 for treatment technology availability and capacity. For responses to comments on the analyses for greenhouse gas emissions, please see section XIII.A.2 in the FRN.

Maine Organic Farmers and Gardeners Association (MOFGA) (Doc. #1660, SBC-043379)

SUBMITTED VIA REGULATIONS.GOV PORTAL

May 30, 2023

Michael S. Regan

Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N. W.

Mail Code: 4607M

Washington, DC 20460

RE: Comments submitted by the Maine Organic Farmers and Gardeners Association on EPA's Proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation, Docket ID: EPA-HQ-OW-2022-0114.

Dear Administrator Regan,

The Maine Organic Farmers and Gardeners Association (MOFGA) appreciates the opportunity to submit these comments in strong support of the proposed rule. We oppose any delay in completing this rulemaking, which is long overdue.

MOFGA'S interest in the rulemaking. MOFGA has a strong interest in this rulemaking, which will improve the lives and health of Maine's farming families and communities. A broad-based

community, MOFGA is creating a food system that is healthy and fair for all of us. Through education, training and advocacy, we are helping farmers thrive, making more local, organic food available and building sustainable communities. MOFGA certifies 535 organic farms and processing operations representing roughly $90 million in sales, and we are working hard to create opportunities for Maine's next generation of farmers. Each of these farmers is a Maine businessperson for whom economic health and environmental health are interdependent.

Unfortunately, adhering to organic practices provides no guarantee that the scourge of PFAS contamination won't impact an organic farm business. Whether organic or conventional, farms can produce contaminated crops and animal products, and farm families are vulnerable to health problems, if using drinking and irrigation water contaminated with PFAS, or growing crops on soils once spread with PFAS-contaminated sludge.

Since 2016, when PFAS was first found to have contaminated water, milk and soils at a Maine dairy farm, the state has been on the front lines developing its own health standards in the absence of enforceable federal drinking water standards. At least 56 Maine farms, both conventional and organic, are now known to have been contaminated with PFAS, and more than 300 drinking water wells have been polluted. These investigations are still underway; PFAS contamination at more farms and wells is likely to be discovered as the Maine Department of Environmental Protection (MDEP) completes this 3-year investigation. [FN1: Maine DEP PFAS Investigation, https://maine.maps.arcgis.com/apps/webappviewer/index.html?id=468a9f7ddcd54309bc1ae8ba173965c7]

Maine taxpayers have invested more than $100 million to test soil, water and food for PFAS, install filtration systems, conduct research, fund farmer assistance, and initiate testing and health monitoring for people exposed to high levels of PFAS in drinking water. This doesn't include additional sludge disposal costs now the State has – correctly -- banned land-spreading.

Removing and destroying contaminated soils and restoring healthy agricultural soils currently isn't feasible either technologically or economically. MOFGA has been on the front lines helping farmers dealing with the devastating consequences of PFAS contamination, including by fundraising and administering with the Maine Farmland Trust an emergency relief fund as a bridge to the State's efforts to stand up publicly funded assistance. [FN2: https://www.mofga.org/pfas/pfas-emergency-relief-fund/]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For topics out of scope of this rulemaking, please see section 15 of the *Response to Comments* document.

Maine Organic Farmers and Gardeners Association (MOFGA) (Doc. #1660, SBC-043381)

Federal regulation and funding is necessary. Is Maine's PFAS experience an outlier? We very much doubt it. Even today, PFAS-contaminated sludge is being spread on farm fields across the country. It's just that Maine is the only state methodically investigating every site where sludge-spreading may have occurred in the past 40 years. Other states must do the same to protect the health of their residents and the safety of the Nation's food system.

EPA's proposed drinking water testing, monitoring and health standard for six PFAS is an important first step towards this needed national response. Without this standard, states like Maine have had to establish their own health and safety criteria for water and food, with only EPA's outdated and unenforceable 70ppt advisory as federal guidance. Some other states are doing nothing and likely allowing meat, milk and produce onto the market without regulation, and PFAS-contaminated drinking water in their schools, nursing home facilities, residences and workplaces.

We support EPA setting an MCLG at zero for PFOA and PFOS. As testing technologies become more sensitive and reliable, the rule should require the 4 parts per trillion MCL to ratchet down.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

J.R. Simplot Company (Doc. #1661, SBC-044154)

Conclusion

Proper regulation for PFAS substances in water is important but must be done in a lawful and science-based process. Thus, for an appropriate and science-based regulation of PFAS chemicals, EPA must ensure that its regulations are based on robust scientific evaluations and meet statutory criteria. The proposed rule does not meet this benchmark. Several examples are provided in this comment letter as the deficiencies in this rulemaking. EPA should withdraw the proposed rule.

Please reach out to Rachel Roskelley, Sr. Environmental Programs Manager, at rachel.roskelley@simplot.com or 208-780-7426 or myself at 208-780-7365 if you have any questions about these comments.

Sincerely,

Alan L. Prouty

Vice President, Environmental & Regulatory Affairs

C:

Ed Thomas

The Fertilizer Institute

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

J.R. Simplot Company (Doc. #1661, SBC-044147)

May 30, 2023

SUBMITTED VIA: www.regulations.gov

Docket #: EPA-HQ-OW-2022-0114

Mr. Alex Lan

Office of Ground Water and Drinking Water Environmental Protection Agency 1200 Pennsylvania Ave, N.W.

Washington, D.C. 20460-0001

RE: The J.R. Simplot Company Comments for Proposed EPA PFAS National Primary Drinking Water Regulation, 40 CFR Parts 141 and 142

(Docket# EPA-HQ-OW-2022-0114)

Dear Mr. Lan:

The J.R. Simplot Company (Simplot) submits these comments in response to U.S. Environmental Protection Agency's (EPA's) proposed PFAS National Primary Drinking Water Regulation (PFAS NPDWR) published in the Federal Register on March 29, 2023 (88 FR 18638) and effective 3 years after the date of publication of the final rule in the Federal Register.

EPA has proposed Maximum Contaminant Levels (MCLs) and Maximum Contaminant Level Goals (MCLGs) in drinking water for per- and polyfluoroalkyl substances (PFAS) substances, as follows:

• Proposed MCLs for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) are 4 parts per trillion (individually)

• Proposed MCL and MCLG as a mixture containing perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonia salt (also known as GenX Chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) with a Hazard Index (HI) of 1.0

• Proposed MCLGs for PFOA and PFOS are zero

The proposed rule would also require public water systems to implement a monitoring program for PFAS substances, provide public notification of MCL exceedances to the public, and reduce the levels, including installing best available technology (BAT) if proposed MCLs are exceeded.

The J.R. Simplot Company (Simplot) is a privately held agribusiness corporation based in Boise, Idaho. The corporation is engaged in a number of businesses including food processing, farming, fertilizer manufacturing, mining, ranching and other enterprises related to agriculture. Simplot has operations throughout the United States. Simplot's facilities operate non-transient, non-community water systems (NTNCWSs) or obtain water from community water systems (CWS). Thus, this PFAS NPDWR rulemaking is of direct interest to the company, and we offer the following comments.

EPA Response: The EPA acknowledges this comment.

Water Supply District of Acton (Doc. #1662, SBC-043668)

Thank you for the opportunity to provide these comments. As a public utility, our staff and elected officials work hard to always follow the laws and regulations put forth by our regulatory agencies. I am sounding the alarm that I do not think this rule is reasonable, nor easily achievable. EPA has an obligation to address the water sector's implementation concerns and craft a final rule that is more realistic in its expectations of implementation and schedule and comes with a guarantee of the requisite funding to ensure PWS can comply.

Sincerely,

Matthew L. Mostoller

District Manager

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Water Supply District of Acton (Doc. #1662, SBC-043659)

May 30, 2023

Mr. Michael S. Regan, Administrator

U.S. Environmental Protection Agency

EPA Docket Center, OLEM Docket, Mail Code 28221 T 1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114 - National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS)

Dear Administrator Regan

I am writing on behalf of the Water Supply District of Acton (District) to provide comments on the Environmental Protection Agency's (EPA) proposed National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS). Our utility fully supports efforts to expand verified public health protections, but EPA needs to consider the challenges associated with its proposed rulemaking and address the concerns regarding implementation before finalizing any standards. The District has a long track record of dealing with emerging contaminants dating back to the discovery of Volatile Organic Compounds (VOCs) in our water supply during the 1970s and 1980s. We believe our experience is extremely valuable and should be considered as the EPA intends to act relating to the newest class of emerging contaminants, PFAS.

The District provides drinking water and fire protection to approximately 95% of homes and businesses in Acton, MA, a suburb of Boston with almost 24,000 residents. All our supply is sourced from a network of groundwater wells located within the community. Through extensive sampling, we have identified PFAS at varying concentrations in every well we operate. A definitive source, or more likely sources, has yet to be identified. Our utility is aware that EPA will receive comments from other utilities and water works organizations that are submitting more comprehensive comments. I would urge EPA to pay close attention to the points raised by these associations as they are comprised of individuals and companies with expertise in designing and operating Public Water Systems (PWS) and they have additional understanding of the challenges which will be associated with implementing any final rule EPA adopts. The District's major concerns about the proposed rulemaking are as follows:

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Blue Ridge Environmental Defense League (BREDL) (Doc. #1663, SBC-044388)

Millions of people in this country are unknowingly drinking, cooking, making Kool Aid, and baby formula with water contaminated by PFAS. The Environmental Protection Agency must use its authority to confirm that state and local agencies are taking adequate steps to inform the public about PFAS in their drinking water. EPA should take additional steps to improve their own guidance regarding notification and to regulate PFAS as a class.

Respectfully Submitted,

Therese Vick

North Carolina Healthy, sustainable Communities Campaign Coordinator

[Attachment 3: see docket ID EPA-HQ-OW-2022-0114-1663]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion around communications, please see section 1.2 of the *Response to Comments* document.

Santa Clara Valley Water District (Valley Water) (Doc. #1664, SBC-043129)

Valley Water appreciates the extensive work by the EPA to date to address PFAS and the significant public health and environmental challenge they pose. While we strongly support EPA's effort to develop drinking water standards based on sound science, we respectfully ask that you consider our comments prior to finalizing the regulation.

Again, thank you for the opportunity to provide comments. If you have any questions or would like follow-up information, please contact me at (408) 630-2135 or abaker@valleywater.org.

Sincerely,

Aaron Baker, P.E. Chief Operating Officer Water Utility Enterprise

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR as well as its comments. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Santa Clara Valley Water District (Valley Water) (Doc. #1664, SBC-043124)

The Honorable Michael Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, D.C. 20460

Jennifer McLain

Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, D.C. 20460

Subject: PFAS National Primary Drinking Water Regulation Rulemaking; EPA–HQ– OW–2022–0114; FRL 8543–01– OW

Dear Administrator Regan and Director McLain:

The Santa Clara Valley Water District (Valley Water) appreciates the opportunity to comment on the per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulation (NPDWR) proposed by the Environmental Protection Agency (EPA) as part of Docket No. EPA-HQ-OW-2022-0114.

Valley Water provides safe, clean water to nearly two million people who live in Santa Clara County, the heart of Silicon Valley. Valley Water operates three water treatment plants that clean and disinfect imported water and water from our local reservoirs, producing as much as 220 million gallons of drinking water per day. Valley Water also operates the Silicon Valley Advanced Water Purification Center which can produce up to eight million gallons of highly purified water each day and is used to improve non-potable recycled water quality; ultimately Valley Water has plans to use water purification for potable reuse. Valley Water also operates seven managed aquifer recharge systems throughout the county. As the water wholesaler and groundwater management agency for the region, Valley Water collaborates with 13 local retailers to deliver drinking water to homes and businesses throughout the county.

Valley Water strongly supports the EPA's effort to limit PFAS and provide a nationwide health-protective drinking water standard based on sound science. We have been proactive in evaluating PFAS risks to local water supplies through voluntary testing and monitoring as well as collaboration with retailers and regulatory agencies.

PFAS presents unique challenges for drinking water and recycled water providers, water and wastewater treatment plants, and water purification facilities nationwide, with many agencies facing similar issues. Valley Water therefore supports the comments submitted by the Association of California Water Agencies (ACWA), the California Municipal Utilities Association, and the Western Urban Water Coalition along with the joint comments submitted by the Association of Metropolitan Water Agencies, National Association of Clean Water Agencies, National Rural Water Association, and League of Cities. We also respectfully offer the following Valley Water comments regarding the proposed NPDWR.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Washington State Department of Health (DOH) (Doc. #1665, SBC-044389)

May 30, 2023

The Honorable Michael S. Regan

Administrator

U.S. Environmental Protection Agency

EPA Docket Center

Mail Code 2822IT

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Subject: PFAS National Primary Drinking Water Regulation Rulemaking Comments - Docket ID No. EPA-HQ-OW-2022-0114

Dear Mr. Regan,

Thank you for the opportunity to review this proposed rulemaking for regulating per- and polyfluoroalkyl substances (PFAS). The Washington State Department of Health (DOH) has reviewed the proposed PFAS National Primary Drinking Water Regulation in Federal Register Volume 88, No. 60, dated March 29, 2023. This letter represents DOH's general and detailed comments on the proposed PFAS drinking water standards.

DOH strongly supports the proposed PFAS drinking water standards. This represents an important step in reducing exposure to PFAS to consumers of drinking water supplied by public water systems. Based upon our implementation experience of state PFAS rules, we recommend clarification, additional information, and guidance as discussed in the attached general and detailed comments document and include the following important areas of the rule:

1. Hazard Index methodology

2. Data challenges for compliance

3. Implementation challenges

4. Laboratory capability and capacity

5. Monitoring waivers

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Inland Empire Utilities Agency (IEUA), California (Doc. #1666, SBC-043387)

May 30, 2023

Electronically submitted to EPA via the Federal eRulemaking Portal:

https://www.regulations.gov Docket ID No. EPA–HQ–OW–2022–0114

Federal eRulemaking Portal

U.S. Environmental Protection Agency (EPA) EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking - Docket ID No. EPA–HQ–OW– 2022–0114; FRL 8543–01–OW

To Whom It May Concern,

On behalf of the Inland Empire Utilities Agency (IEUA), we greatly appreciate the opportunity to provide comments in response to the U.S. Environmental Protection Agency's (EPA) request for public comments on the proposed PFAS National Primary Drinking Water Regulation (NPDWR), published in the Federal Register on March 29, 2023.

IEUA is a regional public water and wastewater treatment agency servicing a population of approximately 935,000 in western San Bernardino County, California (known as the Inland Empire). The communities within IEUA's 242 square miles service area depend upon a diverse portfolio of water resources and demand management strategies to responsibly support an increasing population and a growing economy.

Over the past 70 years, IEUA's services have expanded well-beyond its original mission of providing imported water supplies to nine retail water agencies. It now includes recharging local groundwater basins with captured stormwater and recycled water, and several other innovative programs that conserve water within the basin area. IEUA also uses recycled water for non-potable uses such as landscape irrigation through a separate distribution system. To manage salinity and in anticipation of increasingly stringent regulatory requirements, IEUA's wastewater treatment processes are evolving to include advanced water treatment.

PFAS contamination presents challenges for many drinking water and wastewater treatment providers throughout our nation. While IEUA strongly supports EPA's approach to addressing PFAS to safeguard public health, protect the environment, and hold polluters accountable, we do have significant concerns with the proposed rule as drafted.

EPA Response: The EPA appreciates this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Inland Empire Utilities Agency (IEUA), California (Doc. #1666, SBC-043393)

Conclusion

IEUA supports EPA's efforts to address PFAS contamination through investments in research, development, and innovation, through a comprehensive approach that prevents PFAS from entering air, land, and water through source control, and ultimately to broaden and accelerate the cleanup of PFAS contamination to protect human health and ecological systems.

IEUA recommends additional monitoring efforts to better understand the extent of PFAS in drinking water and the environment; this data will ensure science-based decision-making in support of EPA's Health Risk Reduction and Cost Analysis for the determination of the MCLs.

Most importantly, IEUA seeks assurances that all public sanitation agencies will be allowed a minimum of five years to comply with the new regulations, by extension or otherwise. Anything less is insufficient lead time to install the necessary capital improvement projects. Finally, it is imperative that significant federal funding be made available to minimize affordability impacts on the public.

We appreciate your consideration of these comments and the opportunity to collaborate with EPA staff on the proposed rulemaking. If you have any questions, please contact Mr. Pietro Cambiaso at pcambiaso@ieua.org or (909) 993-1639.

Sincerely,

INLAND EMPIRE UTILITIES AGENCY

Shivaji Deshmukh, P.E. General Manager

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the compliance deadline concern, the EPA has exercised its authority under SDWA to implement a nationwide capital improvement extension to comply with the MCL. For more information on this, please see section 13.1 of the *Response to Comments* document as well as section XI.D of the FRN. In response to the recommendation about monitoring, please see section 8 of the *Response to Comments* document.

City of Allentown and Lehigh County Authority (LCA), Pennsylvania (Doc. #1667, SBC-043686)

In summary the City and LCA have a joint mission to protect public health and the environment by providing high-quality, safe, and reliable water services to the communities that we serve. We support the establishment of national primary drinking water standards for PFAS and applaud EPA's efforts to address this important public health issue. However, it is equally important for EPA to consider the impact on communities, which translates to a financial burden to our citizens. Please consider these comments as reasonable refinements to the approaches EPA has developed so that communities can achieve compliance while navigating the many challenges we face. Thank you for the opportunity to comment on this important regulatory change

Sincerely,

Mark Shahda

Director of Public Works

CC: Office of Compliance, City of Allentown

Liesel Gross, Lehigh County Authority

[Attachment: See Docket ID EPA-HQ-OW-2022-0114-1600]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR, and acknowledge the commenters' concern about the financial burden on this rulemaking. Please see sections 1.3 and 13.3 of the EPA response in this *Response to Comments* document.

Aurora Water, City of Aurora, Colorado (Doc. #1669, SBC-043735)

Conclusion

In conclusion, Aurora Water appreciates the opportunity to provide feedback on the proposed National Primary Drinking Water Regulation of PFOA, PFOS, PFBS, GenX, PFNA, and PFHxS. We support EPA's continued efforts to ensure the safety of our nation's drinking water and look forward to working with the EPA to ensure the safety and reliability of our drinking water supply. However, we urge the EPA to review our comments and consider our recommendations to ensure the proposed regulation is practical and cost-effective for water systems to comply with. In addition, Aurora Water strongly encourages the EPA to include measures for removing PFOA, PFOS, PFBS, GenX, PFNA and PFHxS from manufacturing processes to prevent their introduction into water supplies and avoid the burden from being placed only on water providers and wastewater treaters.

If you have any questions or would like to meet to discuss our comments in more detail, please reach out to Sherry Scaggiari by email at sscaggia@auroragov.org or by phone at 303.739.7390.

Thank you,

Sherry Scaggiari

Environmental Services Manager Aurora Water

cc: Marshall Brown

Todd Brewer Bethany Green

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. In response to the commenter's urging that the EPA ensure the proposed regulation is practical and cost-effective for water systems to comply with, please see section 13.3 of the EPA response in this *Response to Comments* document. In response to the comment regarding removing PFOA, PFOS, PFBS, HFPO-DA, PFNA and PFHxS from manufacturing processes, please see section 15.1 of the EPA response in this *Response to Comments* document.

Aurora Water, City of Aurora, Colorado (Doc. #1669, SBC-043706)

May 30, 2023

Docket Id No. EPA-HQ-OW-2022-0114

Environmental Protection Agency EPA Docket Center

Via Federal eRulemaking Portal: https://www.regulations.gov/

RE: National Primary Drinking Water Regulations: PFAS Rule (EPA-HQ-OW-2022-0114).

Aurora Water welcomes the opportunity to provide comments on the proposed National Primary Drinking Water Regulation of PFOA, PFOS, PFBS, GenX, PFNA, and PFHxS. We are supportive of the determination to regulate certain PFAS chemicals using MCLs based on sound science while balancing feasibility and the most up-to-date information available to the agency. We do not believe the cost analysis is reflective of the cost of treating to the proposed MCL level. Aurora proposes an MCL of 10 ppt for PFOA and PFOS and a trigger level of 4 ppt. In addition, Aurora Water urges EPA to work with anyone who is manufacturing PFAS chemicals to remove the compounds from use. Until the source of the contaminants are controlled, the public's health will be at risk and the burden should not be solely placed on water providers and wastewater treaters to fix the issue. Our comments below expand on several areas of the proposed regulation where Aurora Water believes changes could be made to improve the effectiveness, practicality, and cost-effectiveness of the regulation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the regulation of PFAS, although with different MCL levels. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has determined that 4.0 ppt is feasible for treatment and costs. Please see additional discussion in section 5.1 of the *Response to Comments* document. Please see section 13.3 of the EPA response in this *Response to Comments* document addressing costs of this rule.

National Association of Water Companies (NAWC) (Doc. #1670, SBC-044155)

U.S. Environmental Protection Agency

EPA Docket Center

Docket EPA-HQ-OW-2022-0114

Mail Code 28221T

1200 Pennsylvania Avenue

Washington, D.C. 20460

Re: Comments by the National Association of Water Companies (NAWC) on EPA PFAS National Primary Drinking Water Regulation Rulemaking, Docket No. EPA-HQ-OW-2022-0114.

Dear Administrator Regan,

The National Association of Water Companies (NAWC) and its members are pleased to offer this comment letter regarding the agency's PFAS National Primary Drinking Water Regulation Rulemaking published in the Federal Register on March 29, 2023. NAWC agrees that EPA should take action to address the health risk posed by the presence of PFAS chemicals in drinking water supplies. We support a national drinking water standard for PFOA and PFOS based on the best available science and an appropriate balancing of potential risks and the costs to implement the rulemaking.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Association of Water Companies (NAWC) (Doc. #1670, SBC-044167)

Conclusion

NAWC and its members appreciate EPA's efforts to protect public health and the environment from the harmful PFAS chemicals that pose a risk to many. We support EPA's efforts to better understand PFAS sources, take measured and practical approaches in gathering data and assessing the risks of PFAS to public health and the environment and urge EPA to consider NAWC's comments to ensure that the agency produces a rule that is protective, feasible and affordable.

Please feel free to contact me at (267) 291-7765.

Sincerely,

Robert Powelson

cc: Radhika Fox

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Association of Water Companies (NAWC) (Doc. #1670, SBC-044157)

About NAWC

NAWC represents regulated water and wastewater companies, as well as those engaging in partnerships with municipal utilities. NAWC members provide 73 million Americans with safe and reliable water service and have an exceptional record of compliance with federal and state health and environmental regulations. Ensuring this high standard of quality requires extraordinary amounts of capital investment. NAWC estimates that its 10 largest members alone are collectively investing $3.9 billion each year in their water and wastewater systems.

Providing affordable, safe, clean water to the customer is a high priority for NAWC's members. Toward that end, a 2018 study published in the Proceedings of the National Academy of Sciences confirmed that investor-owned water companies have a more consistent record of delivering high-quality water that meets or surpasses federal standards than their municipal counterparts. [FN1: See article, February 12, 2018 (https://www.pnas.org/doi/10.1073/pnas.1719805115)] NAWC is proud of that record and its members will continue to lead in delivering the highest attainable compliance results. NAWC works with its members to adopt a public commitment beyond compliance to proactively protecting the public health of its members' customers.

EPA Response: The EPA acknowledges this comment.

Cleveland Water, City of Cleveland, Ohio (Doc. #1672, SBC-044898)

Docket ID: EPA-HQ-OW-2002-0114

Per- and Polyfluoroalkyl Substances

Proposed PFAS National Primary Drinking Water Regulation

Cleveland Water Comments

Section 1: Overarching comments

Cleveland Water supports regulation based on sound science that is protective of human health. Due to the significant risks of severe health effects and their persistent nature, we agree with EPA's 2021 final determination to regulate PFOA and PFOS in drinking water. Public water systems (PWSs) and EPA share the same goal of ensuring the delivery of clean, safe drinking water to the public, and welcome continued dialogue on the best ways to accomplish this goal.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

North Jersey District Water Supply Commission (NJDWSC) (Doc. #1673, SBC-044201)

May 30, 2023

The North Jersey District Water Supply Commission (NJDWSC) was established in 1916 by the State of New Jersey to provide safe and reliable drinking water to a large portion of Northern New Jersey. NJDWSC owns and operates the Wanaque Water Treatment Plant located in Wanaque, New Jersey. The facility is a conventional surface water plant with an average daily demand of 100 MGD and max daily demand of 140 MGD and provides drinking water to over 3 million people in 14 member municipalities and many consecutive systems.

EPA Response: The EPA acknowledges this comment.

A. O. Smith Corporation (Doc. #1674, SBC-043690)

Mr. Lan, please see the attached file of the comments submitted by the A. O. Smith Corporation. A. O. Smith appreciates the opportunity to submit these comments to the U.S. Environmental Protection Agency regarding its request for comment on its PFAS National Primary Drinking Water Regulation Rulemaking No. EPA-HQ-OW-2022-0114/ RIN 2040-AG18 and looks forward to continuing the dialogue with the Agency moving forward.

May 30, 2023

Alexis Lan

(Mail Code 4607M)

Environmental Protection Agency

1200 Pennsylvania Avenue, NW Washington, DC 20460

E-Mail: PFASNPDWR@epa.gov

Re: A. O. Smith Comments on Docket ID No. EPA-HQ-OW-2022-0114/ RIN 2040-AG18 - PFAS National Primary Drinking Water Regulation Rulemaking

Dear Mr. Lan

A. O. Smith Corporation ("A. O. Smith" or "Company"), with global headquarters in Milwaukee, Wisconsin since 1874, is a global leader in applying technology and energy-efficient solutions to products manufactured and marketed worldwide. Listed on the New York Stock Exchange (NYSE: AOS), the company is one of the world's largest manufacturers of residential and commercial water heating equipment and boilers, as well as a leading global manufacturer of water treatment and air purification products.

A. O. Smith appreciates the opportunity to submit these comments to the U.S. Environmental Protection Agency ("EPA") regarding its request for comment on its PFAS National Primary Drinking Water Regulation Rulemaking ("PFAS NPDWR"). The Company has long standing working relationship with the EPA as a participant in the ENERGY STAR® program having received multiple Partner of the Year awards for its high-efficiency water heating equipment.

The Company's North American Water Treatment division is a vertically integrated business unit that manufacturers point-of-use and point-of-entry drinking water treatment and filtration solutions for residential and commercial applications with distribution through channels such as Lowe's® as well as through its nation-wide network of professional water quality dealers and installers. It is this experience helping consumers daily to improve their drinking water quality at the point of consumption that informs the Company's comments.

Overview

A. O. Smith applauds the EPA for proposing a national primary drinking water standard for six covered PFAS chemicals, including establishing maximum contaminant level goals ("MCLG") as well as a maximum contaminant level ("MCL") for perfluorooctanoic acid ("PFOA") and perfluorooctane sulfonic acid ("PFOS"). As the EPA has laid out in the PFAS NPDWR, and as independent research and toxicological data demonstrates, exposure to elevated levels of PFAS or so-called "forever chemicals" are harmful to human health and accordingly the Company agrees that an NPDWS will help mitigate one of the pathways through which people are exposed to PFAS – their drinking water. The Company also supports and is encouraged by EPA's recognition that third-party certified point-of-use ("POU") and point-of-entry ("POE") water treatment systems are a cost-effective solution to address PFAS chemicals at the point of consumption of drinking water and may be a more cost-effective solution for small community water systems to utilize to demonstrate compliance with the proposed PFAS NPDWS.

Finally, the Company does have some concerns relating to the 4 ppt MCL regulatory determination for PFOA and PFOS; the workability of the Hazard Index ("HI") related to GenX chemicals; certified laboratory capacity to timely, and cost-effectively, test drinking water samples from thousands of public water systems that are covered under the proposed PFAS NPDWS; as well as potential supply chain impacts on certain activated carbon and other treatment media that are primarily sourced outside of the United States. What follows are the Company's comments to some of the EPA's specific requests for comment as outlined in Section XIV of the proposed PFAS NPDWS. [FN1: 88 FR 18729.]

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies (ACWA) (Doc. #1675, SBC-044926)

May 30, 2023

The Honorable Michael Regan

Administrator

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, D.C. 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking; EPA–HQ–OW–2022–0114; FRL 8543–01– OW

Dear Administrator Regan:

The Association of California Water Agencies (ACWA) appreciates the opportunity to provide comments on the Environmental Protection Agency's (EPA) proposed PFAS National Primary Drinking Water Regulation (NPDWR). ACWA's more than 460 public water agency members supply over 90 percent of the water delivered in California for residential, agricultural, and business uses. ACWA strongly supports drinking water standards for PFAS that are based on sound science and robust analysis.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies (ACWA) (Doc. #1675, SBC-044929)

II. Comments

The Safe Drinking Water Act (SDWA) was established to protect the quality of drinking water. SDWA authorizes EPA to set national health-based standards for drinking water to protect against both naturally occurring and man-made contaminants that may be found in drinking water [FN1: EPA, Overview of the Safe Drinking Water Act (last updated Feb. 14, 2023), click here [Link: https://www.epa.gov/sdwa/overview-safe-drinking-water-act]]. Under SDWA a significant responsibility is placed on EPA "to realistically assess the capabilities of and resources available to those who could be affected by any future drinking water rulemaking." [FN2: EPA, SDWA Economic Analysis (last updated Feb. 14, 2023), click here.[link: https://www.epa.gov/sdwa/sdwa-economic-analysis]].

ACWA recognizes that SDWA is a vital tool in EPA's mission to safeguard public drinking water. We strongly support setting drinking water standards for PFAS that are based on sound science and robust analysis. EPA's proposed PFAS NPDWR, however, raises several concerns for our members. Following are ACWA's comments on EPA's proposed rule.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Association of California Water Agencies (ACWA) (Doc. #1675, SBC-044939)

III. Conclusion

ACWA strongly supports EPA's efforts to address PFAS contamination and protect public health through setting drinking water standards that are based on sound science and robust analysis. We

have concerns with this proposal in its current form and ask EPA to take our comments under consideration before finalizing the regulation.

Thank you for the opportunity to provide comments on this proposed rule. If you have any questions or would like any follow-up information, please contact Madeline Voitier, ACWA's Federal Relations Representative at madelinev@acwa.com.

Sincerely,

Madeline Voitier, Federal Relations Representative

CC:

The Honorable Radhika Fox, Assistant Administrator, Office of Water, U.S. Environmental Protection Agency

Jennifer McLain, Director, Office of Ground Water and Drinking Water, U.S. Environmental Protection Agency

Alexis Lan, Ground Water and Drinking Water, Standards and Risk Management Division, U.S. Environmental Protection Agency

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

California Association of Mutual Water Companies (Doc. #1676, SBC-043773)

May 30, 2023

Jennifer McLain, Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1201 Constitution Avenue, NW

Washington, DC 20004

Subject: Comment Letter- Proposal to Limit PFAS in Drinking Water- Docket ID Number: EPA-HQ-OW-2022-0114

Dr. McLain,

I am writing on behalf of the California Association of Mutual Water Companies (CalMutuals). Our organization represents almost 500 small water systems throughout the state that collectively serve 1.3 million Californians. We appreciate the Environmental Protection Agency's (EPA) commitment to protecting public health and note that the action of setting a federal standard is an extraordinary and atypical response to addressing contaminants that impact our water supply.

While CalMutuals recognizes the challenge of developing a nation-wide proposal that would apply to systems of all sizes and types, CalMutuals does not believe the needs and concerns of very small water systems (i.e., those having 15 to 3000 service connections) are adequately addressed. This letter sets forth several areas of concern with respect to application of the proposed PFAS standard to small water systems.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that small water systems were not considered or have their needs adequately addressed in this rule. Please see the following sections of the EPA response in this *Response to Comments* document for evidence of the EPA's considerations for small water systems: section 10.5 for small system compliance technologies identification and evaluations, section 13.10 for discussion on affordability, as well as section 14.10 for federal actions to address EJ in minority and low-income populations.

Arizona Corporation Commission (Doc. #1680, SBC-044216)

May 30, 2023

By Electronic Submission to http://www.regulations.gov/

Michael S. Regan, Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N.W.

Mail Code: 1101A Washington, DC 20460

Re: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking (EPA- HQ-OW-2022-0114).

Dear Administrator Regan,

My name is Commissioner Anna Tovar and I am writing as the sole Democrat member of the Arizona Corporation Commission ("ACC").1 [FN1: A majority of Commissioners signed public comments filed on behalf of the Arizona Corporation Commission in this docket. While I join in those sentiments, I am providing these comments to highlight two additional areas of concern not addressed in the comments from the ACC.] I appreciate the opportunity to submit comments to the Environmental Protection Agency's ("EPA" or "Agency") PFAS National Primary Drinking Water Regulation Rulemaking. I agree that EPA should take action to address the health risk posed by the presence of PFAS chemicals in drinking water supplies.

About the ACC

The ACC is the state regulatory body responsible for the regulation of Arizona's public service corporations, including 266 water utilities providing service to the residents of Arizona. The ACC has broad authority over private utilities under Article XV of the Arizona Constitution and

Arizona Revised Statutes, Title 40, and sets the rates and provides for the health and safety of the public these companies serve.

In Arizona, smaller utilities are classified as Class D and E and serve populations ranging from five to 10,000 customers. These utilities typically have wells with flow rates between 50 GPM and 200 GPM (0.07-0.288 MGD). Class D utilities have operating revenues between $50,000 and $249,000, while Class E utilities have operating revenues of less than $50,000. In Arizona, Class D and E utilities comprise 228 of the approximately 266 regulated water utilities. The vast majority of these water systems are rural and draw upon a finite supply of water that is dwindling as the Arizona desert continues to grow.

EPA Response: The EPA acknowledges this comment.

Arizona Corporation Commission (Doc. #1680, SBC-044219)

In conclusion, I applaud the EPA for taking this important step to protect the public health and appreciate the opportunity to provide comments.

Sincerely,

Anna Tovar Commissioner

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Public Employees for Environmental Responsibility (PEER) (Doc. #1683, SBC-044967)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460.

RE: Docket ID No. EPA-HQ-OW-2022-0114

Sent via www.regulations.gov

To Whom It May Concern:

Public Employees for Environmental Responsibility (PEER) is providing comments on the U.S. Environmental Protection Agency's (EPA) proposed "Per-and Polyfluoroalkyl Substances National Drinking Water Regulation" for six PFAS published on March 29, 2023. Specifically, EPA proposes to:

• regulate perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) as contaminants under the Safe Drinking Water Act (SDWA), with health-based Maximum Contaminant Level Goals (MCLG) of zero, and individual Maximum Contaminant Levels (MCLs) of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt); and

• regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and their mixtures as contaminants under SDWA, using a unitless Hazard Index (HI) of 1.0.

While PEER is pleased that EPA is finally setting MCLs for some PFAS in drinking water, we believe much more needs to be done. Our specific comments are set forth below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

City of Vancouver Water Utility, Vancouver, WA (Doc. #1684, SBC-044317)

Conclusion:

Vancouver is in support of PFAS rulemaking utilizing a science-based approach in which the data is clear and complete.

The majority of public water systems make the provision of clean, safe water to their customers their number one priority. This rulemaking process and uncertainty regarding the data and results can only create mistrust across the nation. Please ensure that an adequate benefit/cost analysis is completed and levels are set accordingly to the outcome of that analysis and not based on an interpretation of data.

Thank you for your consideration of these comments. Sincerely,

Tyler Clary, P.E., W.D.M 4

Water Engineering Program Manager City of Vancouver

cc: Lon Pluckhahn Brian Wilson Tim Buck Patrick Craney

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. An adequate benefit and cost analysis was completed by the agency, and can be reviewed in section XII of the FRN.

Wisconsin Department of Justice et al. (Doc. #1687, SBC-044451)

Conclusion

The States appreciate this opportunity to submit these comments supporting EPA's proposed drinking water standards for PFOA, PFOS, PFHxS, GenX, PFNA, and PFBS. We urge EPA to promptly finalize the rule and proceed apace to consider regulating additional PFAS that pose demonstrable risks to human health.

Re: Comments on Preliminary Regulatory Determination and Proposed Rule; PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638 (Mar. 29, 2023)

Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Regan:

The Attorneys General of the States of Arizona, California, Colorado, Connecticut, Delaware, Illinois, Maine, Maryland, Massachusetts, Michigan, New Jersey, New York, North Carolina,

Oregon, Pennsylvania, Wisconsin, and the District of Columbia (collectively, the States) offer these comments in support of the U.S. Environmental Protection Agency's (EPA) preliminary regulatory determination and proposed rule to set enforceable drinking water standards for certain per- and polyfluoroalkyl substances (PFAS) (PFAS Rule). [FN1:Preliminary Regulatory Determination and Proposed Rule; PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638 (March 29, 2023).] The PFAS Rule would set Maximum Contaminant Levels (MCL) and Maximum Contaminant Level Goals (MCLG) for six PFAS as follows:

• Perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS): EPA proposes an MCL of four parts per trillion (ppt) and an MCLG of zero for each contaminant. [FN2: In March 2021, EPA issued a final regulatory determination to regulate PFOA and PFOS as contaminants under the federal Safe Drinking Water Act, 42 U.S.C. § 300f, et seq. (SDWA).]

• Perfluorohexane sulfonic acid (PFHxS); hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (known collectively as GenX); perfluorononanoic acid (PFNA); and perfluorobutane sulfonic acid (PFBS): EPA makes a preliminary regulatory determination to regulate these four PFAS, and mixtures of these PFAS, as contaminants under the Safe Drinking Water Act (SDWA). EPA also proposes a Hazard Index approach to set a limit on these four PFAS and any mixture containing one or more of these four PFAS. EPA proposes a Hazard Index of 1.0 as the MCL and MCLG for these four PFAS and any mixture containing two or more of them. [FN3: The Hazard Index is a tool used by EPA to evaluate the potential health risks from exposure to chemical mixtures. The PFAS Rule proposes a ratio for each of the four PFAS to be used to calculate a compliance value based on detected levels of these PFAS—a combination of these four ratios equaling or exceeding 1.0 will trigger the need to reduce their levels in drinking water; see EPA Fact Sheet: Understanding the PFAS National Primary Drinking Water Proposal Hazard Index, https://www.epa.gov/system/files/documents/2023-03/How%20do%20I%20calculate%20the%20Hazard%20Index._3.14.23.pdf.]

The States have a significant interest in ensuring that their residents have access to safe drinking water, and many have taken action to set their own drinking water standards for various PFAS. [FN4: See infra at 13-14; see also Envt'l Council of the States, Processes & Considerations for Setting State PFAS Standards 7 (Feb. 2020; updated Mar. 2023), https://www.ecos.org/wpcontent/uploads/2023/03/2023-ECOS-PFAS-Standards-Paper-Update.pdf.] We strongly support EPA's proposed action to set national standards to protect the public from the harmful health impacts of PFAS in drinking water and offer the following comments for the agency's consideration as it proceeds in this important effort. We also emphasize the need for significant resources for state and local governments to remove PFAS from drinking water supplies and to help with the cost of rule implementation and regulatory enforcement. The comments proceed as follows:

• First, we explain EPA's authority to set enforceable drinking water standards for these PFAS because they: (a) have known adverse health effects, (b) are likely to occur in public water systems, and (c) present a meaningful opportunity for health risk reduction, if regulated.

• Second, we explain that EPA has authority to issue a preliminary determination and simultaneously propose MCLs and MCLGs for PFAS in drinking water.

• Third, we offer support for the proposed Hazard Index approach to regulate PFHxS, HFPO-DA, PFNA, and PFBS and explain why the Hazard Index approach is both appropriate and justified to address the health effects of PFAS mixtures.

• Fourth, we urge EPA to make technical and engineering resources available to public water systems so that the financial burden of removing PFAS does not unfairly fall on ratepayers and customers.

• Fifth, we urge EPA to issue the final rule as quickly as possible because these contaminants are so toxic, while at the same time giving States the opportunity to revise their programs.

• Sixth, after finalizing this PFAS Rule, we suggest that EPA should similarly consider setting drinking water standards for other PFAS both alone and in combination.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR, and appreciates the subsequent comments provided. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Three Rivers Waterkeeper (3RWK) (Doc. #1689, SBC-044971)

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue

NW, Washington, DC 20460

(filed online via eComment)

Comment on Docket Number EPA-HQ-OW-2022-0114. Re: EPA's proposed national drinking water standard for six per- and polyfluoroalkyl substances (PFAS).

To Whom it May Concern:

Three Rivers Waterkeeper (3RWK) thanks you for the opportunity to comment in support of the Environmental Protection Agency's (EPA) proposed national drinking water standard for six per- and polyfluoroalkyl substances (PFAS), Docket ID Number: EPA-HQ-OW-2022-0114. 3RWK was founded in 2009 and aims to improve and protect the water quality of the Allegheny, Monongahela, and Ohio Rivers. These waterways are critical to the health, vitality, and economic prosperity of our region and communities. We are both a scientific and legal advocate for the community, working to ensure that our three rivers are protected and that our waters are

safe to drink, fish, swim, and enjoy. We are one of the 300 organizations that make up the global Waterkeeper Alliance and work together to connect local communities to global environmental and advocacy resources. For these reasons and due to our significant experience and knowledge as stewards and advocates for the Three Rivers, we believe that we can provide the EPA with valuable insight on the proposed rulemaking.

PFAS, commonly known as "forever chemicals," do not degrade and are bioaccumulative, polluting waterways and sickening people and wildlife. They are associated with a wide range of health risks including cancers, birth defects, and weakened immune systems. While 3RWK supports further legislation and regulation, including up to a total phase-out of PFAS as a class of chemicals, this proposed rule is an important step toward reducing the deaths and illnesses caused by PFAS.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Three Rivers Waterkeeper (3RWK) (Doc. #1689, SBC-044973)

II. The inconsistency of State regulation and the transboundary nature of PFAS pollution make federal regulation necessary to effectively address the issue.

3RWK's work at the confluence of the Allegheny, Monongahela, and Ohio rivers has profoundly demonstrated to us the importance of halting pollution at its source. The Ohio River provides drinking water to over 5 million people. It sends more water into the Mississippi than any other tributary, along with any contaminants it picks up along its 981-mile stretch through the Rust Belt. [FN13: Susan Cosier, The Ohio River Defines the Borders of Five States–But Its Pollution Doesn't Stop at State Lines, National Resources Defense Council, Aug. 21, 2019, https://www.nrdc.org/stories/ohio-river-defines-borders-five-states-its-pollution-doesnt-stop-state-lines#:~:text=Five%20million%20people%20rely%20on,most%20polluted%20in%20the%20country.] With the United States' current patchwork of regulation, downstream States are at the mercy of their upstream neighbors to regulate PFAS and prevent the contamination of the watershed. The Pennsylvania Department of Environmental Protection (DEP) published its final PFAS drinking water regulation only in January 2023, setting Maximum Contaminant Levels (MCLs) for PFOS and PFOA at 18 ppt and 14 ppt respectively. [FN14: 25 Pa. Code §109.202 (Jan. 14, 2023).] Other States at the time had stricter PFAS standards, including California, Colorado, Connecticut, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York, North Carolina and Vermont, leaving Pennsylvania residents more at risk for PFAS exposure than residents of those States.

The regulatory framework has already changed substantially in recent months, with Minnesota recently agreeing to pass new PFAS protections, including blanket prohibitions on certain consumer goods containing PFAS of any kind. [FN15: Min. 3 HF 2310-4 § 21 (May 25, 2023) https://www.revisor.mn.gov/bills/text.php?number=HF2310&type=bill&version=4&session=ls9

3&session_year=2023&session_number=0.] PFAS regulations are inconsistent across the country, leaving some States with stronger protections than others, even as PFAS originating in one state can flow through waterways into neighboring areas. We need strong federal PFAS protections that account for the known danger of PFOS and PFOA, as well as the cumulative effects of those and other PFAS.

Although PFAS are dangerous and widespread, there is currently no federal regulatory safeguard protecting us from PFAS in our drinking water. This puts the U.S. behind the EU, which currently regulates PFOS and PFOA under the Persistent Organic Pollutants (POPs) Regulation, and which is currently considering universal PFAS restriction. [FN16: Per- and Polyfluoroalkyl Substances (PFAS), European Chemicals Agency, https://echa.europa.eu/hot-topics/perfluoroalkyl-chemicals-pfas (Last Accessed May 30, 2023).] While the U.S. has been slow to adopt stringent federal PFAS regulations, this proposed drinking water standard is a crucial step in the right direction.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Three Rivers Waterkeeper (3RWK) (Doc. #1689, SBC-044978)

In conclusion, while 3RWK believes that this rule would be a major improvement to the nation's overall PFAS regulatory scheme, it should not be the end if the EPA is to satisfy the goals of the Clean Water Act and the Safe Drinking Water Act. We know that the EPA and other agencies are continuously researching PFAS and working on new regulations to better protect the public. [FN20: PFAS Strategic Roadmap: EPA's Commitments to Action 2021-2024, United States Environmental Protection Agency, 10-21, Oct. 18, 2021, https://www.epa.gov/system/files/documents/2021-10/pfas-roadmap_final-508.pdf.] The danger posed by PFAS and the rapidly-evolving scientific understanding of these chemicals necessitate a regulatory approach that is both strong and able to withstand new information. While the given PFOS and PFOA MCLs provide more protection than the MCLs in 3RWK's home state of Pennsylvania, the science is always developing. It will be necessary to adjust these rules in the future as the situation evolves, but in the meantime we cannot ignore the tens of thousands of illnesses and deaths that the EPA expects this rule to prevent. Thank you for your time and consideration,

Sincerely,

Heather Hulton VanTassel, PhD

Executive Director, Three Rivers Waterkeeper

PO Box 97062

Pittsburgh, PA 15229

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Massachusetts Coalition for Water Resources Stewardship (MCWRS) (Doc. #1691, SBC-044318)

May 30, 2023

Mr. Michael S. Regan, Administrator

U.S. Environmental Protection Agency

EPA Docket Center, OLEM Docket, Mail Code 28221T 1200 Pennsylvania Avenue, NW

Washington, DC 20460

RE: Docket ID No. EPA-HQ-OW-2022-0114

National Primary Drinking Water Regulation Rulemaking PFAS MCL

Dear Administrator Regan,

The Massachusetts Coalition for Water Resources Stewardship (MCWRS) is a non-profit organization representing the interests of municipalities, districts and commissions in the world of wastewater, stormwater and drinking water. Members include municipal, district and commission wastewater, stormwater and drinking water utilities, engineering consultants, legal firms and stormwater coalitions. MCWRS offers the following comments on EPA's draft Maximum Contaminant Levels (MCLs) for various polyfluoroalkyl substances (PFAS) in drinking water.

MCWRS understands there is tremendous pressure on EPA from advocacy groups, the media and politicians to set a very low MCL for certain PFAS compounds. While it is agreed that PFOA and PFOS need to be regulated in drinking water through an MCL, the proposed limits are far too extreme, not supported by science, too costly, reactionary and fraught with unintended consequences that may lead to greater threats to drinking water quality and public health than are posed by the contaminants being regulated.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. The EPA disagrees with the comments stating that the rule is too extreme, not supported by science, too costly, reactionary, and fraught with unintended consequences. Please see the preamble and sections 1.1 and 1.3 of the EPA response in this *Response to Comments* document.

Massachusetts Coalition for Water Resources Stewardship (MCWRS) (Doc. #1691, SBC-044320)

PFOA and PFOS in drinking water is not an emergency. It is a 70-year old problem that was only recently brought to light as a result of improved laboratory detection levels. Our ability to detect contaminants far exceeds our ability to understand what minute levels of these contaminants in drinking water may mean. We cannot afford, both financially and from a societal perspective, to regulate drinking water based on irrational fears, irresponsible media and the hyper-political world where we currently find ourselves.

EPA Response: The EPA disagrees with this comment objecting to the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has conducted health assessments to determine what small levels of these contaminants may mean in drinking water, and these assessments can be found in the Toxicity Assessments and the PFOA/PFOS MCLG support documents. See also sections 3.1.1 and 3.2.1 of the *Response to Comments* document for more information on health impacts of PFOA and PFAS. For concerns around affordability, the agency conducted a cost and benefit analysis that can be found in section XII of the FRN, the Economic Analysis support document (USEPA, 2024a), with response to comments regarding costs throughout section 13.3 of the *Response to Comments* document.

American Council of Independent Laboratories (ACIL) (Doc. #1692, SBC-044735)

May 30, 2023

U. S. Environmental Protection Agency

Water Docket (Mail code: 4203M)

1200 Pennsylvania Ave. NW.,

Washington, DC 20460.

Attention Docket ID number EPA–HQ–OW–2022-0114

Re: ENVIRONMENTAL PROTECTION AGENCY

40 C.F.R. Part 141 Safe Drinking Water Act National Primary Drinking Water Regulation Rulemaking on Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS)

The American Council of Independent Laboratories (ACIL) is broadly supportive of the EPA's efforts to regulate PFAS in the nation's drinking water and to provide clear guidance on the monitoring of the specific compounds listed. The laboratory community is well placed to respond to the additional monitoring demands arising from this MCL determination and look

forward to supporting drinking water utilities in their efforts to monitor PFAS, and to deal with any analytical issues they encounter.

The American Council of Independent Laboratories (ACIL) serves as the trade association representing independent, commercial scientific and testing laboratories. Its members are professional services firms engaged in testing, product certification, consulting, and research and development. Affiliated members include testing instrument manufacturers, consultants, laboratory assessment and accreditation organizations, consultants, and other suppliers to the industry. The association was founded in 1937. ACIL member environmental testing laboratories are independent scientific services firms engaged in environmental sampling and testing. They are not affiliated with any institution, company, or trade group that might affect their ability to conduct investigations, render reports, or give professional, objective, and unbiased counsel. As a result, the industry has a long history of serving government agencies (including the Environmental Protection Agency (EPA), the Department of Defense (DOD), and the Department of Energy (DOE)) with environmental sampling and analysis services in support of agency regulatory rulemaking, site assessment, site cleanup efficacy evaluations, and enforcement data gathering.

The measurement and research conducted by ACIL members yield data about chemical and biological pollutants and their effects on the environment and citizen health and, over the years, have formed the basis of much of EPA's regulatory and enforcement actions.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ontario International Airport Authority (OIAA), California (Doc. #1693, SBC-043504)

May 30, 2023

Michael S. Regan, Administrator Environmental Protection Agency 1200 Pennsylvania Ave, NW Mail Code: 4670M

Washington, D.C. 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114 – Comments on PFAS, PFOA, and PFOS National Primary Drinking Water Regulation Rulemaking

Dear Mr. Regan:

This firm represents the Ontario International Airport Authority, located in southern California. We have reviewed the proposed rulemaking that would establish National Primary Drinking Water standards and regulations for certain species of per- and polyfluoralkyl stances (PFAS), including perfluorooctanoic acid (PFOA), and perfluorooctane sulfonic acid (PFOS), under the federal Safe Drinking Water Act. As we understand it, EPA is proposing a maximum

contaminant level (MCL) of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt) for PFOA and PFOS.

EPA Response: EPA acknowledges this comment.

Water Quality Association (WQA) (Doc. #1694, SBC-044979)

May 30, 2023

Alexis Lan

Office of Ground Water and Drinking Water, Standards and Risk Management Division

(Mail Code 4607M)

Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Re: WQA's Comments on Docket ID No. EPA-HQ-OW-2022-0114

Dear Alexis Lan,

On behalf of the Water Quality Association (WQA), a not-for-profit trade association representing 2500 member companies in the residential, commercial, and industrial water treatment industry, we are submitting comments in reference to the EPA's proposed National Primary Drinking Water Regulation (NPDWR) Rulemaking for six PFAS chemicals. We applaud the agency's actions in researching and taking action to improve water quality across the country and hope you will utilize us as a resource in responding to PFAS contamination.

About WQA

Since its creation in 1974, WQA and its member companies have worked tirelessly to improve water quality through sustainable technologies and services. As a leader in the point-of-use (POU) and point-of-entry (POE) drinking water treatment system industry, the association operates an American National Standards Institute National Accreditation Board (ANAB) accredited testing and certification program that evaluates and certifies water filtration products to nationally accepted industry standards for contaminant removal. The association also operates a Professional Certification Program with a rigorous continued education component that qualifies a level of knowledge to enhance the application of the certified products. WQA also offers a variety of technical skills and educational resources, many of which can serve as vital tools as the EPA aims to reduce PFAS in drinking water.

WQA's Comments to the proposed-NPDWR

Navigating drinking water challenges and regulating contaminants is a complex and difficult task. Setting Maximum Contaminant Levels (MCLs) and monitoring the nation's water supply

are the first steps, but as areas of contamination are identified, residents will be looking for assurance of safe water supplies. While our association will not be providing recommendations on appropriate MCLs for PFAS chemicals, we can inform you of the current feasibility of mitigation and treatment techniques in relation to the proposed NPDWR. Most of our comments will focus on the industry's current capabilities, including information on performance standards, lab capabilities, and available treatment technologies. However, it's important to highlight a few other considerations in direct response to the proposed MCLs.

Outlined below are WQA's comments on the preliminary regulatory determination and the proposed rule. Supporting information for WQA's comments can be found in the attached analysis.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

City of Lancaster, Pennsylvania (Doc. #1695, SBC-044991)

May 26th, 2023

U.S. Environmental Protection Agency

Re: Safe Drinking Water PFAS MCL Rule

Ladies and Gentlemen:

The City of Lancaster is in favor of protecting the citizens of the United States and instituting a PFAS/PFOA mean contaminant level (MCL) based upon thoroughly collected data analysis of all scientific, journaled and peer reviewed studies on PFAs contamination. UCMR5 has still not been completed and it is designed to specifically include analysis of the PFAS contaminants. The proposed limits are confusing and problematic.

Setting a regulatory limit that is near the baseline detection limit that excludes key research data is a troubling and problematic practice on multiple levels for both the taxpayer and the regulatory body. The proposed low limit of 4 ppt can barely be differentiated from the background noise of detection systems, and creates a narrow and challenging window to operate in. Constructing new treatment systems will result in significant economic impacts on water systems and their rate payers. However, this proposed regulation does nothing to stop the polluters and sources of contamination and sends a questionable message. Please consider the following comments on the Environmental Protection Agency's new MCL limit for PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that the limit of 4.0 ppt is too low. Please see section 5.1 and section 7 of the *Response to Comments* document discussing chosen limits and analytical methods. The available UCMR 3 and state occurrence data are sufficiently robust

to support the final rule and the EPA is not obligated to use/collect the entire UCMR 5 dataset prior to finalizing the rule. UCMR 5 data are relevant for reduction of initial monitoring costs and for informing regulatory decisions for 23 PFAS not included in this rule action. For more discussion on the UCMR 5 data set, please section 6.8 of the EPA response in this *Response to Comments* document. For concerns around affordability, the agency conducted a cost and benefit analysis that can be found in section XII of the FRN, the Economic Analysis support document, with response to comments regarding costs throughout section 13.3 of the *Response to Comments* document.

Clean Water Action/Clean Water Fund (Doc. #1697, SBC-045001)

Finalizing Health-Protective NPDWR is essential given on-going PFAS water pollution

Despite widespread concern about PFAS chemicals in water, including drinking water sources, progress in regulatory and non-regulatory approaches for keeping PFAS chemicals out of water is disturbingly slow in comparison to the increased discovery of these chemicals in drinking water at very low levels and the growing knowledge base on their health effects, including at low levels. Despite the pollution prevention values that have guided United States environmental policy conceptually, the reality is that often pollution is not handled at its source and it falls on communities and water systems and their customers to handle contaminants that put public health at risk. This is certainly the case with PFAS chemicals. While it is ultimately more efficient and equitable to address PFAS water pollution at its source, the public health risks posed by PFAS in drinking water must be addressed now despite the fact that the contamination should be controlled upstream. EPA's own summary in the proposed rule of ongoing manufacture and use of PFOA and PFOS illustrates the problem.

Domestic production and import of PFOA has been phased out in the United States by the companies participating in the 2010/2015 PFOA Stewardship Program. Small quantities of PFOA may be produced, imported, and used by companies not participating in the PFOA Stewardship Program and some uses of PFOS are ongoing (see 40 Code of Federal Regulations (CFR) § 721.9582). EPA is also aware of ongoing use of the chemicals available from existing stocks or newly introduced via imports. Additionally, the environmental persistence of these chemicals and formation as degradation products from other compounds may still contribute to their release in the environment. [FN4: PFAS National Primary Drinking Water Regulation Rulemaking, Federal Register / Vol. 88, No. 60 / Wednesday, March 29, p. 18642]

Despite widespread perception that PFOA and PFOS are "behind us," EPA notes that their manufacture and use continue and that they are highly persistent and can form as degradation products of other compounds. Monitoring and setting drinking water limits for PFOA and PFOS is needed to protect public health.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

New Jersey Department of Environmental Protection (NJDEP) (Doc. #1699, SBC-045009)

U.S. Environmental Protection Agency

Submitted Via Regulations.gov EPA Docket Center

Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking (Docket ID No. EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox,

The New Jersey Department of Environmental Protection (NJDEP) is pleased to provide comments on the U.S. Environmental Protection Agency's (EPA) proposed "PFAS National Primary Drinking Water Regulation Rulemaking."

We applaud EPA for moving forward with the establishment of primary drinking water standards for PFAS.

As a result of our unique experience in implementing MCLs for PFOA, PFOS, and PFNA, NJDEP is particularly well-suited to provide feedback on EPA's proposal. In 2018, New Jersey became the first state to establish a Maximum Contaminant Level (MCL) for any PFAS chemical, setting a limit of 13 parts per trillion (ppt) for PFNA based on recommendations from the New Jersey Drinking Water Quality Institute. This was followed by the adoption of MCLs for PFOA (14 ppt) and PFOS (13 ppt) in 2020. Community and non-transient non-community water systems in New Jersey have been monitoring for PFNA since 2019 and PFOA and PFOS since 2021. Many of these systems have completed or are in the process of taking remedial actions to reduce the levels of PFAS in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

New Jersey Department of Environmental Protection (NJDEP) (Doc. #1699, SBC-045012)

NJDEP offers detailed comments attached in response to EPA's request. These comments are informed by NJDEP's experience in adopting and implementing primary drinking water standards for PFOA, PFOS, and PFNA. The NJDEP would like to highlight the following topic areas for the EPA's consideration:

1) Health-based science supports the development of drinking water standards

2) Implementation of MCLs from a primacy agency perspective

3) Evaluation of existing treatment technology

4) Cost analysis

My NJDEP colleagues and I look forward to collaborating with our partners at EPA as this proposal advances.

Sincerely,

Shawn M. LaTourette, Commissioner

New Jersey Department of Environmental Protection

New Jersey Department of Environmental Protection (NJDEP)

Comments on USEPA's Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Docket EPA-HQ-OW-2022-0114

Introduction

To address the public health risk from PFAS contamination, in 2014, NJDEP called upon the expertise of the New Jersey Drinking Water Quality Institute (DWQI), to recommend enforceable drinking water standards for perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS) , and perfluorononanoic acid (PFNA). The DWQI is an advisory body, established by the New Jersey Safe Drinking Water Act, made up of scientists and technical experts that is charged with providing NJDEP with recommendations regarding its drinking water program, including the development of New Jersey- specific drinking water standards. Based on recommendations from the DWQI, in 2018, New Jersey became the first state to establish a Maximum Contaminant Level (MCL) for any PFAS chemical, setting a limit of 13 part per trillion (ppt) for PFNA. This was followed by the adoption of MCLs for PFOA (14 ppt) and PFOS (13 ppt) in 2020. Community and non-transient non-community water systems in New Jersey have been monitoring for PFNA since 2019 and PFOA and PFOS since 2021. Many of these systems have taken action to reduce the levels of PFAS in their drinking water or are in the process of doing so.

NJDEP is familiar with the unique challenges of implementing drinking water standards for PFAS and has years of data which can be utilized to benefit EPA in this endeavor. This places New Jersey in a unique position to comment on EPA's proposed rulemaking. NJDEP applauds EPA for moving forward with establishing National Primary Drinking Water Regulations (NPDWR) for PFAS and urges EPA to consider the detailed comments provided below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Wildlife Federation et al. (Doc. #1702, SBC-043513)

The PFAS crisis is widespread in our nation's drinking water, with an estimated 200 million Americans drinking water in which PFAS chemicals are detected. National drinking water standards to reduce PFAS are long overdue and EPA's current proposal marks the first ever federal limits on PFAS in drinking water. Currently, we have a woefully inadequate regulatory regime across the country that leaves our drinking water, communities, and wildlife at risk from further PFAS contamination. While some states like Michigan have advanced PFAS standards, the current patchwork of regulations does not adequately protect people and wildlife.

This proposal will significantly reduce the exposure to PFAS in our nation's drinking water by setting strong science-based drinking water standards for six types of PFAS, which will provide more protection and certainty that doesn't depend on where you live. The proposal would set the national standard for PFOA and PFOS at the lowest detection level approved by the EPA, 4 parts per trillion each. It would also establish limits on GenX, PFBS, PFNA, and PFHxS using a hazard index, recognizing that chemical mixtures of PFAS as well as individual PFAS can threaten human health. The proposal allows the EPA to establish legally enforceable levels, called Maximum Contaminant Levels (MCLs), requiring public water systems to monitor for, notify the public about, and reduce the levels of the six PFAS chemicals in our drinking water. The EPA estimates that between 70-94 million people receive drinking water contaminated by one or more of these PFAS chemicals above the proposed limits, so this move will help reduce the threat of PFAS exposure through drinking water for millions of Americans.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

California Farm Bureau Federation (Doc. #1704, SBC-045064)

May 30, 2023

Submitted via www.regulations.gov

Alexis Lan

Office of Ground Water and Drinking Water Environmental Protection Agency

1200 Pennsylvania Avenue, N.W. Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114, Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

The California Farm Bureau is a non-governmental, non-profit, voluntary membership California corporation whose purpose is to protect and promote agricultural interests throughout the state of California and to find solutions to the problems of the farm, the farm home, and the rural community. California Farm Bureau is California's largest farm organization, comprised of 53

county Farm Bureaus currently representing approximately 29,000 agricultural, associate, and collegiate members in 56 counties. California Farm Bureau strives to improve the ability of farmers and ranchers engaged in production agriculture to provide a reliable food and fiber supply through responsible stewardship of California's resources.

On behalf of California family farmers and ranchers, California Farm Bureau appreciates the opportunity to submit these comments to the U.S. Environmental Protection Agency ("EPA") in response to its proposed rule to set National Primary Drinking Water Regulations (NPDWR) for six PFAS chemicals,[FN1: "Perfluoroalkyl or polyfluoroalkyl substance" (PFAS) means a non-polymeric perfluoroalkyl or polyfluoroalkyl substance that contains at least 2 sequential fully fluorinated carbon atoms, excluding gases and volatile liquids, that is a hazardous substance (as defined in section 101 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (42 U.S.C. 9601)).] including perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS). While California Farm Bureau supports EPA's underlying goal of addressing widespread contamination of the environment caused by historic use of PFOA and PFOS, the proposed Maximum Contaminant Level (MCLs) of 4 ppt for PFOA and PFOS and the designation of a hazard index for PFNA, PFHxS, Gen X, and PFBS overlooks the many challenges that will be placed on farm families located in rural communities.

California Farm Bureau shares the concerns regarding the health impacts of PFAS exposure. The research to prove causation is still under development and we encourage this work to continue. In addition, many additional factors must also be considered when developing regulatory limits. For this reason, we offer the following comments which outline the challenges we foresee with setting the drinking water MCL for PFOA and PFOS at the very low level of 4ppt. We are additionally concerned that the costs to rural farming communities will be disproportionally burdensome and ask that this review be taken into consideration.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that more research is needed to prove causation. Please see sections 3.1.1 and 3.2.1 of the EPA response in this *Response to Comments* document for more information, as well as the EPA response to comment Doc. #1704, SBC-045066 in section 3.1.2 in this *Response to Comments* document. Please see section 5.1 of the EPA response in this *Response to Comments* document for responses to concerns about the level of the MCL. The EPA conducted a cost and benefit analysis that took into consideration the costs for small and/or low-income communities. Please see sections 13.10 and 14.10 of the EPA response in this *Response to Comments* document.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045720)

INTRODUCTION

The Environmental Protection Agency's ("EPA" or the "Agency") Proposed PFAS National Primary Drinking Water Regulation Rulemaking (the "Proposed Rule") is an exhaustive

scientific and economic digest that soundly supports the need to stringently regulate six per- and polyfluoroalkyl substances ("PFAS") in American's public water systems. Minnesota Center for Environmental Advocacy, [FN1: Minnesota Center for Environmental Advocacy ("MCEA") is a Minnesota non-profit organization whose mission is to use the law, science, and research to preserve and protect Minnesota's natural resources, its wildlife, and the health of its people. For over forty years, MCEA has worked with citizens and government decision-makers to protect and improve the quality of Minnesota's environment.] Clean Water Action Minnesota, [FN2: Clean Water Action has been in Minnesota since 1982, focusing on finding solutions to health, consumer, environmental and community problems, developing strong, community-based environmental leadership, and working for policies that improve lives and protect water.] and the collection of concerned clean water, public health, and environmental conservation organizations identified on the endorsement page (collectively, "Commenters"), applaud EPA's proposed regulatory approach, and write in support of the Agency's 1) carcinogenic determinations for PFOA and PFOS; 2) use of a hazard index to regulate PFHxS, GenX Chemicals, PFNA, and PFBS; and 3) conclusion that the benefits of the proposed rule outweigh the costs of implementation. The tome of supporting scientific data is clear: PFAS are a national threat to public health, and only near-zero levels of PFAS in our nation's public water systems are tolerable.

But the Commenters also write for a different, more personal reason. As EPA and others sift through the scientific literature that more than adequately justifies the proposed Maximum Contaminant Levels ("MCLs"), it's easy forget that behind the numbers and figures are individuals and communities ravaged by these synthetic chemicals. People like Amara Strande and the other Tartan High School students whose lives are marked by hospital visits and diagnoses of mysterious afflictions attributed to chemicals in the water. It's people like JD and Ben Rule, who were both stricken with rare and aggressive cancers before graduating high school, that offer evidence EPA must consider as it weighs just how costly weakened or watered-down enforcement will be.

The pathway to EPA's proposed MCLs is littered with corporate deception, a patchwork of rapidly stringent and expanding state regulation, and clear scientific proof that national, aggressive action is needed to protect our nation's public water systems from PFAS. EPA's Proposed Rule meets the moment, and the Commenters urge the Agency to swiftly enact the MCLs into law.

I. Minnesota's Fight Against PFAS Offers Stark Evidence To Support EPA's Proposed Rule

Minnesota, home to 3M and one of the country's largest groundwater PFAS plumes, offers compelling lessons for EPA to cite in support of adopting the proposed MCLs. The alarming rate of rare cancers among students at one east Minneapolis / St. Paul Metropolitan Area (the "East Metro") school and similar stories of trauma caused by contaminated drinking water lend credit to EPA's determination that the human health benefits of the proposed MCLs eclipse the costs of compliance. Moreover, the repeated and dramatic changes in Minnesota's PFAS drinking water

regulations cements the need for swift and strict action to protect America's public water supplies from these insidious chemicals.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045722)

B. Minnesota's History Regulating PFAS Supports EPA's Proposed Rule

EPA would be wise to heed the lessons learned from Minnesota and its regulators in the push to respond to PFAS contamination aggressively and meaningfully. These lessons include the rapidly evolving scientific understandings that spark significant regulatory changes, and the need to protect citizens from the PFAS pollution that is already released into the environment.

1. The Minnesota Department of Health's Rapid and Radical Regulatory History of PFAS

As the stories above illuminate, Minnesota has been facing some of the country's worst PFAS contamination for years. Minnesota was also on the vanguard of PFAS regulation, which began in the early 2000s. In the following decades, as the scientific literature grew and the connections to PFAS and adverse health outcomes continued to get clearer at lower and lower concentrations, Minnesota revised its regulations repeatedly to try and protect public health. The frequency and severity of these regulatory changes highlight the need for EPA to take a firm and committed stance now.

In 2002, the Minnesota Department of Health ("MDH") established a Health Based Value ("HBV") [FN19: Health Based Values are "the concentration of a chemical (or a mixture of chemicals) that is likely to pose little or no risk to human health. Health-Based Values and Risk Assessment Advice for Water, Minn. Dep't of Health, https://www.health.state.mn.us/communities/environment/risk/guidance/hbvraawater.html (last visited May 22, 2023).] for PFOS in drinking water at 1,000 parts-per-trillion ("ppt"). [FN20: Toxicological Summary for Perflourooctane Sulfonate, Minn. Dep't of Health (Aug. 2020), https://www.health.state.mn.us/communities/environment/risk/docs/guidance/gw/pfos.pdf.] That same year, MDH set the HBV for PFOA in drinking water at 7,000 ppt. [FN21: Toxicological Summary for Perfluorooctanoate, Minn. Dep't of Health (Mar. 2022), https://www.health.state.mn.us/communities/environment/risk/docs/guidance/gw/pfoa2022.pdf.] MDH developed these standards after reviewing the available peer-reviewed data about the toxicity and adverse health effects from consuming these chemicals. At that time, scant data was available to MDH to guide and justify its regulatory approach, and testing limitations further hampered the ability of labs to accurately identify and quantify the type of PFAS in water. As the scientific literature expanded and testing capabilities became more robust, MDH revised its guidance values for PFOA and PFOS, and the agency started regulating other PFAS, including PFBS and PFHxS.

In 2007, MDH revised its HBVs for PFOS and PFOA to 300 ppt. [FN22: Toxicological Summary for Perflourooctane Sulfonate, supra note 11; Toxicological Summary for Perfluorooctanoate, supra note 12.] These figures remained unchanged until 2017, when MDH revised its guidance values again, this time to 27 ppt for PFOS and 35 ppt for PFOA. [FN23: Id.] The following year, MDH lowered the HBV for PFOS to 15 ppt. [FN24: Toxicological Summary for Perflourooctane Sulfonate, supra note 11.] MDH explained that these changes were due, in part, to "additional toxicological information." [FN25: Id.] Dr. Philippe Grandjean, a preeminent PFAS researcher who has repeatedly published highly cited papers centered around PFAS, noted in 2020 that,

[b]ecause independent PFAS research began only in the last decade or so, our understanding of PFAS toxicity has developed substantially in the past few years and will likely continue to do so. By now, risks to human health have been identified at exposure levels that in the past were considered safe. Thus, as the literature on PFAS toxicity has continued to expand, previous guidelines turned out to be outdated as we discovered the levels to be unsafe. [FN26: Memorandum from Philippe Grandjean to Minn. Ctr. for Envt'l Advocacy (Dec. 7, 2020) at 2 [hereinafter "Grandjean Mem.") (Attachment 5)]

A now-retired senior researcher at MDH charged with developing the agency's guidance values echoed the sentiment of Dr. Grandjean, stating that in his career he had never seen such repeated and significant changes to toxicity levels for contaminants in drinking water.

Minnesota's stunning regulatory changes in only two decades teaches that strong enforcement is needed to stave off the worst public health effects associated with PFAS. It also shows that as the threats these chemicals pose are studied further, that research will likely identify more dangerous links to chronic and debilitating illnesses at lower and lower concentrations. These lessons must be heeded by EPA, who, under the Safe Drinking Water Act ("SDWA"), are obligated to review each national primary drinking water regulation at least once every six years. As the regulatory history of PFAS in Minnesota shows, six years is an eternity, and comes with the risk of many years of public exposure to PFAS at levels which science may later show to be toxic. EPA must pass the Proposed Rule without laxing the MCLs to ensure our nation's public water supplies are protected now and are better insulated from subsequent changes that toxicity research may later reveal.

2. The Minnesota Legislature Starts Turning Off the Tap

One of the troublesome aspects of PFAS is its persistence in the environment. Unlike other contaminants, PFAS do not biodegrade or otherwise decay over reasonable periods of time. Instead, PFAS like PFOA and PFOS are incredibly durable and loom as hazards to drinking water years after being released into the environment. This is one reason why remediating contaminated PFAS areas is so difficult and expensive. While improvements to in-situ treatment are on the horizon, the scientific and regulatory consensus is that upstream source-reduction measures are a vital tool in the fight against PFAS.

Recognizing this, the Minnesota Legislature has responded strongly. In June 2021, Governor Tim Walz signed legislation that, effective January 1, 2024, prohibits PFAS in food packaging. [FN27: Minn. Stat. § 325F.075.] This session, Governor Walz signed a "transformative" environmental bill that effectively bans PFAS in a range of consumer product categories, and phases in a complete ban on intentionally added PFAS unless the product is "essential for health, safety, of the functioning of society and for which alternatives are not reasonably available." [FN28: 2023 Minn. Laws page no. 195, available at https://www.revisor.mn.gov/bills/text.php?number=HF2310&type=bill&version=4&session=ls93&session_year=2023&session_number=0] This law, which is one of the strictest PFAS bans in the country, is named "Amara's Law," after Amara Strande who died from cancer in April. [FN29: Deena Winter, Lawmakers to Name Chemical Ban 'Amara's Law' to Honor 20-Year-Old Cancer Victim, MINN. REFORMER, May 9, 2023, https://minnesotareformer.com/2023/05/09/lawmakers-to-name-chemical-banamaras-law-to-honor-20-year-old-cancer-victim/ (last visited May 30, 2023); Deena Winter, Outspoken PFAS Critic Amara Strande Dies from Cancer, MINN. REFORMER, May 3, 2023, https://minnesotareformer.com/2023/05/03/amara-kind-of-was-someone-wholooked-out-for-the-underdog/ (last visited May 30, 2023).] She was 20 years old. Amara's Law will undoubtedly help prevent further PFAS from infecting Minnesota's drinking water supplies. But it does nothing to respond to the plumes of PFAS contamination that are already in the groundwater below large population centers across Minnesota. EPA's Proposed Rule is a mighty arrow in the quiver of regulations needed to protect public health. The Commenters urge the Agency to work swiftly to protect our nation's drinking water from these toxic contaminants.

II. The Commenters Support EPA's Proposed Rule

The Commenters agree with EPA that the Safe Drinking Water Act ("SDWA") compels the Agency to take swift responsive action to regulate PFAS in our nation's drinking water supplies. Without a robust nationwide standard, Americans will be reliant upon a patchwork of state regulations that vary dramatically across the country, exposing millions of households to contaminated drinking water that undeniably leads to adverse health outcomes. Part of EPA's mandate is to ensure that Americans have clean water. [FN30: Our Mission and What We Do, EPA, https://www.epa.gov/aboutepa/our-mission-andwhat-we-do (last visited May 30, 2023).] The Proposed Rule does just that. The Commenters offer support for the Proposed Rule in sum, and write to specifically support the Agency's carcinogenic determinations, the use of a hazard index, and the Health Risk Reduction and Cost Analysis ("HRRCA").

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. The EPA acknowledges the shared experiences and state perspective on this regulation. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Minnesota Center for Environmental Advocacy et al. (Doc. #1707, SBC-045728)

CONCLUSION

EPA has spilled a lot of ink explaining why swift and decisive action is needed to ensure the integrity of our nation's public water supplies are not compromised by synthetic PFAS. But between the lines of technical text explaining the causal links between PFAS and adverse health outcomes are real people who can tell you directly just how toxic these chemicals are. EPA is obligated to ensure that every American has access to clean, safe drinking water. The Proposed Rule honors that mandate. Commenters implore the Agency to act quickly to compel water suppliers to monitor and eradicate dangerous levels of PFAS from the drinking water they serve to tens of millions of Americans every day.

Respectfully submitted,

State of Vermont Agency of Natural Resources and Department of Health (Doc. #1708, SBC-045086)

The State of Vermont Agency of Natural Resources and Department of Health is hereby submitting these comments to docket EPA-HQ-OW-2022-0114; Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking.

The State of Vermont is supportive of the EPA taking the lead and enacting federal nation-wide minimum standards for PFAS in drinking water; however, we have some specific concerns as

identified below, based on our experience implementing our state specific MCL since 2019. We also have information to answer questions posed in the preamble of the proposed regulation which we provide below.

Based on our experience implementing a state PFAS regulation since 2019, Vermont is providing a broad range of comments, with specific recommendations on the following:

• Vermont requests that additional financial support and resources be provided to address impacts to water systems with a focus on small water systems.

• EPA should establish a dedicated funding source for O&M expenses for small water systems who are disproportionately impacted by PFAS contamination.

• Vermont is identifying laboratory capacity concerns, specifically for EPA to ensure that there is sufficient, reliable laboratory capacity nation-wide to support the proposed PQL of 4 parts per trillion (ppt).

• Vermont requests EPA accept existing data on-file by states with state programs if that data meets the current EPA Method 537.1 or 533.

• EPA must establish an equitable and health-protective sampling framework, accommodating the subtleties of PFAS regulation, and a post-treatment sampling framework due to the shortcomings of the use of the existing Synthetic Organic Chemical (SOC) sampling framework that is proposed to be applied.

• Vermont requests clarification of health effects as it relates to treatment design, treatment Operation & Maintenance, and messaging to system users.

EPA Response: The EPA acknowledges and appreciates this comment in general agreement of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For laboratory capacity and availability concerns, please see section 5.1.2 and 8.7 of this *Response to Comments* document. For cost-related concerns, please see section 13.3.1 of this *Response to Comments* document, particularly the EPA response to comment Doc. #1708, SBC-045091. For discussion on the use of existing data that meets the current EPA Method 537.1 or 533, please see section 8.3 of this *Response to Comments* document, particularly the EPA response to comment Doc. #1708, SBC-045105. For a response to the sampling framework, please see the EPA response to comment Doc. #1708, SBC-045093 in section 8.1.2 in this *Response to Comments* document. The EPA recognizes the importance of communication during the implementation phases of this NPDWR, and the EPA is taking these requests under consideration. Please see section 1.2 of the EPA response in this *Response to Comments* document for additional discussion around communications.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045755)

PWD requests that the EPA consider the following actions:

• EPA should reevaluate the proposed MCL values for PFOA and PFOS and must consider more factors in evaluating technical and economic feasibility.

• EPA must utilize a holistic regulatory approach to rulemaking that includes considerations for PFAS generators, an extension to the implementation timeline of up to two years to accommodate capital improvements associated with proposed Best Available Technology (BATs) and competing regulatory requirements when determining implementation of MCLs for PFOA and PFOS.

• EPA should pursue a separate rulemaking determination from PFOA and PFOS for the constituents considered in the Hazard Index (HI) and should provide more data supporting its analyses.

• EPA should provide additional clarification and support around compliance and communication and allow more time for implementation.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document, as well as arguments outlined in the EPA response to comment Doc. #1709, SBC-045729. For additional information about the rationale for the selected MCL levels of PFOA and PFOS, please see section 5 of this *Response to Comments* document. Please see section 12 of the EPA response in this *Response to Comments* document for information about the two-year extension for capital improvements. The EPA disagrees that the agency should pursue a separate regulatory determination for PFOA and PFAS compared to the Hazard Index contaminants. The EPA conducted a concurrent preliminary regulatory determination, and the EPA has statutory authority to do so, as discussed in section III of the FRN and section 3 of this *Response to Comments* document. The EPA agrees that communications materials are important for implementation of this rule, as discussed in section 1.2 of this *Response to Comments* document.

Philadelphia Water Department (PWD) (Doc. #1709, SBC-045729)

May 30, 2023

U.S. Environmental Protection Agency

Office of Ground Water and Drinking Water

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114

Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation

To Whom It May Concern:

The Philadelphia Water Department (PWD) appreciates the opportunity to provide comment on the Environmental Protection Agency's (EPA's) landmark proposed rulemaking for enforceable limits on the presence of per- and polyfluoroalkyl substances (PFAS) in drinking water. Given that the presence of PFAS in drinking water may pose a risk to human health over a lifetime of exposure, PWD fully supports regulating these compounds.

PWD is the largest public utility in the Commonwealth of Pennsylvania, providing 1.6 million residents with clean drinking water and more than 2.2 million people with reliable wastewater and stormwater collection and treatment services. PFAS have been used in a multitude of industries since the 1940s, but it has only been recently that the general scientific community has developed a better understanding that they accumulate and cycle throughout the environment, entering air, water, soil, and biota. As a combined utility providing water, wastewater, stormwater, and biosolids treatment services, PWD is particularly concerned with PFAS as these harmful and persistent chemicals can exist throughout our collection and treatment systems.

PWD operates three drinking Water Treatment Plants (WTPs) with a combined maximum rated capacity of over 500 million gallons per day (MGD). Like many regions across the country, Philadelphia is subject to pollution from the producers, manufacturers, users, and disposers of PFAS and, like many other water suppliers across the nation, PFAS exists throughout Philadelphia's source waters, impacting the greater water supply area and the Delaware River Watershed.

PWD has the following overarching comments related to the draft National Primary Drinking Water Rule (NPDWR):

• EPA should reevaluate the proposed MCL values for PFOA and PFOS and must consider more factors in evaluating technical and economic feasibility.

• EPA must utilize a holistic regulatory approach to rulemaking that includes considerations for PFAS generators, an extension to the implementation timeline of up to two years to accommodate capital improvements associated with proposed Best Available Technology (BATs) and competing regulatory requirements when determining implementation of MCLs for PFOA and PFOS.

• EPA should pursue a separate rulemaking determination from PFOA and PFOS for the constituents considered in the Hazard Index (HI) and should provide more data supporting its analyses.

• EPA should provide additional clarification and support around compliance and implementation.

PWD appreciates the opportunity to provide comments and has taken this opportunity to provide detailed comments to support these positions below. PWD greatly appreciates EPA's steadfast commitment to implementing the holistic management approach in the PFAS Strategic Roadmap and its continued efforts to address one of the most significant environmental challenges facing the nation.

Sincerely,

Randy E. Hayman

Commissioner and Chief Executive Officer

Philadelphia Water Department

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR, with some additional modifications. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has considered the MCL values for PFOA and PFOS to be appropriate and meet technical and economic feasibility, as discussed further in section 5.1 of this *Response to Comments* document. Discussion on PFAS generators is considered out of scope and a response can be found in section 15 of this *Response to Comments* document. Based on public comment and interest, a national two-year capital extension has been granted, and details can be found in section 12 of this *Response to Comments* document. The EPA has the authority to pursue a rulemaking determination for the four additional PFAS with the final NPDWR. In 2021, the EPA made a determination to regulate two PFAS—PFOA and PFOS—in drinking water under SDWA. The EPA describes its regulatory determination findings of the three additional PFAS and the mixtures of four PFAS in section III of the FRN and section 3 of this *Response to Comments* document. The EPA recognizes the importance of communication for systems to comply with this NPDWR and will take these recommendations into consideration during the implementation phase of this rulemaking. For additional discussion on communications, please see section 1.2 of this *Response to Comments* document.

<u>Citizens Campaign for the Environment (CCE) (Doc. #1710, SBC-045126)</u>

Comments to the United States Environmental Protection Agency (EPA)

By Citizens Campaign for the Environment

RE: U.S. EPA's proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS

Docket ID: EPA-HQ-OW-2022-0114

May 30, 2023

On behalf of Citizens Campaign for the Environment (CCE), thank you for the opportunity to provides comments on the U.S. EPA's proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS, including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS).

CCE is a 120,000-member, non-profit, non-partisan organization that empowers communities and advocates solutions to protect public health and the natural environment in New York State

and Connecticut. Since our inception in 1985, protecting clean drinking water for the public has been a top priority for CCE. CCE is grateful that EPA has taken this action and we are very supportive of adopting the proposed regulations with recommendations to further strengthen them thereby providing additional public health protection.

New York State is a national leader on clean water and an early adopter of MCLs for PFOA and PFOS, however EPA's proposed regulations follow the latest science and further enhance public health protections for New Yorkers and all Americans. We support the EPA's stronger proposed federal standard which will increases public health and drinking water protections for New Yorkers and other states across the nation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045874)

In addition, costs of the proposed rule, as presented in EPA's own analysis, could exceed $1,000 per household annually. As a result, EPA's proposed rule raises the following concerns:

• EPA substantially underestimates the potential costs that this proposed rule will impose on public water systems and overstates the benefits of the rule.

• EPA's preliminary determination to regulate PFHxS, HFPO-DA, PFNA, and PFBS is inconsistent with statutory criteria under SDWA because the available health data and occurrence data do not support a decision to regulate, and the data does not demonstrate that this rulemaking is a "meaningful opportunity" for health risk reduction.

• EPA skirted its own required procedures by proposing a preliminary determination for PFHxS, HFPO-DA, PFNA, and PFBS simultaneously with its proposed MCL and maximum contaminant level goal (MCLG), contrary to SDWA requirements, and deprived the public of sufficient time and opportunity to comment on the proposal.

• EPA has also failed to satisfy its obligations under SDWA when it did not consult with the Science Advisory Board (SAB) prior to proposing a National Primary Drinking Water Regulation (NPDWR) and MCLG for PFHxS, HFPO-DA, PFNA, and PFBS.

• EPA also fails to use the best available science in proposing the MCLs and MCLGs for all six PFAS.

• The Hazard Index approach proposed by EPA as the MCL and MCLG for PFHxS, HFPO-DA, PFNA, and PFBS violates SDWA because it does not reflect the use of the best available science and is not actually a proposed level for the contaminants.

• The Hazard Index approach is not a proposed level for a contaminant, but a mixture of contaminants. SDWA requires MCLs and MCLGs for individual contaminants rather than mixtures.

• EPA's re-interpretation of PFOS as a "likely carcinogen" is not supported by the science.

Consistent with the comments presented, significant scientific uncertainties and legal inadequacies must be addressed. EPA has not demonstrated that PFNA, PFHxS, PFBS, and HFPO-DA warrant regulation under SDWA, and EPA should withdraw the proposed MCL and MCLG for these four PFAS.

While the science is better developed for PFOA and PFOS, the documents EPA presented to the SAB were not sufficiently robust to allow the SAB to make actionable recommendations, and EPA did not adequately apply the SAB input to refine the documents prior to proposing the rule. Consequential uncertainties remain regarding the cancer classification for PFOS, and EPA is still awaiting robust and representative occurrence data from the Unregulated Contaminants Monitoring Rule (UCMR) 5 sampling for both PFOA and PFOS. EPA's cost and benefits analyses for these PFAS is flawed, both qualitatively and quantitatively, with notable underestimates of the costs and overestimates of the benefits. An MCL of 4 ppt is simply not justified, and the MCL must be adjusted upward to make this proposal feasible.

[Table of Contents: see docket ID EPA-HQ-OQ-2022-0114-1713].

I. Introduction

The U.S. Chamber of Commerce (the Chamber) and its coalition of companies, trade associations, and other stakeholders appreciate this opportunity to comment on EPA's proposed rule, [FN1: 88 Fed. Reg. 18638 (Mar. 29, 2023).] which (1) issues a preliminary regulatory determination for PFNA, PFHxS, PFBS, and HFPO-DA, and (2) proposes MCLs [FN2: In these comments, we use the term "MCL" interchangeably with the term national primary drinking water regulation or "NPDWR." The NPDWR refers to EPA's regulation which specifies contaminants and a MCL or a treatment technique (if it is not economically or technologically feasible to ascertain the level of the contaminant). The MCL is the level set under the NPDWR—the maximum permissible level of a contaminant in water delivered to a user of a public water system. In this proposed rule, EPA proposes MCLs and MCLGs (not treatment techniques), which is why the term is used interchangeably.] and MCLGs for these four PFAS as well as PFOA and PFOS [FN3: Throughout these comments references to specific PFAS also refer to all salts, isomers and derivatives, including derivatives other than the anionic form. This is consistent with EPA's approach in the proposed rule. However, we note that the inclusion of isomers for each PFAS is not justified as EPA presented virtually no scientific information on these various isomers and their environmental and human health effects. This expanded listing is problematic for multiple reasons.]. We represent member companies, trade associations, and state and local chambers that span key U.S. supply chains using PFAS chemistries and whose products and technologies are essential to America's economic growth, water infrastructure, and national security. Many of these companies operate public water systems, including Non-

Transient Non-Community Water Systems (NTNCWS) that would be regulated. The Chamber and its coalition are committed to managing PFAS safely and protecting human health and the environment. The Chamber and the coalition support national drinking water standards for select PFAS based on the best science and risk, rather than the current patchwork of state approaches. Customers, employees, and the communities where Chamber and coalition members operate depend on clean, safe drinking water for a better quality of life and economic growth. But any regulation of PFAS must be informed by the best available science and comply with the rigorous mandates of SDWA [FN4: SDWA also requires the use of best available science, stating "In carrying out this section, and, to the degree that an Agency action is based on science, the Administrator shall use— (i) the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and (ii) data collected by accepted methods or best available methods (if the reliability of the method and the nature of the decision justifies use of the data)." 42 U.S.C. [sec] 300g-1(a)(3)(A).]. The proposed rule falls short of those requirements, would impose significant and underestimated costs, and will lead to considerable challenges for the water utilities and many other industries.

EPA Response: The EPA disagrees with the critiques of the final PFAS NPDWR in the comment. The EPA used the best available and peer-reviewed science to promulgate this PFAS NPDWR as required by the SDWA. Please see the FRN and section 1.3 of the EPA response in this *Response to Comments* document, as well as the EPA response to comments Doc. #1713, SBC-045926 and Doc. #1714, SBC-045945 in section 1.3 in this *Response to Comments* document.

For specific analysis on the costs and benefits of this rule, please see section 13.3 of the EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1713, SBC-045911; SBC-045906; SBC-045918; SBC-045914; and SBC-045916.

In response to concerns raised about occurrence data, as documented in the FRN the available UCMR 3 and state occurrence data are sufficiently robust to support the final rule. The EPA is not obligated to use/collect the entire UCMR 5 dataset prior to finalizing the rule. For additional discussion of the UCMR 3 and UCMR 5 occurrence data, please see sections 6.1 and 6.8 of the EPA response in this *Response to Comments* document.

The EPA disagrees that its preliminary determination to regulate PFHxS, HFPO-DA, PFNA, and PFBS does not follow SDWA criteria, or that proposing a preliminary determination for PFHxS, HFPO-DA, PFNA, and PFBS simultaneously with a proposed MCL and MCLG violates the SDWA. The EPA has thoroughly addressed the rationale for its determination in the FRN as well as responding to these concerns throughout section 3 of this *Response to Comments* document, particularly in the EPA response to comment Doc. #1713, SBC-045875; SBC-045894; and SBC-045897.

The EPA notes that it satisfied its obligations to consult with the SAB prior to proposing a NPDWR and MCLG for PFHxS, HFPO-DA, PFNA, and PFBS. Please see section 14.11 of the

EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1713, SBC-045896 in section 14.11.1 in this *Response to Comments* document.

The EPA disagrees with the comments stating that the EPA failed to use the best available science for determining the MCLs, as well as the claims that the hazard index violates SDWA. Please see section 5 of the EPA response in this *Response to Comments* document, particularly the EPA response to comments Doc. #1713, SBC-053343 and Doc. #1713, SBC-045898 in section 5.2.1 in this *Response to Comments* document.

Please see section 4.1.4 of the EPA response in this *Response to Comments* document for a response regarding PFOS deemed a "likely carcinogen".

Regarding the inclusion of isomers for the six PFAS in this NPDWR, please see additional discussion in section 2.1 of this *Response to Comments* document.

U.S. Chamber of Commerce et al. (Doc. #1713, SBC-045926)

VIII. Conclusion

SDWA sets a high bar by requiring best available science because drinking water regulations are vital to protect human health. At the same time, SDWA can impose significant costs on many public water systems throughout the country. Accordingly, regulation for PFAS substances in water is important but must be done in a lawful and science-based process. This proposal falls short in both respects. Significant scientific uncertainties and legal inadequacies remain. EPA has not yet demonstrated that PFNA, PFHxS, PFBS, and HFPO-DA warrant regulation under SDWA. As such, it is premature to set MCL or an MCLGs. Because EPA skipped important steps in the statutory process, including by forgoing the advice of the SAB on these four PFAS, EPA's proposals for these four should be withdrawn.

While the science is more developed for PFOA and PFOS, the documents EPA presented to the SAB were not sufficiently robust to allow the SAB to make actionable recommendations. Where SAB made valuable and important recommendations, EPA appears to have failed to revise the proposals in a meaningful and cohesive manner. Consequential uncertainties remain regarding the cancer classification for PFOS, and EPA is still awaiting robust and representative occurrence data from the UCMR 5 sampling for both PFOA and PFOS. EPA's cost and benefits analyses for PFOA and PFOS is flawed (as it is for the other PFAS as well), both qualitatively and quantitatively, with notable underestimates of the costs and overestimates of the benefits. An MCL of 4 ppt is simply not justified, and the MCL must be adjusted upward to meet SDWA's feasibility requirements. Finally, if EPA moves forward with setting the proposed MCLs at near-zero levels based on the level of information available for the six PFAS and without adequate weight placed on cost and feasibility, it would set a precedent that is inconsistent with prior MCLs and one that would be difficult to meet when applied going forward.

The Chamber and coalition members welcome any questions and further discussion from EPA on this important, precedent-setting rulemaking. Please contact Chuck Chaitovitz, Vice President

of Environmental Affairs and Sustainability at the U.S. Chamber of Commerce (cchaitovitz@uschamber.com), with any questions.

U.S. Chamber of Commerce

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see the EPA response to comment Doc. #1713, SBC-045874 in section 1.3 in this *Response to Comments* document. The EPA disagrees that it did not follow a lawful and science-based process for promulgating this NPDWR. Please see sections 1.1 and 1.3 of the EPA response in this *Response to Comments* document for the EPA's discussion of its adherence to the SDWA process.

The EPA disagrees that it has not shown that PFNA, PFHxS, PFBS, and HFPO-DA warrant regulation under SDWA. The EPA provides ample information to support individual regulation of PFHxS, PFNA, and HFPO-DA, as well as mixtures of these three PFAS and PFBS, based on the three statutory criteria, as well as its authority to regulate. This is described in both section

III.2 of the FRN, as well as sections 3.1 and 3.2 of this *Response to Comments* document, particularly the EPA response to comment Doc. #1713, SBC-045875 in section 3.1 in this *Response to Comments* document. Additionally, the EPA has outlined its process for considering feasibility (as defined by SDWA) for establishing MCLGs and MCLs for mixtures of PFHxS, PFNA, HFPO-DA, and PFBS. Please see section V.B.2 of the EPA response in this *Response to Comments* document for discussion on the use of an Hazard Index approach and the regulation of additional PFAS. For additional discussion on evidence used to establish Hazard Index MCLGs or the occurrence in relation to the Hazard Index PFAS compounds, please see sections 4.3 and 6.3 of this *Response to Comments* document.

The EPA also disagrees that important steps were skipped in the SDWA process, including forgoing the advice from the SAB on the four PFAS. The EPA disagrees that the documents presented to the SAB were not sufficiently robust to allow the SAB to make actionable recommendations, and that the EPA failed to revise proposals in a meaningful and cohesive manner. The EPA sent four documents to the SAB, including the *Draft Framework for Estimating Noncancer Health Risks Associated with Mixtures of Per- and Polyfluoroalkyl Substances (PFAS)*. The SAB responded with input summarized in a report. It explicitly applauded the agency's efforts to develop new approaches for assessing the risk of PFAS mixtures and recognized the benefits arising from reducing exposure to these chemicals as adopted by the EPA in the Hazard Index approach in this proposed rule. The SAB also provided recommendations that the EPA took under consideration, and the agency made many adjustments based on SAB input, as described in section XIII.K.1 of the FRN. The commenter does not provide any details or support for its claims that the EPA did not respond to or meaningfully address the SAB's advice. For more discussion of the SAB's advice and the EPA's consideration of their input, please see section 14.11.1 of the EPA response in this *Response to Comments* document, specifically in the EPA response to comment Doc. #1713, SBC-045896. See also the EPA response to comment Doc. #1713, SBC-045901 in section 14.11.1 in this *Response to Comments* document.

Regarding the UCMR 5 dataset, the EPA has determined that it is not appropriate to wait to finalize the rule until it receives occurrence data from the UCMR 5 sampling for both PFOA and PFOS. The EPA is not required under the statute to wait for another round of UCMR data to be collected before proposing or finalizing a regulation; in this case, the completion of UCMR 5 data reporting is expected at the end of 2025, with the final dataset not being available until 2026. Rather, SDWA Section 1412(b)(1)(B)(ii)(II) expressly provides that the EPA must use the "best available public health information" in making a regulatory determination (emphasis added). The EPA has sufficiently robust occurrence information to make regulatory determinations and promulgate a regulation for the six PFAS in this regulation. In addition to serving as a significant way for helping many utilities reduce initial monitoring costs, the final full UCMR 5 dataset will also be valuable for informing future regulatory decisions for the 23 PFAS included in UCMR 5 that are not directly addressed by this proposed rulemaking. The agency believes that the best currently available occurrence data demonstrates sufficient occurrence or substantial likelihood of occurrence for the contaminants included in the proposed

rule. While the EPA is under no legal obligation to consider the preliminary, partial UCMR 5 dataset prior to rule promulgation, based on public comment and interest, the agency considered UCMR 5 data released as of July 2023 (USEPA, 2024i). The partial data results are included in section VI of the FRN. Please see section 6 of the EPA response in this *Response to Comments* document for further discussion regarding UCMR and the best available science for the occurrence analysis, particularly the EPA response to comment Doc. #1713, SBC-045902 in section 6.8 in this *Response to Comments* document.

The EPA disagrees with the commenter's arguments on the benefits and costs of the rule, as well as the MCL of 4.0 ppt not being justified. Please see the FRN and sections 1.3 and 13.8 of the EPA response in this *Response to Comments* document for further discussion of these issues.

Protecting Our Water, Environment, and Ratepayers (POWER) (Doc. #1714, SBC-045945)

II. CONCLUSION

POWER! Believes it is important for EPA to address the risks of PFAS, including PFOA and PFOS, in the environment. However, POWER! Believes that EPA's proposed rule is premature because it precedes completion of processes under the Safe Drinking Water Act that are intended to help EPA understand the full impacts of the MCLs, and precedes technologies or standards for cleanup, handling, or destruction and/or disposal of the proposed chains.

To arrive at a proposal that considers and comports with precedent and sound science, EPA should:

• Finalize technological standards for the disposal and destruction of treatment byproducts prior to finalizing the MCLs.

• Adequately consider the reasonably foreseeable costs of the proposed rule.

• Use the data received from UCMR 5 through 2025 to assess the prevalence of the six PFAS substances and inform the costs and benefits of any MCLs for these compounds.

• Provide a longer implementation period to allow sufficient time to bring new treatment facilities online and expand lab capacity for the monitoring the proposed rule requires.

• Abandon a Hazard Index approach that is unsupported by precedent or science.

• Finalize Toxicity Assessments, Health Advisories, and Reference Doses before determining and finalizing MCLs for PFHxS, HFPO-DA (GenX), PFNA, or PFBS.

• Follow EPA precedent and sound science in setting trigger levels, PQLs, and MCLs that can be detected reliably using Method 533 and Method 537.1.

Thank you for the opportunity to provide comments on this proposed rule. If you have any questions or would like any additional information, please contact Ana Schwab at Ana.Schwab@BBKLaw.com.

Sincerely,

POWER!

Protecting Our Water, Environment, and Ratepayers!

CC: The Honorable Radhika Fox, Assistant Administrator, Office of Water, U.S. Environmental Protection Agency

Alexis Lan, Ground Water and Drinking Water, Standards and Risk Management Division, U.S. Environmental Protection Agency

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that it has not completed processes required under the SDWA prior to promulgation of this rulemaking. For full details regarding the preliminary regulatory determinations of four PFAS, please see section 3 of the EPA response in this *Response to Comments* document.

The EPA currently has the *2020 Interim PFAS Destruction and Disposal Guidance* (USEPA, 2020) that discusses disposal options for systems. The National Defense Authorization Act for Fiscal Year 2020, Public Law No: 116-92 Section 7361 directs the EPA to revise the *PFAS Destruction and Disposal Guidance* triennially; the new destruction and disposal guidance is anticipated to be released approximately concurrently with this rule and further revisions may be expected before the effective dates for this rule. Therefore, the EPA disagrees that the projected significant and direct public health protections for drinking water consumers in this rule should be delayed for the revision of guidance on management of PFAS waste streams. Please see section 10.4 of the EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1714, SBC-045930 in section 10.4.1 in this *Response to Comments* document.

The costs of this rule have been adequately considered and are described in section XII of the FRN, as well as the Economic Analysis. Additional discussion on the costs of the rule is included in section 13.3 of this *Response to Comments* document, particularly in the EPA response to comment Doc. #1714, SBC-045931.

The EPA has determined that it is not appropriate to wait to finalize the rule until it receives another round of UCMR 5 data. The EPA is not required under the statute to wait for another round of UCMR data to be collected before proposing or finalizing a regulation; in this case, the completion of UCMR 5 data reporting is expected at the end of 2025, with the final dataset not being available until 2026. Rather, SDWA Section 1412(b)(1)(B)(ii)(II) expressly provides that the EPA must use the "best available public health information" in making a regulatory determination (emphasis added). The EPA has sufficiently robust occurrence information to make regulatory determinations and promulgate a regulation for the six PFAS in this regulation. In addition to serving as a significant way for helping many utilities reduce initial monitoring costs, the final full UCMR 5 dataset will also be valuable for informing future regulatory decisions for the 23 PFAS included in UCMR 5 that are not directly addressed by this proposed

rulemaking. The agency believes that the best currently available occurrence data demonstrate sufficient occurrence or substantial likelihood of occurrence for the contaminants included in the proposed rule. While the EPA is under no legal obligation to consider the preliminary, partial UCMR 5 dataset prior to rule promulgation, based on public comment and interest, the agency considered UCMR 5 data released as of July 2023 (USEPA, 2024i). The partial data results are included in section VI of the FRN. Please see section 6 of the EPA response in this *Response to Comments* document for further discussion, particularly in the EPA response to comment Doc. #1714, SBC-045936 in section 6.8 in this *Response to Comments* document.

Based on public comment and further considerations, the EPA is exercising its authority under SDWA § 1412(b)(10) to implement a two-year nationwide capital improvement extension to comply with the MCL. All systems must comply with the MCLs by five years after the rule is promulgated. All systems must comply with all other requirements of the NPDWR, including initial monitoring, by three years after the rule is promulgated. For additional discussion on extensions and exemptions, please see section XI of the FRN.

The EPA disagrees with and denies the request for abandoning the Hazard Index approach. The EPA has provided ample science and health-based evidence for using the Hazard Index. The Hazard Index approach is outlined in section IV.B of the FRN, as well as section 4.3 of this *Response to Comments* document. Additionally, please see section VI.D for the occurrence data relative to the Hazard Index.

The EPA disagrees that finalizations of the Toxicity Assessments, Health Advisories, and Reference Doses are required prior to promulgating MCLs for the three additional PFAS (PFHxS, HFPO-DA [GenX], PFNA). Please see sections 4.3.3 and 3.1.1 f the EPA response in this *Response to Comments* document for a more thorough response to the request to finalize the EPA toxicity assessments for PFHxS and PFNA rather than relying on the Agency for Toxic Substances and Disease Registry (ATSDR) assessments. For the request on health advisories, Health Advisories are not a pre-requisite for an NPDWR under the SDWA and there is nothing in the statute or the EPA's historical regulatory practice that suggests that the agency should delay regulation of a contaminant in order to develop a Health Advisory first. The EPA does have final toxicity assessments and reference doses (RfDs) for HFPO-DA and PFBS. The EPA maintains that the final published peer-reviewed human health toxicity assessment that derives the RfD for HFPO-DA is appropriate and sound, reflects the best available peer-reviewed science, and is consistent with agency guidance, guidelines, and best practices for human health risk assessment. Notably, the EPA sought external peer review of the toxicity assessment *twice* (USEPA, 2018; USEPA, 2021c), released the draft toxicity assessment for public comment and provided responses to public comment (USEPA, 2021d), and engaged a seven-member pathology working group at the National Institutes of Health—an entirely separate and independent organization—to re-analyze pathology slides from two critical studies (USEPA, 2021b, Appendix D), all of which supported the EPA's conclusions in the toxicity assessment, including the RfD derivation. Lastly, regarding the PFBS assessments, the Feng et al. (2017) study, the critical effect of thyroid hormone disruption in offspring, dose-response assessment,

and corresponding RfD were subjected to extensive internal EPA, interagency, and public/external peer review and should be treated as best-available science.

Lastly, the EPA agrees that it is important to use precedent and sound science in setting trigger levels, PQLs, and MCLs that can be detected reliably using Method 533 and Method 537.1, and the EPA believes it has done so. For further response, please see the EPA response to comment Doc. #1714, SBC-045943 in section 7.2 in this *Response to Comments* document.

Monterey One Water (Doc. #1715, SBC-043826)

May 30, 2023

Dear Administrator Regan:

Monterey One Water appreciates the opportunity to submit comments regarding the U.S. Environmental Protection Agency's (EPA) preliminary regulatory determination and proposed rule to establish Maximum Contaminant Levels (MCLs) for certain per- and polyfluoroalkyl substances (PFAS). Monterey One Water is a public utility providing wastewater and water recycling services for diverse communities throughout northern Monterey County in California. We recognize the importance of addressing threats from chemicals to public health and the environment, and we are an organization dedicated to providing safe and reliable clean water services to the public. However, we are concerned about tangential impacts created by the preliminary determination and proposed rule, as described in our complete comment letter attached. Key concerns relate to the compliance timeline, economic impact, and PFAS disposal guidelines.

We thank EPA for the continued engagement with the water stakeholder community. Monterey One Water recognizes the need to address PFOA and PFOS in our environment but urges EPA to evaluate and consider unrealistic implementation goals. This includes identifying or establishing additional financial avenues that follow the polluter pays principle to fund required changes.

Regards,

Rachel Gaudoin, Federal Advocacy Lead

May 30, 2023

The Honorable Michael S. Regan Administrator

U.S. Environmental Protection Agency William Jefferson Clinton Building 1201 Pennsylvania Avenue, N.W. Washington, D.C. 20460

Submitted Electronically: https://www.regulations.gov

Re: Docket ID No. EPA–HQ–OW–2022–0114

Dear Administrator Regan:

Monterey One Water appreciates the opportunity to submit comments regarding the U.S. Environmental Protection Agency's (EPA) preliminary regulatory determination and proposed rule to establish Maximum Contaminant Levels (MCLs) for certain per- and polyfluoroalkyl substances (PFAS). Monterey One Water is a public utility providing wastewater and water recycling services for diverse communities throughout northern Monterey County in California. Every day we collect and treat approximately 17 million gallons of used water before safely reintroducing it into the environment, including through potable reuse via groundwater replenishment of a critical drinking water aquifer.

Monterey One water recognizes the importance of addressing threats from chemicals to public health and the environment, and is an organization dedicated to providing safe and reliable clean water services to the public. However, we are concerned about tangential impacts created by the preliminary determination and proposed rule as described below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with some additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Wyoming Department of Environmental Quality (WDEQ) (Doc. #1716, SBC-044746)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center, Office of Ground Water and Drinking Water Docket Mail Code 2822IT

1200 Pennsylvania Avenue NW Washington, DC 20460

Via: https://www.regulalion .gov /

RE: Docket ID No. EPA-HQ-OW-2022-0114; FRL 8543-01-OW

PFAS National Primary Drinking Water Regulation Rulemaking, A Proposed Rule by the Environmental Protection Agency on March 29, 2023

Preliminary Regulatory Determination and Proposed Rule; Request for Public Comment; Notice of Public Hearing

To Whom It May Concern:

As part of its mission to protect, conserve, and enhance the quality of Wyoming's environment for the benefit of current and future generations, the Wyoming Department of Environmental Quality (WDEQ) implements programs that help ensure the public has access to safe drinking water. Under the Wyoming Environmental Quality Act, the WDEQ issues permits for the construction of public water systems in accordance with regulations. The WDEQ also implements several Safe Drinking Water Act (SDWA) programs, including Operator Certification, Capacity Development, and, in coordination with partner agencies, the Drinking

Water State Revolving Fund. EPA Region 8 directly implements the SDWA Public Water System Supervision (PWSS) Program in Wyoming, and WDEQ routinely communicates and coordinates with EPA Region 8 on drinking water protection activities.

Therefore, the WDEQ takes considerable interest in the proposed rulemaking, as National Primary Drinking Water (NPDW) standards and new regulations for drinking water systems will impact Wyoming's communities and their infrastructure, including publicly owned treatment works (POTW) and Public Water Systems (PWSs). In addition, NPDW standards and drinking water regulations will impact activities in other WDEQ programs, including establishing surface water quality standards, point source discharge permitting under the Wyoming Pollutant Discharge Elimination System (WYPDES), and any implications for assessment and remediation of sites that are regulated by the Solid and Hazardous Waste Division (SHWD).

WDEQ appreciates the opportunity to review (1) the proposed NPDW rule to set Maximum Contaminant Levels (MCLs) for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) and (2) the preliminary determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as GenX), perfluorononanoic acid (PFNA), perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS using a Hazard Index (HI).

WDEQ shares EPA's interest in protecting human health and the environment from PFAS. However, WDEQ recommends the following comments be addressed before EPA finalizes the proposed rule.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Washington, DC 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking – Docket ID No. EPA-HQ-OW-2022-0114; FRL 8543-01-OW

To Whom it May Concern,

On behalf of the Monte Vista Water District (MVWD), we appreciate the opportunity to provide comments in response to the U.S. Environmental Protection Agency's (EPA) request for public comments on the proposed PFAS National Primary Drinking Water Regulation (NPDWR), published in the Federal Register on March 29, 2023.

MVWD provides retail and wholesale water supply services to over 130,000 individuals residing within the communities of Montclair, Chino, and Chino Hills in San Bernardino County, California. Our service area includes disadvantaged, low-income communities with a high Social Vulnerability Index according to the Center for Disease Control.

Over the past several decades, MVWD has expanded its water resources portfolio and demand management strategies to build a resilient water supply for its customers. MVWD is committed to delivering high quality drinking water that meets or exceeds drinking water standards. We have implemented costly new treatment technologies to meet increasingly more stringent drinking water standards, and the proposed NPDWR could drive treatment costs even higher and force consumers to bear the expense.

PFAS contamination presents many challenges for drinking water providers, and MVWD supports EPA's efforts in addressing PFAS to protect public health and the environment. That said, MVWD has significant concerns with the proposed regulation, including the costs, timeline, and methodology for setting the proposed Maximum Contaminant Levels (MCLs).

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for EPA's PFAS efforts with significant additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Monte Vista Water District (MVWD) (Doc. #1718, SBC-043527)

Monte Vista Water District (MVWD) provides retail and wholesale water supply services to over 130,000 individuals residing within the communities of Montclair, Chino, and Chino Hills in San Bernardino County, CA. Our service area includes disadvantaged, low-income communities with a high Social Vulnerability Index according to the Center for Disease Control.

Over the past several decades, MVWD has expanded its water resources portfolio and demand management strategies to build a resilient water supply for its customers. Louisville Water Company (Doc. #1720, SBC-043550)

Louisville Water appreciates the opportunity to provide input to the U.S. Environmental Protection Agency (EPA) as the agency considers finalizing a National Primary Drinking Water Regulation for Per- and Polyfluoroalkyl Substances. We also welcome continued dialogue with how best to approach the regulation of PFAS. In that regard, we are providing the attached comments on key issues that we think require consideration.

May 30, 2023

Dr. Jennifer McLain, Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Submitted electronically

RE: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation ((88 FR 18638, EPA-HQ-OW-2022-0114-0027)

Dear Dr. McLain:

Louisville Water is proud to provide safe, high-quality drinking water to a diverse community of approximately one million people in the Louisville Metro region. Our retail service area includes Louisville Metro and parts of Bullitt and Oldham counties in Kentucky. Louisville Water provides wholesale service to nine regional water utility partners. We serve the urban core of Louisville with historic areas dating back to the early 1800s, suburban communities, rural areas, and some of the region's largest employers such as Ford Motor Company, UPS, and nearly two dozen bourbon distilleries. Public health, equitable infrastructure investment, and the economic well-being of the communities we serve are amongst Louisville Water's highest priorities.

Louisville Water continues to support regulations based on sound science and that are protective of human health. Due to the significant risks of health effects and the persistent nature of PFAS, Louisville Water appreciates EPA's 2021 final decision to regulate PFOA and PFOS in drinking water. Louisville Water and EPA share the goal of ensuring the delivery of clean, safe drinking water to our customers.

Louisville Water appreciates the opportunity to provide input to the U.S. Environmental Protection Agency (EPA) as the agency considers finalizing a National Primary Drinking Water Regulation for Per- and Polyfluoroalkyl Substances. We also welcome continued dialogue with how best to approach the regulation of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045402)

May 30, 2023

Submitted via www.regulations.gov

Assistant Administrator Radhika Fox

Office of Water

U.S. Environmental Protection Agency

1200 Pennsylvania Ave. NW

Washington, DC 20460–0001

Re: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation, EPA-HQ-OW-2022-0114-0027

Dear Assistant Administrator Fox:

The Environmental Working Group offers these comments in strong support of the EPA's proposal to set maximum contaminant levels, or MCLs, for PFOA, PFOS, PFNA, PFHxS, PFBS, and GenX.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Environmental Working Group (EWG) (Doc. #1721, SBC-045405)

The EPA estimates that twenty percent of exposure to the PFAS covered by the proposed rule comes from drinking water. [FN9: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18654, 18664-65, 18670 (March 29, 2023).] The MCLs proposed by the Environmental Protection Agency will dramatically reduce that exposure and improve health outcomes for Americans across the country.

The Environmental Working Group offers the following comments:

• The EPA should finalize the proposed drinking water standard as quickly as possible.

• The proposed regulatory determination for GenX, PFBS, PFNA, and PFHxS is appropriate and necessary.

• The hazard index is a critical tool to address cumulative risks from mixtures of PFAS.

• The benefits of the proposed rule are underestimated and outweigh the costs.

• The proposed MCLs are feasible with current technology.

• The costs of the proposed rule are affordable.

• The EPA should lower the health-based water concentrations.

• After finalizing the rule, the EPA should promulgate national primary drinking water standards for additional PFAS.

• The EPA should update the final rule as new science emerges and as detection methods improve.

• The EPA should take additional steps to address source reduction and regulate PFAS under additional statutes.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For a response on the comment that the benefits have been underestimated, please see section XII.A.1.b of the FRN. For a response to the comment that the EPA should lower the health-based water concentrations, please see section 4.3.3 of the *Response to Comments* document, including the EPA response to comment Doc. #1721, SBC-045417. While beyond the scope of the PFAS NPDWR, this rule complements many other actions in the PFAS Strategic Roadmap to protect public health and the environment from PFAS. For more discussion on the PFAS Strategic Roadmap, please see section 15 of the *Response to Comments* document.

Massachusetts Department of Environmental Protection (MassDEP) (Doc. #1726, SBC-045140)

May 30, 2023

U.S. Environmental Protection Agency

Office of Water

Health and Ecological Criteria Division

Washington, DC

RE: MassDEP Comments on PFAS National Primary Drinking Water Regulation Rulemaking Docket ID No. EPA-HQ-OW-2022-0114

Dear EPA Reviewers:

The Massachusetts Department of Environmental Protection (MassDEP) commends the U.S. Environmental Protection Agency (EPA) for working to develop a National Primary Drinking Water Regulation (NPDWR) for Per- and Polyfluoroalkyl Substances (PFAS) and is pleased to submit comments on EPA's PFAS National Primary Drinking Water Regulation Rulemaking, published March 29, 2023 (88 Fed. Reg. 18638).

The Commonwealth of Massachusetts has a strong record of addressing emerging contaminants in drinking water and is committed to continuing to protect public health through ensuring safe drinking water from public water systems (PWS). Specifically, MassDEP has been at the forefront of regulating PFAS in drinking water. In October 2020, Massachusetts established one of the most protective, enforceable drinking water standards in the nation of 20 nanograms per liter (ng/L) (or parts per trillion (ppt)) for the sum of six PFAS and required all PWS to test for PFAS in their drinking water. In addition to these requirements, between July 2020 and June 2022, MassDEP implemented a PFAS Free Analyses Program for PWS and select private well owners to provide the opportunity for one round of free PFAS drinking water analysis and technical assistance. 1,171 public water systems and 1,668 private wells were sampled as part of this initiative. To date, all PWS in Massachusetts have completed at least one round of sampling of their finished water sources for PFAS and MassDEP continues to work with systems to reduce levels.

In addition to regulatory and technical assistance activities, Massachusetts has already provided PWS in the state with financial assistance to address PFAS. MassDEP and the Massachusetts Clean Water Trust have provided 0% interest rate loans totaling more than $149 million to remove PFAS contamination from drinking water in communities across the Commonwealth.

Massachusetts is committed to continuing its strong track record of addressing emerging contaminants in drinking water. MassDEP is preparing Massachusetts PWS for the adoption of EPA's PFAS NPDWR and is pleased to offer these comments.

EPA Response: The EPA acknowledges and appreciates this comment.

North Carolina Conservation Network (Doc. #1728, SBC-043559)

May 30, 2023

Administrator Michael S. Regan

U.S. Environmental Protection Agency

EPA Docket Center, OW Docket

Mail Code 28221T

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Per- and Polyfluoroalkyl Substances (PFAS): Proposed National Primary Drinking Water Regulations (Docket ID: EPAHQ-OW-2022-0114)

Dear Administrator Regan,

We submit this comment to express support for the U.S. Environmental Protection Agency's (EPA) proposal to establish a national primary drinking water regulation for a set of per- and polyfluoroalkyl substances (PFAS). The NC Conservation Network advocates in coordination with dozens of partners organizations and on behalf of tens of thousands of North Carolinians. Too many of our activists and supporters have experienced years of exposure to high levels of PFAS in the Cape Fear River, including both PFAS that are covered by the proposed standard: PFOS, PFOA, GenX - as well as PFAS that are not: PFMOAA, Nafion byproducts 1 & 2.

We have joined technical comments by Earthjustice and the Natural Resources Defense Council (NRDC) that spell out in detail the reasons why EPA should adopt both the proposed maximum contaminant levels (MCLs) for PFOS and PFOA, and the index approach for four other PFAS (PFHxS, PFNA, PFBS, and GenX). In this short letter, we also write separately to highlight a challenge that your proposed rule will face in North Carolina, and to recommend a solution that we think could significantly increase the benefits of your rule here and in similarly situated states across the nation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chattahoochee Riverkeeper (CRK) (Doc. #1730, SBC-043562)

We need national drinking water standards for PFAS. We applaud EPA for the proposed National Primary Drinking Water Regulation (NPDWR) that includes six known, harmful PFAS chemicals—perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS). We urge EPA to maintain the stringent proposed maximum contaminant levels (MCLs) included in the proposal.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Clean Air Council, et al. (Doc. #1731, SBC-043887)

Conclusion

Commenters strongly support the proposed NPDWR. Commenters thank EPA for the sound research and effort that generated the proposed NPDWR and for the opportunity to comment. The MCLs and HI/HBWC are reasonable and adequate to protect public health based on current data, and are feasible for both testing and treatment. To maintain the efficacy of the proposed rule in protecting public health as scientific knowledge and technical methods improve, EPA should regularly update the rule by modifying MCLs/HBWC and adding more chemicals to the regulations. Furthermore, EPA needs to address the safe disposal of the PFAS waste produced during treatment to avoid re-introduction of the contaminants into groundwater and soil, or of their fluorinated incomplete combustion products into air.

In summary, the current rule is a crucial step in protecting human health from significant harm caused by PFAS contamination.

Sincerely,

Joseph Otis Minott, Esq.

Re: Docket ID No. EPA-HQ-OW-2022-0114, Comments on Proposed Per- and

Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation

To Whom It May Concern:

Clean Air Council (the "Council"); Environmental Integrity Project; PennFuture; Mountain Watershed Association; Aquashicola Pohopoco Watershed Conservancy; PennEnvironment; Breathe Project; Food and Water Watch; and Physicians for Social Responsibility Pennsylvania (collectively, "Commenters") appreciate the opportunity to submit the following comments in response to the Environmental Protection Agency's ("EPA's") proposed Per- and

Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation [FN1: Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation, 88 Fed. Reg. 18638 (proposed March 29, 2023) (to be codified at 40 C.F.R. pts. 141, 142), available at https://www.govinfo.gov/content/pkg/FR-2023-03-29/pdf/2023-05471.pdf.]. As is detailed herein, Commenters strongly support this rulemaking as a vital step in protecting public health from a subset of harmful PFAS. Commenters urge EPA to provide for the regulation to be updated to regulate additional chemicals and set more stringent standards as scientific knowledge and technical feasibility increase.

About the Commenters

Clean Air Council is a nonprofit environmental health organization headquartered in Philadelphia, Pennsylvania with additional offices in Pittsburgh, Pennsylvania. The Council has been working to protect everyone's right to a clean and healthy environment for over 50 years. It has members throughout Pennsylvania and the Mid-Atlantic region who support its mission. It works closely with frontline communities who trust the Council to advocate for their right to a healthy environment and environmental justice.

The Environmental Integrity Project ("EIP") is a national nonprofit organization with staff in Pittsburgh and Philadelphia. EIP is dedicated to advocating for effective enforcement and implementation of environmental laws, including the Safe Drinking Water Act and the Clean Water Act. EIP has three goals: (1) to provide objective analyses of how the failure to enforce or implement environmental laws increases pollution and affects public health; (2) to hold federal and state agencies, as well as individual corporations, accountable for failing to enforce or comply with environmental laws; and (3) to help local communities obtain the protection of environmental laws. Comprised of former EPA enforcement attorneys, public interest lawyers, analysts, investigators, and community organizers, EIP has worked in partnership with communities and organizations affected by water pollution for many years.

PennFuture is a Pennsylvania-statewide environmental organization dedicated to leading the transition to a clean energy economy in Pennsylvania and beyond. PennFuture strives to protect our air, water and land, and to empower citizens to build sustainable communities for future generations. A main focus of PennFuture's work is to improve and protect air quality across Pennsylvania through public outreach and education, advocacy, and litigation.

Mountain Watershed Association (MWA) is the home of the Youghiogheny Riverkeeper. MWA is a nonprofit, citizen-led, environmental organization that works to protect, preserve and restore the Indian Creek and greater Youghiogheny River watersheds. MWA represents over 1,900 members, many of whom are impacted by the poor air quality-linked extractive industries such as mining and fracking, which are prevalent throughout the watershed.

The Aquashicola Pohopoco Watershed Conservation was organized in 2002. Volunteers monitor several different sites for water quality in the Aquashicola Pohopoco watershed and participate in stream clean-ups, roadside clean-ups, and share their knowledge and experience with others. APWC plans educational and community events to be held throughout the year, reports on water

quality and monitors for threats of pollution, engages in improvement plans such as planting riparian barriers to protect runoff into the streams, and engages members who appreciate and value our watershed.

PennEnvironment Research & Policy Center is dedicated to protecting our air, water and open spaces. We work to protect the places we love, advance the environmental values we share, and win real results for our environment. For more information, visit www.pennenvironment.org/center.

The Breathe Project is a coalition of citizens, environmental advocates, public health professionals and academics working to improve air quality, eliminate climate pollution and make Southwestern Pennsylvania a healthy and prosperous place to live through science-based work and a community outreach platform.

Food and Water Watch, with more than 2 million supporters, fights for safe food, clean water, and a livable climate for all of us. We protect people from the corporations and other destructive economic interests that put profit ahead of everything else.

Physicians for Social Responsibility Pennsylvania (PSR PA) promotes socially and environmentally responsible practices, policies, and programs to safeguard and improve public health. We accomplish this through education, training, direct service, and advocacy.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rio Grande Waterkeeper and WildEarth Guardians (Doc. #1732, SBC-045423)

In the Rio Grande Basin, concern about PFAS contamination of our water sources is heightened by the arid environment and lack of alternative drinking water sources in the case of contamination. Climate change is only magnifying this problem. As temperatures warm and winter precipitation becomes less reliable, drought is becoming more of the norm in the Rio Grande Basin, adding stress to an already over-appropriated river. [FN15: Sara E. Pratt, Rio Grande Runs Dry, Then Wet, NASA EARTH OBSERVATORY, https://earthobservatory.nasa.gov/images/150244/rio-grande-runs-dry-then-wet (last visited May 23, 2023).] Rising temperatures will likely cause available water in the river to decrease, due to increased evapotranspiration, while crop irrigation requirements will increase. [FN16: Home – About, Rio Grande Water, http://riograndewater.org/about/ (last visited May 23, 2023).] Meanwhile, population centers relying on the Rio Grande for drinking water continue to grow. Given the limited - and shrinking - water available in the Rio Grande Basin, protection of these scarce water sources is of the utmost importance.

We believe the EPA's proposed national drinking water standard for six PFAS substances represents an important first step in securing the safety of our drinking water and the wellbeing of our communities. EPA should follow through by finalizing this rule to prevent PFAS-

attributable illness and death in our communities. However, there is much more work to be done in protecting the environment and safeguarding the public health from these harmful "forever chemicals".

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rio Grande Waterkeeper and WildEarth Guardians (Doc. #1732, SBC-045421)

May 30, 2023

Michael S. Regan Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue NW

Mail Code: 4607M Washington, DC 20460

Re: Comments for EPA's proposed national drinking water standard for six per- and polyfluoroalkyl substances (PFAS) (Docket ID: EPA-HQ-OW-2022-0114)

Dear Administrator Reagan,

On behalf of Rio Grande Waterkeeper and WildEarth Guardians, I write to express support for the Environmental Protection Agency's (EPA) proposed national drinking water standard for six per- and polyfluoroalkyl substances (PFAS). These chemicals are detrimental to the public health and the environment, taking thousands of years to break down. PFAS contamination in the Rio Grande and its tributaries is a threat to the ecological integrity of the Rio Grande ecosystem, people recreating on the River, and the numerous communities in Colorado, New Mexico, and Texas which rely on the Rio Grande and its tributaries for their drinking water.

As a member of the Waterkeeper Alliance, Rio Grande Waterkeeper protects and restores flows in the Rio Grande to ensure that life is sustained throughout the Rio Grande Basin for generations. WildEarth Guardians advocates for the protection of wild rivers, wildlife, wild places, and public health throughout the American West. This includes advocacy for clean water, healthy flows, and resilient communities in the Rio Grande Basin.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rio Grande Waterkeeper and WildEarth Guardians (Doc. #1732, SBC-045426)

IV. Conclusion

Thank you for taking this first step to address the widespread public health threat posed by PFAS in drinking water. We are hopeful that you will uphold EPA's mandate to protect people and the

environment by expeditiously finalizing your plan to limit PFAS contamination in drinking water; however, we also urge that you consider more comprehensive regulation of PFAS chemicals, including adopting drinking water standards addressing a much broader swathe of PFAS contaminants, as well regulating these chemicals at the source of discharge under the Clean Water Act. Thank you for your consideration of our comments.

Sincerely,

Daniel Timmons

Rio Grande Waterkeeper

Wild Rivers Program Director, WildEarth Guardians

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michigan Section American Water Works Association (MI-AWWA) (Doc. #1734, SBC-044474)

May 30, 2023

Mr. Michael Regan Administrator

Environmental Protection Agency

1200 Pennsylvania Ave, NW

Washington, DC 20460

Re: Observation on Implementation of Proposed PFAS rule Dear Administrator Regan:

We write to you regarding EPA's Memorandum to State Drinking Water Administrators on Implementability of Proposed PFAS rule.

The Michigan Section of the American Water Works Association represents water professionals in Michigan. Collectively, we are dedicated to protecting public health and the environment by providing safe drinking water to Michigan communities. What follows are highlights of input from our members. We ask that you reconsider implementation of the new rule on the grounds of cost of treatment, feasibility of reliable treatment at the method reporting level (MRL) for PFOA and PFAS, and communication challenges.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For responses on cost of treatment, please see section XII.A.2.b of the FRN, as well as section 13.3.3 in this *Response to Comments* document (particularly, the EPA response to comment Doc. #1734, SBC-044475). For responses on feasibility of treatment, please see section 5.1.4 of the *Response to Comments* document

(particularly, the EPA response to comment Doc. #1734, SBC-044476 in section 5.1.2 in this *Response to Comments* document). For communication challenges, please see section 1.2 of the *Response to Comments* document (particularly, the EPA response to comment Doc. #1734, SBC-044479).

Michigan Section American Water Works Association (MI-AWWA) (Doc. #1734, SBC-044480)

We hope you will consider the feedback of Michigan water professionals highlighted here and implore you to consider gathering more data before proceeding. Use the full time available to set realistic and meaningful MCLs that will provide more reliable and meaningful action levels while also enabling water systems to continue to build and maintain a productive relationship with their customers.

Sincerely,

Bonnifer Ballard

Executive Director

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Arizona Corporation Commission (ACC) (Doc. #1735, SBC-045191)

CONCLUSION

In conclusion, while the ACC is a strong proponent for safe, clean drinking water, it believes that adopting the MCLs as proposed for PFAS before further consideration of the cost impacts, sampling detection challenges, and disposal issues identified in this Comment will have a far-reaching negative impact on some of Arizona's most vulnerable citizens. The ACC therefore urges the EPA to address the aforementioned issues before finalizing the rule.

RESPECTFULLY submitted this 30th day of May, 2023.

RE: PFAS National Primary Drinking Water Regulation Rulemaking (Docket EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox:

Washington County Department of Public Health and Environment appreciates the opportunity to provide comment on the PFAS National Primary Drinking Water Regulation Rulemaking proposal. We commend the EPA for taking action and proposing Maximum Contaminant Levels (MCLs) for PFOS and PFOA, and a hazard index for additional PFAS contaminants. Our county is located in the Minneapolis-St Paul metropolitan area of Minnesota. Communities in the southern half of our county are greatly impacted by PFAS groundwater contamination. Our state agencies, Minnesota Department of Health (MDH) and Minnesota Pollution Control Agency (MPCA), have worked closely with the county, affected communities and private well owners for many years, to mitigate impacts of PFAS. The comments reflected within this letter echo those from our state partners.

Please contact me with any questions at 651-430-6662 or David.brummel@co.washington.mn.us.

Sincerely,

David Brummel, Director Washington County

Department of Public Health and Environment 14949 62nd St N

Stillwater, MN 55082

CC: Washington County Board of Commissioners, Washington County Administrator Kevin Corbid

EPA Response: The EPA acknowledges this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michael Regan, Administrator

U.S. Environmental Protection Agency

Office of Ground Water and Drinking Water Docket 1200 Pennsylvania Ave NW

Washington, DC 20460

Submitted online via regulations.gov

RE: Docket ID Number EPA-HQ-OW-2022-0114, PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18,638 (Mar. 29, 2023)

Dear Administrator Regan:

We support the EPA's proposal to establish the first-ever nationwide limits on per- and polyfluoroalkyl substances (PFAS) in drinking water. Craft brewers understand the importance of clean and safe drinking water not only for our businesses but also for the health and well-being of our communities. We urge you to finalize the proposed standards as quickly as possible.

PFAS chemicals are present in the drinking water of millions of people across the country. They have been linked to numerous health problems, including cancer, immune system dysfunction, and developmental issues. The fact that these chemicals do not easily break down in the environment and can accumulate in the human body is particularly concerning. It is essential that we take action to limit people's exposure to them.

Beer is mostly water, and we depend on reliable access to clean water to produce a high- quality finished product. It is thanks in part to this critical resource that the craft brewing industry contributed about $76.3 billion to the U.S. economy in 2021, along with more than 490,000 jobs.1 [FN1: Brewers Association statistics from 2021. https://www.brewersassociation.org/statistics-and- data/economic-impact-data/]. If our water supplies were contaminated with PFAS, it could affect the integrity of the brewing process and harm the reputation and profitability of our businesses, putting our bottom lines and the health of our customers at risk.

The proposed PFAS limits are an important and scientifically supported step toward protecting public health and the environment. They would significantly reduce exposure to some of these harmful chemicals. We are counting on you to adopt, implement, and enforce them swiftly. Protecting safe water is central to our long-term success. Moreover, it is vital to the health and the economy of the communities where we live and work.

Thank you for considering our views on this important matter. Sincerely,

Defend Our Health (Doc. #1741, SBC-045192)

Assistant Administrator Radhika Fox

Office of Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

May 30, 2023

Via Regulations.gov

Re: PFAS National Primary Drinking Water Regulation Rulemaking, Docket No. EPA–HQ–OW–2022–0114

Dear Assistant Administrator Fox:

Defend Our Health submits these comments in support of the EPA's proposed drinking water standards for six per- and polyfluoroalkyl substances ("PFAS"). Our non-profit is headquartered in Maine and has played a pivotal role in identifying the impacts of PFAS contaminated sludge spreading to farmland and farmland-adjacent water supplies including surface water and groundwater wells. Defend Our Health believes that all people deserve clean drinking water, clean air and a healthy life free from toxic chemicals, and we advocate to protect the health of people whose water supplies have been contaminated with PFAS and other chemicals.

We support the speedy implementation of a national drinking water standard for PFAS. While some states have adopted regulations that move towards health protective drinking water standards, the current regulatory patchwork leaves people unfairly at risk of exposure to these chemicals depending on where they live. Defend Our Health applauds the EPA's move towards a

national drinking water standard based on the most current understanding of the toxicity and risks of these chemicals.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

LSP Association (LSPA) (Doc. #1742, SBC-043599)

Slide 5: Concurrent with these preliminary regulatory determinations, EPA is proposing an NPDWR for these four PFAS as well as for PFOA and PFOS

• A model was used to estimate blood PFAS levels associated with a certain toxicity value. This was part of the calculation for deriving the MCLs and it includes numerous safety/uncertainty factors. The actual background levels of PFAS in blood have decreased over time since the prohibition of PFOS and PFOA in commercial products (cf. PFAS in the US population | ATSDR (cdc.gov)) [Link: https://www.atsdr.cdc.gov/pfas/health-effects/us-population.html]. Was this actual decrease in background blood PFAS level taken into account with the proposed MCLs?

• The decrease in PFAS blood concentrations observed by the CDC indicates that prohibition of PFAS in commercial products has significantly decreased potential PFAS exposures. While the LSPA absolutely believes that public health should be protected by safe drinking water supplies, promulgating extremely low MCLs, at concentrations that are barely detectable by a laboratory, without significantly limiting their use in commercial products is a fruitless effort because there will continue to be more PFAS introduced into the environment.

• There are significant hurdles for all stakeholders if USEPA proceeds with the proposed NPDWR. The LSPA concurs with and wishes to amplify the implementation challenges identified by the Massachusetts Water Works Association (MWWA of Acton, MA) in their May 26, 2023 comment letter to USEPA regarding the proposed rule. Of particular note are the sections related to Occurrence; Source Water and Analytical Variability; Analytical Methodology; Treatment Considerations; Liability Concerns; Supply Chain/Procurement; and Cost.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. The EPA disagrees with the first bulleted statement on estimated blood PFAS levels, as the statement is inaccurate. The MCLs are not calculated as the commenter described. The MCLs represent "the maximum permissible level of a contaminant in water which is delivered to any user of a public water system," Section 1401(3). In setting the MCL level, the EPA also identifies the level at which it is technologically feasible to measure the contaminant in the public water system. To identify this level, the EPA considers (1) the availability of analytical methods to reliably quantify levels of the contaminants in drinking water and (2) the lowest levels at which contaminants can be reliably quantified within specific

limits of precision and accuracy during routine laboratory operating conditions using the approved methods (known as the PQLs). The PFOA and PFOS MCLGs are zero based on the cancer classifications and did not incorporate quantitative toxicokinetic models, toxicity values, or uncertainty factors. Carcinogens have no safe exposure level regardless of whether the serum concentrations are declining. Lastly, the unique physical and chemical properties that make some PFAS, including PFOA and PFOS, highly stable and resistant to degradation in the environment and human body, resulting in their colloquial name of "forever chemicals," indicates that exposure to these chemicals will continue.

For bullet two, the EPA disagrees that the PFAS levels are barely detectable by a laboratory. Discussion on laboratory detections can be found in sections 5.1.2 and 7 of the *Response to Comments* document. The EPA has described other actions that are occurring simultaneously with this NPDWR in sections 1.3 and 15 of the EPA response in this *Response to Comments* document.

For bullet three on implementation challenges, please see sections 1.3 and 11 of the EPA response in this *Response to Comments* document.

San Gabriel Basin Water Quality Authority (WQA) (Doc. #1743, SBC-043611)

Sent Via Federal eRulemaking Portal: https://www.regulations.gov/

May 26, 2023

U.S. Environmental Protection Agency EPA Docket Center

Office of Ground Water and Drinking Water Docket, Mail Code 2822IT

1200 Pennsylvania Avenue NW, Washington, DC 20460

Subject: Docket ID: EPA-HQ-OW-2022-0114

Proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS).

Thank you for the opportunity to comment on U.S. Environmental Protection Agency's (EPA's) proposed National Primary Drinking Water Regulation for six PFAS compounds (Docket ID #EPA-GQ-OW-2022-0114).

The San Gabriel Basin Water Quality Authority (WQA) was created by the California State Legislature to oversee the groundwater cleanup of the San Gabriel Groundwater Basin (Basin) which is one of the largest Superfund sites in the country. The Basin provides drinking water to over 1.4 million residents and is served by dozens of water purveyors that include cities, water districts and private water companies.

We respectfully submit the following comments:

1. WQA appreciates EPA's goal of protecting the public health and urges EPA to follow good science-based approaches when establishing drinking water standards for PFAS and other emerging contaminants to assure the public's confidence in any adopted regulation.

EPA Response: The EPA has followed a strong science-based approach in establishing the drinking water standards in this regulation. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Del-Co Water Company, Inc. (Doc. #1744, SBC-043614)

May 29, 2023

United Sates Environmental Protection Agency

Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation

Rulemaking Office of Ground Water and Drinking Water

1200 Pennsylvania Avenue NW Washington, DC 20460

To Whom it May Concern,

Del-Co Water Company, Inc. appreciates the opportunity to comment on the U.S. Environmental Protection Agency's proposed PFAS National Primary Drinking Water Regulation. Del-Co Water is a private, non-profit, member-owned PWS that owns and operates three surface water plants and one groundwater plant. Del-Co Water is the 7th largest PWS in the State of Ohio, covering 800 square miles, and currently serving over 52,000 customers in eight Central Ohio counties. Our mission is to enhance the quality of life to our growing region by providing exceptional water services in an affordable and environmentally responsible manner. We strive to partner with peer water utilities, consultants, manufacturers, vendors, regulators, academia, and other interested parties to network, educate, and advocate for safe drinking water.

Our objective and goal is to provide public health protection to all customers. We take this role very seriously and work hard to ensure that the water provided to residents meets all Safe Drinking Water Act standards.

Del-Co Water fully supports the efforts to strengthen verified, scientifically-proven public health protections, but EPA must consider the challenges and complexities associated with implementation of the proposed PFAS rules before finalizing these regulations.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

West Virginia Rivers Coalition et al. (Doc. #1746, SBC-045244)

May 30th, 2023

Submitted via www.regulations.gov

Radhika Fox

Assistant Administrator, Office of Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460–0001

Re: Comments on Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation [Docket ID: EPA-HQ-OW-2022-0114]

Dear Assistant Administrator Fox,

Thank you for the opportunity to comment on EPA's proposed National Primary

Drinking Water Regulation for six per- and polyfluoroalkyl substances (PFAS). West Virginia Rivers Coalition (WV Rivers) is the statewide organization focused on promoting the overall health of West Virginia's waters, and the associated environmental and public health benefits. We submit these comments on behalf of our members and the undersigned organizations.

We strongly support EPA's proposal to set science-based drinking water standards for six PFAS and commend EPA's recognition that both individual PFAS and chemical mixtures of PFAS threaten human health. PFAS-contaminated water has harmed the health of West Virginians for decades, and people in our communities have lost parents, children, and other loved ones to cancer. This is a critical and long overdue step to protect our public health. We applaud this step and provide the following comments for EPA's consideration.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Liberty (Doc. #1747, SBC-043622)

May 30, 2023

The Honorable Radhika Fox

Assistant Administrator

Office of Water

Environmental Protection Agency

Washington, DC 20020

RE: Docket No.: EPA-HQ-OW-2022-0114 PFAS: PFOA and PFOS NPDWR

Dear Assistant Administrator Fox,

Liberty Utilities (Liberty) provides potable water service to nearly 70 communities in seven states [FN1: Liberty provides water and/or wastewater services to customers in Arizona, Arkansas, California, Illinois, Missouri, New York, and Texas.] through more than 250,000 customer service connections. We are heavily invested in the welfare of our customers and the communities in which we serve. The protection of public health and the environment is at the forefront of all we do, and our mission is sustaining energy and water for life.

Given this mission, Liberty does not oppose the Environmental Protection Agency's (EPAs) proposed MCL for PFOA and PFOS; or the assigned Hazard Index for the four additional PFAS species.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

City of Thornton, Colorado (Doc. #1748, SBC-044790)

Thornton supports a MCL of 4 ppt for both PFOA and PFOS and the approach of using a Hazard Index MCL of 1 for PFHxS, PFBS, PFNA, and Gen-X.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

City of Thornton, Colorado (Doc. #1748, SBC-044780)

May 30, 2023

Michael S. Regan, Administrator Environmental Protection Agency 1200 Pennsylvania Avenue, N. W. Washington, DC 20460

*Comments submitted through the Federal Register Portal

RE: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation (Docket ID EPA-HQ-OW-2022-0114)

Administrator Regan,

The City of Thornton, Colorado (Thornton) appreciates the opportunity to partner with the EPA on the development of a National Primary Drinking Water Regulation for six PFAS compounds. Thornton applauds the EPA’s efforts to protect public and environmental health from the risks of

PFAS. Thornton operates two drinking water treatment plants producing approximately 8.3 billion gallons of treated drinking water annually to more than 160,000 customers. Following the issuance of the revised HAL in 2022, Thornton begun plans to implement treatment processes to remove PFAS from our waters in anticipation of the forthcoming NPDWR. We appreciate the opportunity to provide the following comments to the EPA to ensure that the proposed rule is properly informed and effective.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National Center for Health Research (NCHR) (Doc. #1749, SBC-044495)

The National Center for Health Research (NCHR) appreciates the opportunity to provide public comment on the Environmental Protection Agency (EPA) Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation.

NCHR is a nonprofit think tank that conducts, analyzes, and scrutinizes research on a range of health issues, with particular focus on which environmental exposures are most dangerous for consumers. We do not accept funding from companies that make products that are the subject of our work, so we have no conflicts of interest.

We agree that this proposed rule will improve public health, reducing cancer, heart disease, stroke, low birth weight, and other harms to adults and children. It will save lives. However, we have several concerns and here are our recommendations to improve the proposed rule.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with some additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Harris County Attorney's Office (HCA) (Doc. #1751, SBC-045266)

In conclusion, the Harris County Attorney's Office supports the EPA's current proposed rule regarding an MCL for perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these per- and polyfluoroalkyl substances (PFAS) under the Safe Water Drinking Act (SDWA); however, HCA has concerns about fiscal and timeline hurdles that stand in the way of effective compliance.

HCA appreciates the work EPA has done to minimize PFAS exposure and the opportunity to comment. If you have any questions, please reach out to Annie.Hutson@harriscountytx.gov or elizabeth.hidalgo@harriscountytx.gov.

Sincerely,

CHRISTIAN D. MENEFEE

Harris County Attorney

JONATHAN G. C. FOMBONNE

First Assistant County Attorney

TIFFANY S. BINGHAM

Managing Counsel, Affirmative

Litigation, Environmental & Compliance

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Environmental Council of the States (ECOS) (Doc. #1752, SBC-044500)

May 30, 2023

Honorable Radhika Fox

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue NW Washington, DC 20460

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking (EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox,

The Environmental Council of the States (ECOS) appreciates the opportunity to provide comments on EPA's proposed per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulation (NPDWR). State and territorial environmental agencies are the primary regulators for water, land, and air in almost all the states and have called on U.S. EPA to

advance science-based standards to protect our precious drinking water supplies from toxic chemicals. EPA has taken an important step forward under the Safe Drinking Water Act proposing first-ever enforceable limits for PFAS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Environmental Council of the States (ECOS) (Doc. #1752, SBC-044508)

States are committed to working in partnership with EPA and other federal agencies to prevent pollution and achieve enforceable standards. ECOS understands that there are numerous technical and feasibility challenges in implementing this rule. We request that EPA address these concerns to the extent possible as it finalizes the rule and continue needed investments to respond to them going forward. ECOS recommends your consideration of individual state comments and those of other state associations. ECOS appreciates your review of these comments and continued collaboration with states to work to protect communities and the environment from PFAS. Please reach out to me at 803-898-4132 with any questions.

Sincerely,

Myra Reece ECOS President

Director, South Carolina Department of Health and Environmental Control

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Las Cruces Utilities (LCU) (Doc. #1753, SBC-043925)

In the short time allocated for reviewing the proposed rulemaking documents, LCU concludes that EPA's determinations necessitate more open discussion for input from the water service providers and extended research prior to finalizing the regulations.

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Aclarity (Doc. #1755, SBC-044509)

May 26, 2023

SUBMITTED ELECTRONICALLY

U.S. Environmental Protection Agency EPA Docket Center Attn: EPA-HQ-OW-2022-0114

1200 Pennsylvania Avenue NW Washington, D.C. 20460

SUBJECT: Proposed PFAS National Primary Drinking Water Regulation

Docket ID No. EPA-HQ-OW-2022-0114

Introduction

We urge the federal government to support PFAS drinking water legislation. While there is known toxicity of PFAS, there are no meaningful federal regulatory standards preventing their release into our waters. This has led to PFAS being found in our drinking water and ecosystems throughout the United States. Virtually all Americans have detectable levels of PFAS in their bodies. We are extremely concerned that these toxic chemicals remain unregulated despite the fact that they have been used in manufacturing and sold in commerce for more than a half century. A dangerous amount of PFAS have already been released into our waterways, and because of their persistence in the environment, they never truly go away. Instead, these dangerous chemicals continue to bioaccumulate in people and in the ecosystems we all rely upon to survive. For these reasons, we must immediately address the discharge of PFAS with strong legislation. This legislation should require EPA to review sources of contamination, set protective limits, establish water quality criteria, set enforceable deadlines, and, most critically, appropriate funding to support this necessary work.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. New Congressional legislation is outside the scope of this rulemaking.

Los Angeles County Sanitation Districts (Doc. #1756, SBC-044517)

The Sanitation Districts appreciate the opportunity to comment on the EPA's proposed NPDWR for PFAS. The Sanitation Districts support EPA's effort to protect public health by regulating PFAS. However, we are concerned about the potential impacts of the proposed rule on wastewater treatment, water recycling and solid waste management facilities, and we urge the EPA to comprehensively consider these impacts when assessing costs and feasibility of the proposed rule and finalizing the MCLs. Thank you for your consideration of these comments. If you have any questions, please do not hesitate to contact Sharon Green, Legislative & Regulatory Programs Manager at sgreen@lacsd.org or (562) 908-4288, ext. 2503.

Very truly yours,

Ajay M. Malik, Head Technical Services Department

AMM:KCM:SNG:djm

EPA Response: The EPA acknowledges concerns raised about the potential impacts of the PFAS rule. Please see sections 1.3 and 13 of the EPA response in this *Response to Comments* document.

El Paso Water (Doc. #1757, SBC-044528)

El Paso Water is proud to provide safe and reliable drinking water for our community, and we support regulations based on sound science that is protective of human health. Our staff is dedicated to protecting our water supplies from harmful contaminants that could render them unsafe and cause our customers to lose faith in our product. This is a charge we do not take lightly, and we will continue to find new ways to improve our detection and treatment methods.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for ensuring drinking water is safe. Please see section 1.3 of the EPA response in this *Response to Comments* document.

El Paso Water (Doc. #1757, SBC-044518)

May 30, 2023

Dr. Jennifer Mclain Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

Submitted electronically

Re: Docket ID: EP•HQ-OW•2022·0114, PFAS NPDWR

Dear Dr. McLain:

As the municipally owned water utility for the City of El Paso, Texas, El Paso Water provides water to a community of nearly 700,000 residents. With a broad range of consumers residing in both incorporated and unincorporated areas, we welcome the opportunity to provide public comment on the Environmental Protection Agency's proposed PFAS National Primary Drinking Water Regulations (NPDWR).

Both the City and County of El Paso are home to large populations of Hispanic residents as well as economically distressed populations. These groups often experience disproportionate negative impacts from contaminants and from lack of affordable safe drinking water. As the public water system (PWS) serving these populations, we appreciate the intent of the EPA to improve conditions for these groups.

However, as proposed, the PFAS NPDWR revisions raise several concerns among PWSs that the EPA is overlooking:

• Honoring the "polluter pays" principle

• Better identification of the source of PFAS introduction

• Addressing other sources of PFAS exposure

• Cost increases for heightened testing and treatment

• lowering the MCL is costly and not based on reliable data

EPA Response: The EPA acknowledges this input to the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045643)

In summary, EPA is strongly encouraged to consider the impacts of this rule carefully and to ensure that, if finalized, the regulations are feasible, based on the best available public health information, based on accurate cost assessments, and legally defensible. While the agency has a strong interest in expeditious action, it is important to move actions forward meaningfully and in a way that avoids negative consequences that are avoidable. AWWA's recommendations are intended to assist EPA ensure that high-risk water systems are prioritized while also providing EPA with additional time to get better data and make additional sound, defensible risk management decisions. AWWA's recommendations also reflect EPA placing the onus of PFAS risk reduction on polluters rather than communities through the source water protection actions framed in the agency's Strategic Roadmap for PFAS.

EPA Response: The EPA's final rule represents data-driven drinking water standards that are based on the best available science and meet the requirements of SDWA. Regulation of

the PFAS covered by the NPDWR is vital for protecting public health by removing these contaminants from our nation's drinking water. The EPA believes that the regulations are feasible, based on the best available public health information, based on accurate cost assessments, and legally defensible. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has addressed the many comments by the American Water Works Association (AWWA) regarding costs and the cost-benefit analysis, which can be found throughout section 13.3 of the *Response to Comments* document. For concerns around high-risk systems, please see section 14 of the *Response to Comments* document, particularly the EPA response to comment Doc. #1759, SBC-045632 in section 14.10 in this *Response to Comments* document.

American Water Works Association (AWWA) (Doc. #1759, SBC-045548)

Michael Regan

Administrator

Environmental Protection Agency

1200 Pennsylvania Avenue, N.W.

Mail Code: 1309

Washington, DC 20004

SUBMITTED ELECTRONICALLY

RE: Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking, Docket No. EPA–HQ–OW-2022-0114 [Link: https://www.regulations.gov/docket/EPA-HQ-OW-2022-0114]

Dear Administrator Regan,

The American Water Works Association appreciates the U.S. Environmental Protection Agency's (EPA) efforts to propose national primary drinking water regulations for per- and polyfluoroalkyl substances (PFAS), including perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS). The proposal includes several major actions for PFAS in drinking water, including:

- Proposal for drinking water standards for PFOA and PFOS, individually,

- Preliminary determinations for perfluorohexanesulfonic acid (PFHxS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA), perfluorobutanesulfonic acid (PFBS), and the mixture of these four PFAS, and

- Proposal for drinking water standard for PFHxS, PFNA, HFPO-DA, and PFBS as a mixture using a hazard index.

AWWA supports the development of primary drinking water standards for PFOA and PFOS and supports the agency's interest in proposing regulatory determinations for additional PFAS. AWWA recommended the development of standards for PFOA and PFOS in comments to the EPA in 2021 and provided a shortlist of PFAS compounds for the agency's consideration for additional action as appropriate. In these comments, AWWA provided additional recommendations relating to the use of occurrence data, an approach to monitoring requirements, and available cost data for drinking water treatment facilities.

AWWA believes that EPA has put forward a rule framework that begins to address a number of stakeholder concerns. The proposal serves as a good starting point for finalizing a rule that will address PFAS compounds in drinking water. Attached are detailed comments on the proposed rule.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with heavy considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has addressed the many comments by AWWA regarding the following topics. For responses concerning occurrence data, please see sections 3.1.2 and 3.2.2 of the *Response to Comments* document. For responses concerning monitoring requirements, see sections 8.1.1 and 8.1.2 of the *Response to Comments* document. For responses concerning cost data, please see section XII.A.2.b of the FRN for this rule.

California State Water Resources Control Board (Doc. #1760, SBC-044221)

State Water Resources Control Board

May 30, 2023

Honorable Radhika Fox

Assistant Administrator Radhika Fox

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue NW

Washington, DC 20460

COMMENTS ON PROPOSED PFAS NATIONAL PRIMARY DRINKING WATER REGULATION RULEMAKING: EPA-HQ-OW-2022-0114

Dear Assistant Administrator Fox,

The California State Water Resources Control Board (State Water Board) appreciates the opportunity to comment on the U.S. Environmental Protection Agency's (EPA) proposed PFAS National Primary Drinking Water Regulation. The State Water Board is the Safe Drinking Water Act Primacy Agency for California and implements the Safe Drinking Water Act in California.

Extensive PFAS contamination has been found in California's groundwater that supplies many of the state's public drinking water systems. Over 600 contaminated wells have been identified so far and more are expected as testing continues to expand to new wells. California has not yet adopted a primary maximum contaminant level (MCL) for any of the identified PFAS compounds but has issued notification and response level values, essentially California health advisory numbers, for perfluorooctanoic acid (PFOA), perfluorooctance sulfonic acid (PFOS), perfluorobutane sulfonic acid (PFBS), and perfluorohexane sulfonic acid (PFHxS). California statutes were also amended by the Legislature to require water systems to provide public notice if a source water containing a PFAS compound exceeds a notification and response level set by the State Water Board. As a result, many water systems have proceeded to or are planning to install treatment in order to serve water to the public that is below notification and response levels and thus will not require public notification.

Based on our experience so far in dealing with PFAS contamination of drinking water supplies, the State Water Board overall supports EPA's proposed PFAS rule, including the inclusion of a hazard index. Attempting to establish MCLs for every PFAS shown to have detrimental health impacts would be impossible to accomplish given the large number of compounds and the ability for industry to quickly switch to new compounds with similar properties but different formulations. The State Water Board has utilized a similar approach as the health index when permitting highly impaired source waters containing contaminants that do not have an MCL with success.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

PFAS Regulatory Coalition (Doc. #1761, SBC-046092)

I. Conclusion

In these comments, the PFAS Regulatory Coalition has raised a series of substantial concerns with the EPA Proposal, which need to be addressed before EPA moves forward with any rulemaking setting drinking water standards for PFAS. The Coalition looks forward to continuing to engage with EPA on these issues. Please feel free to call or email if you have any questions, or if you would like any additional information concerning the issues raised in these comments.

Table of Contents

1.0 Introduction

The US EPA issued a PFAS National Primary Drinking Water Regulation Rulemaking notice in the Federal Register Volume 88 Number 60 on March 29, 2023. Within the notice, the US EPA indicated that the US EPA is issuing a preliminary regulatory determination to regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these per- and polyfluoroalkyl substances (PFAS) as contaminants under Safe Drinking Water Act (SDWA). Through this action, US EPA is also proposing a National Primary Drinking Water Regulation (NPDWR) and health-based maximum contaminant level goals (MCLGs) for these four PFAS and their mixtures as well as for PFOA and PFOS. US EPA is proposing to set the health-based value, the MCLG, for PFOA and PFOS at zero. Considering feasibility, including currently available analytical methods to measure and treat these chemicals in drinking water, US EPA is proposing individual maximum contaminant levels (MCLs) of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt) for PFOA and PFOS.

US EPA is proposing to use a Hazard Index (HI) approach to protecting public health from mixtures of PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS because of their known and additive toxic effects and occurrence and likely co-occurrence in drinking water. US EPA is using Health-Based Water Concentrations (HBWCs) as follows: 9.0 ppt for PFHxS, 10.0 ppt for HFPO–DA; 10.0 ppt for PFNA; and 2000 ppt for PFBS. US EPA is proposing an HI of 1.0 as the MCLGs for these four PFAS and any mixture containing one or more of them because it represents a level at which no known or anticipated adverse effects on the health of persons is expected to occur and which allows for an adequate margin of safety. US EPA has determined it is also feasible to set the MCLs for these four per- and polyfluoroalkyl substances (PFAS) and for a mixture containing one or more of PFHxS, HFPO–DA and its ammonium salt, PFNA, PFBS as an HI MCLG of 1.0 (unitless). In addition, the US EPA has proposed a trigger level of 1/3 of the MCL for PFOS and PFOA (i.e., 1.3 ppt).

EPA Response: The EPA acknowledges this comment. The EPA has addressed the concerns of the commenter throughout this *Response to Comments* document. Please see section 1.3 of the EPA response in this *Response to Comments* document.

PFAS Regulatory Coalition (Doc. #1761, SBC-046066)

May 30, 2023

Ms. Alexis Lan

Office of Ground Water and Drinking Water

Standards and Risk Management Division (Mail Code 4607M) U.S.

Environmental Protection Agency 1200 N. Pennsylvania Avenue,

N.W.

Washington, D.C. 20460

Re: Comments on EPA's Proposed PFAS National Primary Drinking

Water Regulation Rulemaking

Docket ID No. EPA-HQ-OW-2022-0114

Dear Ms. Lan:

The PFAS Regulatory Coalition (the Coalition) submits the following comments on EPA's Proposed PFAS National Primary Drinking Water Regulation Rulemaking, ("the EPA Proposal") (88 Fed. Reg. 18638, Mar. 29, 2023).

The Coalition is a group of industrial companies, municipal entities, agricultural parties, aviation representatives and trade associations, each of which has facilities or members that are directly affected by the development of policies and regulations related to per- and poly-fluoroalkyl substances (PFAS). Coalition membership includes entities in the automobile, airport, coke and coal chemicals, iron and steel, municipal, paper, petroleum, and other sectors. None of the Coalition members manufacture PFAS compounds. Coalition members, for purposes of these comments, include: Airports Council International – North America; American Coke and Coal Chemicals Institute; American Forest and Paper Association; American Fuel and Petrochemical Manufacturers; American Iron and Steel Institute; American Petroleum Institute; Barr Engineering; Brown & Caldwell; City of Pueblo, CO; Gary Sanitary District (IN); HDR; Illinois Association of Wastewater Agencies; National Oilseed Processors Association; Portland Cement Association; Trihydro; and Western States Petroleum Association.

PFAS Regulatory Coalition member entities or their members own and operate facilities located throughout the country. Many of those facilities would incur substantial costs to comply with the new drinking water standards being proposed by EPA. In addition, these standards would affect

other regulatory requirements that are regularly imposed on Coalition members and their operations, including remediation mandates. The Coalition, therefore, has a direct interest in the EPA Proposal.

The Coalition had requested an extension of the comment period on the EPA Proposal, in a letter dated April 17, 2023. On May 5, 2023, EPA denied all requests for extension. The Coalition has prepared these comments in the limited timeframe allowed by EPA. Other issues may have been included if additional time for review and comment had been allowed by the Agency.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. For a response to the concern about the lack of extension of the comment period, please see sections 2.3 and 17.1 of the *Response to Comments* document.

Center for Environmental Health et al. (Doc. #1764, SBC-044242)

The proposal is a significant step in the right direction, both in terms of setting health protective drinking water standards for PFOA and PFOS, and also in taking the first approach to addressing PFAS as a class, including GenX chemicals. We believe the MCLs for PFOA and PFOS are as close as feasible to the maximum contaminant level goal (MCLG) of zero for these stressors, in accordance with the mandate of the Safe Drinking Water Act. We also believe the proposal adequately reflects the MCLs for PFBS, PFHxS, PFNA, HFPO-DA and its ammonium salts. We urge the agency to quickly finalize these MCLs, and further refine its calculations of MCLs for PFBS, PFHxS, PFNA, HFPO-DA using additional data sources, such as the epidemiological data called for in our petition.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

U.S. Poultry & Egg Association et al. (Doc. #1765, SBC-044543)

May 30, 2023

RE: Docket ID No. EPA–HQ–OW–2022–0114

To whom it may concern:

The following comments are submitted in response to the US Environmental Protection Agency's (EPA) March 29, 2023, proposed drinking water regulation that includes six Per- and Polyfluorinated Substances (PFAS). EPA's proposal would establish Maximum Contaminate Level Goals (MCLGs) and a National Primary Drinking Water Regulation (NPDWR) for the six PFAS in public drinking water supplies. Specifically, the March 29, 2023, proposal would establish MCGLs of zero (0) for PFOA and PFOs and an enforceable Maximum Contaminate Level (MCL) for PFOA and PFOS in drinking water at 4.0 ppt.

EPA is also requesting comment on a preliminary determination to regulate additional PFAS to include PFHxS, HFPO–DA1 (also known as and referred to as ‘‘GenX Chemicals’’), PFNA, and PFBS. Concurrent with this preliminary determination, EPA is proposing a “Hazzard Index” (HI) of 1.0 as the MCLG and enforceable MCL to address individual and mixtures of these four contaminants where they occur in drinking water.

The U.S. Poultry & Egg Association (USPOULTRY), the National Turkey Federation (NTF) and numerous state poultry associations (collectively, the U. S. Poultry and Egg Industry) appreciate the opportunity to submit these comments. These comments align with a more comprehensive set of comments submitted by the U.S. Chamber of Commerce

USPOULTRY is the world’s largest and most active poultry organization with membership comprised of producers and processors of broilers, turkeys, ducks, eggs, and breeding stock, and alliances that include farmers and growers ranging from large agricultural operations to mom-and-pop shops. NTF serves as the national advocate for America’s turkey farmers and producers, raising awareness for its members’ products while strengthening their ability to profitably and safely deliver wholesome, high-quality, and nutritious food to consumers worldwide.

Many of our members live and operate in small rural communities that will certainly be affected by the proposed NPDWR. Additionally, some of our processor members operate their facilities using groundwater. As such, these facilities are classified as Non-Transient Non-Community Water System (NTNCWS).

The following comment topics are of relevance to the U. S. Poultry and Egg Industry, and other food and agricultural stakeholders:

Key Comments

1. Limited technical expertise to execute, interpret, and manage compliance with the proposed MCLs

2. Lack of adequate laboratory capabilities, especially in the southeastern U.S. region

3. Challenges associated with inconsistent and dynamic regulations across EPA and state-led drinking water programs:

a. Fragmented US federal approach and lack of coordination with relevant federal agencies with additional oversight of the U.S. food and agriculture industry (e.g., FDA, USDA)

b. Inconsistent messaging across federal agencies and international community regarding the human health risks associated with low levels of PFAS

c. Unintended consequences of EPA’s proposed regulation on other environmental and public health sectors including WWTPs, biosolids, and food safety

4. The use of a Hazard Index to regulate “levels” of PFAS Mixtures

5. Flaws in the Economic Analysis

EPA Response: The EPA acknowledges and appreciates this comment that expresses concerns with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The concerns and considerations about laboratory capability and availability, including technical expertise, are discussed in section 5.1 (particularly, the EPA response to comments Doc. #1765, SBC-044544 and Doc. #1765, SBC-044546 in section 5.1.2 in this *Response to Comments* document) and section 8.7 of the *Response to Comments* document. After the NPDWR takes effect, SDWA requires primacy agencies to have a standard that is no less stringent than the NPDWR, which should reduce confusion on inconsistent regulations. Additional discussion on state drinking water standards can be found in section 5.1.5 of the *Response to Comments* document. The EPA disagrees that there is fragmented coordination across the federal government. The EPA coordinated with all applicable federal agencies as required. For responses to comments concerning this coordination, please see section 14 of the *Response to Comments* document. For discussion on communications materials, including for implementation by water systems and for health risks, please see section 1.2 of the EPA response in this *Response to Comments* document. For the unintended consequences of the regulation, please see section 15 for out-of-scope topics. The EPA believes the Hazard Index is an appropriate approach for regulating levels of PFAS mixtures, and additional discussion can be found in section 4.3 of the EPA response in this *Response to Comments* document. Please see section 13.3 (particularly, the EPA response to comment Doc. #1765, SBC-044549) of the EPA response in this *Response to Comments* document for a discussion about the EPA's cost estimate methods.

New Mexico Environment Department (NMED) (Doc. #1766, SBC-044246)

May 30, 2023

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue NW, Washington, DC 20460

Submitted electronically to: https://www.regulations.gov/

RE: Preliminary Regulatory Determination and proposed rule for PFAS National Primary Drinking Water Regulation Rulemaking Docket ID No. EPA–HQ–OW–2022–0114

Dear Administrator Regan,

The New Mexico Environment Department (NMED) appreciates the opportunity to submit comments to the U.S. Environmental Protection Agency (EPA) on the Preliminary Regulatory Determination and proposed rule for PFAS National Primary Drinking Water Regulation Rulemaking under the authority of the Safe Drinking Water Act (SDWA). EPA published the

preliminary determination in the Federal Register on March 19, 2023, Docket ID No. EPA–HQ–OW–2022–0114.

NMED serves as a coregulator with EPA for the National Primary Drinking Water Regulations (NPDWRs) and is responsible for overseeing their implementation across 1,076 active public water systems in New Mexico. Protecting New Mexico's drinking water quality for present and future generations is fundamental to NMED's mission.

NMED supports EPA's positive regulatory determination for perfluorooctanoic acid (PFOA), perfluorooctanesulfonic acid (PFOS), Perfluorononanoic acid (PFNA), Perfluorohexane sulfonate (PFHxS), Perfluorobutane sulfonic acid (PFBS), and hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX). The absence of an NPDWR for these compounds has resulted in varying or nonexistent regulatory actions among states, despite their occurrence in public drinking water systems across the country.

While NMED supports EPA's positive regulatory determination for these PFAS chemicals, NMED also believes that it is important for EPA to consider a number of factors that may impact effective implementation of this rule by local public water systems and state primacy agencies like NMED.

As a member of the Association of State Drinking Water Administrators (ASDWA), NMED also supports ASDWA's comments regarding EPA's Preliminary Regulatory Determination and proposed rule for PFAS National Primary Drinking Water Regulation Rulemaking. Similarly, NMED supports the Environmental Council of the States' (ECOS) comments on the proposed rule. The ASDWA and ECOS letters are attached to this letter.

NMED appreciates this opportunity to comment on this regulatory determination. NMED encourages EPA to work hand in glove with states like New Mexico to ensure effective implementation of drinking water regulations and ensure a safe and sustainable drinking water supply for our communities.

Sincerely,

James C. Kenney

Cabinet Secretary

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Western Urban Water Coalition (WUWC) (Doc. #1768, SBC-043936)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

RE: PFAS National Primary Drinking Water Regulation Rulemaking; Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Regan:

The Western Urban Water Coalition (WUWC) appreciates the opportunity to comment on the Environmental Protection Agency's (EPA) proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation Rulemaking (the "Proposed Rule"). [FN1: 88 Fed. Reg. 18638 (Mar. 29, 2023)] WUWC is a coalition of 19 of the largest western water utilities [FN2: WUWC was established in 1992 to address the West's unique water supply and water quality challenges, and consists of the following members: Arizona (Central Arizona Project, City of Phoenix and Salt River Project); California (Eastern Municipal Water District, City of Los Angeles Department of Water and Power, The Metropolitan Water District of Southern California, San Diego County Water Authority, Santa Clara Valley Water District, and City and County of San Francisco Public Utilities Commission); Colorado (Aurora Water, Colorado Springs Utilities, and Denver Water); Nevada (Las Vegas Valley Water District, Southern Nevada Water Authority, and Truckee Meadows Water Authority); New Mexico (Albuquerque Bernalillo County Water Utility Authority); Utah (Salt Lake City Public Utilities and Washington County Water Conservancy District); and Washington (Seattle Public Utilities).] formed more than 30 years ago to address the unique water issues facing the western United States. Its members serve over 40 million water consumers in major metropolitan areas in seven western states, including through operation of water treatment facilities that will become subject to the Proposed Rule.

WUWC appreciates that regulation of PFAS under the Safe Drinking Water Act (SDWA) is an appropriate and necessary step to address public safety concerns with the potential for service of PFAS-contaminated drinking water. WUWC also understands that the Proposed Rule represents

just one piece of a broader federal regulatory priority that EPA is addressing through several ongoing rulemaking proceedings and concurrent policy setting. WUWC shares the fundamental goal to ensure that its western water agencies and their customers are assured a public water supply that is reliable, affordable, and safe.

The proposal to adopt national primary drinking water standards for perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonate (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) is a historic milestone in the regulation of PFAS as emerging contaminants. EPA has not issued a primary drinking water standard for a new contaminant on its own volition for the past twenty-six years. The drinking water standards adopted through this rulemaking have the potential to set a new precedent for further regulation of additional PFAS.

Given the significance of this moment, WUWC urges EPA to adopt a rule only after assuring that the standards it selects are based on best available peer-reviewed science and are feasible, as required by the SDWA. WUWC offers the following comments to EPA that animate WUWC's concern that EPA has not yet fully analyzed the legal, practical, or economic feasibility of the Proposed Rule.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Council of State and Territorial Epidemiologists (CSTE) (Doc. #1770, SBC-044259)

CSTE applauds and supports the Proposed Primary Drinking Water Regulation and recognizes the many factors and considerations that informed the proposed rule. CSTE applauds the recognition that a determination of public health concern involves consideration of a number of factors, some of which include the level at which the contaminant is found in drinking water, the frequency at which the contaminant is found and at which it co-occurs with other contaminants, whether there is an sustained upward trend that these contaminant will occur at a frequency and at levels of public health concern, the geographic distribution (national, regional, or local occurrence), the impacted population, health effect(s), the potency of the contaminant, other possible sources of exposure, and potential impacts on sensitive populations or life stages. Given the many possible combinations of factors, a simple threshold is not viable and is a highly contaminant-specific decision that takes into consideration multiple factors.

Additionally, CSTE recognizes due to the environmental persistence of these chemicals, there is potential for toxicity at environmentally relevant concentrations as studies show it can take years for many PFAS to leave the human body. Given this, a multifaceted approach is needed to support implementation of the regulation.

In accordance with EPA's request for comments on the proposed rule, CSTE reviewed the proposed rule and solicited input from its members to inform the following comments.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Council of State and Territorial Epidemiologists (CSTE) (Doc. #1770, SBC-044257)

The Council of State and Territorial Epidemiologists (CSTE) is a member organization representing all U.S. states and territories and over 3,000 applied public health epidemiologists. CSTE's mission is to promote effective use of epidemiologic data to guide public health practice and improve health, and advocate for epidemiologic capacity, resources, and scientifically based policy. Public health action by CSTE member states has led to improvements in clinical practice, medical procedures, surveillance, detection and control of public health threats, and the ongoing development of evidence-based environmental contaminant, occupational health, and disease control policies. Additional disease and condition prevention successes include multiple position statements to standardize national surveillance efforts.

We greatly appreciate the opportunity to comment on the proposed rule and applaud the tremendous amount of thought, time and energy EPA has invested in proposing meaningful changes to PFAS, PFOA, and PFOS Maximum Contaminant Levels (MCL), which has critical importance to public health practice in the United States.

Public Health Agencies (PHAs) across the U.S. face many challenges in their efforts to collect and provide complete, timely and accurate information for decision-making, and in communicating the risks and response to communities related to PFAS, PFOA and PFOS. The availability of feasible, effective guidelines to regulate PFAS levels in drinking water is crucial to assisting PHAs with reducing PFAS pollution, protecting public health, and delivering safe drinking water. In accordance with EPA's request for comments on the proposed rule, CSTE reviewed the proposed rule and solicited input from its members to inform the attached detailed comments for critical review and consideration by the EPA.

Re: Docket ID No. EPA-HQ-OW-2022-0114, Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

Dear Dr. McLain,

Please find enclosed comments from the Council of State and Territorial Epidemiologists (CSTE) on the proposed rule, EPA-HQ-OW-2022-0114, Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking.

CSTE is a member organization representing all U.S. states and territories and over 3,000 applied public health epidemiologists. CSTE's mission is to promote effective use of epidemiologic data to guide public health practice and improve health, and advocate for epidemiologic capacity, resources, and scientifically based policy. Public health action by CSTE member states has led to improvements in clinical practice, medical procedures, surveillance, detection and control of public health threats, and the ongoing development of evidence-based environmental contaminant, occupational health, and disease control policies.

Additional disease and condition prevention successes include multiple position statements to standardize national surveillance efforts.

We greatly appreciate the opportunity to comment on the proposed rule and applaud the tremendous amount of thought, time and energy EPA has invested in proposing meaningful changes to PFAS, PFOA, and PFOS Maximum Contaminant Levels (MCL), which has critical importance to public health practice in the United States.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sierra Club of Hawai'i (Doc. #1771, SBC-044733)

PFAS in Hawai‘i

In Hawai‘i, fresh water is a public trust resource and is a critical part of Native Hawaiian traditional and customary practices. Much of Hawai‘i's drinking water is sourced from finite groundwater aquifers. It takes nearly 30 years for rainfall to percolate down to replenish our aquifers, making our drinking water aquifers irreplaceable. Hawai‘i's water security is already fragile, and becomes increasingly threatened by impacts like climate change, growing populations, and pollution. Safeguarding our ‘aina and people is incredibly important to our cultural integrity and resilience. Setting enforceable limits on PFAS is an extremely important mechanism in enacting this protection. Facilitating this protection is a key pillar for building resilience in our communities based on foundations of Indigenous science, values, and practices.

Cultural Importance of Water

The Sierra Club urges the EPA to adopt PFAS regulations because PFAS disrupt the sacred relationship Native Hawaiians have with wai or water. The proposed limits and regulations of PFAS work toward restoring the quality of water that Native Hawaiians have stewarded for

generations, wai is not a commodity; it is an entity with which Native Hawaiians have held a deeply sacred relationship since time immemorial. Wai is spiritually significant in its purest form because it is one of the forms of akua or gods. Because of this spiritual and timeless form, wai represents a pillar of life for Native Hawaiians across ancestral and future generations. Native Hawaiians' intergenerational dependency on clean water is not replaceable; and it is not contaminable. Nevertheless, our wai has been contaminated by PFAS. Future generations depend on present-day stewards to ensure water is free from contamination. Currently the non-naturally occurring placement of PFAS significantly disrupts this relationship. An entity, sacred to the Hawaiian people, has the opportunity to be addressed. Mandated limits by the EPA have been successful in decreasing the detectable amount of PFOS in water. With the EPA's adoption of limits on persistent PFAS, kupuna, or elders, may once again have the assurance that the water inherited by future generations will be clean.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sierra Club of Hawai'i (Doc. #1771, SBC-044729)

To: Michael S. Regan Administrator

Environmental Protection Agency 1200 Pennsylvania Avenue, N.W. Mail Code: 4607M

Washington, DC 20460 Via Regulations.gov

Date: May 29, 2023

Re: Comments on Docket No. EPA-HQ-OW-2022-0114

Administrator Regan,

On behalf of our over 20,000 members and supporters, the Sierra Club of Hawai‘i strongly supports docket number EPA-HQ-OW-2022-0114, the proposed regulations on Per- and Polyfluoroalkyl Substances in drinking water. These proposed regulations confirm the urgency and severity of the threat that PFAS and other forever chemicals pose to our water, our ‘aina, and our current and future generations.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Environmental Protection Network (EPN) (Doc. #1773, SBC-043838)

EPN Comments on EPA's Proposed Per- and Polyfluoroalkyl Substances

National Primary Drinking Water regulation

Docket No.: EPA-HQ-OW-2022-0114

May 30, 2023

Founded in 2017, the Environmental Protection Network [Link: https://www.environmentalprotectionnetwork.org/] (EPN) harnesses the expertise of more than 550 former Environmental Protection Agency (EPA) career staff and confirmation-level appointees from Democratic and Republican administrations to provide the unique perspective of former regulators and scientists with decades of historical knowledge and subject matter expertise.

EPN commends EPA for making a preliminary determination to regulate PFHxS, HFPO-DA, PFNA, and PFBS and for proposing health protective MCLs for PFOA and PFOS. We provide comments on the preliminary determination, the MCLGs and MCLs for PFOA and PFOS, the Hazard Index MCLG and MCL for PFAS mixtures, monitoring requirements, public notification requirements, compliance requirements, and the benefit/cost analyses.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

3M Company (Doc. #1774, SBC-045699)

XI. CONCLUSION

As detailed in the above comments and the attached appendices, EPA's Proposed Rule does not comply with either the SDWA or the APA. The Proposed Rule is not based on best available, peer-reviewed science, as required by the SDWA, nor does it comport with EPA's own guidance on how to conduct the analyses underlying the Proposed Rule. These numerous failures are identified in detail in 3M's comments.

3M appreciates the opportunity to comment on the Proposed Rule.

Public Health. 18(3).

EPA Response: The EPA disagrees with the commenter's statements that the agency did not comply with SDWA or the Administrative Procedures Act. As described in the FRN, the EPA has finalized the PFAS NPDWR based on the requirements of the SDWA, using the best

available science, state-of-the-art scientific approaches, and high-quality information sources. The agency has provided reasonable explanations for its decisions in the rule. Please see section 1.3 of the *Response to Comments* document, including the EPA response to comment Doc. #1774, SBC-045706 in section 1.3 in this *Response to Comments* document, and the subsequent sections of this *Response to Comments* document for responses to specific comments elsewhere in this letter.

3M Company (Doc. #1774, SBC-045706)

Conclusion

The methods and procedures used by EPA to support the Proposed NPDWR did not follow EPA's own established procedures and guidance, including those for good data practice, good statistical analysis practice, consistency of methods and models, and the ability to replicate analytical results. Therefore, the analytical findings by EPA and outside sources cannot be validated, and EPA's proposed standard lacks scientific and statistical merit. EPA's reliance on non-national data bases, work by external authors, inability to quality control the data, models, and outputs is shown to be a major criticism of the underlying statistical approaches EPA has used to support the MCLG and MCL.

1979 M.S., Environmental Toxicology and Statistics, University of Texas School of Public Health

1976 B.S., Magna cum laude, Biology with Honors, University of Houston

Professional Associations:

American Statistical Association

Society of Environmental Toxicology and Chemistry

Positions:

EcoStat, Inc., Mebane, NC

2004 – ongoing Chief Executive Officer. EcoStat Inc. is a small women-owned business specializing in the quantitative environmental and human health sciences. Areas of expertise include environmental risk assessment in air, water and terrestrial environments; statistics and data analysis in both human health and environmental sciences; data base development and management; computer programming; water and air quality permitting; quantitative toxicity test evaluation; terrestrial and water quality modeling and model validation; and chemical exposure modeling and model validation.

Example Clients: 3M, Dow Chemical, Syngenta Crop Science, private clients through attorneys, British Petroleum, US EPA Clean Air Markets Division, US EPA Office of Water, US EPA Office of Groundwater and Drinking Water, Bayer Crop Science, Department of Energy, Water Environment Research Foundation (WERF), Florida Power and Light, California Wind Energy Association (CalWEA), and NextEra Energy.

Social and Scientific Systems, Durham, NC

2015 – 2016 Director of Biostatistics. Provide senior leadership in the statistical sciences and related quantitative disciplines applicable to public health research. These areas include (1) public and private clinical trials of new and existing pharmaceutical products, (2) analysis of epidemiological data including –omics studies, (3) statistical analysis of laboratory derived assay data, and (4) oversight of data operations and data management for clinical studies. Manage a group of approximately 40 individuals, in the areas of statistics, modeling, statistical programming, data base management, and analytics.

Clients: National Institute of Health, Center for Disease Control, Coast Guard, National Institute of Environmental Health Sciences, private biotech firms, and private pharmaceutical companies.

Cardno ENTRIX., Raleigh, NC

2011 – 2015 Principal/Vice President/Technical Director/Biostatistics Practice Leader. Responsible for Cardno-wide intellectual leadership and business development in the quantitative sciences. Lead statistician for BP Gulf Oil Spill (Clean Water Act litigation, National Resource Damage Assessment litigation). Incrementally managed over 25 statisticians and scientists in the role of biostatistics practice leader.

Other clients: US Fish and Wildlife Service, Upper Neuse River Basin Association, Mosaic Fertilizer, Inpex Oil (Australia), Sidley Austin (Washington), Arnold and Porter (New York), and Duke Energy.

The Cadmus Group, Chapel Hill, NC

2003 - 2004 Vice President for Strategic Science Initiatives: Member of the Cadmus executive committee that provides overall business oversight and direction for the company; responsible for business management and development in human health and environmental sciences, strategic company planning, market forecasting, and intellectual leadership at the corporate level. Technical areas of responsibility include human health and environmental risk assessment, modeling and statistics in the air quality sciences, and exposure and effects assessment in both human and ecological risk sciences.

Example clients:

Government: EPA Office of Research and Development, EPA Office of Water, EPA Office of Air and Radiation, EPA Clean Air Markets Division, EPA Office of Ground Water and Drinking Water, Department of Energy, Corps of Engineers.

Industry:

3M, Syngenta Crop Science, Bayer Crop Science, Aventis Crop Science, City of Cary, NC, Weyerhaeuser Pulp and Paper, American Chemistry Council, CEFIC, Water Environment Research Foundation (WERF), American Metropolitan and Sewage Association (AMSA), Utility Water Act Group.

1997 - 2003 Vice President and Group Manager: Responsible for business development, business management, and personnel management in the ecological risk sciences, statistics, and engineering; manager of the Cadmus North Carolina office; responsible for offices in Ottawa, Ontario, Canada, Oak Ridge, TN, Laramie, WY, Springfield, MA, and Cincinnati, OH; Managed over 60 scientists, statisticians, and engineers; developed both a government and private client practice; responsible for group-level contracts, budgets, legal issues, and personnel issues. Responsible for over 100 projects in the human and environmental risk sciences, and air quality.

1991 - 1997 Principal Scientist: responsible for business development and personnel management in the ecological risk sciences, statistics, and engineering; manager of the Cadmus North Carolina office and four other offices in the US and Canada.

Kilkelly Environmental Associates, Raleigh, NC

1988 - 1991 Senior Scientist: responsible for data analysis and statistical assessments of environmental exposure and effects data; worked with EPA's Corvallis Laboratory to develop EPA's first risk assessment documents including the development of assessment and measurement endpoint concepts; published well received papers on toxicity test variability; worked with EPA's Acid Rain Division to develop the Acid Rain rules for utility emissions of SO2, NOx CO2, and particulates.

Carolina Power and Light Company, Raleigh, NC

1982 - 1988 Senior Statistician: supported over 60 biologists in the assessment of impacts to biota at CP&L's nuclear and coal-fired power plants; generated survey designs, performed statistical analyses, participated in on-site sample collection activities, and generated reports to State and Federal agencies; developed thousands of lines of code in SAS and Fortran for the statistical assessment of environmental data.

TRW Environmental, RTP, NC

1980 - 1982 Engineer: supported EPA's Office of Air Quality Policy and Standards (OAQPS) in running air quality models, setting of NAAQS values, and PSD permit development.

Duke University Center for Demographic Studies

1977 - 1985 Programmer and Statistician: developed maximum likelihood statistical models of longitudinal cancer trends over various demographic groups and geographical areas of the US; developed program code in Fortran, IBM assembly language, and Basic.

Professional Highlights

• Over 35 years of experience supporting industry, government programs, academic institutions, and research initiatives in water, air, and terrestrial environments. Areas include development of statistical analysis of water, air, biota, and groundwater data; NRDA studies; exposure and effects data analysis, risk assessment methods and procedures development in both human health and environmental sciences, evaluation of toxicity data for both terrestrial and aquatic species, criteria development, development and implementation of regulations, overall support of programmatic goals and objectives, formal research activities, analysis of avian survey measurements, development collision risk assessment methods and models for the wind industry.

• Manager of over 400 projects for industry and government resulting in numerous reports, conference proceedings, and peer-reviewed publications in the areas of NRD litigation, wind power, water quality, air quality, environmental statistics, epidemiology studies, human health

risk assessment, probabilistic risk analysis, watershed assessment, bioassessment, and Bayesian decision and inference.

• Initiated and developed four individual businesses within existing firms: (1) air quality division The Cadmus Group, (2) risk assessment division The Cadmus Group, (3) statistics group Cardno ENTRIX, (4) Biostatistics Center within Social and Scientific Systems.

• Originated, managed, and maintained EcoStat, Inc., a small business working with both industry and government.

• Science Advisory Board: Restoration of the Missouri River (ongoing).

• EPA Science Advisory Board: Ecological Risk Assessment of PCB Impacts, Kalamazoo River, Michigan.

• Statistician: Evaluation of airborne risk from radioactive nuclides. Hunters Point, CA Superfund Site.

• Statistical support to Dow Chemical: Tittabawassee River Risk Assessment. Evaluation of risk to avian species.

• Fish and Wildlife Service Science Advisory Board: Evaluation of PCB toxicity on the Hudson River, NY: Evaluation of Laboratory Toxicity Tests.

• Fish and Wildlife Service Science Advisory Board: Evaluation of PCB toxicity on the Hudson River, NY: Evaluation of PCB Effects on Mink.

• Fish and Wildlife Service, State of Michigan, EPA- Science Advisory Board: Evaluation of PCB toxicity to avian species on the Hudson River, NY.

• Invited panel member of the National Wind Coordination Committee (NWCC), Risk Assessment Workgroup.

• Invited speaker and associated lead chapter author of six SETAC Pellston Conferences including Sediment Risk Assessment, Multiple Stressors (steering committee member), Probabilistic Risk Assessment of Pesticides, Whole Effluent Toxicity Testing, Uncertainty Analysis In Ecological Risk Assessment (chair, lead editor, lead conference organizer, and creator), and Pesticide Risk Assessment for Pollinators.

• Instructor and creator of a continuing education course sponsored by the Duke University School of the Environment entitled New Advances in Quantitative Ecological Risk Assessment. Invited speaker in the School of the Environment at Duke University in the areas of risk assessment, data analysis, probability, and ecological modeling.

• Invited panel member and reviewer of the EPA Framework Document For Ecological Risk Assessment, The Superfund Risk Assessment Guidance Document, and the Canadian Risk Assessment Guidance Document for New Substances.

• Lead consulting statistician supporting the majority of the EPA Acid Rain Division's (now the Clean Air Markets Division) regulatory development activities under the 1990 Clean Air Act Amendments.

• Project manager for major research initiatives including: ecological risk assessment methods and software (WERF), assessments of whole effluent toxicity test variability (WERF), site-specific nutrient criteria, development of risk assessment methods for DOE sites (DOE EM-6), state-of-the-science in ecological risk assessment uncertainty methods (American Chemical Society), and case studies in ecological risk assessment (CEFIC Long-term Research Initiatives).

• Lead statistician for British Petroleum on the Deepwater Horizon Oil Spill in the Gulf of Mexico.

• Developer of Using Monte Carlo Analysis In The Probabilistic Risk Assessment of Pesticides, a course in uncertainty analysis methods that was given multiple times to EPA's Office of Pesticide Programs (OPP), individual chemical companies, and industry coalitions. Created courses in statistics and probability for Environment Canada's Priority Substances Assessment Program. Developer of courses at Duke University and SETAC in decision sciences, statistics, and probabilistic risk assessment.

• Lead statistician to the Federal Insecticide, Fungicide and Rodenticide Act Environmental Model Validation Task Force (FEMVTF) Statistics Committee in conducting an uncertainty analysis of the PRZM3.12 model.

• Lead statistician supporting 316(b) studies for the assessment of fish entrainment at the Brunswick nuclear power plant, Duke Energy.

• Over 50 platform and poster presentations at NWCC, SETAC, and SOT annual meetings. Frequent invited session chair and speaker at conferences, symposium, and ASTM meetings.

CLASSES TAUGHT

Decision-Making Under Uncertainty – Bayesian Inference. 2016. Seminar Series. Law Seminars International.

New Advances in Ecological Risk Assessment: July 2008. Duke University, School of the Environment, Durham, NC.

Statistical Methods for Water Quality Data Analysis. March 2008. U.S. EPA Region 5. Chicago, Ill.

Bayesian Statistics for Dummies. With Tom Aldenberg. November 2004. Portland, Oregon.

Statistics MTH 112. Fall Semester. 2004. Elon University, Elon, NC.

New Advances in Ecological Risk Assessment: June 2004. Duke University, School of the Environment, Durham, NC.

Methods (Old and New) in Probabilistic Ecological Risk Assessment. April 2004. SETAC Europe Annual Meeting Short Course, Prague, Czech Republic.

Methods (Old and New) in Probabilistic Ecological Risk Assessment. November 2003. SETAC Annual Meeting Short Course, Austin, TX.

Technical Approaches to Setting Site-specific Nutrient Criteria. September 2002. Water Environment Federation, Chicago, IL.

Using Monte Carlo Analysis in the Probabilistic Risk Assessment of Pesticides. June 2002. Syngenta, Jealott's Hill Research Station, Jealott's Hill, England.

Uncertainty Analysis. Duke University School of Engineering. Spring Semester 2001. Durham, NC.

Using Monte Carlo Analysis in the Probabilistic Risk Assessment of Pesticides. November 2001. Syngenta, Greensboro, NC.

Using Monte Carlo Analysis in the Probabilistic Risk Assessment of Pesticides. July 2001. American Crop Protection Association, Baltimore, MD.

Using Monte Carlo Analysis in the Probabilistic Risk Assessment of Pesticides. January 2001. EPA Office of Pesticide Programs, Washington, DC.

Using Monte Carlo Analysis in the Probabilistic Risk Assessment of Pesticides. March 2000. EPA Office of Pesticide Programs, Washington, D.C.

New Advances in Ecological Risk Assessment: April 2002. Duke University, School of the Environment, Durham, NC.

Advanced Topics in Ecological Risk Assessment: March 1999. Duke University, School of the Environment, Durham, NC.

Uncertainty Analysis in Ecological Risk Assessment. 1998. SETAC Annual Meeting, Charlotte, NC

Advanced Topics in Ecological Risk Assessment: March 1998. Duke University, School of the Environment, Durham, NC.

Statistics Course. April,1997. Priority Substances Assessment Program. Environment Canada. Hull, Ontario, Canada.

Advanced Topics in Ecological Risk Assessment: March 1997. Duke University, School of the Environment, Durham, NC.

Uncertainty Analysis in Ecological Risk Assessment. 1996. SETAC Annual Meeting, Washington, DC.

Aquatic Ecological Risk Assessment: Methods for Screening-Level and Probabilistic Risk Assessments. November 1996. Sponsored by the Water Environment Federation. Washington, DC.

Advanced Topics in Ecological Risk Assessment: February 1996. Duke University, School of the Environment, Durham, NC.

Invited Lectures: Overview of Ecological Risk Assessment. Spring 1995. Course title: Environmental Risk Assessment and Decision Making. Duke University, School of the Environment, Durham, NC.

Aquatic Ecological Risk Assessment: April 1995. Duke University, School of the Environment, Durham, NC.

Invited Lectures: Risk Assessment Methods in Water Quality. Spring 1993. Course title: Environmental Risk Assessment and Decision Making. Duke University, School of the Environment, Durham, NC.

Invited Lectures: Risk Assessment Methods in Water Quality. Spring 1992. Course title: Environmental Risk Assessment and Decision Making. Duke University, School of the Environment, Durham, NC.

Invited Lectures: Risk Assessment Methods in Water Quality. Spring 1992. Short course: Environmental Risk Assessment. Duke University Continuing Education Series, Duke University, Durham, NC.

Invited Lecture: Variability of Biological Endpoints and Effects on Standard Setting. Fall 1991. Course title: Environmental Toxicology. Duke University, School of the Environment, Durham, NC.

Regression Analysis, With Laboratory. Spring Semesters 1986-1988. Duke University, School of Environmental Sciences, Durham, NC.

Graduate Student Committee Assignments

Eric Thirolle, M.S.: Thesis title: Guidance for the selection and use of exposure models in ecological risk assessment. Duke University School of the Environment. 1996.

Tom Stockton, Ph.D. Thesis title: Using Bayesian MARS methods for assessing acid deposition. Duke University School of the Environment. 1998.

Molly Haviland. M.S. Thesis title: Soil carbon and dryland spring wheat yield response to a onetime compost application. Montana State University. Ongoing.

DONALD G. CATANZARO, PHD

479-721-2533

dgcatanzaro@gmail.com

Dr. Catanzaro is a Project Scientist and Project Manager that has over 20 years of experience working in statistics, human and ecological health, internet technologies, and Geographic Information Systems (GIS). I have devoted my career to turning large data systems into information and eventually into knowledge. I have developed skills over the long-term using several different GIS, remote sensing, CAD, and GPS software and hardware systems. Dr. Catanzaro's previous employment has been with County Planning Agencies, Federal Agencies, and private firms where his clients have included Federal, State, Tribal, Local, Non-Government organizations as well as private companies. I have a broad Biogeographical and Computer Science background and am well grounded in data analysis including survival, uni/multi-variate, nonparametric, and spatial statistics. My career has been multidisciplinary in approach, wide in scope, and international in scale.

I have the ability to move seamlessly between large relational databases (multi- million rows) and several computer languages and have analyzed large datasets such as forest inventory data for bioenergy assessments; risk analysis of invasive species to the Great Lakes based on shipping data and habitat niche models; analysis of NO2 and SO2 National Ambient Air Quality Standards (NAAQS) for the EPA; analysis of long term monitoring of air quality monitors within California; creating interactive graphical libraries to explore the scientific literature, and conceptual models of nitrogen and phosphorus flows through ecosystems; analyzing pollution attenuation through ground water with spatial statistics; genetic determinates of Extensively Drug-Resistant Tuberculosis (XDR-TB); and; creating population models using multiple US Census Bureau products. I am also currently investigating the effects of air pollution on TB patients (California and Viet Nam), long-term mortality trends in Moldova TB patients, and the use of Artificial Intelligence (Google's TensorFlow) to detect tuberculosis in chest x-rays.

Education

PhD, Biology, University of Arkansas, 1998

BA, Geography, University of California – Los Angeles, 1991

Additional Training

Human Subjects Training (CITI and NIH)

McGill Infectious Diseases and Global Health (2016)

Course I: Tuberculosis Research Methods

Course II: Advanced TB Diagnostics Research

Good Clinical Practice (GCP)

Curry International Tuberculosis Center (2015)

Course I: Focus on LTBI

Course II: Tuberculosis Clinical Intensive

Specialized Computer Applications

Statistics

Microsoft Office

R, MatLab/Octave, SAS , SAS JMP, SPLUS

Excel (expert), Word, PowerPoint, Access

Programming

Business Intelligence

SQL, Python, Visual Basic for Applications,

PowerBI

Java, JavaScript, HTML, XML, Flash / Flex,

Relational Databases

UNIX

MS SQL Server/Azure, MySQL, PostgresSQL,

GIS/Remote Sensing

Oracle, Informix

ESRI ArcPro/GIS/View/Info, CAD, GRASS 6.4,

ERMapper, GeniePro, PCI, ERDAS

Other Technical Skills

Univariate, Multivariate Parametric and Non-Parametric Statistics, Artificial Intelligence/Machine Learning, Regression, Geostatistics, Time Series, Survival Analysis

Database Theory and Management

Integration of data collection hardware and software - mobile computers, depth sounder, GPS

Remote Sensing Application and Theory (aerial photography and digital systems)

Professional Experience

University of Arkansas, Fayetteville, Department of Biological Sciences

Dates Employed: 2014 - Present

Research Assistant Professor: I am the lead Data Analyst & Statistician for a large group researching various aspects tuberculosis diagnostics and treatment. My core responsibilities includes installing & managing REDCap (a browser-based clinical data system), developing and implementing data capture/entry systems (paper, computer, mobile), and creating web-enabled databases which drive project related analysis. As leader of the Data Core, I develop SQL code (and other languages) to support project management by displaying analytics of disparate datasets and creating unique data visualizations. I have used Artificial Intelligence (Google's TensorFlow) to detect tuberculosis in chest x-rays; combined Python & SQL to ingest data from REDCap to MS SQL Server and display information in MS PowerBI, implemented a bioinformatics pipeline to process whole genome sequencing data; developed SQL code which ingests and processes XML data created by a tuberculosis diagnostic device; performed statistical analysis (e.g. trend, regression) for several scientific papers; served as SQL developer to use the common cellphone to provide a simple/easy way to monitor adherence to anti-tuberculosis therapy; performed spatial analysis combining coccidioidomycosis natural history, epidemiology, and global climate change data to predict areas where coccidioidomycosis may increase over time; and used SQL and R to analyze Arkansas All Payer's Claim Database (APCD) investigating age/gender relationships and nontuberculous mycobacterial infection.

Sustainment & Restoration Services (SRS) / Oneida Total Integrated Enterprises (OTIE)

Dates Employed: Jan 2006 - Present

Landscape Ecologist: I have been both a Project Manager (PM) and Project Scientist (PS) for OTIE for the last 16 years. On work assignments where I was PM, I was responsible for developing work plans and budgets, ensuring the overall quality of project work, supervising work performed by other PS and staff members, writing monthly reports and summaries, and preparing final project report(s). On work assignments where I was a PS, I was responsible for

assembling data sources, analyzing spatial and temporal patterns, running statistical analysis, reviewing and writing reports.

Projects I have been involved in over the last 16 years include: providing technical support to the EPA National Center for Environmental Assessment (NCEA) and National Exposure Research Laboratory (NERL) who provide guidance to regions, states and tribes on how tools and science to support implementation of the Clear Water Act & Clean Air Act. Both offices in particular are working to develop metrics that define a relationship between specific ecosystem service and one (or more) aspects of community health.

I have worked with Census 2010, 2000, and 1990 as well as American Community Survey (ACS) data and recreational user data (e.g. USFWS National Survey of Fishing, Hunting, and Wildlife-Associated Recreation).

Selected Project Experience

• Lyme Disease - Over three Work Assignments served as the statistical analyst and GIS support for determining the generalized applicability of a model to predict Lyme disease incidence across Maryland and Pennsylvania from landscape variables such as population and forest cover. An online interactive viewer was developed tying ArcGIS for Server Javascript API to logistic regression predictive equations and assisted users as they explore models by the usage of interactive sliders to vary disease rate thresholds and risk probabilities and examine the consequences

• CADStat – Served as QA/QC Manager for two EPA Work Assignments to develop CADStat, a menu-drive statistical package of several data visualization and statistical methods. CADStat is currently deployed on EPA's server (http://www.epa.gov/caddis) and is a Java Graphical User Interface to R (R is an open source statistical software). Methods in CADStat include: scatter plots, box plots, correlation analysis, linear regression, quantile regression, conditional probability analysis, and tools for predicting environmental conditions from biological observations

• CCAT – I developed an HTML5/Javascript application for the EPA called the Community Cumulative Assessment Tool (CCAT) which combines EPA's Environmental Justice, Risk Assessment, and Community Involvement concepts to address multiple stressors within the EPA's cumulative risk assessment framework.

• C/T-FERST – Performed data development, integration and deployment of the EPA's Community/Tribally-Focused Exposure and Risk Screening Tool (C/T-FERST) which supports EPA's integration with other decision-support tools for communities and tribes. C/T-FERST is intended to assist community partners with the challenge of identifying and prioritizing community environmental health risk issues.

EcoStat, Inc

Dates Employed: Feb 2010 - Present

Statistician Provided data quality, processing and statistical analysis for multiple projects including in the development of Data Quality Objectives (DQOs) for the EPA's NO2 and SO2 National Ambient Air Quality Standards (NAAQS). NAAQS are designed to provide requisite protection of public health as appropriate under section 109 of the Clean Air Act (CAA). The interacting effects of precision, bias, and completeness were investigated using hourly measurements at over 300 monitoring stations across the country. Other projects include developing an interactive data exploration tool (using MS Excel) for pesticide risk assessment, data processing and analysis of MTBE contamination of private wells, spatial and time series analysis of pollutant inputs into Puget Sound ,exploratory data analysis and model development between Carbon Dioxide emissions and measurements of other power plant variables.

San Diego State University, Bioinformatics & Medical Informatics Department

Dates Employed: May 2012-May 2013

Adjunct Faculty: Data Core leader, lead statistician, and member of the Leadership Team for a NIH sponsored project to test new genetic-based diagnostics tools to detect XDR-TB (U01-AI082229). The project enrolled over 1,110 subjects in three international sites to investigate common mutations which confer drug-resistance. I provided technical oversight of data collection systems (both web and laptop/netbook based), quality assurance, as well as liaison support between the Health Information Technology Group and the clinical staff.

The complexity of project components required several staff members input into how to most efficiently store, manage, query, analyze, and visualize the large quantity of data collected. I played a major role in many of these activities, using expert knowledge to maintain a high level of data collections efficiency and quality. I provided statistical analysis, geographic analysis, and data visualizations to other project staff working with epidemiological and genetic data.

1726 N Charlee Fayetteville, Arkansas

72703 Dates Engaged: 2007-2012

As a consultant to BioEnergy Systems, I worked on natural resource evaluations, project site assessments (desk studies), renewable energy systems, and data visualizations of complex issues for clients. I compiled the data to support an assessment of agricultural and forest biomass resources in the mid portion of the Mississippi River Alluvial Valley, an area that included 98 counties in Arkansas, Kentucky, Mississippi, Missouri and Tennessee)

Co-developed a high-resolution user-interactive tool for analyzing biomass feedstock supplies (BioFeedStAT® see http://www.biomass2.com/fsa/fsa.html). The tool is used to determine quantities vs. distances (in 0.5-mile increments -- actual road miles, not air miles) and transport costs of any combination of target feedstocks. Source data for BioFeedStAT® is a combination

of large databases housing data from the US Forest Service Forest Inventory Data, USDA Cropland Data Layer, and USDA Census of Agriculture.

US Census Bureau / Census Coverage Measurement, Kansas City Regional Census Center

Dates Employed: May 2009- July 2011

Regional Technician (Grade GG-0301-12): As a Regional Technician for 2010 Census, provided technical assistance to the Kansas City Regional Census Center (KC-RCC) for all five Census Coverage Measurement (CCM) operations. CCM operations have three primary objectives: (1) to inform the public about the quality of the census counts; (2) to help identify sources of error to improve census taking, and (3) to provide alternative counts based on information from the coverage measurement program.

As a Regional Technician, I worked under specific direction from the regional office to provide technical and administrative support for all recruitment, personnel, payroll, field data collection, group quarters, office and evaluation operations, automation activities, postal liaison activities, map/geography problems.

Served as a Master Trainer and trained Field Operation Supervisors, Crew Leaders, and Enumerators in all CCM operations in Arkansas, Oklahoma, Missouri, and Minnesota. I trained over 350 employees in small group settings (classes of 10-20). I served as trouble shooter in all five CCM operations and backfilled Field Operation Supervisors, Crew Leaders, and/or Enumerators when field staff quit or not available to work.

Enercon Services, Inc

Dates Employed: Mar 2006 – May 2007

Project Scientist: Provided training to subordinate employees on how to conduct a Severe Accident Mitigation Alternatives (SAMA) for the Nuclear Regulatory Commission (NRC). Oversaw work of subordinate employees, and performed quality checks to ensure high quality work was submitted.

Provided project work, Quality Assurance, and Technical Review for several different nuclear license renewal applications from Entergy Corporation to the NRC. Project works included using GIS to collect, analyze, and support the writing of reports to support the construction of a SAMA for submittal to the NRC. Used US Census Bureau Summary File (SF) 1 and SF3 (for general and environmental justice populations) and Agricultural Census, and local sources of data (e.g. tourism, tax assessment, population growth) to investigate how a severe accident at a nuclear power plant may affect the surrounding communities.

Quality reviews included ensuring all calculations and methodologies follow NRC guidance, performing independent checks on data, reviewing all written materials and sources to ensure accuracy and veracity.

FTN Associates, LTD

Dates Employed: Oct 2002 – Dec 2005

Landscape Ecologist: Provided GIS, biological and statistical expertise for industrial, governmental, and nongovernmental clients for a water resources environmental consulting company. Wrote proposals (technical and cost), analyzed data, wrote monthly and final report(s) and recruited and supervised subordinate employees (as necessary).

Created socio-economic and agricultural datasets (data sources were Census 2000 SF1 and SF3 and Census of Agriculture 1997 and 2002) to support Severe Accident Mitigation Alternatives (SAMA) and NEPA analyses for nuclear power industry; providing global climate change research on coral reefs of American Samoa; used GIS to model a new framework for sustainable water resources management; remote sensing and wildlife assessment for Columbian Sharp-Tailed Grouse; organizing and facilitating a 30 person workshop to address multiple stressors to aquatic ecosystems; synthesizing and reviewing the results of the EPA STAR Ecosystem Indicator Program; conducting literature review and analysis on nitrogen phosphorus-algae dynamics; and used GIS to model pollution attenuation through groundwater.

National Park Service, Virgin Islands / South Florida Cluster – Long Term Ecological Monitoring

Dates Employed: Oct 1999 - Oct 2002

Inventory & Monitoring Coordinator (Grade GS-0401-12): Number of Employees: 3

Budget: $350,000Supervised employees, responsible for purchasing major/minor equipment, develop and tracked budgets for a brand new Inventory & Monitoring Program. Responsible for developing and implementing a statistically defensible program to inventory and monitor six marine natural resources found in the 98,000 acres of natural resources at three National Park Service (NPS) units: Virgin Islands National Park, Buck Island Reef National Monument, and Dry Tortugas National Park. These six resources were: water quality, coral reefs, seagrass, seabirds, fish, and sea turtles. Infused several technological improvements in the monitoring program which reduced field time and data transcription such as: obtaining remote sensing datasets (multispectral and hyperspectral), creating several park-wide fully functional GIS, using SONAR technology to locate monitoring sites for coral reefs and seagrass beds, standardizing underwater digital photography and videography, use of digital field data recorders, and storage of field data in relational databases. During my tenure, I was able to infuse several technological improvements in the monitoring program which reduced field time and data transcription by at least 30%. Developed and maintain a comprehensive GIS and Relational Database Management System (RDMS) for spatial and biological data to link coral reef, seagrass, fish population, seabird, water quality and sea turtle datasets together into one cohesive unit. Created interactive programs to ensure correct data entry into computerized systems, served as primary statistical consultant for data analysis, and presented results of data analysis to NPS management.

National Park Service

Virgin Islands / S Florida Cluster – Long Term Ecological Monitoring

Dates Employed: Apr 1999 – Oct 1999

Ecologist/Data Manager (Grade GS-0401-11): Primary duties were to develop and maintain a comprehensive Relational Database Management System for spatial and biological data associated with the Virgin Islands-LTEM program. I was responsible for the upkeep of computer systems and linking previously collected datasets together into one cohesive unit. As the lead individual for the VI-LTEM program, I provided oversight for the construction of statistically defensible I & M protocols that are consistent with current policies and guidelines. Hired new employees, tracked budgets and projected budgetary needs into the future. I increased the visibility of the Virgin Islands-LTEM program by increasing communication and information flow to the national NPS I&M Program, higher level management in each park, and division managers within each park.

National Park Service

Prairie Cluster-Long Term Ecological Monitoring Program

Wilson's Creek National Battlefield

Dates Employed: Sep 98 – Apr 99

Ecologist/Data Manager (Grade GS-0401-11 (Term Position)): Primary duties were to develop and maintain a comprehensive Relational Database Management System for spatial and biological data associated with the Prairie Cluster LTEM program. As Data Manager, I met with Principal Investigators which were writing monitoring protocols and worked to standardize data collection procedures while ensuring contracted work fulfilled NPS I&M goals. I constructed digital databases using geographically registered data, analyzed and derived new data themes to interpret long-term monitoring data, ensured that documentation of these datasets was maintained and that long-term archiving, integration, and retrieval of data sets produced by the Prairie Cluster LTEM program and supporting cooperators occurred. I was program liaison with GIS providers to ensure appropriate development of spatial layers and integration of Prairie Cluster LTEM datasets into GIS themes. I provided technical support with respect to accuracy, precision and completeness of all resultant datasets of Prairie Cluster LTEM work. Other duties included interpreting aerial photographs, satellite and other types of data using knowledge of geography, physical and biological resources and wrote a scope of work for an adjacent land use study using historic aerial photographs dating to 1936. I installed and integrated GIS and data management software programs and provided training on new software applications.

EPA Response: The EPA disagrees with the commenter's statements; the EPA followed its procedures and guidance, including those for good data and statistical practices, good statistical analysis practices, consistency of methods and models, and the ability to replicate analytical results. The EPA disagrees with the commenter that the EPA's proposed standard lacks scientific and statistical merit. As discussed throughout the *Response to Comments* document, the EPA has used best available, peer-reviewed science to inform its decision making. See section 1.3 of the *Response to Comments* document, and section I and III.A-D of the FRN

and section 3 of the *Response to Comments* document for summaries of best available science used for preliminary regulatory determinations of four PFAS. Please see section IV of the FRN, as well section 4.1.2 of the EPA response in this *Response to Comments* document, particularly the EPA response to comment Doc. #1774, SBC-045680, for discussion of the EPA's health-based approach, which relies on the EPA's guidance and procedures and the best available science for the toxicity assessments for the six PFAS.

In response to the commenter's critique that the agency considered research produced by external authors, the EPA notes that excluding this research would ignore the best available science, given that the vast majority of peer-reviewed science is produced by scientists not employed by the EPA. The EPA has addressed other specific comments raised by the commenter in subsequent sections of the *Response to Comments* document.

California-Nevada Section American Water Works Association (CA-NV AWWA) (Doc. #1775, SBC-045267)

May 30, 2023

Jennifer McLain

Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1201 Constitution Avenue, NW

Washington, DC 20004

Re: Docket EPA-HQ-OW-2022-0114 FRL 8543-01-OW – Proposed National Primary Drinking Water Regulation for Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS)

Dear Dr. McLain:

The California-Nevada Section of the American Water Works Association (CA-NV AWWA) is pleased to have the opportunity to submit comments on the proposed National Primary Drinking Water Regulation (NPDWR) for the PFAS compounds, PFOA and PFOS. CA-NV AWWA comprises the members of the American Water Works Association in California and Nevada: over 5,000 water professionals and over 500 water utilities of all sizes and types, collectively providing the drinking water for over 90 percent of the population of the two states, or about 40 million people. Many of our member utilities also provide wastewater collection and treatment service to their communities.

Per- and polyfluoroalkyl substances (PFAS) burst into public awareness as a drinking water and wastewater contaminant, triggering massive efforts to understand the full impacts of this broad category of thousands of chemical compounds. The water sector is on a steep learning curve

along with government regulators about the geographic occurrence, the health effects, the effective methods for treatment and disposal or destruction of the substances, and the cost and economic feasibility of dealing with this new scourge. CA-NV AWWA strongly supports the regulatory system developed under the statutory framework of the Safe Drinking Water Act (SDWA), which rests on application of the best scientific knowledge of human health effects, expert understanding of technical feasibility, and careful analysis of the economic feasibility of a proposed regulation. AWWA has been a leader in pursuing the goal of safe and affordable water and successful, well managed utilities since its formation in 1881 – and in the case of the California-Nevada Section, since 1920. We support following these same objectives and established SDWA regulatory processes as EPA and drinking water providers strive to protect public health and balance competing, sometimes incompatible factors.

CA-NV AWWA supports the extensive comments submitted by the American Water Works Association and wishes to highlight some of the main concerns our members have raised. First, we have concerns with several technical aspects of the proposed regulation: misapplication of the Practical Quantitation Limits (PQLs); inclusion of nonviable "trigger levels"; effects of the novel Hazard Index (HI) as proposed; and constraints on both laboratory capacity and capabilities. Second, we find the economic feasibility analysis to be inadequate by relying on incomplete PFAS occurrence data, underestimating the cost of compliance for water systems and communities nationwide, and being unresponsive to serious concerns about the impact on household affordability, contrary to environmental justice concerns expressed to the Agency. Third, CA-NV AWWA has several concerns about the regulatory process underway. We make several recommendations on steps and timeframes EPA should adopt to strengthen this rulemaking process and implementation of the regulation when it is promulgated.

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on PQLs, trigger levels, and laboratory capacity please see sections 5.1, 8.8, and 7 of the *Response to Comments* document. For additional discussion on the MCLG derivation for a PFAS mixture (Hazard Index), please see section 4.3 of the *Response to Comments* document. Please see section 13.3 of the *Response to Comments* document for a discussion on costs and affordability.

California-Nevada Section American Water Works Association (CA-NV AWWA) (Doc. #1775, SBC-045282)

Until practical and achievable PFAS regulations are developed, CA-NV AWWA supports the use of existing health protective measures already implemented by states and EPA to protect public health.

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document.

American Fluoridation Society, Inc. (Doc. #1776, SBC-043830)

May 30, 2023

U.S. Environmental Protection Agency

Office of Ground Water and Drinking Water

Mail Code 2822IT

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114—PFAS National Primary Drinking Water Regulation

To Whom it May Concern,

On behalf of, and as President of, the American Fluoridation Society, Inc., we would like to comment on the Environmental Protection Agency's proposal to reduce exposure to several per- and polyfluoroalkyl (PFAS) substances in drinking water. These comments are in response to your Federal Register notice of March 29, 2023 (88 FR 18638).

The American Fluoridation Society, Inc. is a 501c4 not for profit that works to assure that all residents of the U.S. served by community water systems continue to have community water fluoridation (fluoridation, water fluoridation). We are a group of healthcare professionals that do not receive any income or remuneration for our efforts to defend, protect, and to expand water fluoridation.

Water fluoridation is the only public oral health measure that provides health equity among everyone in our country. We must continue to provide fluoridation uninterrupted to our families as it is the only cost-effective means to provide the right amount of fluoride to everyone on community water systems. Fluoridation does not take a change in behavior or cognitive effort for people to realize its benefits. Water fluoridation reduces cavities by at least 25% for adults and children regardless of age, race, ethnicity, socioeconomic status, level of education, or access to dental care. As of 2018, the U.S. Centers for Disease Control and Prevention lists the number of U.S. residents served by fluoridation to be in excess of 207 million people.

Water fluoridation improves the general health of our nation's families through improving good oral health. You cannot have good general health without good oral health. For many families, fluoridation is the only dental preventive care that they will ever receive.

The American Fluoridation Society applauds the EPA for its diligence to protect our residents from the health effects of PFAS "forever" manmade chemicals. We all want to improve the lives of our residents in all ways that we possibly can without removing positive measures that protect them from preventable diseases. Dental cavities are the number one chronic disease of adults and

children, multiple times more common than asthma, diabetes, and obesity. Cavities are an infectious and transmissible disease that is reduced by at least 25% by water fluoridation.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Metropolitan Water District of Southern California (Doc. #1777, SBC-045427)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket, Mail Code 2822IT 1200

Pennsylvania Avenue NW

Washington, DC 20460

Subject: Docket ID No. EPA–HQ– OW–2022–0114 -- PFAS National Primary Drinking Water Regulation Rulemaking

Dear Sir/Madam:

The Metropolitan Water District of Southern California (Metropolitan) appreciates the opportunity to comment on the United States Environmental Protection Agency's (EPA's) proposed PFAS National Primary Drinking Water Regulation (NPDWR) Rulemaking. As a regional water wholesaler, Metropolitan delivers water to 26 member agencies (including 14 cities, 11 municipal water districts, and one county water authority), which in turn, directly or through their customers, provide water to approximately 19 million people in southern California. Metropolitan's mission is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

The issue of per- and polyfluoroalkyl substances (PFAS) in drinking water supplies is of growing concern in southern California, including for many of Metropolitan's member agencies and other retail water and groundwater management agencies within our region. Perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) have been detected in groundwater in monitoring wells, private drinking water wells, and public drinking water systems across the country. [FN1: See 87 Fed. Reg. 54415, at 54417 (Sept. 6, 2022).] PFOA and PFOS have been detected in over 400 groundwater wells in southern California alone. [FN2: GeoTracker PFAS Map (ca.gov)] Water agencies have taken numerous groundwater wells out of service due to PFAS detections and are seeking alternative supplies or investing in costly treatment to ensure a safe and reliable water supply for their communities.

Metropolitan supports EPA's effort to regulate PFOA and PFOS in drinking water and recognizes EPA is uniquely qualified to address the complex issues surrounding PFAS in the environment. In this letter, Metropolitan highlights the operational feasibility and financial impacts of the proposed NPDWR Rulemaking which water agencies may face and provides recommendations to strengthen the regulation. Specifically, Metropolitan has the following comments and recommendations:

1. EPA's proposed Maximum Contaminant Levels (MCLs) and Maximum Contaminant Level Goals (MCLGs) for PFHxS, GenX chemicals, PFNA, and PFBS are premature and should follow EPA's established regulatory process.

2. EPA should consider data from UCMR 5 and updated treated drinking water occurrence data from states for PFHxS, GenX chemicals, PFNA, and PFBS.

3. Current analytical methods cannot reliably quantify PFOA and PFOS at the proposed trigger level of 1.3 parts per trillion (ppt).

4. EPA should consider the consequences and impacts of using the proposed Hazard Index approach.

5. EPA should fully consider the economic impacts and feasibility of the proposed regulations.

These comments are supported by a more detailed explanation below.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional information on MCLs and MCLGs, please see sections 4 and 5 of the *Response to Comments* document, respectively. For additional discussion of UCMR 5 data, please see section 6.8 of the *Response to Comments* document. For additional discussion of analytical methods, please see section 7 of the *Response to Comments* document. For additional discussion on the Hazard Index approach, please see section 4.3.2 of the *Response to Comments* document. For additional discussion on economic impacts and feasibility, please see section 13 of the *Response to Comments* document.

Metropolitan Water District of Southern California (Doc. #1777, SBC-045438)

Conclusion

Metropolitan supports EPA's efforts to address the issue of PFAS in drinking water supplies. However, absent sufficient occurrence data, adequate analytical methods and lab capacity, feasible procedures for treating and disposing of residuals, and a thorough economic analysis, Metropolitan is concerned that this regulatory action may have far-reaching implications and could unintentionally harm water agencies, as well as their ratepayers. Metropolitan urges EPA to ensure that regulatory decisions are made after appropriate consideration of the likely consequences and all available data, the proposed NPDWR Rulemaking's benefits justify the costs, and accountability and transparency are promoted as described in this letter.

Metropolitan appreciates the attention that EPA is placing on this important issue that impacts drinking water systems across the country. If you have any questions regarding these comments, please contact me at prochelle@mwdh2o.com or (909) 392-5155.

Sincerely,

Paul A. Rochelle, Ph.D.

Water Quality Section Manager Water System Operations

[Attachment 1: see docket ID EPA-HQ-OW-2022-0114-1777]

EPA Response: The EPA acknowledges this comment. As discussed in the FRN and sections 1.1, 1.3, and 13 of the *Response to Comments* document, the EPA is taking this action after full consideration of the likely consequences and available data, costs and benefits, and ensuring accountability and transparency. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Uttara Jhaveri (Doc. #1778, SBC-045452)

Conclusion

Ultimately, the regulation's purpose is to protect and promote human health and safety. The permissible limit should be more achievable considering the current technology and economic feasibility. The scope of the regulation should be extended to other PFAS, which are part of the UCMR, and cost-benefit analysis should highlight the public health benefit and 'Polluter Pays Principle' to push the rulemaking with stakeholders.

I appreciate the opportunity to comment on the "PFAS National Primary Drinking Water Regulation Rulemaking," and I hope that the regulations create a safer environment and drinking water standards for our community and children. The regulation is historic and a much-anticipated step towards providing clean and safe drinking water for Americans.

Sincerely,

Uttara Jhaveri

Healthcare Attorney

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see generally section 1.3 of the EPA response in this *Response to Comments* document, and please see section 4.3.5 in response to the request to incorporate additional PFAS into the scope of the final rule.

San Diego County Water Authority, CA (Doc. #1779, SBC-045285)

May 30, 2023

The Honorable Michael S. Regan

Administrator

U.S. Environmental Protection Agency

William Jefferson Clinton Building

1201 Pennsylvania Avenue, N.W.

Washington, D.C. 20460

RE: PFAS National Primary Drinking Water Regulation – Docket ID No. EPA-HW-OW-2022-0114

Dear Administrator Regan:

The San Diego County Water authority (Water Authority) appreciates the opportunity to provide comments on the U.S. Environmental Protection Agency's (EPA) proposed PFAS National Primary Drinking Water Regulation. The Water Authority is a regional wholesale water supply agency whose mission is to provide a safe and reliable water supply to 24 retail member agencies in San Diego County. We provide approximately 80% of the water used in San Diego County, sustaining a $240 billion economy and quality of life for 3.3 million residents. The Water Authority supports EPA establishing drinking water standards for FPAS to protect health, and offer the following additional comments:

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

San Diego County Water Authority, CA (Doc. #1779, SBC-045292)

In closing, we support EPA taking steps to protect public health, and encourage EPA to prioritize protecting source water quality and investing in research to reduce the impacts of costs to end users. If you have any questions, please contact Lesley Dobalian at LDobalian@sdcwa.org.

Sincerely,

Kelley Gage

Director of Water Resources

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Coralie Pryde (Doc. #1781, SBC-043813)

Comment on Docket ID: EPA-HQ-OW-2022-0114.

From: Coralie Pryde, Wilmington, DE

Date: May30, 2023

I strongly support the EPA's proposed action to establish a National Primary Drinking Water Regulation that would create enforceable limits for the concentrations of PFOA and PFOS in our drinking water.

I believe regulations would be particularly important in Delaware. We have had several situations in which drinking water levels near military airports and sites used for testing PFOAS on fires were extremely high. In the city of New Castle, PFOS levels as high as 4500 ppt were measured in city wells. [FN1: https://apnews.com/ar1cle/business-health-environment-and-nature-956fa8e2d60f3e5b2f92B520ea2ac53]

Tests near Dover Air Force Base showed levels of POA and PFOS of about 290.000 ppt a decade after a fire from a plane crash necessitated the use of massive amounts of fire-fighting foam. [FN2: https://www.delawareonline.com/story/opinion/2022/12/10/contaminated-delaware-bases-threaten-vulnerable-communi1es/69715281007/] This contamination was found to have spread to nearby wells serving Environmental Justice communities.

Water from these extremely contaminated wells has bens treated by filtration. State officials say that PFAS contamination in such sites is now "acceptable", but it is not clear what standard is being used.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Northwest Biosolids Association et al. (Doc. #1783, SBC-043791)

Thank you for the opportunity to comment on the National Drinking Water Regulations for Per- and polyfluoroalkyl substances (PFAS) proposed by the Environmental Protection Agency (EPA) on March 31, 2023. Our collective biosolids associates represent Publicly Owned Treatment Plants (POTWs), Farmers, Foresters, Scientists and Regulators from across the U.S. We applaud EPA's efforts to protect public health by minimizing exposure to PFAS from drinking water sources. There is more work to be done and we offer the following attached comments to further efforts on protection.

May 30, 2023

SUBMITTED ELECTRONICALLY: HTTPS://WWW.REGULATIONS.GOV

Subject:

Docket ID #EPA-HQ-OW-2022-0114 Per- and polyfluoroalkyl substances (PFAS): Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS) National Primary Drinking Water Regulation Rulemaking

To Whom It May Concern:

On behalf of NW Biosolids Association, Mid-Atlantic Biosolids Association, Northeast Biosolids and Residuals Association, Midwest Biosolids Association, Virginia Biosolids Council, and Southeast Biosolids Association, thank you for the opportunity to comment on the National Drinking Water Regulations for Per- and polyfluoroalkyl substances (PFAS) proposed by the Environmental Protection Agency (EPA) on March 31, 2023. Our collective biosolids associates represent Publicly Owned Treatment Plants (POTWs), Farmers, Foresters, Scientists and Regulators from all four corners of the U.S. We applaud EPA's efforts to protect public health by minimizing exposure to PFAS from drinking water sources. National Drinking Water Regulations have implications for other regulated programs. Therefore, we offer the following comments for the agency to consider before establishing drinking water regulations for these substances.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Silent Spring Institute (Doc. #1784, SBC-045798)

We commend the EPA for proposing drinking water MCLs for PFOA, PFOS, PFHxS, HFPO-DA, PFNA, and PFBS. Below is a summary of our main points:

1. There is strong evidence of harm from low-dose exposures to PFOA and PFOS, including for sensitive subpopulations such as pregnant women, children, and nursing individuals.

2. Setting standards for PFHxS, HFPO-DA, PFNA, and PFBS, in addition to PFOA and PFOS, is appropriate given strong evidence for adverse health effects and their prevalence in public water supplies.

3. Regulating PFHxS, HFPO-DA, PFNA, and PFBS cumulatively under a hazard index is appropriate. It is a practical decision for addressing noncancer effects, and has been previously applied in numerous regulatory settings such as Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). We recognize the proposed rule as a step in the right direction toward a class-based approach.

4. The Health Risk Reduction and Cost Analysis (HRRCA) likely omits or underestimates significant health and environmental benefits to PFAS limits in drinking water.

5. EPA should target support towards communities and water systems that bear the brunt of PFAS contamination, including, but not limited to, small water systems, rural or isolated

systems, overburdened systems, communities of color, low-income communities, and communities in proximity to PFAS-manufacturing and media-disposal facilities.

In addition to our comments on the current proposed standards, we have included supplemental comments for EPA's consideration after these current standards are finalized. Beyond the six compounds included in the current draft standards, other PFAS are also prevalent in U.S. public water supplies and are linked with adverse health outcomes.

The proposed standards will go a long way toward addressing this class of pervasive, highly persistent, and toxic compounds that are well documented to be associated with many health concerns and should be finalized as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on the HRRCA, please see section 13 of the *Response to Comments* document. For additional discussion about other PFAS, please see section 4.3.5 of the *Response to Comments* document. For additional discussion about environmental justice, please see section14.10 of the *Response to Comments* document.

Bailey Smith (Doc. #1787, SBC-045808)

Thus, this public comment seeks to elaborate on the reasons for which I support EPA's proposed rule as well as address the following requests for comments from the EPA:

• "what may be needed for water systems to effectively communicate information about the PFAS [National Primary Drinking Water Regulations] NPDWR to the public,"[FN3: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18638, 18731 (proposed Mar. 29, 2023) (to be codified at 40 C.F.R. pts. 141 and 142) [hereinafter "Proposed Rule"].]

• "the impacts that the disposal of PFAS contaminated treatment residuals may have in communities adjacent to the disposal facilities,"[FN4: Proposed Rule, supra note 3 at 18731.] and

• "proposed determination to set [maximum contaminant levels] MCLs at 4.0 ppt for PFOA and PFOS."[FN5: Id. at 18730.]

Ultimately, I believe that EPA's proposed rule will benefit the public health and this comment aims to express support for it as well as provide recommendations to strengthen it.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. For the requests for comment from the EPA on the listed topics, please see the below EPA responses in this *Response to Comments* document. Regarding communications between water systems and the public, please see section 1.2 in this *Response to Comments* document, including the EPA response to comment Doc. #1787, SBC-045810. For further discussion regarding disposal of PFAS contaminated treatment residuals, please see section 10.4.3, particularly the EPA response

to comment Doc. #1787, SBC-045813. For comments regarding the set MCLs for PFOA and PFOS, please see section 5.1.1, particularly the EPA response to comment Doc. #1787, SBC-045814.

Bailey Smith (Doc. #1787, SBC-045816)

Ultimately, I believe it is in the public's best interest for the EPA to move forward with its "PFAS National Primary Drinking Water Regulation Rulemaking." The proposed rule comports with SDWA's "best available science" standard [FN50: 42 U.S.C. § 300g-1(b)(3)(A)(i).] and protects vulnerable communities.

Thank you for your time and consideration.

Sincerely,

Bailey Smith, J.D., LL.M.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mr. Michael Regan, Administrator

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N. W. Washington, D.C. 20460

Re: Support for regulating PFAS chemicals in drinking water (EPA DOCKET ID NO: EPA-HQ-OW-2022-0114)

Dear Administrator Regan,

I, like many others, were pleased to see the revised health advisories (HAs) for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) and issued new HAs for four additional PFAS (US Environmental Protection Agency, 2022). The new HAs for PFOA and PFOS HAs are 17,500 times lower than the prior HAs and are below the current capabilities of laboratories to detect PFOA and PFOS. This supports what many of us have been saying for years: there is no safe level of exposure to PFOA and PFOS and prior HAs greatly underestimated health risks from PFOA and PFOS (Grandjean & Clapp, 2015).

Without federal action to curb public exposure, between 2016 and 2022, legislators like me in New Hampshire in several other states including New Jersey, New York, Vermont, and Massachusetts, etc. took action to regulate PFOA and PFOS, and other PFAS chemicals in drinking water in response to concerns raised by exposed communities like mine. The states enacted MCLs that were approximately 1/10th of the 2016 EPA HAs.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fairfax Water (Doc. #1789, SBC-045311)

In closing we offer the following summary of our comments:

1. Fairfax Water supports the development of primary drinking water standards for PFAS compounds based on the best available science and understanding of risk as part of a national, comprehensive regulatory regime to remove these substances from the environment.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Re: Docket ID No. EPA-HQ-OW-2022-0114

PFAS National Primary Drinking Water Regulation Rulemaking

Dear Assistant Administrator Fox:

Fairfax Water is a not-for-profit utility that proudly provides high quality drinking water to over two million residents of Northern Virginia. One in four Virginians receives water produced by Fairfax Water. We operate two water treatment plants sourced by the Occoquan Reservoir and Potomac River respectively, with a combined production capacity of 345 million gallons per day.

Fairfax Water supports the development of primary drinking water standards for PFAS compounds based on the best available science and understanding of risk. A national standard is preferable to the current patchwork of differing state standards and will provide clarity for both water utilities and the public we serve. However, we do have significant concerns with aspects of the proposed regulation and its successful implementation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR as well as additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Re: Docket ID No. EPA-HQ-OW-2022-0114, Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan,

I am writing on behalf of the Metropolitan Washington Council of Governments (COG) Chesapeake Bay and Water Resources Policy Committee (CBPC) to provide our committee's comments on the proposed per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulations (NPDWR). COG is a nonprofit association, with a membership of

300 elected officials from 24 local governments, the Maryland and Virginia state legislatures, and U.S. Congress. Every month, more than 1,500 officials and experts connect through COG to develop solutions to the region's major challenges and plan for the future. Established in 1998, the CBPC is comprised of local elected officials and representatives from COG's member governments and water and wastewater utilities in the metropolitan Washington region. The CBPC recommends water resources policies to the COG Board of Directors, addressing issues related to water and wastewater treatment, local water quality, stormwater management, flooding, and more.

COG and our member jurisdictions have a long history of partnership with the federal government, including strong support for environmental regulations based on sound science and equity. We share the same goal as EPA of ensuring the delivery of clean, safe drinking water to the public. Considering the persistent nature of PFAS and their potential human health risks, COG supports EPA's decision to regulate PFOS and PFOA in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

RE: Comments regarding Proposed PFAS National Primary Drinking Water Regulation (Docket ID: EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox:

The Ohio Environmental Council appreciates the opportunity to provide comments on EPA's proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS). In 2018, the Ohio Environmental Council submitted a petition for rulemaking to the EPA pertaining PFAS, outlining the need for comprehensive regulation under the Safe Drinking Water Act and Clean Water Act. Since submission, the science surrounding PFAS has provided even more evidence demonstrating its risks. And while it has taken nearly five years for the agency to take substantive action under either law, we're excited by these first steps, and look forward to additional PFAS regulation over the coming years.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peggy Kurtz (Doc. #1799, SBC-046043)

I urge you to approve these regulations as written. And then to begin the work to halt the approval of all new PFAS.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Massachusetts Municipal Association (MMA) (Doc. #1800, SBC-043759)

Washington, DC 20460

Submitted via Regulations.gov

Re: Docket ID No. EPA-HQ-OW-2022-0114 - National Primary Drinking Water Regulation Rulemaking for per- and polyfluoroalkyl substances (PFAS)

Dear Administrator Regan,

On behalf of the 351 cities and towns of the Commonwealth, the Massachusetts Municipal Association (MMA) is writing to provide comments on the proposed National Primary Drinking Water Regulation (NPDWR) for per- and polyfluoroalkyl substances (PFAS).

We deeply appreciate the Environmental Protection Agency's (EPA) focus to address emerging contaminants in drinking water, including PFAS. The MMA greatly appreciates the intent of the proposed regulations by the EPA to protect public and environmental health. Massachusetts municipalities and their public water systems (PWS) take their role as stewards of clean, safe drinking water seriously. Their continued protection of this important natural resource to the residents, businesses, and communities they serve reflects an ongoing commitment to the well-being of the environment, our economy, and our daily lives.

As one of several states with experience regulating PFAS through a state-specific drinking water standard, we would like to provide further context on how the EPA's proposed National Primary Drinking Water Regulation for PFAS could impact the cities and towns of Massachusetts in the future, and identify areas of concern.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR with additional considerations. Please see section 1.3 of the EPA response in this *Response to Comments* document.

RE: ASTSWMO Comments on U.S. EPA's Proposed PFAS National Priority Drinking Water Regulation; Docket ID No. EPA-HQ-OW-2022-0114

Dear Sir or Madam:

The Association of State and Territorial Solid Waste Management Officials (ASTSWMO) appreciates the opportunity to provide comments regarding the U.S. Environmental Protection Agency's (EPA) proposed Per- and Polyfluoroalkyl Substances (PFAS) National Primary Drinking Water Regulation (NPDWR) Rulemaking. ASTSWMO is an association representing the waste management and remediation programs of the 50 States, five Territories, and the District of Columbia (States). Our membership includes State program experts from all States who manage State-run programs under both the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and the Resource Conservation and Recovery Act (RCRA).

ASTSWMO commends the EPA for taking this important step to regulate perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO–DA) and its ammonium salt (also known as GenX chemicals), perfluorononanoic acid (PFNA), perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS under the Safe Drinking Water Act (SDWA) and is pleased to offer comments on this proposed regulation.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Earthjustice et al. (Doc. #1808, SBC-046122)

Conclusion

For the millions of people with PFAS in their tap water, strong federal drinking water standards are essential and long overdue. We appreciate EPA's leadership in developing this proposed rule, and we urge EPA to resist efforts to weaken its proposal. We further urge EPA to revise its proposed HBWCs and to incorporate the changes outlined above. Finally, EPA should move quickly to finalize this rule and to pursue s for the PFAS that are not addressed in the proposed rule.

If you have any questions about these comments, please contact Jon Kalmuss-Katz (jkalmusskatz@earthjustice.org) or Katherine O'Brien (kobrien@earthjustice.org) at Earthjustice or Erik Olson (eolson@nrdc.org), Anna Reade (areade@nrdc.org) or Katherine Pelch (kpelch@nrdc.org) at the Natural Resources Defense Council.

May 30, 2023

Via Regulations.gov

Assistant Administrator Radhika Fox Office of Water

U.S. Environmental Protection Agency 1200 Pennsylvania Avenue, N.W. Washington, DC 20460

Re: PFAS National Primary Drinking Water Regulation Rulemaking, Docket No. EPA– HQ–OW–2022–0114

Dear Assistant Administrator Fox:

The undersigned 36 organizations submit these comments on EPA's proposed National Primary Drinking Water Regulation for six per- and polyfluoroalkyl substances ("PFAS") (the "Proposed Rule"). [FN1: Preliminary Regulatory Determination and Proposed Rule, PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18,638 (Mar. 29, 2023). The six PFAS covered by the Proposed Rule are perfluorooctanoic acid ("PFOA"), perfluorooctane sulfonic acid ("PFOS"), perfluorohexane sulfonic acid ("PFHxS"), hexafluoropropylene oxide dimer acid and its ammonium salt ("GenX"), perfluorononanoic acid ("PFNA"), and perfluorobutane sulfonic acid ("PFBS") (collectively, the "Six PFAS").] Our organizations include communities with PFAS-contaminated drinking water, scientists who study the harms associated with PFAS, and longtime advocates for health- protective PFAS drinking water standards.

We strongly support EPA's issuance of PFAS drinking water standards, which are a critical and long overdue step to address a public health crisis that threatens the health and lives of hundreds of millions of people in the United States. For decades, communities across the country have been drinking tap water contaminated with PFAS, a large class of long-lasting and dangerous

chemicals. People in those communities have lost parents, children, and other loved ones to cancer, liver and heart disease, and other diseases associated with PFAS. The longer that EPA waits to establish federal drinking water standards, the more people will be exposed, in violation of the Safe Drinking Water Act ("SDWA") mandate to reduce the harmful effects from drinking water contaminants as much as feasible.

The Proposed Rule is an important step forward. EPA correctly found that there is no safe exposure level for many PFAS, including PFOA and PFOS, and it proposed maximum contaminant levels ("MCLs") for PFOA and PFOS that are readily achievable using existing treatment technologies. EPA also recognized the serious health risks associated with exposures to mixtures of GenX, PFNA, PFBS, and PFHxS—PFAS that are frequently found in the same drinking water supplies—and it proposed an MCL that is designed to protect people who are exposed to those contaminants individually or in combination. EPA's proposed Maximum Contaminant Level Goals ("MCLGs") and MCLs are supported by an extensive factual record and are required by the SDWA. EPA must resist efforts to weaken those levels and diminish the rule's protections.

At the same time, EPA must revise aspects of its Proposed Rule that would limit the rule's reach and undermine its effectiveness. First, EPA should update its Health Based Water Concentrations ("HBWCs")—the toxicity values that EPA uses to calculate the drinking water limits—for PFBS, GenX, PFNA, and PFHxS to address the dangers those chemicals pose to infants, children, and other higher-risk populations. Second, while EPA conducted an extensive economic analysis and found that the Proposed Rule's benefits outweigh its costs, that analysis understates the benefits of reduced PFAS exposures and should be expanded to better account for health benefits that EPA has acknowledged but has not yet quantified or monetized. Third, when determining compliance with the new drinking water standards, EPA should consider all monitoring results with detectable PFAS rather than treating samples with lower but still harmful levels of PFAS as though they were PFAS-free. Fourth, EPA should maintain the minimum requirement of quarterly PFAS monitoring for all water systems with prior PFAS detections and should not permit such systems to evade further detections and necessary treatment by monitoring just once or twice every three years. Finally, EPA should mandate public notification of MCL violations within 24 hours, as is required for all violations that may cause serious, short-term health effects.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on toxicity values for HFPO-DA, PFNA, PFHxS, and PFBS, please see section 4.3 in the *Response to Comments* document. For more discussion on the benefits from this final PFAS NPDWR, please see section 13.4 of the *Response to Comments* document. For discussion of the comparison of costs and benefits for this action, please see section 13.8 of the *Response to Comments* document. For more discussion on compliance monitoring, please see section 8.1.2 in the *Response to Comments* document. For

additional discussion on public notification, please see section 9.2 of the *Response to Comments* document.

Green America (Doc. #1809, SBC-045339)

May 30, 2023

Docket (EPA-HQ-OW-2022-0114)

Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Green America, a nonprofit organization founded in 1982, submits the following comment to the Environmental Protection Agency on behalf of 11,877 individuals.

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is an important first step to protecting our families and communities.

PFAS chemicals are now found in the drinking water of many communities nationwide. These toxic chemicals are linked to cancer, immune suppression, developmental harm, and many other adverse health impacts.

The EPA's proposed rule would provide safer drinking water for millions of people, save thousands of lives, and prevent tens of thousands of serious PFAS-related illnesses each year.

EPA Response: The EPA acknowledges and appreciates this comment expressing general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dear Administrator Reagan,

Thank you for proposing health protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. The EPA should finalize these safe drinking Water Act regulations as quickly as possible, including the hazard index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures and water around the country. EPA should address the whole class of PFAS chemicals whenever possible.

All parts of EPA and the federal government need to take equally bold action to stop pfos pollution, hold polluters accountable, and curtail users of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Clean water should be a priority for every living being.

Sincerely

Judith A. Krouse

2337 Tague Ave

Dear EPA Administrator Regan,

Attached please find 14,949 individual comments in support of the proposed PFAS drinking water standard from collected by Environment America Research and Policy Center.

RE: Docket ID: EPA-HQ-OW-2022-0114

Dear EPA Administrator Regan:

PFAS are known as "forever chemicals" and can be found everywhere, including clothes, food packaging and even Norwegian Arctic ice. And now these toxic substances are getting into our drinking water, threatening the health of millions of Americans.

I am writing in support of the proposed National Primary Drinking Water Regulation to set low, health-based limits on 6 PFAS chemicals in our drinking water. I also urge the EPA to prevent future PFAS water contamination by phasing out the use of these dangerous substances to begin with.

Sincerely,

[Table 1: Signatures See Docket ID EPA-HQ-OW-2022-0114-1814]

Re: Docket EPA–HQ–OW–2022–0114

Dear Sir/Madam:

The West Virginia Municipal Water Quality Association (WVMWQA) appreciates the opportunity to comment on USEPA's proposed National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for PFOA and PFOS, as well as PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS and their mixtures.

The WVMWQA comprises public utilities statewide in the drinking water, wastewater, and stormwater fields. As public utilities that do not manufacture or use PFAS chemicals in our water or wastewater treatment processes, we are innocent receivers of these chemicals. Our members are dedicated to protecting both public health and the environment. However, as public utilities we must provide these essential services in an affordable and cost-effective manner. We never seek to avoid necessary and appropriate requirements. Instead, we embrace such requirements and simply work to prioritize them and obtain the funding necessary to comply from the public that we serve.

With that perspective, we are compelled to submit these comments because EPA's proposed MCLs for PFAS have the potential to impose the greatest compliance costs in the history of the Safe Drinking Water Act both from a capital as well as ongoing operation and maintenance cost perspective. Such massive and far-reaching regulatory impacts are particularly unprecedented given that thousands of water plants will be impacted and will have to plan, design, and construct still embryonic PFAS barrier technologies at an unprecedented speed. This costly effort will be borne by the customers of public utilities all while PFAS levels in Americans have been dropping dramatically and are poised to plummet even farther due to the legislative, regulatory, and litigation pressure around these chemicals.

Below we explain why we believe EPA's draft MCLs are based upon significant errors which must be addressed and then EPA must republish different MCLs, ideally using a tiered or phased approach that will allow us to prioritize water plant upgrades over a 15- 20-year period. We also explain our significant concern that EPA has chosen to extrapolate public health impacts from literature and animal studies rather than using the extensive human health PFAS-related data both from the Federal Drug Administration and its own information from PFAS hotspots around the country.

We also explain why we believe EPA's cost estimate understates compliance costs by upwards of an order of magnitude while simultaneously overstating public health benefits because EPA has relied on extrapolation and associated uncertainty factors rather than using available public health PFAS-related data.

Finally, it bears noting that our members – and public utilities nationwide – have been aggressively working to characterize and reduce PFAS levels in our finished drinking water, wastewater, and stormwater. On the drinking water side, we have evaluated rebalancing water sources to reduce PFAS levels, working with upstream dischargers to reduce their loadings, and evaluating available technologies should PFAS barrier technology become necessary. We believe enormous PFAS reductions have occurred through these efforts. Thus, we are not waiting

for EPA to adopt MCLs to further minimize PFAS chemicals in public utility drinking water, wastewater, and stormwater. We will continue to make significant further progress while EPA reevaluates its proposed MCLs.

We appreciate the Agency's consideration of our comments and are available to discuss our concerns.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional discussion on the set MCLs for the final PFAS NPDWR, please see section 5 of the *Response to Comments* document. For additional discussion on the cost estimates for the rule, please see section 13.3 of the *Response to Comments* document.

Association of Missouri Cleanwater Agencies (Doc. #1817, SBC-044641)

May 30, 2023

By Electronic Submission: Docket EPA–HQ–OW–2022–0114

U.S. Environmental Protection Agency EPA Docket Center

PFAS: PFOA and PFOS National Primary Drinking Water Regulation Rulemaking, Mail Code 28221T

1200 Pennsylvania Avenue NW Washington, DC 20460

Dear Sir/Madam:

The Association of Missouri Cleanwater Agencies (AMCA) appreciates the opportunity to comment on USEPA's proposed National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for PFOA and PFOS, as well as PFHxS, HFPO–DA and its ammonium salt, PFNA, and PFBS and their mixtures.

AMCA comprises public utilities statewide in the drinking water, wastewater, and stormwater fields. As public utilities that do not manufacture or use PFAS chemicals in our water or wastewater treatment processes, we are innocent receivers of these chemicals. Our members are dedicated to protecting both public health and the environment. However, as public utilities we must provide these essential services in an affordable and cost-effective manner. We never seek to avoid necessary and appropriate requirements. Instead, we embrace such requirements and simply work to prioritize them and obtain the funding necessary to comply from the public that we serve.

With that perspective, we are compelled to submit these comments because EPA's proposed MCLs for PFAS have the potential to impose the greatest compliance costs in the history of the Safe Drinking Water Act both from a capital as well as ongoing operation and maintenance cost perspective. Such massive and far-reaching regulatory impacts are particularly unprecedented given that thousands of water plants will be impacted and will have to plan, design, and construct

still embryonic PFAS barrier technologies at an unprecedented speed. This costly effort will be borne by the customers of public utilities all while PFAS levels in Americans have been dropping dramatically and are poised to plummet even farther due to the legislative, regulatory, and litigation pressure around these chemicals.

Below we explain why we believe EPA's draft MCLs are based upon significant errors which must be addressed and then EPA must republish different MCLs, ideally using a tiered or phased approach that will allow us to prioritize water plant upgrades over a 15-20-year period. We also explain our significant concern that EPA has chosen to extrapolate public health impacts from literature and animal studies rather than using the extensive human health PFAS-related data both from the Federal Drug Administration and its own information from PFAS hotspots around the country.

We also explain why we believe EPA's cost estimate understates compliance costs by upwards of an order of magnitude while simultaneously overstating public health benefits because EPA has relied on extrapolation and associated uncertainty factors rather than using available public health PFAS-related data.

Finally, it bears noting that our members – and public utilities nationwide – have been aggressively working to characterize and reduce PFAS levels in our finished drinking water, wastewater, and stormwater. Neuse Regional Water and Sewer Authority (Doc. #1822, SBC-044565)

May 26, 2023

Filed via regulations.gov

The Honorable Michael Regan Administrator

Environmental Protection Agency Mail Code: 1101A

1200 Pennsylvania Avenue, N.W. Washington, DC 20460

RE: Comments on Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Docket ID No. EPA-HQ-OW-2022-0114

Dear Administrator Regan:

The Neuse Regional Water and Sewer Authority ("NRWASA") is a public body established pursuant to Chapter 162A of the North Carolina General Statutes. NRWASA appreciates the opportunity to comment on the Environmental Protection Agency's ("EPA") proposed PFAS National Primary Drinking Water Regulation Rulemaking ("Proposed Rulemaking"). NRWASA

agrees with EPA's overall goal of limiting the public's exposure to PFAS, and we believe our comments will help EPA improve its approach to its regulation of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Neuse Regional Water and Sewer Authority (Doc. #1822, SBC-044567)

,COMMENTS

The Proposed Rulemaking is a welcomed step to protect public health from the harmful effects of PFAS. However, it is important to note that the regulation will have a significant cost for water utilities. It should be implemented only after careful consideration of various factors that impact cost and ability to comply.

Specifically, NRWASA's comments focus on four recommendations. EPA's Proposed Rulemaking should:

1. Address how wholesale water systems with multiple system customers should comply with the new regulations.

2. Temporarily exempt from compliance water systems not responsible for causing the PFAS pollution problem; instead, shift compliance costs to those responsible for creating PFAS pollution, including PFAS manufacturers.

3. Delay the official promulgation of a PFAS National Primary Drinking Water Standard until EPA completes its identification of all PFAS substances and the levels at which it deems such substances harmful so that water systems can treat all regulated PFAS substances effectively through a single capital upgrade to a comprehensive purification system.

4. Provide guidance and support to NRWASA and similarly-situated entities in need of significant, unfunded capital investments to comply with treatment standards under any legally enforceable level.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA addressed the responsibilities of wholesale systems in section I of the FRN and additional discussion on the applicability of this action is in section 1.4 of the EPA response in this *Response to Comments* document. For finished water that is provided through a system interconnection, the wholesale systems will be responsible for conducting the monitoring requirements at the entry point to the distribution system (EPTDS). The final regulation does not require that any monitoring be conducted at a system interconnection point. Where a violation does occur, the wholesale system must notify any consecutive systems of this violation and it is the responsibility of the consecutive system to provide PN to their customers pursuant to § 141.201(c)(1). In addition, wholesale systems must also provide information in Subpart O to

consecutive systems for developing CCRs (§ 141.201(c)(1)). Consecutive systems are responsible for providing their customers with the reports (§ 141.153(a)).

For the exemption requirements, please see section 12.1 of the EPA response in this *Response to Comments* document. For recommendation 3, the EPA disagrees with delaying the official promulgation of the NPDWR. The EPA completed its assessment with the best available science and has determined it has sufficient information to promulgate under SDWA, as discussed in section 1.3 of the EPA response in this *Response to Comments* document. As to the concern for capital upgrades, treatment is available to effectively remove all regulated PFAS substances; please see section XII in the FRN and section 13.3 of the EPA response in this *Response to Comments* document. For information on funding and capital investments, please see section 2.4 of the EPA response in this *Response to Comments* document.

Oneida Nation (Doc. #1825, SBC-044271)

Submitted electronically: Federal eRulemaking Portal: https://www.regulations.gov/

Office of Management and Budget (OMB) 725 17th St., NW

Washington, DC 20503

May 30, 2023

RE: Per- and Polyfluoroalkyl Substances (PFAS) Proposed PFAS National Primary Drinking Water Regulation

Docket ID No. EPA-HQ-OW-2022-0114

To Whom It May Concern:

On behalf of the Oneida Nation, I am submitting comments on the proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS, including perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA, commonly known as GenX Chemicals), perfluorohexane sulfonic acid (PFHxS), and perfluorobutane sulfonic acid (PFBS).

Water Quality Monitoring on the Oneida Reservation

The primary objective of water quality monitoring is to gather environmental information on the water quality of the Reservation. This information is used to detect trends in water quality, measures success and effectiveness of water resource management practices, and to detect water quality/quantity problems on the Reservation. We use the best available science for decision-making related to freshwater ecosystems and communicate this science as necessary to inform the Oneida community and decision makers.

Introduction

On March 14, 2023, EPA announced the proposed National Primary Drinking Water Regulation (NPDWR) for six PFAS compounds including PFOA, PFOS, PFNA, PFHxS, PFBS, and GenX chemicals.

• PFOA and PFOS: EPA is proposing to regulate PFOA and PFOS at a level they can be reliably measured at 4 ppt.

• PFNA, PFHxS, PFBS, and GenX Chemicals: EPA is also proposing a regulation to limit any mixture containing one or more of PFNA, PFHxS, PFBS, and/or GenX Chemicals. For these PFAS, water systems would use an established approach called a hazard index calculation, defined in the proposed rule, to determine if the combined levels of these PFAS pose a potential risk.

The proposed PFAS NPDWR does not require any actions until it is finalized. EPA anticipates finalizing the regulation by the end of 2023. The Agency expects that if fully implemented, the rule will prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses. EPA is re-questing public comment on the proposed regulation.

Oneida Environmental, Health and Safety Area supports this action as a first step to having regulatory oversight of these contaminants in drinking water. We believe it is in the best interest of the Oneida Community and the Nation.

More technical version of above description of their action if preferred:

Through this action, EPA is also proposing a National Primary Drinking Water Regulation (NPDWR) and health-based Maximum Contaminant Level Goals (MCLG) for these four PFAS and their mixtures as well as for PFOA and PFOS. EPA is proposing to set the health-based value, the MCLG, for PFOA and PFOS at zero. Considering feasibility, including currently available analytical methods to measure and treat these chemicals in drinking water, EPA is proposing individual MCLs of 4.0 nanograms per liter (ng/L) or parts per trillion (ppt) for PFOA and PFOS. EPA is proposing to use a Hazard Index (HI) approach to protecting public health from mixtures of PFHxS, HFPO-DA and its ammonium salt, PFNA, and PFBS because of their known and additive toxic effects and occurrence and likely co-occurrence in drinking water. EPA is proposing an HI of 1.0 as the MCLGs for these four PFAS and any mixture containing one or more of them because it represents a level at which no known or anticipated adverse effects on the health of persons is expected to occur and which allows for an adequate margin of safety. EPA has determined it is also feasible to set the MCLs for these four PFAS and for a mixture containing one or more of PFHxS, HFPO-DA and its ammonium salt, PFNA, PFBS as an HI of unitless 1.0.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Plymouth Village Water & Sewer District (Doc. #1827, SBC-044554)

May 30, 2023

U.S. Environmental Protection Agency EPA Docket Center

Docket ID: EPA-HQ-OW-2022-0114;

Mail Code 28221T

1200 Pennsylvania Ave., NW Washington, DC 20460

Subject: Docket ID: EPA-HQ-OW-2022-0114; Proposed PFAS Drinking Water Standards

Dear EPA Office of Water:

The Plymouth Village Water & Sewer District's (PVWSD) mission is to provide the highest quality water and wastewater services possible. The Commissioners and staff members' primary responsibility is to the ratepayers. In meeting the needs of the District, we strive to provide clean, safe, and affordable public water and wastewater services, using sound science to define practical policy that protects human health and the environment. As a leader in the discovery, definition, regulation, treatment, and funding to reduce threats caused by per- and polyfluorinated substances (PFAS) chemicals, we are providing important input to EPA's proposed MCLs for six PFAS compounds; PFOA (4 ppt), PFOS (4 ppt), PFNA (Hazard Index 10 ppt), HFPO-DA (Hazard Index 10 ppt), PFHxS (Hazard Index 9 ppt), PFBS (Hazard Index 2000 ppt).

PVWSD and New Hampshire have been at the forefront of this issue in the past decade, having experienced significant contamination issues with firefighting foam (AFFF) at a former airbase on the Seacoast and with a manufacturing facility in Merrimack. PFAS compound prevalence is far and wide, reaching even the most remote parts of our state, including native soils, air, and water. The PVWSD and the state have taken a pro-active approach with sampling, outreach, community engagement, and regulatory action. We have not only sampled PFAS in our drinking water, but also have completed a significant amount of testing of wastewater Biosolids (residuals from wastewater treatment).

Since 2016 our primacy agency, the New Hampshire (NH) Department of Environmental Services (NHDES), and hundreds of public water and wastewater systems and their communities, have spent substantial time and money collecting and analyzing water and sludge samples to identify PFAS occurrence. NHDES requires regulated public water and wastewater systems to continue monitoring for PFAS, with sampling frequencies based on initial occurrence analysis. See where PFAS chemicals are found across the state and review USGS Soil and Sludge Leaching Study data.

In order to develop science-based MCL's/AGQS for each compound protective of the most sensitive population at all life stages, NH legislators adopted Chapter Law 368 directing NHDES to consider: 1) the extent to which the contaminants are found in NH; 2) the ability to detect the

compound; 3) the ability to treat the contaminant; 4) benefits associated with adopting an MCL; and 5) the costs associated with adopting an MCL. NHDES provided a summary technical report on the MCL development that included a health risk assessment for each compound and information on occurrence, and ability to detect and treat these chemicals, along with an estimate of costs and benefits for impacted cities and towns. Although, the report states… "as with any risk assessment, this process was subject to uncertainty and limitations… A major uncertainty was quantifying the exact risks of disease incidence for each compound, which is also a significant challenge for quantifying, or monetizing, the benefits of the proposed MCL's."

EPA Response: The EPA acknowledges the commenters' significant experience in addressing PFAS contamination. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Wisconsin Department of Natural Resources (Doc. #1828, SBC-044800)

May 30, 2023

Jennifer McLain, Director

Office of Ground Water and Drinking Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Subject: National Primary Drinking Water Regulations: PFAS Rules Promulgation (88 FR 18638, EPA-HQ-OW-2022-0114)

Dear Dr. McLain,

Wisconsin Department of Natural Resources (WDNR) maintains primacy for implementation of the Safe Drinking Water Act (SDWA) in the state of Wisconsin. WDNR is generally in agreement with the comments provided by the Association of State Drinking Water Administrators (ASDWA) as characterized below, and is hereby submitting these comments on the proposed PFAS standards during the public comment period between 3/29/2023 – 5/30/2023.

EPA Response: The EPA acknowledges WDNR's comments.

National PFAS Contamination Coalition (Doc. #1830, SBC-044550)

Via www.regulations.gov

U.S. Environmental Protection Agency EPA Docket Center

EPA-HQ-OW-2022-0114

Mail Code 28221T

1200 Pennsylvania Avenue, NW Washington, DC 20460

May 30th, 2023

Public Comment in Support of EPA-HQ-OW-2022-0114

Dear Administrator Regan, Assistant Administrator Fox, and Director McClain,

The National PFAS Contamination Coalition is pleased to submit comments in support of the proposed EPA drinking water standard for six PFAS. A strong enforceable national drinking water standard has been long overdue and are essential for ensuring safe, clean water for all.

The National PFAS Contamination Coalition is composed of more than 30 community groups from across the country who are directly impacted by PFAS from a variety of contamination sources. We envision a PFAS-free world where people are not exposed to any PFAS, where the environment and public health are protected, where there is justice for the victims of PFAS exposure, and where laws and regulations prevent contamination disasters like this from happening again. We strongly believe that everyone deserves clean, safe, sustainable, and affordable drinking water supplies.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

National PFAS Contamination Coalition (Doc. #1830, SBC-044552)

We have experienced the impacts of PFAS contamination first hand. We have known the true cost of this crisis, not just physically, but financially and emotionally as well. We know that the establishment of a strong Maximum Contaminant Levels is critical to protect communities from the harmful effects of these chemicals, and to ensure that our drinking water is safe for all.

We support the EPA's proposal to regulate PFOA and PFOS as individual contaminants at 4 parts per trillion (ppt), and PFHXS, PFNA, PFBS, and HFPO-DA (commonly referred to as GenX Chemicals) together at a Hazardous Index of 1.0 (unitless), as well as the requirement for public water systems to monitor for these PFAS, notify the public to the levels of these PFAS, as well as reduce the levels of these PFAS in drinking water if they exceed the proposed standards.

These new regulations will provide a clear standard for water utilities and other organizations to follow, and will ensure that they are taking appropriate steps to remove PFAS from our water supply. We applaud the acknowledgment that individual PFAS and PFAS mixtures can have an impact on our health. We believe using mixtures as a regulatory tool is an incredibly useful framework for regulating additional groups of PFAS. We hope to see implementation of this as soon as possible as we know that all of these chemicals have a cumulative impact on our bodies.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Groundwater Resources Association of California (Doc. #1831, SBC-045359)

GRA believes that by incorporating all available statewide PFAS data, considering equity and resource availability for smaller water systems, evaluating groundwater considerations in the cost-benefit-risk analyses, ensuring clarity in sampling and monitoring requirements, and adding clarity and flexibility to the sampling/monitoring requirements, the proposed ruling could be further improved, which in turn increases the acceptance among industries and practitioners. We hope that EPA finds our comments useful in finalizing the proposed MCLs. If you have any questions or require clarifications regarding GRA's comments, please do not hesitate to contact the GRA Technical Committee Chair, Dr. Abhishek Singh (asingh@intera.com).

GRA appreciates the opportunity to provide comments on the proposed PFAS regulations. We also wish to acknowledge and thank all members of the GRA Technical Committees and participants from other affiliate organizations who participated and contributed to the review and comment process.

Sincerely,

Abhishek Singh, PhD, PE GRA Director

GRA Technical Committee Chair

Roohi Toosi, PE

GRA Director

GRA Technical Committee Member

Michael Schaefer

GRA Technical Committee Member

cc: GRA Board of Directors, Technical Committee Members

EPA Response: The EPA used the best available public health information including data from UCMR 3 and state occurrence data for the PFAS NPDWR. For additional information on the occurrence data used in the PFAS NPDWR, please see section VI of the FRN and section 6 of the EPA response in this *Response to Comments* document. Please see section 1.3 of the EPA response in this *Response to Comments* document for discussion on small system considerations. The EPA includes small system flexibilities in the PFAS NPDWR and additional information can be found in section 10.5 of the EPA response in this *Response to Comments* document. The EPA disagrees with the commenter that further evaluation of groundwater considerations in the benefit cost analysis is necessary. Benefit cost estimates are informed by

data on occurrence, exposure, and treatment in both ground and surface water systems. For additional information on the EPA's methodology to assess impacts to PWSs including ground water systems, see the economic analysis for the final NPDWR (USEPA, 2024a). For the EPA responses to comments raised on the cost-benefit model, please see section 13.2 of the EPA response in this *Response to Comment*s. The EPA has provided clarity on sampling and monitoring in the final rule based on public comments. For more discussion on compliance monitoring, please see section 8 of the EPA response in this *Response to Comments* document.

Corix Infrastructure Inc. (Doc. #1834, SBC-045360)

May 30, 2023

U.S. Environmental Protection Agency

EPA Docket Center

Docket EPA-HQ-OW-2022-0114

Mail Code 28221T

1200 Pennsylvania Avenue

Washington, D.C. 20460

Dear Administrator Regan:

RE: Comments by the Corix on EPA PFAS National Primary Drinking Water Regulation Rulemaking, Docket No. EPA-HQ-OW-2022-0114.

Corix Infrastructure Inc., on behalf of itself and its operating subsidiaries, respectfully submits this comment letter regarding the U.S. Environmental Protection Agency's PFAS National Primary Drinking Water Regulation Rulemaking published in the Federal Register on March 29, 2023.

Through its operating subsidiaries, Corix provides drinking water to approximately 800,000 people in 18 states and two Canadian provinces. Corix is a member of the National Association of Water Companies (NAWC) and agrees with the NAWC in its support for the EPA taking action to address the health risk posed by the presence of PFAS chemicals in drinking water supplies. We support a national drinking water standard for PFOA and PFOS based on the best available science and an appropriate balancing of potential risks and the costs to implement the rulemaking.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document..

Little Hocking Water Association (Doc. #1835, SBC-045506)

After confronting years of informational obstacles and getting no assistance from the state of Ohio, LHWA was finally forced to file a Resource Conservation and Recovery Act (RCRA) citizen suit and damage claims in federal court. The suit led to the first judicial finding of DuPont's liability for PFOA contamination. Little Hocking Water Ass'n v. E.I. du Pont de Nemours & Co., 91 F. Supp. 3d 940 (S.D. Ohio 2015). The parties resolved the case through settlement, the terms of which are confidential.

At Little Hocking, a granular activated carbon (GAC) plant treats the PFOA contamination before it enters the LHWA water supply pipes. To date the GAC plant's dual set of carbon beds filters out HFPO-DA down to the detection limits. If bi-weekly testing shows exceedance of the 15 ppt trigger between both carbon beds, a new set of carbon beds is added.

Even though this arrangement reduces the prospective additive drinking water risk for LHWA water users, it does not eliminate the risk of "drinking DuPont's surfactant" during the decades of secrecy. This cost carries forward and so does the cost of regulatory delay. LHWA had a front row seat to the promises of regulation. After starting to learn of the severity of the PFOA contamination in its wellfield in 2002, LHWA spent many days in Washington DC as a member of the Enforceable Consent Agreement (ECA) process under the Toxic Substances Control (TSCA) review process. LHWA spent considerable resources to serve throughout this process and was the only representative of a public water system to serve as a member throughout the process. At the end of the ECA process, LHWA was told that there would be an MCL for PFOA in 2005.

While LHWA fully supports most of today's 2023 proposed MCLs, Little Hocking is keenly aware of the staggering health and social cost incurred over the 18 years it took to reach this proposed action. Those health and social costs of the period of regulatory delay will continue to be incurred by the community served by LHWA even after the MCLs are adopted. This speaks to prompt, albeit overdue, adoption of robust MCLs that are protective of human health.

PFAS is a pressing public health crisis created by entities which greatly profited while they created the crisis. Those entities should promptly pay for measures to abate threats.

Little Hocking's story illustrates that the pervasive contamination of PFOA and other PFAS in the environment, including public water supplies, and the potential threats to public health have been known to the few companies that invented and/or manufactured PFAS for decades. It shows the gross excesses of self-regulation. The contamination and threat were intentionally hidden for decades, creating a public health crisis. This makes EPA's current proposed rulemaking under the Safe Drinking Water Act (SDWA), and other environmental laws, urgently needed.

EPA Response: The EPA acknowledges the commenters' efforts in addressing PFAS contamination and its general support for the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document..

WASHINGTON STATE BOARD OF HEALTH (Doc. #1837, SBC-044264)

STATE OF WASHINGTON

WASHINGTON STATE BOARD OF HEALTH

PO Box 47990 • Olympia, Washington 98504-7990

May 30, 2023

Michael S. Regan, Administrator

U.S. Environmental Protection Agency

EPA Docket Center

Office of Ground Water and Drinking Water Docket

Mail Code 2822IT

1200 Pennsylvania Avenue, NW

Washington, DC 20460

Subject: Public Comment on PFAS National Primary Drinking Water Regulation, Docket ID No. EPA-HQ-OW-2022-0114

Dear Mr. Regan,

Thank you for the opportunity to comment on the proposed National Primary Drinking Water Regulation for per- and polyfluoroalkyl substances (PFAS). The Washington State Board of Health (Board) is submitting the following comments in strong support of this proposed action.

In Washington State, the Board serves as the rulemaking authority and the Washington Department of Health serves as the regulatory agency administering the rules for Group A public drinking water systems under chapter 246-290 WAC, Group A Public Water Supplies.

In the absence of national primary drinking water standards for PFAS, the Board adopted State Action Levels (SALs) for five PFAS analytes that took effect January 1, 2022. Implementation of the rule's monitoring requirements coupled with past voluntary monitoring for PFAS is providing valuable insights and detections of PFAS drinking water contamination in many water supplies across the state.

National maximum contaminant levels (MCLs) are essential for protecting public health and creating greater regulatory certainty for drinking water systems, local communities, and other parties. Adoption of national primary drinking water standards for PFAS will help set a level playing field for this national drinking water problem that involves significant financial, emotional, and public health effects on communities served by public water systems. Sadly,

these same effects extend to people and businesses served by small drinking water systems and private wells in impacted areas.

EPA Response: The EPA acknowledges the commenters' efforts in addressing PFAS contamination and its comment in general agreement with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document..

Gujarat Fluorochemicals Limited (Doc. #1840, SBC-044852)

Fluoropolymers are indispensable for critical applications in many existing and emerging technologies like electric vehicles, hydrogen fuel cells and semiconductors but the use of PFAS processing aids is not necessary for manufacturing of majority of such fluoropolymers. As a result, GFL supports EPA's efforts to protect human health and environment by setting MCLs and MCGLs to address the presence of PFAS of concern in drinking water, and looks forward to working with the Agency to foster the shift to alternatives to GenX and other PFAS of Concern. Such targeted regulation encourages the shift towards the use of non-PFAS processing aids in fluoropolymer manufacturing.

GFL would be pleased to answer any questions and to provide additional technical assistance as the EPA refines this proposed NPDWR.

[Attachment 1: see docket ID EPA-HQ-OQ-2022-0114-1840].

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please section 1.3 of the EPA response in this *Response to Comments* document..

American Chemistry Council (ACC) (Doc. #1841, SBC-044814)

ACC urges the Agency to withdraw its preliminary regulatory determination and proposed standard for the four PFAS until its has collected additional information on the national occurrence of these substances. ACC further urges EPA to reconsider the proposed standards for PFOA and PFOS in light of the inability to determine that the benefits of the current proposal justify its costs, per Section 1412(b)(4)(C) of the SDWA.

Sincerely,

Stephen P. Risotto

Senior Director

Enclosure

EPA Response: The EPA disagrees with the need to collect additional information on national occurrence to promulgate this PFAS NPDWR. The available UCMR 3 and state occurrence data are sufficiently robust to support the final rule. Please see sections 3.1.2, 3.2.2,

6.2 and 6.5 of the EPA response in this *Response to Comment*s document. In addition, please see the EPA response to comment Doc. #1841, SBC-044810, SBC-044819 and SBC-044840 in section 6.5 of this *Response to Comments* document for detailed responses to specific concerns about national occurrence provided to the commenter.

The EPA Administrator reaffirms the finding made at proposal under Section 1412(b)(4)(C) of SDWA that the quantified and nonquantifiable benefits of the MCLs justify the costs. See section XII of the preamble for this final rule and section 13.8 of this *Response to Comments* document for an explanation of this finding.

American Chemistry Council (ACC) (Doc. #1841, SBC-044824)

As a result of the numerous and significant shortcomings of its analysis, the Agency cannot determine that the benefits of the proposed standards for PFOA and PFOS justify the costs per Section 1412(b)(4)(C) of the Act. [FN4: 42 U.S.C. Section 300g-1(b)(4)(C)] Nor can the Administrator conclude that there is a meaningful opportunity for public health risk reduction by reducing levels of PFBS, HFPO-DA, PFHxS, or PFNA per Section 1412(b)(1)(A). EPA must revise its economic analysis to better assess the costs and benefits of reducing PFOA and PFOS levels in drinking water systems and must delay any attempt to regulate PFBS, HFPO-DA, PFHxS, or PFNA until it has collected sufficient and appropriate data to make a regulatory determination regarding these substances.

EPA Response: The EPA disagrees that it cannot determine that the benefits for PFOA and PFOS justify the rule costs or that the Administrator cannot conclude there is a meaningful opportunity for regulation of PFBS, HFPO-DA, PFHxS, and PFNA. Please see section 1.3 of the EPA response in this *Response to Comments* document.. For an explanation of why the Administrator confirms the finding made at proposal under section 1412(b)(4)(C) of SDWA that the quantified and nonquantifiable benefits of the MCLs justify the costs, see section XII of the PFAS NPDWR preamble and section 13.8 of the EPA response in this *Response to Comments* document. For discussion on the Administrator's meaningful opportunity determinations, please see sections 3.1.3 and 3.2.3 of the EPA response in this *Response to Comments* document.. For additional general information on the health risk reduction from the PFAS NPDWR, please see section 13 of the EPA response in this *Response to Comments* document.

Washington Association of Sewer and Water Districts (Doc. #1842, SBC-044768)

VIA (PDF) FEDERAL ERULEMAKING PORTAL REGULATIONS.GOV

May 30, 2023

United States Environmental Protection Agency (USEPA)

Re: Comments on Proposed Rule: Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation [Federal Register Docket ID EPA-HQ-OW-2022-0114-0027]

The Washington Association of Sewer and Water Districts (WASWD) appreciates the opportunity to comment on the proposed rules setting limits for PFAS compounds in drinking water. WASWD represents more than 180 public water and sewer districts in the state, serving nearly 25% of our state's population. These districts provide cost-effective water and sewer services—ranging from the state's largest population centers, to the smallest rural communities. The potential for contamination is always a concern. Beyond our wellheads and collection points, we have no control over what is sprayed, injected, discharged, or built proximal to our facilities. The situation with PFAS is especially disturbing due to the longevity of the compounds, their toxicity, and their ability to travel long distances in water and soil.

We all must move forward with efforts to eliminate the use of PFAS compounds and clean up contaminated drinking water. For this reason, we commend EPA for moving forward to propose national standards for some of these compounds. As our members are the "boots on the ground" people dealing day to day to provide safe drinking water to our state's residents, our comments on the proposed rule focus on the significant challenges for implementation.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Metropolitan Washington Council of Governments (Doc. #1843, SBC-044751)

May 30, 2023

The Honorable Michael S. Regan Administrator

U.S. Environmental Protection Agency

Office of the Administrator, Mail Stop 1101A 1200 Pennsylvania Avenue, NW Washington, DC 20004

Re: Docket ID No. EPA-HQ-OW-2022-0114, Development of the Proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

Dear Administrator Regan,

I am writing on behalf of the Metropolitan Washington Council of Governments (COG) Chesapeake Bay and Water Resources Policy Committee (CBPC) to provide our committee's comments on the proposed per- and polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulations (NPDWR).

COG is a nonprofit association, with a membership of 300 elected officials from 24 local governments, the Maryland and Virginia state legislatures, and U.S. Congress. Every month, more than 1,500 officials and experts connect through COG to develop solutions to the region's major challenges and plan for the future. Established in 1998, the CBPC is comprised of local elected officials and representatives from COG's member governments and water and wastewater

utilities in the metropolitan Washington region. The CBPC recommends water resources policies to the COG Board of Directors, addressing issues related to water and wastewater treatment, local water quality, stormwater management, flooding, and more.

COG and our member jurisdictions have a long history of partnership with the federal government, including strong support for environmental regulations based on sound science and equity. We share the same goal as EPA of ensuring the delivery of clean, safe drinking water to the public. Considering the persistent nature of PFAS and their potential human health risks, COG supports EPA's decision to regulate PFOS and PFOA in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment supporting the EPA's decision to regulate PFOS and PFOA in drinking water. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amigos Bravos (Doc. #1844, SBC-045399)

Regulation for PFAS is Growing

The State of New Mexico is taking its concern over PFAS and turning it into action via monitoring, sampling, and increased regulation. Regulatory action has been taken by the New Mexico Environment Department (NMED), conjointly with the NM Office of the Attorney General, against the DoD. Additionally, NMED, in partnership with the US Geological Survey, and the NM Department of Health, engage in PFAS testing across the state, and the State of New Mexico follows EPA guidelines on PFAS regulation. New Mexico is also taking action by engaging with affected communities, working with industry for PFAS mitigation and remediation, partnering with academia to research and create advancements in capture and eradication solutions, and most of all- taking action to hold polluters accountable. Amigos Bravos partners with the New Mexico Department of Environment to help bring community concern on PFAS to the fore, and work on evidence and science based solutions that support science and policy when mitigating and regulating PFAS.

The EPA is required to make amendments to drinking water standards every five years. This process includes developing a contaminant candidate list of unregulated chemicals that are known to and can occur in public water systems, as well as specifically including the MCL's of these chemicals. Several States are taking initiative and developing more stringent PFAS MCL standards as more information on impacts to health and the environment comes available and New Mexico is working to do the same.

Amigos Bravos supports the proposed NPDWR rule and urge the EPA to finalize it quickly, and move to take additional action on PFAS including taking steps to make sure PFAS doesn't enter our environment by: limiting new PFAS production, cleaning up PFAS contaminated sites, sunset the most toxic and environmentally mobile forms of PFAS as it has with PFOA, PFOS, PFHxS, and ensure that federal and state issued Clean Water Act permits can adequately regulate

PFAS discharges by setting effluent limits and regulating PFAS under the Resource Conservation and Recovery Act.

EPA Response: The EPA acknowledges the commenters' efforts in addressing PFAS contamination and its comment in general agreement with the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

The Chemours Company FC, LLC (Doc. #1845, SBC-046049)

May 30, 2023

Submitted via the Federal eRulemaking Portal: https://www.regulations.gov/

U.S. Environmental Protection Agency

EPA Docket Center, Office of Ground Water and Drinking Water Docket

1200 Pennsylvania Avenue NW

Washington, DC 20460

Re: Comments of The Chemours Company FC, LLC

EPA PFAS National Primary Drinking Water Regulation Rulemaking

Docket ID No. EPA–HQ–OW–2022–0114

Dear Sir or Madam:

We are submitting these comments on behalf of The Chemours Company FC, LLC ("Chemours" or "the Company") on EPA's proposed PFAS National Primary Drinking Water Regulation Rulemaking ("Proposed Rulemaking") under the Safe Drinking Water Act ("SDWA"), including specific comments with respect to EPA's proposed regulation of hexafluoropropylene oxide dimer acid and its ammonium salt. These compounds are sometimes referred to collectively by the trade name "GenX" or "GenX technology" and will be collectively referred to here as "HFPO-DA."[FN1: Chemours is a domestic manufacturer that uses HFPO-DA as a polymerization aid in the manufacture of fluoropolymers. Fluoropolymers—extremely stable molecules composed of multiple carbon-fluorine bonds—are essential to a variety of key industries. To provide just a few examples, fluoropolymers are used in every car, airplane, and cellphone. They are critical to maintaining the integrity and quality of most prescription drugs; to producing medical equipment; and to manufacturing computer chips. Fluoropolymers are also necessary for green technology, including hydrogen fuel cells.]

In the Proposed Rulemaking, EPA has proposed to set both the Maximum Contaminant Level Goal ("MCLG") and the enforceable Maximum Contaminant Level ("MCL") as a Hazard Index ("HI") of 1.0 for mixtures containing one or more of the following four PFAS compounds: perfluorohexane sulfonic acid ("PFHxS"), HFPO-DA, perfluorononanoic acid ("PFNA"), and perfluorobutane sulfonic acid ("PFBS"). In calculating the HI value, EPA has proposed to use

Health Based Water Concentrations ("HBWCs") of 9 parts per trillion ("ppt") for PFHxS, 10 ppt for HFPO-DA, 10 ppt for PFNA, and 2000 ppt for PFBS. In sum, with respect to HFPO-DA under EPA's proposal, if water delivered to any user of a public water system ("PWS") were to contain greater than 10 ppt of HFPO-DA, then the HI of 1.0 (and hence, the MCLG and MCL) would be exceeded. If such water were to contain less than 10 ppt of HFPO-DA but detectable amounts of PFHxS, PFNA, or PFBS, then the HI of 1.0 (and the MCLG and MCL) could also be exceeded, depending on the specific amount of each compound detected as compared to its HBWC. If any of the levels of PFHxS, PFNA, or PFBS exceeded their respective HBWC, any detectable level of HFPO-DA could be considered an exceedance of the MCL.

Chemours supports EPA's efforts to protect public drinking water using established statutory and regulatory processes and the best available science. However, EPA's proposed regulation of HFPO-DA under the SDWA, as part of the Proposed Rulemaking, falls far short of these standards. As discussed below, as well as in the materials attached hereto and in the materials incorporated herein by reference, EPA's proposed regulation of HFPO-DA does not comply with the legal requirements of the SDWA and is based on substantial scientific flaws at every step of its development, including flaws that Chemours previously identified and requested EPA to correct. EPA's cost-benefit analysis for the proposed regulation is also flawed. Accordingly, Chemours requests that EPA withdraw the proposed regulation.

EPA Response: The EPA disagrees that the proposed regulation of HFPO-DA does not comply with the legal requirements of SDWA, that it is not based on the best available science, and that the EPA's cost-benefit analysis is flawed. Please see sections 1.3, as well as sections 3.1, 3.2, 4, 6, and 13 of the EPA response in this *Response to Comments* document for discussion on the regulatory determinations, health and occurrence data, and cost-benefit analysis. For information on the appropriateness of using the Hazard Index approach for MCLGs, please see section 4.3.2 of the EPA response in this *Response to Comments* document. For information on the appropriateness of using the Hazard Index approach for MCLs, please see section 5.2 of the EPA response in this *Response to Comments* document.

Regarding the commenter's statement on water delivered to systems with HFPO-DA and the use of the Hazard Index, the EPA would like to clarify that HFPO-DA is just one component of the Hazard Index. In the instance that there is a concentration of HFPO-DA below its HBWC, it's not that the detectable level of HFPO-DA below its HBWC is individually considered an MCL exceedance, but it is that when combined with any of the other three PFAS in the Hazard Index that the combination of concentrations exceeding the overall Hazard Index is considered an exceedance of the Hazard Index MCL. Moreover, as part of the Hazard Index, the four PFAS are not considered in isolation.

The EPA disagrees with the request to withdraw this NPDWR, as the EPA has completed its assessment with the best available science and has determined there is sufficient information to promulgate under SDWA. Please see section 1.3 of the EPA response in this *Response to Comments* document for more information.

For the specific concerns regarding legal requirements and scientific flaws referenced in this comment, please see the applicable sections of the EPA response in this *Response to Comments* document responding to the detailed comments. The EPA responses are in section 3, specifically the EPA responses to comment Doc. #1845, SBC-046050; SBC-046051; SBC-046052; and SBC-046057.

The EPA disagrees that the cost-benefit analysis is flawed. For additional information on the appropriateness of the cost-benefit analysis, please see section 13.3.2, specifically the EPA response to comment Doc. #1845, SBC-046055, in this *Response to Comments* document.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045822)

Finally, we commend the Agency's decision to regulate these PFAS in public water systems and provide great risk reduction benefits nationwide. In Wisconsin, the roughly four million people relying on public water systems for drinking water will benefit from adequate monitoring of their water supplies and the subset of people already impacted by PFAS contamination will greatly benefit from protective action under the proposed NPDWRs.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Midwest Environmental Advocates +more (Doc. #1846, SBC-045818)

May 30, 2023

Assistant Administrator Radhika Fox

Office of Water

U.S. Environmental Protection Agency

1200 Pennsylvania Avenue, N.W.

Washington, DC 20460

Submitted via Regulations.gov

Re: Comments on Proposed National Primary Drinking Water Regulations for Certain Per- and Polyfluoroalkyl Substances under the Safe Drinking Water Act

(Docket ID: EPA-HQ-OW-2022-0114)

Dear Assistant Administrator Fox,

Please accept these comments on behalf of the undersigned Wisconsin-based organizations (collectively, Commenters) in strong support of the U.S. Environmental Protection Agency's (EPA's or the Agency's) proposed National Primary Drinking Water Regulations (NPDWRs) for

Perfluorooctanoic Acid (PFOA), Perfluorooctane Sulfonic Acid (PFOS), Perfluorobutane Sulfonic Acid (PFBS), Perfluorononanoic Acid (PFNA), Hexafluoropropylene Oxide Dimer Acid (GenX), and Perfluorohexane Sulfonic Acid (PFHxS) pursuant to the Safe Drinking Water Act (SDWA). [FN1: PFAS National Primary Drinking Water Regulation Rulemaking, 88 Fed. Reg. 18,638 (proposed March 29, 2023).]

We strongly support EPA's commitment to "using and advancing the best available science to tackle per- and polyfluoroalkyl substances (PFAS) pollution, protect public health, and harmonize policies that strengthen public health protections with infrastructure funding to help communities, especially disadvantaged communities, deliver safe drinking water." [FN2: Id. at 18,638.] The establishment of standards under the SDWA for certain PFAS is an important step towards the fulfillment of the Agency's commitment.

Commenters support the proposed NPDWRs as a meaningful action to mitigate the health risks associated with oral exposure to the PFAS subject to this rulemaking. Following the years- long, meticulous process established by the SDWA, EPA seeks to establish protective and feasible national standards to regulate contaminants of health concern in public water systems based on the best available science. This proposed regulation will improve drinking water safety for millions of Americans. In Wisconsin, thousands of people who rely on drinking water via community water systems will receive meaningful risk-reduction benefits from this proposed rule. Accordingly, for the reasons detailed below, we urge EPA to finalize the proposed NPDWRs.

I. EPA is Required to Promulgate NPDWRs for PFOS, PFOA, PFBS, GenX, PFNA, and PFHxS Based on the Best Available Science and Information.

Commenters support EPA's determinations triggering EPA's obligation to promulgate standards for PFOS, PFOA, PFBS, GenX, PFNA, and PFHxS. Because the Agency determined that these substances meet the criteria for health risk regulation, EPA is obliged to promulgate NPDWRs under the SDWA.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Anderson (Doc. #1863, SBC-045842)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Spilotros (Doc. #1864, SBC-045846)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document..

Jeanne Forster (Doc. #1865, SBC-045850)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

K Murphy (Doc. #1866, SBC-045854)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paula Okin (Doc. #1867, SBC-045858)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document..

Katrina Rudmin (Doc. #1868, SBC-045862)

Dear whom it may concern,

I strongly support adoption of EPA's proposed Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation. The proposed regulation is a critically important step to protect drinking water and public health from dangerous PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

North Carolina Conservation Network (Doc. #1869, SBC-045868)

Environmental Protection Agency,

Thank you for the strong proposal to regulate PFAS in drinking water.

Many North Carolina residents have been over-exposed to PFAS chemicals in their drinking water for decades. The public first learned about the widespread contamination in the Cape Fear River basin in 2017. In the years since, we've learned how pervasive PFAS chemicals are and that the chemicals are extremely toxic at levels far lower than previously understood.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

North Carolina Conservation Network (Doc. #1869, SBC-045866)

May 25, 2023

Environmental Protection Agency 1200 Pennsylvania Avenue NW Washington, DC 20460

Re: Docket ID No. EPA-HQ-OW-2022-0114

Dear Environmental Protection Agency,

Please see the petitions signed by over 1,230 North Carolina residents who strongly support the proposed drinking water standards for PFOS and PFOA, as well as the use of the hazard index

for additional PFAS chemicals, and urge Environmental Protection Agency to swiftly finalize the proposal.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Great Lakes PFAS Action Network (Doc. #1870, SBC-045871)

Comment letter submitted by the Great Lakes PFAS Action Network and signed by 213 individuals, Re: Per- and Polyfluoroalkyl Substances (PFAS): Proposed National Primary Drinking Water Regulations (Docket ID: EPA-HQ-OW-2022-0114)

Great Lakes PFAS Action Network

340 Beakes St., Suite 110, Ann Arbor, MI 48104

734-222-9650

connect@glpan.org

Dear Administrator Regan,

Re: Per- and Polyfluoroalkyl Substances (PFAS): Proposed National Primary Drinking Water Regulations (Docket ID: EPA-HQ-OW-2022-0114)

We commend the Environmental Protection Agency (EPA) for proposing to regulate six per- and polyfluoroalkyl substances (PFAS) in drinking water. We urge you to finalize these standards as quickly as possible. While this is an important first step, in order to fully protect the health of people, communities and the environment we urge the EPA to move toward regulating PFAS as an entire class of chemicals instead of one-by-one.

EPA's proposed rule would provide safer drinking water for communities by establishing strong limits on six widely detected PFAS. While PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. The proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The Great Lakes PFAS Action Network (GLPAN) represents PFAS-impacted communities across the Great Lakes region who are unified in their efforts to prevent and clean-up PFAS contamination. We are encouraged that the EPA is proposing to use a hazard index on GenX, PFBS, PFNA, and PFHxS to inform risks of chemical mixtures. GLPAN's impacted community members have been exposed to both individual PFAS and chemical mixtures of PFAS. These exposures are linked to serious health issues including increased rates of cancer, developmental and reproductive harm, and other diseases. Many community members in GLPAN have personally experienced health problems or live in health-affected communities. We have waited long enough for the EPA to take action.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1872, SBC-046574)

Docket ID No. EPA-HQ-OW-2022-0114

RE: EPA Proposed Rule – Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation

March 30, 2023

I live in Madison, Wisconsin. On Feb. 23, 2022, the State of Wisconsin Natural Resources Board met to discuss the proposed WDNR standard of 20 parts per trillion (ppt) for two of the most studied PFAS compounds - PFOA and PFOS. The Natural Resources Board amended the proposed Drinking Water rule, changing the maximum contaminate level (MCL) for PFOA and PFOS to 70 ppt to match the U.S. Environmental Protection Agency's Health Advisory level for the same compounds.

The science is clear: PFAS persists in the environment – air, water, and soil – for long periods of time and has deleterious health effects on humans. Human exposure to PFOA and PFOS, members of the PFAS chemical group, disrupts hormone production, immune responses, and cell growth leading to problems with reproductive health, developmental issues in children, and increases the risk of developing cancer.

Please consider taking immediate action.

-Elimination in the production of unnecessary PFAS compounds.

-Establish a safe federal PFAS drinking water standard.

-Establish safe federal PFAS surface & groundwater standards.

-Provide federal recourse for states that do not comply with established PFAS regulations.

Thank you for your consideration.

Respectfully,

A Concerned Citizen

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

M Love (Doc. #1873, SBC-046592)

Since studies of PFAS/PFOA are extremely limited, and conclusions used by the EPA are inconclusive at best, 4 PPT seems particularly random. The MCL for cyanide is 0.2 PPM (200,000 PPT) and you are effectively saying that PFAS/PFOA is roughly 50,000 times more toxic than cyanide, an extremely toxic chemical with known effects. This makes the EPA seem untrustworthy, much like the CDC with Covid-19, especially since the correlation between PFAS/PFOA is inconclusive at best.

In addition to seeming fishy as to where the numbers come from, along with all the assumptions, it also sounds like someone within this regulatory community has something to gain from the proposed regulatory amount. Confidence in the government to put the health and safety of US citizens ahead of their own political and economic gains is at an all-time low.

Perhaps it's time to literally go back to the lab again and conduct more scientific research before coming out with the proposed MCLs. Also, federal agencies should wait for the "Advisory Committee for International Collaboration on the PFOA/PFAS Safe Dose" report due later this year before rushing to make random MCL levels law.

The EPA's own analysis considers that 20% of total PFAS exposure comes from drinking water sources, with 80% from food and other sources. Proposing such a low drinking water number will do little to reduce human exposure to PFAS.

Again, this legislation is appealing to people's emotional response to the issue, much like Covid, in order to over-regulate something where there is little data to support the effort. My guess, and the guess of many, is that persons within the government at several levels have something to gain at the detriment to the taxpayers and everyday citizens.

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees with the commenter that the conclusions from heath studies are inconclusive and that the 4 ppt was randomly decided. The EPA has provided ample science and health-based evidence for the health effects of PFOA and PFOS, outlined in section IV of the FRN. For discussion on why 4 ppt was used for the PFOA and PFOS MCLs, please see section 5 of the EPA response in this *Response to Comments* document. The EPA disagrees with the statement that the agency is not putting the health and safety of US citizens at the forefront of this work. On the contrary, the EPA believes that this NPDWR is putting Americans first in protecting them from potential PFAS contamination from drinking waters. Further, the commenter has provided no evidence for the lack of information or data around these contaminants. The EPA has provided ample evidence on the health effects of the six PFAS and have been transparent on the use of best available science, the systematic review process, what evidence was used to determine hazard characterizations, the data used to derive all components of the health assessments, as well as the rationale behind the final conclusions for the MCLGs of the six PFAS. This information is outlined in section IV of the FRN, the Toxicity Assessments support documents, the PFOA/PFOS and Hazard Index MCLG documents (USEPA, 2024c;

USEPA, 2024d; USEPA,2024e; USEPA, 2024f), and is further discussed in section 4 of the EPA response in this *Response to Comments* document.

Regarding commenter's allegations that "persons within the government at several levels have something to gain", EPA employees, like all executive office government officials, may not use public office for private gain. All EPA government employees must follow stringent ethics guidelines which prevents the actual or perception of personal financial gain or conflict of interest. The public entrusts EPA employees to implement its regulatory programs in a fair and impartial manner, and each EPA employee is responsible for performing their duties in accordance with federal ethical requirements. To help ensure that EPA decision makers meet and exceed federal ethical requirements, they regularly review their financial interests (including for spouses and minor children) and outside activities and affiliations. They are expected to adhere to any recusal requirements and do not participate in agency matters that create an actual or perceived conflict of interest or a loss of impartiality.

Darlene Price (Doc. #1874, SBC-047326)

I am entering this letter in support of the EPA proposed rule on "Forever Chemicals" (www.regulations.gov, Docket ID: EPA-HQ-OW-2022-0114.)

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James Sorrells (Doc. #1875, SBC-046623)

Dear Administrator Regan,

We continue to pump toxins into the environment we rely on to survive. We are poisoning the people we claim to love and setting up our children and their children for a tragic future. It is time to take a stand against those that contribute to the destruction of our natural environment.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

D Salerno (Doc. #1876, SBC-046682)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water.

I encourage the EPA to finalize Safe Drinking Water Act regs soon, including the Hazard Index approach for 4 PFAS chemicals, based on the latest scientific information on health effects. Please consider addressing the whole class of PFAS chemicals when possible.

Let's stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. It isn't right to place more burdens on our communities, drinking water, and our health. Be well.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1877, SBC-047308)

I am in full support of this proposed rule. Our health including sensitive populations, children, wildlife, pets, natural resources are the most important factor here. Public water utility companies will do the best they can to adapt to the changes within the confines of their resources and be fully transparent with the community with the help of EPA backing as it is of no fault to them. There are water filters--POET, R/O, bottled water other available in Lowes, Home Depot, private companies etc. should individuals want to take further control inside one's home/business.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Louise Nolta (Doc. #1878, SBC-046624)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. Water is so essential to life and health for all. Please do all to keep dangerous PFAS chemicals in drinking water. Please do what you can to keep our water safe.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gloria Shen (Doc. #1879, SBC-046625)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Without hefty fines or other deterrents in place for polluters, the problem will only get worse.

I look to your leadership today and hope that you will make the decision that serves the best interest of families, communities and wildlife.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michael Bange (Doc. #1880, SBC-046626)

Dear Administrator Regan,

Please don't delay in implementing the proposed protections for our drinking water. No consideration about this proposal can supersede that of the safety of our water and, thus, the survival of humans and other life on the planet.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Suzanne Chapelle (Doc. #1882, SBC-046627)

Dear Administrator Regan,

This is important to me personally as well as to Americans everywhere! We need totally safe drinking water. It is unforgivable that some people in thei wealthy nation do not have regular access to safe drinking water.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Enviro Show (Doc. #1883, SBC-046678)

Administrator Regan,

The EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Karen Rist (Doc. #1884, SBC-046628)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible. Wouldn't you agree that something so vital to our health, the water we drink, needs the strongest protections possible?

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. I shouldn't have to filter my water, at great expense to me as a retired senior, because of this harmful pollution from industry.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cynthia Morton (Doc. #1885, SBC-046629)

Dear Administrator Regan,

In order that our grandchildren may live long, healthy lives, we are anxious to see that PFAS contamination of our water supplies is strictly regulated and existing pollution is cleaned up. This cannot wait, as the harm is being done today.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

Cynthia Morton

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Eleuthera Paulina Dupont Passigli (Doc. #1886, SBC-046630)

Dear Administrator Regan,

Thank you for proposing these limits on the toxins in drinking water.I am lucky to have a well of my own, but many people are forced to drink water from iffy sources or go to the expense of buying bottled water. And there are all sorts of worries about the safety of bottled water as well. I hope that your scientists are fierce in grading the safety of water that our children will drink. Thank you

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ralph Heimlich (Doc. #1887, SBC-046631)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

In particular, it would be helpful for EPA to reach out to industries that use PFAS chemicals in their production processes and encourage them to explore substitutes that do not pollute forever.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tina Back (Doc. #1888, SBC-046632)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals.

Variations thereofs are just as hazardous. Stop this.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gloria McClintock (Doc. #1889, SBC-046633)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Since PFAS are forever chemicals and remain in our environment forever, they undoubtedly also remain in our human bodies forever and are a detriment to our health.

Even nursing infants have been found to be ingesting these chemicals in their mother's breast milk. This is not the legacy that we want to give our children.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals.

Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bernadette Tourtual (Doc. #1890, SBC-046634)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

I add my personal comments to this letter indicating that it is a national health issue that I am concerned about that PFAS are allowed in our drinking water. We have had many areas in our country where communities have been exposed and have suffered. Please make an effort to remove these chemicals.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dale King (Doc. #1891, SBC-046635)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. Here in Maine we have seen first hand the effects of PFAs in both water and soil. Though Maine is working diligently to test people's wells and soil, this issue with PFA contamination is happening all over the United States; it is the responsibility of the federal government to create regulations to assure the American public that the water people are drinking is not contaminated with PFAs that are a hazard to their health.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andy Bauer (Doc. #1892, SBC-046490)

Dear Administrator Regan,

Way to go on your recent proposal limit PFAS chemicals in our drinking water! Thank You! It is indeed refreshing to have an agency that embraces, rather than runs from, making rules based on actual science.

Please fast track this. Gently inform industry opposition that safequarding public health really needs to take precedence over profits, and maybe this will spur them to develop safer alternatives. Especially if the whole class of PFAS chemicals is affected (as it rightly should be!).

Sincerely,

Andy Bauer

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dorothy Jordan (Doc. #1893, SBC-046636)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

These chemicals have been spreading in our environment for years. Now that we know the toxic effects which can be caused by these chemicals, we need to take immediate action.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lori Stetson (Doc. #1894, SBC-046637)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals.

Taking the burden off our communities, our drinking water, and our health is the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dayle Severns (Doc. #1895, SBC-046638)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. We need to do all we can to protect and clean our water -get the chemicals, pipeline seepage, train derailment spills, big corporations dumping who knows what into our waterways, and runoff from farms out of our precious drinking water.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diane Krassenstein (Doc. #1896, SBC-046639)

Dear Administrator Regan,

The toxins in these chemicals are absorbed by people. They contribute to various health issues and deaths from diseases such as cancer. As a nation we need to protect everyone.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Derek Benedict (Doc. #1897, SBC-046640)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. And I strongly hope that you continue to lead the fight to get all varieties of man-made toxic poisons out of our air, soil, and water. C'mon man, you can do this!

And the EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sandy Bell (Doc. #1898, SBC-046641)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. The only way for individuals to obtain clean water is with a reverse osmosis water system. Not only are many families unable to afford this, but it wastes water to clean it. We need our government to provide clean water for everyone.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julieann Putt (Doc. #1899, SBC-046409)

Dear Administrator Regan,

Clean water = Life. Thank you for regulating PFAS

Sincerely,

Julieann Putt

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Ramos (Doc. #1902, SBC-046680)

Dear Administrator Regan,

I strongly support your proposal for health-protective limits for PFAS chemicals in drinking water, based the latest scientific information on their health effects.

EPA must see that these Safe Drinking Water Act regulations as soon as possible, including the Hazard Index approach for four PFAS chemicals. EPA should address the whole class of PFAS chemicals wherever possible. There are thousands of PFAS chemicals in use and found in water around the country.

EPA and the federal government must take bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the problem of PFAS.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Todd Snyder (Doc. #1903, SBC-046676)

As a stakeholder, I urge the EPA to finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lori Baranoff (Doc. #1904, SBC-046642)

Dear Administrator Regan:

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

All departments and agencies in the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

The EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. The EPA should address the whole class of PFAS chemicals wherever possible.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1905, SBC-047315)

Water is a basic human right. We should have the right to clean air, clean water, and clean food. These are essential for life, health, and happiness which are/should be universal rights as we co-exist on this planet. There are alternatives to use of these products and while cost is a factor, the associated costs for increased healthcare in an already over-stressed system, is far greater. Our water utility made us aware that this was happening and they have also stated that they already meet the proposed requirements so nothing will change with our water. Any amount of these substances is too much as our bodies do not recognize it. We all know too well what cigarettes, wildfire smoke, smoke from wood-burning, coal, and other contaminates do in our bodies. Must we wait for "more research" to know that PFAs and other contaminants do? We know what they do already. We don't need proof. They likely cause cancer, maybe metabolic issues, possibly hormonal issues. We must do more than the proposed reduction by requiring industries to eliminate the use of these products. We must use BEHAVIORAL principles such as PREVENTION and REACTIVE strategies. Prevention: Do not make the contaminant. Reactive: clean up and filter the already-present contaminants. Let's use the law of parsimony here and use the simplest method. We can deduct that these cause harm, so let's fix it before it gets worse and the population continues to rise. I'd like to put my feet in clear creek water and enjoy what time I have left and leave it better than I left it for the next generations. Our policies are not making that so.

EPA Response: The EPA acknowledges this comment in agreement with safe, clean drinking water. The EPA believes this NPDWR does just that. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ellen E Barfield (Doc. #1906, SBC-046643)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA MUST finalize these Safe Drinking Water Act regulations SOON, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. Pass and ENFORCE real regulations which protect our water NOW!!!

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lisa Trimboli (Doc. #1907, SBC-046644)

Dear Administrator Regan,

I heard on the news the other day that 1 in 6 humans around the world experience infertility, but they don't know why. Maybe it's in the water.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Monte Rogers (Doc. #1908, SBC-046195)

Think of our kids & grankids. Something impactful must be done now,

EPA Response: The EPA acknowledges this comment and believes this NPDWR is an impactful action to reducing PFAS exposure and health effects. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kari Pohl (Doc. #1910, SBC-046645)

Dear Administrator Regan,

I live in a community that routinely has brown drinking water due to the legacy of industrial pollution (namely, from a steel mill that for decades dumped slag into a river that runs directly above the wells that service our municipal water authority). As such, I would like to thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Protecting our nation's drinking water is critical. That's why the EPA should finalize these Safe Drinking Water Act regulations as quickly as possible--including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. Residents in affected communities need the EPA to address the whole class of PFAS chemicals wherever possible.

Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge--rather, that's just one more way to privatize profit (allowing transnational corporations to subsidize their wealth with our health) and socialize the expense (forcing taxpayers to cover the costs of corporate criminality). Therefore, it is imperative that all parts of EPA and the federal government take bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Shellee Davis (Doc. #1911, SBC-046646)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Usually, tthe industry itself recommends limits on toxic substances instead of banning them. I believe these "forever chemicals" warrant being banned. There is no safe amount that we can all imbibe along with the hundreds of other toxic chemicals that are already in all of our bodies. They all create havoc by disregulating our systems. The result is chronic disease, or new and rare diseases that are no longer rare, causing American's bodies and pocket books to take the brunt of the problem instead of preventing the problem in the first place.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible. Please use the most stringent, enforceable guidelines for safety.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Guy Marsters (Doc. #1912, SBC-046684)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

What the Hell is wrong with corporate America putting this crap in ANYTHING? What valid reason is there to even produce such compounds? Are people really still living too long with all the other crap you've put into the environment? Is it so profitable that it justifies contaminating the environment for hundreds of thousands of years? Who ever is doing this must have an escape

plan to get off this planet once it becomes just too toxic to sustain life or else the producers of these molecules are dumber than trump supporters! . Stop this nonsense before its too late. Please. What is the motivation to even produce these? And knowing what they are, how can you conscientiously introduce them into products consumers are in direct contact withi, or consume? Do you have such contempt for humanity?

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Guy Marsters

Claremont, CA 91711

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cassandra Reid (Doc. #1915, SBC-046426)

Dear Michael Regan,

I think it's incredibly important to set limits on allowable amount of PFA's in drinking water. I strongly support drinking water regulations regarding these chemicals. Thank you.

Sincerely,

Cassandra Reid

Albuquerque, NM 87105

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Ziegler (Doc. #1916, SBC-046647)

Dear Administrator Regan,

I grew up in Nassau County on Long Island, where the underground aquifer drinking water water source is especially vulnerable to PFA contamination. So I'm writing to thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Arthur Moss (Doc. #1917, SBC-046685)

Dear Michael Regan,

"Thank you for taking the first step to regulate PFAS in drinking water." EARTH JUSTICE

It's simple. Your family, my family, my friends' families, any and all families DO NOT want to drink contaminated water of any kind. Ban what shouldn't be in our water. Fine those who ignore the rules.

Aloha.

Sincerely,

Arthur Moss

Portland, OR 97239

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fred Davis (Doc. #1918, SBC-046686)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS has contaminated drinking water for millions across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide essential and long overdue protections against six of these toxic chemicals. We strongly support the proposed measures and urge EPA to finalize them as quickly as possible.

PFAS is a significant, long-lasting, and hazardous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the atmosphere. PFAS has contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies exposed in utero. Yet despite the severe health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing solid limits on six widely detected PFAS, the proposal would save thousands of lives and prevent thousands of PFAS-related severe illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities that are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to finalize these standards quickly and to implement a most health-protective rule, resisting the industry's efforts to weaken them.

Respectfully I remain

FRED R DAVIS, ("MORTAL" - As Are We All)

Sincerely,

FRED DAVIS

Tampa, FL 33613

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Torger Johnson (Doc. #1919, SBC-046687)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. PFAS have contaminated drinking water supplies for millions of people. The EPA's proposed drinking water standards would provide important protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Torger Johnson

Oakland, CA 94605

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elaine Mayer (Doc. #1920, SBC-046688)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water to provide safer drinking water for communities from coast to coast. It will save thousands of lives and prevent serious PFAS-related illnesses each year. By issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Quickly finalize these standards, and implement a rule to resist any effort to weaken them.

Sincerely,

Elaine Mayer

Minneapolis, MN 55447

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Holly McDonald (Doc. #1921, SBC-046575)

I write today as a deeply concerned American to urge the EPA to swiftly implement drinking water protections against unhealthy PFAS contamination.

Our country must have strong national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and, instead, accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why action must be taken quickly and decisively. Finalizing these regulations will protect drinking water for countless communities. Therefore, I strongly urge your support for these badly needed regulations to protect people and our rivers, oceans, lakes, and communities from unacceptable PFAS contamination.

Thank you for your consideration of my message and for your vital action in this critically important matter to safeguard public health and the environment.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1922, SBC-046267)

EPA should strongly regulate perfluorohexane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA) and its ammonium salt (also known as a GenX chemicals), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS. These substances pose a major risk to public health and must be rapidly addressed.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Karen Rist (Doc. #1925, SBC-046572)

On behalf of myself and every other human who drinks water to urge EPA to swiftly implement drinking water protections against PFAS contamination. Most of us can't afford to filter our way to safer water.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act quickly and decisively. Finalizing these regulations now would protect drinking water for countless communities across our country.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination. this is the kind of protection the EPA is mandated to deliver.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jacqueline Barnes (Doc. #1926, SBC-046418)

Dear Michael Regan,

Please get these toxic chemicals out of our drinking water. Please we are exposed to too much of them as it is in our environment.

Sincerely,

Jacqueline Barnes

Florence, AL 35633

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diane and Jerry Balin (Doc. #1928, SBC-046581)

We are writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

Diane worked for the Metropolitan Water Reclamation District of Greater Chicago in the 1970 when EPA was created to address the degraded state of our waterways. Industry was polluting our wastewater with many deadly chemicals, including heavy metals, arsenic, etc. We created standards to address this problem.

Now we need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

We urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amelia Davis (Doc. #1929, SBC-047449)

Another issue that arises with your third step of this plan is just how the filtering and reduction of PFAs would happen. Laurel Shadier, a senior scientist at Silent Spring Institute, describes ways to reduce these PFAs an describes that some may just close contacted wells and depend on other sources for water, that has the acceptable amount of PFAs. This would be an easier way to bypass the cost that comes with filtering the water mentioned above, but this solution also has serious implications. With climate change being a serious issue, we are already seeing droughts

throughout the world and just cutting off access to water because it's contaminated and using up other water can advance this climate change issue. While safe water is better than contaminated water, it won't make a difference if we run out of safe water because we are unable to use the wells of PFA water. In order, to not advance climate change, it becomes important to focus on the contaminated water and to fix that issue instead of looking for the easy way out. The focus should be on cleaning up the water that we already have easy access to, even though it will cost more financially.

The proposed plan looks good on paper but once you look at the details it is clear that there are some holes, and in order to use these new standards to the best of their ability those holes need to be covered.

EPA Response: The EPA acknowledges and appreciates this comment in support of the PFAS NPDWR, with some concerns that need addressed. Please see section 1.3 of the EPA response in this *Response to Comments* document. The final NPDWR does not require a specific technology and does not dictate specific actions that water systems must take (such as installing a treatment to remove PFAS or use a non-treatment option like drilling a new well). The rule requires that water systems achieve compliance at or below the MCLs by the compliance date but is not prescriptive in how this must be met. There are important considerations in choosing treatment and non-treatment options that need to be considered on a site-by-site basis. Water systems should consider the impacts of new source water wells on existing PFAS contamination plumes before selecting options. PFAS treatment option selection should consider conditions for a given utility including water quality, available space, disposal options, local rules, and currently installed unit operations. These compliance decisions will be made at a system level, and additional considerations that utilities and communities will weigh include relative costs of the various treatment and non-treatment options, viability of alternative water sources or interconnection options, feasibility, existing treatment processes and potentially other co-occurring contaminants, etc. Not every BAT represents the best treatment option for an individual system and site-specific considerations can limit BAT selection. For instance, residuals management considerations can limit the choice of RO/NF, particularly in states with limited water resources. The EPA anticipates that a small subset of water systems will elect for a non-treatment option, based to the decision tree included in section 5 of the Economic Analysis. Additional discussion around treatment technologies and compliance options, please see section X of the FRN and section 10 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1930, SBC-047318)

The ability of companies to disregard the rulings for PFAS due to the sheer amount of leniency and loopholes within this proposed action is absurd. By being under the minimum needed to be reported or cleaned, companies can continuously pollute drinking water with PFAS, known as forever chemicals due to their inability to be broken down and how hard it is to remove from the environment. Once these forever chemicals pollute our drinking water, even a meager amount can have a multitude of adverse health risks such as hampering the immune system, interfering

with hormones, and reducing the effectiveness of vaccines" while in larger doses, PFAS can cause even more dangerous health anomalies such as kidney cancer, testicular cancer, liver damage, and thyroid disease. The toxicity of PFAS has been known by Depont which is the U.S.s leading manufacturer of these forever chemicals for years after they conducted clinical trials on rats. Yet, Dupont willfully chose not to release this information to the public or even to switch to the biodegradable and safer alternative that was at their disposal. How as citizens, are we expected to put our trust in our local public water systems to detect PFAS and help regulate these companies when they failed to even test the harmful effects of these forever chemicals in the past, and what is stopping manufacturers from creating new PFAS that don't fall under the proposed regulation? Additionally, it has been shown by journalistic sites such as Pewtrusts that the American Chemistry Council even finds that the regulation is also inappropriately broad in the way it categorizes what is a forever chemical, leading to many other unintended substances that carry a low safety risk to fall under this regulation despite not being PFAS leading to unnecessary complications with uninvolved private sectors. For the above reasons, I believe the proposed regulation is both too lax and far too broad for it to be reliable in protecting public health, what is needed is not a wide regulation on substances similar to PFAS but rather for the government to hold the private sector more accountable as to what it is allowed to dump into our waterways.

EPA Response: The EPA acknowledges this comment. Please section 1.3 of the EPA response in this *Response to Comments* document. The EPA disagrees that this rule is too relaxed and too broad for reliably protecting public health. The EPA provides ample evidence for public health effects of these six PFAS and the occurrence of these PFAS in drinking waters that indicate that this NPDWR will provide public health protection for many years. Discussion of the health effects information and the occurrence data can be found in section IV and VI of the FRN. For discussion on why the EPA is regulating these six PFAS, please see section 2.1 of the EPA response in this *Response to Comments* document, as well as section 15 of the EPA response in this *Response to Comments* document for remaining topics that are out of scope of this NPDWR.

Mary C. (Doc. #1931, SBC-046605)

As I've learned from the presentation, the EPA is proposing a "National Primary Drinking Water Regulation" (NPDWR) to establish legally enforceable levels (Maximum Contaminant Levels, or MCL's) for six PFAS in our drinking water. After reading the slideshow and the article, PFAS are a category of manufactured chemicals that have been used in industry and consumer products for many years. Because of their widespread use and their persistence in the environment, PFAS tend to break down very slowly and can build up in people, animals, and the environment over time. Scientific studies have shown that the exposure to some PFAS are known to cause an increased risk of cancer, increased cholesterol, decreased vaccine response in children, lead to negative health effects towards pregnant people and in developing babies, and weaken the immune system. They are the same chemicals that exist within our pots and pans, raincoats, and

in our fire extinguisher foam. And, lucky for us, these chemicals are often found in our drinking water.

As we've learned from the article and presentation, these chemicals have a serious and harmful impact on people and animals that they come in contact with. Additionally, we know this because I learned from the Bilott and DuPont case that Wilbur Tennant, a farmer in West Virginia, said that his cattle were dying left and right, and were acting deranged and had been suffering from strange effects. Some had blood running from their noses and mouths, chemical blue eyes, blackened teeth, and much worse. This was a huge problem for Tennant. He needed help- so he contacted Rob Bilott. Bilott, after a lot of research over several years, eventually cracked the case wide open and exposed DuPont (the chemical company responsible for the deaths of Tennant's cattle) and that they had known the damage they were doing for years. This kind of behavior is a huge threat towards our world. It's a threat because not only is it completely morally wrong, and these chemicals can cause serious issues towards people and animals, but DuPont is surely not the only company doing this. I wonder how many other companies are getting away with this to this day.

Although I like the idea of regulating the amount of chemicals in our drinking water, and think it's a good step towards improvement, I still don't think that it's enough. I think it's good that they're finally taking action on this serious issue, and wanting to notify the public of the levels of the PFAS in the drinking water. However, why are we permitting harmful chemicals in our water in the first place? If healthcare authorities are aware that these chemicals are harmful to the public, why are we okay with "minimal levels" of these in our water? We shouldn't have any PFAS in our water at all. Although it's hard to completely avoid these chemicals, they need to take more action against allowing any of these harmful chemicals in our water. These big chemical companies need to be more cautious of what they are releasing into our environment and where they are dumping them.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR, with a request for further action. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diego Carrasco (Doc. #1932, SBC-047313)

The Environmental Protection Agency (EPA) is requesting the public's input on the proposed rule about rules regulating six PFAS also known as chemicals that have been found to be harmful for humans since the 1940s. I think that the proposed rule for requiring the state and city public water system to monitor these PFAS and notify the public when the levels of the drinking water exceed the proposed standard is an excellent proposal that should have been created a long time ago. Giving the public access to the PFAS analytic tool will be very beneficial because it gives individuals information to make their own decisions. Governmental agencies should use this situation with the PFAS as a template on what should be done every time a chemical compound

such as PFAS is created. This would allow them to have more control over the regulations, and have updated data readily available for the citizens of this country.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Guarrera (Doc. #1933, SBC-046689)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Yet despite the serious health risks, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Patricia Guarrera

Pearce, AZ 85625

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Seth Roseman (Doc. #1934, SBC-046539)

PFAS chemicals have been associated with a number of adverse health effects, including cancer, thyroid disease, and developmental issues in fetuses and infants. Studies have found that exposure to PFAS can lead to increased cholesterol levels, decreased fertility, and immune system dysfunction. Even low levels of exposure to PFAS over an extended period can be harmful to human health. Over ninety percent of Americans are estimated to have PFAS chemicals in their blood stream as well.

Drinking water is a major source of PFAS exposure for humans. PFAS can leach into groundwater and surface water from industrial sites, landfills, and wastewater treatment plants.

These chemicals are difficult to remove from water, and traditional water treatment methods are not always effective in removing them. Therefore, it is essential to limit the levels of PFAS in drinking water to protect public health, lower healthcare spending, and stop PFAS-related disease from burdening our healthcare system..

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patrick Coles (Doc. #1936, SBC-046648)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Most importantly, we need to remove PFAs from the water supply in water treatment plants - please direct funding to these plants to remove PFAs from the water supply! Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

Patrick Coles

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mason LaRusso (Doc. #1937, SBC-046323)

Reading through the EPA's proposed rule regarding the Drinking Water Regulation of PFASs, I would say it doesn't go anywhere near "too far," as it's a very serious matter that affects life in many aspects. If anything, it doesn't go far enough. Because PFASs are a group of man-made chemicals, they are primarily used for consumer products and/or industrial applications and are not meant to be mixed with the environment or human bodies. PFASs are used in making things like nonstick cookware, water-repellent clothing, carpets, firefighting foams, and other products that resist grease, water, and oil. According to pbs.org on PFASs, "This stuff is toxic at incredibly low levels and it's persistent – it stays there for hundreds of years in the groundwater,

thousands of years." These chemicals do not break down, so they will remain in the environment, exposing more people to them. It is also mentioned that evidence suggests that exposure to PFASs could potentially lead to increased cholesterol levels, decreased vaccine responses in children, higher risk of preeclampsia in pregnant people, and increased risk of kidney and testicular cancer. The fact that such a harsh chemical is being put into our drinking water is absurd, and should be regulated much more closely - we have no idea where it could hit us from. From the article on atsdr.cdc.gov, it talks about how exposure to PFASs could occur from a) drinking contaminated water, b) food grown or raised near places that use or make PFAS, c) eating fish caught from water contaminated by PFAS (PFOS more specifically), d) accidentally swallowing contaminated soil or dust, e) eating food packaged in material that contains PFAS, or f) using consumer products like the ones I'd listed above - nonstick cookware, water-repellent clothing, etc. etc. Though the EPA's proposed rule to regulate PFASs more closely is a decently significant step towards addressing the public's concerns and protecting our health as humans, it could still be pushed further. Mainly, it focuses on the issue of public drinking water and food products, preventing the PFASs from contaminating those things in particular. Personally, now knowing that PFASs are used in so many products, I think the EPA could take it a step further and strengthen the limits of these chemicals being used in products. The rule definitely has the right idea and does cover quite a bit, they still might not be strong enough to truly and effectively reduce the risk of PFAS exposure in things like food packaging or drinking water containers. By more strongly enforcing these limits within the area of consumer products, it would further reduce the chance for PFASs to be ingested by the public. Another thing the EPA could do to take it a bit further, is expand the list of PFASs that are to be regulated. The rule currently only covers a limited number of them, but according to the EPA's master list of PFAS substances, there are thousands of other PFASs that have been used in various industries and could have similar effects on the environment and human health (12,034 to be exact.). By expanding the list of regulated PFASs, the EPA could ensure that all of the relevant chemicals would be covered and regulated by the rule, therefore reducing the use of them overall. The new rule is definitely a step in the right direction for this country, and it should be pushed as far as it can be by anyone that is concerned about the negative health and environmental impacts these chemicals could have.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Matilda Phillips (Doc. #1938, SBC-046503)

Please urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

We need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

Please support these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Terri Arnold (Doc. #1939, SBC-046222)

Its time the Federal Government start doing their jobs to protect the US citizens! Stop adding cancer to our drinking water and foods! This is horrendous! DO YOUR JOBS!!

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR, as the EPA feels this rule does protect US citizens from PFAS in our drinking water. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alyssa Simms (Doc. #1941, SBC-046211)

I am in support of this new drinking water regulation. I don't want any PFAS in my drinking water, and this is a step in the right direction.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephen Ocallaghan (Doc. #1942, SBC-046563)

Re: Docket ID No. EPA-HQ-OW-2022-0114

Administrator Regan:

Thank you for taking a historic step to regulate PFAS in public drinking water. I urge EPA to finalize the proposed standards as quickly as possible.

I am 77 years old and have enjoyed a pretty healthy life. I have several grandchildren. I very much doubt that my grandchildren will live to my age, certainly not in good health. Why? Because our environment can be bought by wealthy people and corporations. It's time that the rights of the citizens of this country be recognized and protected by our government. The citizens have the right to a healthy life , liberty and a pursuit of

happiness. These rights surpass the rights of large corporations who can buy politicians to do their bidding and make it more profitable to do business that pollutes our environment.

In Wisconsin, two-thirds of the population relies on municipal drinking water. To date, over 70 Wisconsin communities have confirmed detections of PFAS in their water systems. Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. EPA's proposed rule would provide safer drinking water, reduce health risks and save thousands of lives.

These standards need to be finalized IMMEDIATELY!

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Janet Anderson (Doc. #1943, SBC-046585)

These are my comments regarding Docket ID No. EPA-HQ-OW-2022-0114.

Thank you for taking this step to regulate PFAS in public drinking water.

I strongly support the proposed standards and I urge the EPA to finalize them as quickly as possible. For decades, PFAS have contaminated drinking water supplies for millions of people across the country .... resulting in increased rates of cancer, developmental and reproductive harm, and other serious impacts. PFAS have been found in the blood of nearly every individual in the United States, including newborn babies who are exposed in utero.

In WI, 2/3 of the population relies on municipal drinking water. PFAS pollution is affecting an increasing number of communities throughout our state. Many of these contaminated systems have been contaminated for many years already; many of our WI citizens STILL have to purchase water for washing, cooking, bathing, etc because they do not have clean, safe water in their homes. This is absurd that this issue continues to be a hazard to our citizens.

To date, over 70 Wisconsin communities have confirmed detections of PFAS in their water systems. This number is expected to increase as statewide testing continues. Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. EPA's proposed rule would provide safer drinking water, reduce health risks and save thousands of lives.

We urge the agency to finalize these proposed standards as soon as possible to protect public health in communities in Wisconsin and across the country. Sincerely, janet anderson

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Buchholz (Doc. #1945, SBC-046690)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

I am personally terrified. I am 26 years old and I have spent the last 5 years learning about how much your generation has poised mine. You have borrowed from and stolen and poisoned my future and our planet to the point I fear we wont be abke to fix it. Please. Do the RIGHT thing. Now that we KNOW about these MANY issiues, including PFAS, help us change.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Mary Buchholz

Memphis, TN 38122

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chris BarsyEckman (Doc. #1946, SBC-046231)

This is water we are talking about. You know water we drink and wash in and cook with. We need strong stringent safety standards and protections to guarantee our water is safe for all.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR, as the EPA believes this regulation is a strong protection from PFAS in our waters. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Devyn Crane (Doc. #1947, SBC-046203)

The updates guidelines are better but we must strive to be as restrictive with pollution as possible.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1948, SBC-046226)

We need strong drinking water standards to protect us from toxic pfas contamination. Please prioritize public health and enact the proposed standards. We deserve clean water.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Annabelle Ott (Doc. #1949, SBC-047324)

I believe regulating the PFASs (a chemical compound composed of carbon and fluorine) by the Environmental Protection Agency would be good. However, in my opinion, this new regulation would only limit it to 6 PFASs; otherwise known as an unidentifiable amount, although it is known to have adverse effects on humans and animals alike. However, I am aware of the cost this would take on large-scale businesses and those like licensed state professionals, attorneys, and remediation companies, as they could face fines of up to $250,000 with a starting point of $25,000, according to John P. Gardella of Bloomberg Law. Although it is my firm belief that the adverse effects of the chemicals outweigh the cost for companies and those involved in the business of this chemical composition.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR, with a few concerns. Please see section 1.3 of the EPA response in this *Response to Comments* document.

J. Cicini (Doc. #1951, SBC-046608)

The recent US Environmental Protection Agency (EPA) rule regulating six per- and polyfluoroalkyl substances (PFASs), also known as forever chemicals, is a step in the right direction towards protecting human health and the environment. I think the EPA finally batting an eye at PFAs is great and well overdue. However, the new rules are not enough to address the significant harm that these chemicals pose to human health and the environment. The EPA's rule only focuses on six specific PFASs, including perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS), which have been widely used in products such as non-stick cookware, stain-resistant fabrics, and firefighting foam. There are over 5,000 PFASs in use, and many of them have not been studied for their potential harm to human health and the environment according to a Harvard University article done by Professor Karen Feldscher. Furthermore, the EPA's rule only requires companies to report any new uses of these six PFASs and provide information about their use in products. This falls short of what is necessary to protect human health and the environment from the harm caused by these chemicals since it leaves out lots of vital information as to what we are consuming. The harm caused by PFASs is significant. These chemicals do not break down easily and can be present in the environment for decades, accumulating in soil, water, and air. The contamination of these chemicals have devastating effects on wildlife, including fish and other aquatic animals which was seen in the "Dark Waters" film. In addition, PFASs are known to cause a range of health problems, including cancer, liver damage, and developmental issues in fetuses and infants. A 2007 study showed that over 98% of Americans had detectable levels of PFAS in their blood, regardless of demographics(Statnews.com) This alone demonstrates that it is crucial that the EPA take a more serious approach to regulating PFASs. The EPA needs to establish strict limits on the amount of PFASs allowed in products and the environment to prevent further contamination so no places end up like Parkersburg. The EPA should also require companies to disclose information about all PFASs used in their products. Another idea the EPA could implement is to prioritize the protection of vulnerable populations; such as children, pregnant women, and communities living near PFASs manufacturing facilities. These populations are often harmed the most by these chemicals, and it is crucial that they are protected from exposure to PFASs. In addition to stricter regulations, more research is needed to fully understand the impact of PFASs on human health and the environment. This research should be funded by the government and conducted independently of the chemical industry to ensure unbiased results. While regulating PFAs is fantastic and a great start, the guidelines presented and the small number of chemicals . The EPA needs a tighter approach to regulating PFAS. The examples provided would be excellent additions to the rule and create lots of change quicker. I understand why companies use these PFAs and it might be difficult to replace these chemicals in certain products but the amount that is rampant is worrisome.

https://www.statnews.com/2022/12/21/forever-chemicals-pfas-epa-drinking-water/

https://www.hsph.harvard.edu/news/features/why-more-stringent-regulation-is-needed-for-forever-chemicals/

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Wolf (Doc. #1952, SBC-046206)

I strongly support federal limits on PFAFs in our water. This " forever chemical " is indeed forever. Tgank you.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1953, SBC-047431)

Greetings, Mrs. Greene.

I support EPA's Proposed PFAS National Primary Drinking Water Regulations (NPDWR). These efforts to regulate PFAS "forever chemicals" address nuisances to the environment and public health because of its persistent nature. Since the substance does not degrade, it accumulates in sediments and waterbodies. The chemical has especially been a topic of urgency that demands environmental regulation due to PFAS contamination in water supply and agriculture. Potential life threats can occur when people and wildlife indirectly consume PFAS, which are absorbed and can accumulate over long periods of time. High exposure to PFAS can lead to immune suppression, changes in liver function, thyroid cancer, and much more (Minnesota Department of Health 2022). Thus, it is critical that the federal government initiates limitation of exposure to these compounds.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vojin Mastilovic (Doc. #1954, SBC-046252)

I believe that this proposal should be implemented as soon as possible because water should be something we don't have to worry about being clean or bad for us. This rule would be useful to take precautions to take out dangerous chemicals from our water such as PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #1955, SBC-047447)

The 'Forever Chemical' called PFAS surrounds billions of people every second of every day making it almost impossible to avoid. PFAS are found in nonstick cookware, clothing (i.e yoga pants and raincoats) and the public water system. Without even knowing you or the person next to you might be wearing clothes that contain PFAS or cooked eggs using a teflon pan. Millions of people have been exposed to PFAS over many decades from the 1940s. The use of PFAS must be stopped or at least contained to limit the amount of exposure that everyone has experienced or will experience in the near future.

As of January 2023 the EPA proposed a rule that would prohibit anyone from starting or continuing the use of PFAS without complete EPA review, risk determination and manufacture. These new regulations provide a safer environment for all. According to the CDC, exposure to PFAS over a period of time can cause damage to the liver, immune system, increase cholesterol levels, hormone disruption and thyroid disease.

Now water is accessible to everyone and without sufficient amounts of water it would lead to dehydration and potentially death. Clean water should be accessible to everyone because without clean water, there is no saying what the chemicals could do to our body. As of now, some states have passed laws regulating certain PFAS but there is no federal mandate. Without a federal mandate that means not all public water systems have to test for PFAS or filter before others consume it (Isaacs-Thomas). The new proposed rule would require state and city public water systems to monitor for PFAS, notify the public of the PFAS levels, and reduce the levels of these PFAS in drinking water if they exceed the proposed standards is a good start towards having a safer drinking environment for future generations. The EPA is proposing the National Primary Drinking Water Regulation (NPDWR) to have a standard for public water which could legally enforce levels called Maximum Contaminant Level (MCL).

Not only is PFAS found in water systems, they are also found in nonstick cookware such as pans. The PFAS in the nonstick cookware have polluted the water system causing it to be forever contaminated ("Undisclosed PFAS Coatings Common on Cookware, Research Shows"). When the teflon comes in contact with metal or high amounts of heat, PFAS is released into the air which cannot be easily broken down into a simpler compound. The reason why PFAS is considered to be the "˜forever chemical' because it cannot be easily broken down but it is man made ("Frequently Asked Questions about PFAS Chemicals | ATSDR").

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Iresli Jurado (Doc. #1960, SBC-047446)

The fact is that there are proposed rules by the EPA to regulate these six harmful chemicals in drinking water, and it has the potential to protect public health and the environment. It may have negative impacts on businesses and public water systems, however, it should be possible to regulate the rules as long as the aim is to make the water systems better. Trying and failing is

better than not trying at all. Additional evidence is needed to fully analyze the issue, including data on PFAS prevalence and health effects, economic analysis, and examination of alternative approaches. To address this issue, an option for action is to study the benefits and eventual negatives coming with the rule. Ultimately, finding a solution is the number one priority, thereafter one can work on balance and competing concerns.

The ultimate goal will be to protect public health and the environment while maintaining good economic standards. Considering the economy of the public, and more specifically stakeholders in the company, my ethical opinion is that if you invest in something bad, you do not deserve better. However, I want the best for the highest number possible, and it would be great if the government could help out. Reducing private costs for employers and shareholders to keep their jobs would be huge. What justifies this, is that the potential costs for a new monitored water system would possibly be lower than the costs of fixing health issues and other costs coming with bad water systems down the line. We completely agree with the proposed rules and think the focus on knowing how well the rules are regulating the water have to be just as much focused on as implementing them.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gary Overby (Doc. #1961, SBC-046430)

We in the Madison, Wisconsin area are struggling with the legacy effects of PFAS as a result of years of use as fire fighting foam for military planes.

Please help us to rectify this problem with the strongest possible standards, and remediation, Thank you

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jerry M. Littlefield D.O. (Doc. #1963, SBC-046583)

I live in Rome GA. Our city water was drawn from the Oostanaula river, now from the Etowah river. They come together in downtown Rome to form the Coosa I live in Rome Georgia. We formerly drew our water supply from the Oostanaula River, now from the Etowah. These join in downtown Rome to form the Coosa River which flows west into Alabama and eventually to the Gulf of Mexico. This change in source was forced by pollution by PFASs dumped into thOostanaula watershed by carpet mills and other industries upstream in the vicinity of Dalton GA, which prides itself as the "carpet capital of the world."

This will require the construction of a reverse osmosis water treatment plant to use water from the Oostanaula, which has a better flow-costing millions.

We now know that some PFAS compounds are endocrine disrupters and possible carcinogens. Others have as yet unknown effects. As a physician and a parent I am very concerned about increasing exposure to the "forever" chemicals.

While many of these dangerous compounds may make for convenience, most uses are not vital for life or saftey. Most have replacements with known safety records.

I urge you to require monitoring for these compounds by municipalities, and testing to demonstrate saftey by manufacturers and users. Convenience and more profits are not good reasons for poisioning our children!

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR, as the rule will require monitoring of six PFAS. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anya Mulvaney (Doc. #1965, SBC-047320)

I believe the best approach, for the common good, what is just, and what is ethical is to pass this policy. But furthermore, for the local governments to instate regulations on chemical companies so that they are being held accountable. It is not fair for citizens to pay taxes to address problems they aren't making. So I would argue this policy doesn't take it far enough. We need to work towards the regulation of the industry, not just place the burden on local government and even make these chemicals illegal to pump in water. This would have economic costs but the health benefits and safety outways the costs. I would guess that the majority of individuals would mostly agree that it is the fairest and just outcome. The one argument that could appear is from a rights approach. Citizens have a right to safe water, but the question is do companies have a right to pump their waste into sources of water and expect governments to ensure it's safe? Some may argue yes; some may argue no. I would argue that these companies do not have this right. They must take responsibility for their actions and the consequences that come with them. If they wish not to have these consequences, then they should work towards finding an alternative to dumping harmful chemicals into drinking water sources.

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcia Garceau (Doc. #1967, SBC-046691)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in

increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Marcia Garceau

San Diego, CA 92129

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Massa (Doc. #1968, SBC-046445)

Dear Michael Regan,

I am extremely concerned about the harmful effects of PFAS in our drinking water on our health and well being and absolutely approve of the EPA's proposed standards. I am asking you to put them into place as soon as possible to save lives.

Sincerely,

Patricia Massa

Saint John, IN 46373

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carlo Provanzano (Doc. #1969, SBC-046692)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

With so very many toxic chemicals in our air, food, and water, and with the health of millions of Americans suffering for it, it's about time the whole nefarious operation was stopped and our air food, and water cleaned up for the sake of not only the present generation suffering the direct results of toxins and pollutants, but for those yet unborn.

DO SOMETHING! Stop the slow genocide!

Sincerely,

CARLO PROVANZANO

Palos Verdes Peninsula, CA 90274

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Fuoco (Doc. #1970, SBC-046693)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Barbara Fuoco

Portland, OR 97202

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elmo Patrick (Doc. #1971, SBC-046694)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against 6 of these toxic chemicals. We urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment and drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on 6 widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

Sincerely,

Elmo Patrick

Wrightstown, NJ 08562

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mona Perrotti (Doc. #1972, SBC-046695)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I very strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals.PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to very quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Mona Perrotti

Clinton, NY 13323

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Tippery (Doc. #1973, SBC-046696)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Paul Tippery

Karen Burtness Prak (Doc. #1976, SBC-046698)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water!

As you know, PFAS have contaminated drinking water supplies for millions of people across the country for decades, a situation which has caused (among other problems) increased rates of cancer, developmental and reproductive harm, as well as other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of

these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm for decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and have entered the blood of nearly every individual in the United States, including that of newborn babies (who are exposed in utero). Yet, despite the serious health risks known to be associated with PFAS, there remain no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely-detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS.

By issuing this proposal, EPA is taken one important step toward fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and -- resisting industry's efforts to weaken them -- to implement a rule that is extremely protective of individuals' health.

Sincerely,

Karen Burtness Prak

Menlo Park, CA 94025

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Corr (Doc. #1977, SBC-046699)

Dear Michael Regan,

Pure and clean water for a human 70% water means health humans are swimming in internal water all of our lives. If that water has poisons in it the poisons seep into our organs then more toxicity builds up and more diseases occur and deaths. it is your job to prevent this and keep our water clean for all.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue

protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. Susan DuBois

Albany, NY 12209

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vivian Ehresman (Doc. #1980, SBC-046702)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

How these drinking water standards can even be a question/issue to ponder is crazy. These chemicals should have been banned years ago. Science has proven this time and time again and everyone including you and the US government know it. So, at the very lease, please enforce these limits immediately at the very least. We and all the generations to come are depending on it.

Sincerely,

Vivian Ehresman

Chatsworth, CA 91311

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carolynn Kohout (Doc. #1981, SBC-046703)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

For decades, PFAS have

- contaminated drinking water supplies

- for millions of people across the country,

-resulting in

- increased rates of cancer,

- developmental and reproductive harm, and

- other serious diseases.

EPA's proposed drinking water standards would - provide important and long overdue protections

- against six of these toxic chemicals.

We strongly support the proposed standards. We urge EPA to finalize them as quickly as possible.

PFAS are

1. a large, long-lasting, and highly dangerous class of chemicals

- called "forever chemicals,"

2. persist in the environment,

3. build up in our blood and organs, and 4. continue to cause harm decades

- AFTER released into the environment.

4. have contaminated drinking water supplies

- for approximately 200 million people and

- the blood of nearly every individual in the United States,

- including newborn babies who are exposed in utero.

There are currently NO federal limits on PFAS levels in drinking water.

EPA's proposed rule would

1- provide safer drinking water for communities from coast to coast.

2- establishing strong limits on six widely detected PFAS,

3- save thousands of lives and

4- prevent tens of thousands of serious PFAS-related illnesses each year.

The EPA acknowledges and addresses the cumulative impacts on communities

- who are exposed to multiple PFAS,.

By issuing this proposal,

EPA is one step closer to fulfilling its commitment

- under the 2021 PFAS Strategic Roadmap

to begin regulating PFAS in drinking water.

We urge you to

1) quickly finalize these standards,

2) implement a rule that is the most health-protective,

3) resist industry's efforts to weaken them.

Sincerely,

Carolynn Kohout

Hillsboro, OR 97124

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary-Ellen Maynard (Doc. #1982, SBC-047488)

"PFAS are synthetic, fluorinated hydrocarbons, where fluorine takes the place of most of the hydrogen, according to a recent article in Cosmos. Like most everything that's now the product of organic chemistry, the creation of PFAS built upon those first substances derived from coal."

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Elena Engel (Doc. #1983, SBC-046441)

Dear Michael Regan,

Please make sure we get these toxic chemicals out of our drinking water, out of the ocean, out of everything. Who thought this was a good idea to unknowingly take this stuff into our bodies? Not us! Please ban PFAS

Sincerely,

Elena Engel

San Francisco, CA 94110

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tanya Cobb (Doc. #1984, SBC-046704)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, they have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. Your proposed drinking water standards will provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards and ask you to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," they persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. They have contaminated drinking water supplies for about 200 million people and the blood of nearly every individual in the United States, including newborn babies. Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule will provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal will save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. You acknowledge and address the cumulative impacts on communities who are exposed to multiple PFAS,. By issuing this proposal, you are one step closer to fulfilling your commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I ask you to quickly finalize these standards and to implement a rule that is the most health-protective.

Sincerely,

Tanya Cobb

Alexandria, VA 22311

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ruth Fruland (Doc. #1985, SBC-046534)

Dear Michael Regan,

Please take the continuing decline in male sperm counts and the relentless increase in autism seriously.

We lack perfect knowledge but not the wisdom to clean up our environment.

EPA's proposed drinking water standards would provide important and long overdue protections against six PFAS toxic chemicals.

We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual.

If you are not determined enough to withstand industry's efforts to weaken the standards, what makes you think that you and your children will escape the tragic consequences?

Sincerely,

Ruth Fruland

Seattle, WA 98115

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Yvette Kuhns (Doc. #1986, SBC-046705)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

It is unfortunate and preventable cancer plaguing my family, friends and neighbors since the use of PFAS. Our family medical history did not show cancer and other illnesses now linked to PFAS. I never smoked, drank alcohol or took drugs yet I was diagnosed with colon cancer at age 50. My cousin died of colon cancer before age 40 and she worked in the medical field. Many more family members got different forms of cancer and we all live in an area where the water is unsafe for drinking, washing or cleaning. My cat doesn't even want to drink the water!

It is clear that since we use plastic instead of glass bottles, we are being polluted, poisoned and killed by toxic chemicals. Our ancestors were lucky not to have them in their environment and we are trying to reduce the use of plastic and recycle rather than fill the landfills with plastic. But

we have no control over anyone else... but you do! Please do not allow manufacturer's to use unsafe products and packaging.

Please test the water in rural areas as well as urban areas. Be sure the environment is safe for water, air, plants, animals and humans. We have a well pump that brings water into our home. We buy bottled water and we wash dishes, clothes and ourselves with the well water. I don't feel safe drinking well water or bottled water but we have no choice. It is unfair that we are forced to consume poisoned water. Please enact and enforce stricter rules to protect the environment and those who live in it.

Sincerely,

Yvette Kuhns

Orefield, PA 18069

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Ullrich (Doc. #1987, SBC-046474)

Dear Michael Regan,

Clean our water!

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States.

However, despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

Establish strong limits on six widely detected PFAS now!!

Sincerely,

Nancy Ullrich

Long Beach, CA 90808

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rosanne Couston (Doc. #1988, SBC-046706)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Amy Merritt (Doc. #1989, SBC-046707)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Companies like dupont need to be heavily fined. Any company that builds near a water source needs to be added to the watchdog list, because this is not something new that companies/corporations do. Waterways are an easy way for the bad actors to dispose of their waste. These companies/corporations are happy with their profits at the expense of people/animal/fish/communities. Don't you think this needs to end now?? COMMON SENSE.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to

multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them. COMMON SENSE.

Sincerely,

AMY MERRITT

Belle Vernon, PA 15012

John Vanellis (Doc. #1993, SBC-046710)

Dear Michael Regan,

As a former high school biology teacher I understand the importance of science in policy and decision making in our government. I'm afraid too often scientific evidence is ignored. It's time to side with science, not polluters. Please prevent the destruction of our environment and its inhabitants by using standards based on good scientific evidence not big business interests.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

John Vanellis

Trenton, NJ 08618

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Malin Moench (Doc. #1994, SBC-046538)

Dear Michael Regan,

I strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible. Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA

acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Malin Moench

Falls Church, VA 22041

James Sorrells (Doc. #1995, SBC-046711)

Dear Michael Regan,

We are poisoning our environment on an astronomical scale. It is completely unacceptable. Toxins are entering into every aspect of our lives from the incessant pollution that is saturating air, land, and waters. In turn wildlife and humans in general are unknowingly ingesting these chemicals daily. As humankind continues to grow and expand, we must begin to change for our children to have a chance.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

James Sorrells

Clermont, FL 34715

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Deirdre Scott (Doc. #1996, SBC-046712)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Judi Beardsley (Doc. #1999, SBC-046715)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

I suffer immensely from a condition called Multiple Chemical Sensitivities along with MAST Cell/serious allergies and am literally poisoned by all the every day products most use daily in our world today. I deeply understand the importance of getting toxic chemicals out of drinking water. I have pretty much been a prisoner in my home for nearly 2 decades due to serious and severe reactions to the toxic chemicals in our world. I was always chemically sensitive but after multiple toxic black mold exposures and working in a "tight" building full of toxins for decades, I now suffer greatly. We all deserve and need safe and clean drinking water as it is essential for life. Please do the right thing and get these toxic chemicals out of our drinking water. These chemicals lead to many illnesses including many Cancers.

Sincerely,

Judi Beardsley

Arnold, MO 63010

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carol Wong (Doc. #2000, SBC-046716)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks

associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. Joanna Vintilla (Doc. #2005, SBC-046522)

Dear Michael Regan,

Thank you for starting the process to regulate PFAS in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Joanna Vintilla

Seattle, WA 98133

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sandra Lilligren (Doc. #2006, SBC-046720)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

Water is Life, and we must take every measure to keep it healthy. It is the lifeblood of the planet, and we cannot afford to make any further mistakes in its care.

I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Ethical behavior before power or profit is imperative.

Sincerely,

Sandra Lilligren

Clarkston, WA 99403

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Randall Potts (Doc. #2007, SBC-046721)

Dear Michael Regan,

We desperately need to get PFAS out of our water and keep them out of our bodies. Access to clean water is a fundimental human right. We must act now because the problem is destructive to human health at all levels. I live in Bellingham WA, where our water supply is heavily contaminated and our reservor is rated as an "impaired" water source. The cancer rate here is very very high. Local and state officials will not address the problem for political reasons; we need the EPA to protect our bodies and the water we drink.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

randall potts

Bellingham, WA 98226

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cheryl Mitchell (Doc. #2008, SBC-046899)

Dear Michael Regan,

I am an attorney in Washington State and I am writing to express my thanks for taking the first steps to regulate PFAS in drinking water. I am alarmed by the fact that for decades, PFAS have contaminated drinking water supplies for millions of people across the country. This contamination has resulted in increased rates of cancer, developmental and reproductive harm, and other serious diseases. For many years the EPA has done nothing to protect the public from PFAS contamination.

Finally, the EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I, along with many others, strongly support the proposed standards, and I hope that I can count on the EPA to finalize these standards as quickly as possible.

I know from doing research that PFAS are a large, long-lasting, and highly dangerous class of chemicals. PFAS are often called "forever chemicals." These chemicals persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every person in the United States, including newborn babies who are exposed in utero. But despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. Clearly, the interests of chemical companies are much more important than the health of the American people.

Finally, the EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, the EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I can't even begin to state how important it is for the EPA to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them. Let's end the "Greed is good" rule which has been applied for far too long.

Sincerely,

Cheryl Mitchell

Spokane, WA 99205

Perry Kendall (Doc. #2013, SBC-046891)

Dear Michael Regan,

Making the first move to regulate PFAS in our drinking water is extremely important. They have contaminated our essential drinking water supplies nationwide for decade. Tragically we have increased rates of cancer, developmental, reproductive harm, and other serious diseases to demonstrate that. EPA's proposed drinking water standards necessarily provide crucial long overdue protections against six of these toxic chemicals. Your continued support for the proposed standards is urgent l. We need EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

The proposed rule ensures safer drinking water we all require. Establishing strong limits, on six widely detected PFAS, will save thousands of lives preventing tens of thousands of serious PFAS-related illnesses annually. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Perry Kendall

Glenside, PA 19038

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rhona Schwartz (Doc. #2014, SBC-046725)

Dear Michael Regan,

My family and I thank you for taking the first step to regulate PFAS in drinking water.

So much more needs to be done and quickly!

Please keep working hard to finalize the standards and put into place iron-clad rules that hold all companies accountable.

Sincerely,

Rhona Schwartz

Seattle, WA 98119

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James Boone (Doc. #2015, SBC-046886)

Dear Michael Regan,

Thank you, thank you, thank you !!! For taking the first step to regulate PFAS in drinking water. Every day, millions of people across the country drink water contaminated with toxic chemicals known as PFAS. This exposure poses serious health hazards, as PFAS can damage the immune system and cause cancer and other health problems.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Thank you for considering my comments.

Sincerely, James Boone

Nancy Garret (Doc. #2016, SBC-046481)

Dear Michael Regan,

EPA's proposed drinking water standards would provide important and long overdue protections against six toxic PFAS -- a large, long-lasting, and highly dangerous class of chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Also, please implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Thank you.

Sincerely,

Nancy Garret

Redwood City, CA 94062

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jacquelyn Brown (Doc. #2017, SBC-046726)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite

the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

I will no longer take baths at my sister's house which is Town of Campbell, mailing address is La Crosse, Wisconsin due to PFAS in the water on the island. She no longer drinks from her well because it may be unsafe. This is ridiculous! At some point our health needs to be taken into account before profits of corporations. I am so saddened and disappointed that our health is not considered. It is a sad day for us.

Sincerely,

Jacquelyn Brown

Saint Paul, MN 55119

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Brian Levo (Doc. #2018, SBC-046549)

Dear Michael Regan,

Greetings. Thank you for taking the effort to regulate PFAS in our drinking water. I understand PFAS are persistant in the environment, build up in our blood and organs, and continue to cause harm decades after being released into our environment. Yet, despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

I understand that the EPA's proposed rule would provide safer drinking water for communities, establish limits on six widely detected PFAS, and would save lives and prevent PFAS-related illnesses. I have heard the EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I would urge you to please quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them. Thank you for your consideration in this matter.

Sincerely,

Brian Levo

Falls Church, VA 22044

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lena Nilsson (Doc. #2019, SBC-046485)

Dear Michael Regan,

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

Sincerely,

Lena Nilsson

Laguna Beach, CA 92651

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Betsy Webster (Doc. #2020, SBC-046727)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Forever chemicals have no place in our water!

Sincerely,

Betsy Webster

Mount Ulla, NC 28125

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lea Thomas (Doc. #2021, SBC-046484)

Dear Michael Regan,

Thank you for taking action to regulate PFAS in drinking water. But more must be done. It is a health and economic hardship for communities across the country, including my town in NH.

Please quickly finalize the EPS's proposed standards, and do not accommodate industry's attempt to weaken them.

They are only the minimum needed to begin addressing the serious threat these chemicals pose to our health and the future of our society.

Sincerely,

Lea Thomas

Bedford, NH 03110

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jeremy Ehrlich (Doc. #2022, SBC-046453)

Dear Michael Regan,

I strongly support the proposed regulation of PFAS chemicals and hope to see it finalized as soon as possible.

I support EPA's taking the strongest possible protections for our health and our climate. Thank you for these regulations and please let's get them official!

Sincerely,

Jeremy Ehrlich

Seattle, WA 98109

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vasu Murti (Doc. #2023, SBC-047489)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Peter Macfarlane (Doc. #2026, SBC-046730)

Dear Michael Regan,

I congratulate and thank you for taking the first step to regulate PFAS in drinking water. And I urge you strongly to finalise the EPA's proposed drinking water regulations for the six most abundant PFAS.

For decades, PFAS have contaminated drinking water for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. The EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

I fully support these proposed standards, and I strongly urge EPA to finalize them as quickly as possible, and to resist any and all efforts to weaken them.

Thank you for your consideration.

Sincerely,

Peter Macfarlane

Vergennes, VT 05491

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bonnie Bledsoe (Doc. #2027, SBC-046731)

Dear Michael Regan,

I have a water filter that purifies many of the toxins in my city water; many people don't have this option.

It seems extremely urgent to me that all of us have pure drinking water.

Please move to regulate PFAS in drinking water. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Bonnie Bledsoe

Seattle, WA 98125

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Leslie Mink (Doc. #2028, SBC-046452)

Dear Michael Regan,

Thank you for regulating PFAS in drinking water. Max PFAS levels will start to at least limit exposure to these toxins. Its long overdue. Please finalize the regulations as quickly as possible.

Then start working to protect our life support ecosystem from PFAS as well.

Sincerely,

Leslie Mink

Quincy, CA 95971

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michael Margulis (Doc. #2029, SBC-046732)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. We urge you to quickly finalize these new standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Michael Margulis

Valencia, CA 91354

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Thelma S Garbutt (Doc. #2030, SBC-046733)

Dear Michael Regan,

As a resident of Pittsboro, NC and as an American, I would like to thank you for taking the first step to regulate PFAS in drinking water. I have friends with family members who exhibit immune deficiencies and other health problems consistent with their documented high PFAS levels in their blood. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

However, I would like to emphasize that while limiting these six forms of PFAS is an important step, it will not solve the problem of PFAS contamination across our nation. Manufacturers will simply substitute new forms of PFAS for the six PFAS that will be regulated. WHAT IS NEEDED IS REGULATION OF ALL FORMS OF PFAS AS A CLASS OF CHEMICALS. Only then will we be able to begin to limit the prevalence of these chemicals in our environment and in ourselves.

Sincerely,

Thelma S Garbutt

Pittsboro, NC 27312

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Hirose (Doc. #2031, SBC-046734)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Mary Hirose

Hoffman Estates, IL 60192

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynne Harkins (Doc. #2032, SBC-046735)

Dear Michael Regan,

In my view, we simply must not betray today's children and future generations by failing to clean up our drinking water. Therefore, I most enthusiastically thank you for taking the first step to regulate PFAS in drinking water. For decades, as we now know, PFAS have contaminated drinking water supplies for millions of people across the country; resulting in increased rates of cancer, developmental and reproductive harm and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. Along with many others, I most strongly support the proposed standards, and most strongly urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule, it's heartening to see, would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

Summarily, with hopes for a better future for our life-sustaining waters, I join all others in urging and supporting you to quickly finalize these standards and to implement a rule that is the most health-protective;

Thank you for your work!

Sincerely,

Lynne Harkins

Cambria, CA 93428

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dan Rosenberg (Doc. #2033, SBC-046736)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

s h (Doc. #2034, SBC-046737)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible--although I would prefer they were stronger--there seems to be no recognition by Congress or EPA that it's quite likely that few people are exposed to just one "forever chemical" or one of known very long term toxicity. Rather most people in the US are exposed to many of them, PCBs, TCDD/other dioxins, BPA, BPS, PFAS and other of that chemical family. Very little to no research has been done on synergistic effects. It's up to a majority of Congress to provide that funding and to do it NOW. Supposedly all the anti-choice people care so very much about life, let them show it by making sure babies aren't being exposed to toxics in the womb, and later in breast milk (as so many are).

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Emily Wilkins (Doc. #2036, SBC-046738)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. "Clean water" ought to mean safe for human consumption in any quantity without additional filtration. Clean drinking water is essential and the federal government is responsible for overseeing and helping fund water treatment systems nationwide so NO community need experience the disasters of Flint Michigan or Jackson Mississippi.

Endocrine-disrupting chemicals are ubiquitous and having a negative impact on our health. From making it harder to conceive to influencing people's gender identity, the cancer-causing chemicals allowed in a wide range of products must be restricted NOW.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Gary Andrews (Doc. #2044, SBC-046896)

Dear Michael Regan,

Thank you for enacting the first tactics in a strategy to regulate PFA Substances in drinking water.

For decades, companies have profited selling PFAS that contaminated drinking water supplies for millions of people across America, causing the effect of increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would supply strategic and long overdue protections against six of these toxic chemical Substances. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible, and commence enforcement.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to

cause harmful effects decades after companies profit releasing them into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Despite serious health threats associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would supply safer drinking water for Citizens from coast to coast. By establishing strong limits on the profiteering of six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFA Substance-related illnesses each year. The EPA acknowledges and addresses the cumulative effects on Citizens who are exposed to multiple PFA Substances, and by issuing this proposal, EPA is one step closer to fulfilling its tactical commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFA Sibstamces in Citizens' drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's lobbying efforts to weaken them.

Sincerely,

Gary Andrews

Portsmouth, OH 45662

EPA Response: The EPA acknowledges and appreciates this comment in support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2045, SBC-046314)

Next you will be pushing that plastic and PVC is a contaminant that causes cancer and thyroid issues and must be eliminated from contact with drinking water. No one believes the so called best available science you are pushing. This is all Politics and trying to run up the federal debt using the not bypartisan infrastructure waste of tax payers money law funds on shovel ready BS. The people urge you to Drop this regulation and let the states decide. There is no link to cancer, thyroid kidney or any other health issue in people drinking PFAS at below 75 PPT over a 10 year period that can be proven to be from drinking water, no case studies no proof or science whatsoever, just manipulated extrapolations. Forever chemicals is another false statement. There is no repeatable tested science behind this. No links to cancer in humans. As a person sows so they will reap ion all things. It is an immutable law of nature created by Nature's God.

EPA Response: EPA disagrees with this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2046, SBC-046254)

Environmental justice rules where the unelected government decides what is justice and what is not is socialism/communism. America is a representative form of Government. It is a republic and not a democracy and not a bureaucratic nation state. Stop the PFAS regulations.

EPA Response: The comment is out of scope of this NPDWR, please see section 15 of the EPA response in this *Response to Comments* document.

Eri Higashi Durnell (Doc. #2048, SBC-047628)

I live on land polluted by the local Air Force before I moved here, and they have been held to filtering and maintaining the water quality of wells in the area since the groundwater has been so badly damaged by their pollution. However its clear with more recent scientific research that the 4 ppt PFAS limits on our water reports are still too high for our physical health and well-being. The base has shared they are waiting to see what the EPA does before doing anything differently, so I urge you to move forward with stronger measures to ensure lower limits of PFAS are achieved for a healthier populace.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional information on the MCLs under the PFAS NPDWR, please see section 5.3 of the EPA response in this *Response to Comments* document.

Judith Moriarty (Doc. #2049, SBC-047636)

Clean, chemical-free water is vital for human, animal, and even some plant life. I personally know some Wisconsin citizens who have had to purchase bottled water for the past few years because their city water is contaminated with PFAS. A fellow university student was in near tears as he described this type of situation in his middle-of-Wisconsin rural community which has no access to clean, potable water because of the reckless use of "forever" chemicals by corporate concerns. This HAS to STOP!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dorie Reisenweber (Doc. #2050, SBC-047351)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chris Rauber (Doc. #2051, SBC-047606)

PFAS chemicals last forever. That's not a good thing, when we're talking about unnatural chemicals that are dangerous to humans and animals, and have unknown long-term effects on living creatures and the natural environment. I strongly urge the EPA to put the strictest limits possible on these chemicals. And by strict, I mean they shouldn't be allowed. They should be banned as quickly as possible. If an absolute ban isn't possible right away, the strictest of limitations should be imposed. Thanks for listening.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Edward Hyman (Doc. #2052, SBC-047658)

As a healthcare professional, former university administrator and assistant medical school program head I understand the scientific basis of concern for this chemical, which does not belong in water being consumed by human beings, or other mammals.

I strongly support the proposed drinking water limits for six PFAS chemicals currently endorsed by the EPA. During prolonged administrative proceedings, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These new EPA rules will speed the

implementation of life-saving water treatment for U.S. communities. Therefore, I strongly urge the Agency to finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cinda Flynn (Doc. #2053, SBC-047650)

I do not understand why clean drinking water is even an issue. Especially when it comes to cancer causing, endocrine disrupting chemicals, and theres even more. Lets get strong protections from PFAS so we can have a healthy population, healthy kids, healthy environment. All those chemicals ultimately go into the environment, the river and oceans, where wildlife and fish drink them, concentrate them and then people are exposed yet again at even higher levels. Lets get this done!! Thank you!

Oh! You know what would be a good Idea How about we test all the chemicals BEFORE we turn them loose on the environment and people Think how many lives wilder been saved, could be saved by doing that. But seems we only care about a few people making money while the rest of us pay the the price. Do better please!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anthony Gatenby (Doc. #2054, SBC-047665)

The presence of emerging pollutants, including per- and polyfluorinated alkyl substances (PFAS) are of particular concern as they have been implicated in diseases using animal models. These animal studies indicate PFAS may affect reproduction, thyroid function, the immune system, and injure the liver, and are described in more detail by the Centers for Disease Control and Prevention (https://www.cdc.gov/biomonitoring/PFAS_FactSheet.html) and the Agency for Toxic Substances and Disease Registry (https://www.atsdr.cdc.gov/pfas/). Diseases caused by PFAS exposure are likely to be concentration dependent. The Working Environmental Group considers that any public water sample that has more than 1 part per trillion may be harmful to the human body (https://www.ewg.org/research/ewg-proposes-pfas-standards-fully-protect-childrens-health) while the Environmental Protection Agency sets the health advisory levels for humans as 70 parts per trillion for drinking water (https://www.epa.gov/sites/default/files/2016-06/documents/drinkingwaterhealthadvisories_pfoa_pfos_updated_5.31.16.pdf).

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lorene A (Doc. #2055, SBC-047592)

I'm honestly dumbfounded that we even have to have this conversation. It's ridiculous to think that these "chemical companies" are OK with poisoning Americans. Despicable behavior, we should have higher, MUCH HIGHER standards!!! As with all toxins nowadays, if you as a company produce this toxin, then you should have a plan to safely get rid of it too. This should apply to all you jerks who are poisoning our water, land and air just to make a buck. You make me sick!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Thompson (Doc. #2056, SBC-047573)

As a consumer and constituent I demand that theEPA be given great big teeth to insure our water is clean and pure its not to much to ask and if the wealthy paid their fair share it wouldnt be an issue. Of course they can afford whole house filters but that wont remove the PFAS for anyone we need to stop plastics from being produced in the first place we are smart enough to find a plant based alternative! I dont want to be poisoned, do you!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Fishman and Mike Kurokawa (Doc. #2057, SBC-047537)

Our future is our children, and they are being continuously exposed to these low level toxins whose deleterious effects are not felt for decades. We should not make our children into lab rats in a giant experiment on the health effects of toxins. We need to act now on the toxins we already know are harmful to the kids.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

George Banziger (Doc. #2058, SBC-046427)

Protections Against PFAS Chemicals

In Appalachian Ohio and in the Ohio River Valley, where I live, PFAS chemicals are frequent inhabitants which endanger our water and have long-term health consequences. Please strengthen regulations against PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joy Schroeder (Doc. #2059, SBC-047571)

In my lifetime, thousands of chemicals have been added to our food, products we use and leak into our groundwater. I know we can live a cleaner, more safe for our health life when industries are held accountable for polluting. At one time, our country acted and were leading on environmental protection. Allow the EPA to follow the science which can help humans, plants, other creatures and all living things stay more healthy.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-

saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Larry Menkes (Doc. #2060, SBC-047539)

AFFF in our Warminster tap water has given my entire family cancer which was fatal to my wife and father-in-law and nearly bankrupted me. I also have serious cancer and may soon lose my life. What was unethical was that there was so much known and hidden from the general public which caused thousands of needless deaths.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Grason Weinstein (Doc. #2061, SBC-047652)

I'm 18 and everyday I open my computer, look at the news, and I see something bad. Sometimes, I think that things are fake because they sound so preposterous. There's no way us humans would let the world get that bad, right What do you mean there's microplastics in the rainwater, how could that be possible What do you mean that our cheese is filled with cellulose How could 'forever chemicals' exist I thought everything in the world cycled anew As much as I try to eat healthy, drink only water and no soda, I am held back by things literally out of my control. A lot of things are only in the control of the profit-makers. A lot of things are in control of the working class, but not enough. Then, there's policy makers and voters. If those making the profit don't care, then we have to. Think about it long-term.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alice Svendson (Doc. #2062, SBC-047612)

As someone who is very concerned about the health of our growing children, our families and citizens of this powerful country, I want our government leaders to be world leaders in the clean water movement globally. Clean drinking water is vital for human health and well-being. It is vital to a healthy planet. Therefore, the EPA must stand responsible and exert a conscientious effort to protect all our communities from toxic elements in our drinking water. It is a battle that must be won, putting people's health and not profits first.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Faith Moeller (Doc. #2063, SBC-047610)

We have known about the dangers of PFA's for years. Chemical companies have long known of the dangers of these PFAS (Perfluoroalkyl and Polyfluoroalkyl substances) chemicals that never break down in the environment. They are linked to health problems including kidney and testicular cancer, damaged immune systems, and harm to the liver, thyroid, and pancreatic function. We should never have these type of chemicals put in anything that will impact human, animal, or plant health. Please finalize these rules quickly!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges with this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joey Lindsey (Doc. #2064, SBC-047545)

Dirty water is number one killer of mankind. You elected officials were given your jobs on the promise to protect the citizens. You need to be tried in the Hague for crimes against humanity if you fail to do the right thing. Trump when he took office set about to destroy the EPA. Looks like all of you think it's fine to betray your fellow humans.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrew Kaufman (Doc. #2065, SBC-047656)

capitalism and cupidity will be the demise of us all. Once we care about each other, we will make progress. Until then the almighty dollar will rule. We are composed of 60-70% water. The most vital resource on earth for our survival, yet we are constantly abusing it. We all need to just slow down. We are the only creatures on this planet that take resources and modify them to our benefit. We don't live in harmony with mother earth, we take and take and expect it to never run out.

Mother Nature is fickle, and we never know what to expect and we are not very good at figuring it out yet. We are in a conundrum between the resources we now need to live our lives accustomed to what we have evolved to expect. Every person must start to conserve every day. Be conscious of water usage. We all need safe water. We are all just one big chemical reaction and water plays a big role in the correct functioning of our anatomy.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please section 1.3 of the EPA response in this *Response to Comments* document.

Brad Findlay (Doc. #2066, SBC-047594)

Keeping our drinking water, groundwater, as well as the rivers, creeks and lakes we recreate in clear from harmful chemicals is of utmost importance for our communities, our families, our ecosystems and our future. We must do everything possible to prevent and minimize future contamination of water sources by removing these forever chemicals wherever they are used and also set an example for other countries who may use the chemicals and not have any protections in place.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jefferson Hall (Doc. #2067, SBC-047583)

I am greatly concerned with the quality of my drinking water, it comes out of a river that allows surfboard boats to pull surfers on. These boats blast water down 16 feet and kick up silt, copious amounts of silt to be exact. Are used to change my water filters once a year, now its four times a year, that cant be good to the water quality. A lot of states and bodies of water are banning these boats. How can I go about getting them banned from my water way

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. A portion of this comment is out of scope of this NPDWR, please see section 15 of the EPA response in this *Response to Comments* document.

Frederick Ellsworth (Doc. #2068, SBC-047517)

Military is greatest polluter. Regulate, downsize, and convert to clean renewables.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please section 1.3 of the EPA response in this *Response to Comments* document.

Tonda Bian (Doc. #2069, SBC-047549)

It is on you to protect our Earth...We need to reduce emissions and pollutants. Now.. Otherwise, the earth will not be habitable in the near future...I have a Grandson, Miles, who won't be 1 until June, 2023. What will his future be like in a toxic world We owe it to his generation to stop thinking about only money and start thinking about people. Tonda

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges with this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jenny Walker (Doc. #2070, SBC-047563)

As a physician and public health advocate, I am very aware of the myriad of problems PFASs can create or worsen. As water becomes more scarce due to climate change, it is even more imperative that we clean up what we have contaminated and prevent further contamination.

Due to the slow pace of regulatory agencies understanding and actions, many Americans have been drinking harmful amounts of PFAS chemicals for decades. This has negatively impacted health and economics locally and nationally.

Therefore, I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. These rules will speed the implementation of life-saving water treatment for communities across the U.S.

Given the harms caused by PFASs, the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elsa Obuchowski (Doc. #2071, SBC-047531)

EPA needs to do more to stop the chemical companies and manufacturers of household goods from producing PFAS and selling products that contain PFAS. If I understand correctly, PFAS can still be imported and sold in the USA. Needs to stop.

I am glad to see the proposed drinking water limits EPA has proposed for six PFAS chemicals, but I am concerned that there aren't enough labs that can do the testing, especially at the very low

levels EPA is proposing. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. Stronger EPA rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please section 1.3 of the EPA response in this *Response to Comments* document.

Marti Sowka (Doc. #2072, SBC-046446)

Hello - I am writing in support of the EPA proposal of new limits on PFAS pollution. For too long, Americans have been at the mercy of the chemical industry when it comes to PFAS. It is time to issue limits and also to limit the use of these chemicals in the manufacture of consumer products. Thanks you.

Marti Sowka

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Samantha Corte (Doc. #2073, SBC-047547)

We all need water every day--we can't avoid our drinking water. So it's especially important to keep it safe. This affects everyone. And we know that without regulation, there isn't much incentive for companies to be as careful as they should be with our water. We need to measure what's in our water and take steps to keep documented hazards out of it.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Thomas Driscoll (Doc. #2074, SBC-047434)

I believe the EPA's current proposed federal drinking water standards are a step in the right direction and will safeguard the health and safety of Americans for generations to come.

Thank you for your time and please do not hesitate to contact me at thd2tj@virginia.edu if you have any further questions.

Sincerely,

Thomas Driscoll

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dawna Hammers (Doc. #2075, SBC-047525)

Water is sacred and needs to be pure and free of all toxic chemicals now and forever. When we pray for and appreciate water and pray for each other , the water and the planet we purify ourselves and the water. We are all connected! PLEASE STOP polluting our water!!!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Charles Adelman (Doc. #2076, SBC-047575)

I live in the city of Los Angeles where our municipal water agency is spending $100 millions to build filtration plants to remove chemical contamination from our ground water that has forced us to abandon most of the water wells in the San Fernando valley that used to provide nearly 1/3 of our potable water supply. The more of these chemicals that get into our ground water, th more money we will have to spend to make the water potable again!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

N L (Doc. #2077, SBC-047644)

The constant nonchalant exposure and ingestion of PFAS which our modern society deems totally acceptable without realizing the definite harm imposed to our lives, health and longevity +some yet unknown; has been longstanding concern in our family; and to know there are virtually no governmental standards in place for safety and real regulation- yet, with all dangers evident- is alarming and should be so for everyone /any with concern for life sustenance.

To us, this concern is for all living matter; but one would think all people would have concern for their own/family's health and safety from dangerous PFAS.

Please do much more.. and at least support the EPA's new limits regarding PFAS everywhere and especially drinking water.

Thank you for your care-

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Katherine Weaver (Doc. #2078, SBC-047523)

I think we need to be change course and start protecting the environment in ways we never have before. Business and the economy will never put long term preservation as a priority and that is why we need regulations to step in and force it.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Guthrie (Doc. #2079, SBC-047614)

Since "PROTECTION" is part of the name of your agency, it would seem to me that taking STRONG action against PFAS pollution SHOULD be a priority in PROTECTING our drinking water. I'm happy you FINALLY are taking your responsibility for protecting our drinking water seriously. This matters to me because, although I'm in my mid-70s, I have grandchildren and a great-grandson, all of whom could be negatively impacted by these "forever chemicals" in our drinking water. THEY ARE THE FUTURE AND SHOULD NOT HAVE TO WORRY ABOUT POISONS IN THEIR WATER!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges with this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Schneider (Doc. #2081, SBC-047555)

I like very much the idea that I can turn on my faucet and have reasonably safe drinking water. The chemicals discussed below have had their useful properties, which is why they were developed and used so many years, but now that we know the hazards they can pose in drinking water or emissions, we need to act to control and limit them! As discussed below, I support your proposed rule.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sue Keller (Doc. #2082, SBC-047259)

From firefighting foams to non-stick frying pans to food wrappers, the presence of toxic "forever chemicals" have become ubiquitous.

I strongly support the drinking water limits EPA has proposed for six PFAS chemicals. Many Americans have been drinking harmful amounts of PFAS chemicals for decades. These new

rules will speed the implementation of life-saving water treatment for communities across the U.S. I recommend the Agency finalize these rules as quickly as possible.

The hazards posed by PFOS, PFOA, HPFO-DA, PFBS, PFHxS and PFNA are well documented by dozens of human health studies and hundreds of experimental studies in animals. EPA has published an exhaustive analysis of the potency of these six chemicals, as well as a detailed analysis of the economic benefits that will be realized by water limits.

In addition to the strong standards EPA is proposing for PFOS and PFOA, I support EPA's expedited action on the four chemicals it regulates with a hazard index approach.

EPA also should act with haste to address the unchecked emissions of these and other PFAS chemicals from industrial sites and consumer products.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Edith Couchman (Doc. #2083, SBC-047349)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. The Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carl Zimmerman (Doc. #2084, SBC-047535)

Chemical companies have long known of the dangers of these PFAS (Perfluoroalkyl and Polyfluoroalkyl substances) chemicals that never break down in the environment. They are linked to health problems including kidney and testicular cancer, damaged immune systems, and harm to the liver, thyroid, and pancreatic function.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joseph Gibbs (Doc. #2085, SBC-047577)

While we humans are smart enough to create these chemicals

compounds we certainly are smart to keep them out of our water aquifers and other surface water supplies. Why can't these compounds be created with a limited life cycle These compounds are remind of the PCB compound issue in the 70's and 80's. We are stewards of this earth and should leave it as we found it. Strengthen the requirements controlling PFAS pollution in our drinking water.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Erin Kilpatrick (Doc. #2086, SBC-047559)

We have a lot of work to do here and it needs to start now! Not only do we need drinking water limits for six PFAS chemicals, but we also need the corporations responsible for inventing these chemicals (Dupont/Dow) and profiting off them for decades to pay for remediation/water treatment and clean up. But we have to start now! Come on US government, let protect our citizens, not corporations.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Zahrt (Doc. #2087, SBC-047533)

As a public health nurse I am delighted to see that the EPA is acting on this long-term water issue for its citizens. Hold the chemical companies accountable to pay for this serious pollution. The US Military must immediately take care of the water supply for those and their families who protect the rest of us.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alan Birmingham (Doc. #2088, SBC-047620)

Poly- and perfluoroalkene chemicals, otherwise known as PSAFs and "forever chemicals" present a serious problem for the environment at large. The chemicals do not break down, which makes them unique. They are also poisonous at extremely small levels. These are being used by the increasingly large hydraulic frackturing industry by the gallon to pump underground where they are almost certain to seep into the earth and water supplies. This is likely to cause disasterous health consequences for anyone affected. The scope of this problem should not be overlooked.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Louise Usechak (Doc. #2089, SBC-047604)

Not only is PFAS an urgent problem, but the chemicals the industry is using to replace PFAS may be even worse and along the same chemical chain.with tweaks and variations about which we know nothing. We need to stop using PFAS or chemicals in this family in the items we come into contact with daily.. It is shockingly scary how much microplastic we now have in our blood and how much PFAS we have in our bodies. We must remove it from our drinking water which we rely on to maintain health and cook our food.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Debra Johnson (Doc. #2090, SBC-047626)

"Although there is evidence that makers of PFAS were aware of their adverse health effects as far back as the 1950s, the general public was largely uninformed. The companies kept health research from employees and the public for decades, as EWG chronicles in this timeline. We know much more about the health impacts of PFAS today....Bottled water constitutes another emerging PFAS risk. A 2021 study led by Johns Hopkins researchers found 39 out of 100 bottled waters tested contained PFAS...." (https://www.ehn.org/what-are-pfas-2656619391.htmlgclid=EAIaIQobChMIscGe9-HO_gIVoRJlCh3yIAJtEAAYASAAEgLwC_D_BwE)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amy Mueller (Doc. #2091, SBC-047551)

PFAS is a huge issue where I live in Wisconsin, and we need these federal protections as we have been held hostage by state governments tightly aligned with businesses that dont want to be held accountable or change their polluting practices because it will cost them too much!

As citizens - we have paid too much and will continue to pay until we figure this out!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karen Uhlenhuth (Doc. #2092, SBC-046479)

I do not want PFAS in my drinking water. The notion that we're taking in toxic chemicals from firefighting foam and the coating of non-stick pans is abhorrent. Please proceed quickly to adopt standards you have proposed to reduce allowable PFAS in our water. We are counting on you to base your decisions on the science, which solidly supports the need for lower PFAS limits. Thank you very much.

Please adopt stricter limits on PFAS in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bill Johnson (Doc. #2093, SBC-047541)

Drinking water is more critical to survival than food. You can live a lot longer without food than you can without water. Do the right thing. Protect everyone and everything that needs water to survive. Your grandkids will thank you for it. The only ones opposed to this are the companies getting rich off poisoning our future.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peter Beves (Doc. #2094, SBC-047350)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Lambdin (Doc. #2095, SBC-047553)

I live on Cape Cod MA. Here we have a single source aquafer so anything on the ground sinks into IT. It seems to me stronger regulations would be helpful, but more important would be for Chemical companies to be required to undergo the same scrutiny new drugs go through BEFORE they're allowed on the market. If the FDA can monitor before approval the EPA be able to do the same.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Israfel Mark Pafford (Doc. #2096, SBC-047642)

I am an avid supporter of protecting our natural resources and find every opportunity to spend time outside in nature. And I see on occasion, the impact of garbage and runoff both industrial and agricultural on our natural watercourses. Where the least regulated and least monitored states and communities have had to post signs and warnings about limited or no consumption of fish or no swimming is allowed due to the toxic water quality. The residents of these regions are greatly diminished when access to these areas become restricted or outright banned. I hope for a future soon where my neighbors and family can once again feel confident and safe about the quality of drinking water, and waterways for continued recreation and renewal.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Shellee Davis (Doc. #2097, SBC-047598)

PFAS chemicals are deadly and permanent, so they should be banned. Establishing limits is usually a boon to the industry that provide them in any form, leaving the toxic burden to destroy people and all life our environment. I implore you to establish the strongest, enforceable rules to stop this deadly pollution and to find solutions to make products and out environment clean and

safe again. This should be a priority, or we sacrifice all life to those who profit from making and spreading PFAS.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Sander (Doc. #2098, SBC-046745)

Dear Michael Regan,

As a family physician concerned about the health of all Americans, I wanted to thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

Sincerely,

Robert Sander

Custer, WI 54423

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Perry Cogburn (Doc. #2099, SBC-047608)

Growing up in Maine and living along the Androscoggin River, one of the most polluted rivers in the country due to paper mill discharges, no one ever thought that the river was recoverable. However due to environmental activists and strong water pollution laws, the river has become habitable again. We need the same sort of actions now to deal with PFAS. If not now, when How much more pollution do we have to subject people to before action is warranted We need to turn the corner on this problem and now is the time.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful

amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judith Allen-Leventhal (Doc. #2100, SBC-047557)

The harm done by PFAS is not yet known. When I first became aware of the seriousness of the harm that PFAS pollution has been causing without public awareness, I was flabbergasted. This situation must be brought to light and broadly publicized so that the US can protect its citizens and citizens can protect themselves. Enacting the drinking water limits will be a helpful first step.

I strongly support instituting drinking water limits as EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These new rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency should finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Donna Thomas (Doc. #2101, SBC-047352)

strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. We need to reduce the toxic in our water. And maintain out water plants up standards. Its up to the EPA to unforced stronger rules. I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laurie Peek (Doc. #2102, SBC-046242)

I completely support the proposed drinking water limits EPA has proposed for six PFAS chemicals, and I urge the Agency to increase its restrictions on and ideally, eliminate manufacture of these forever chemicals!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcia Jacobs (Doc. #2103, SBC-046746)

Dear Michael Regan,

As a mom of a child who died at age 4 of cancer our family had no history of, brainstem cancer, aka DIPG, and whose second child was born with a brain malformation we have no family history of, Chiari, I know there are too many dangerous chemicals getting into our bodies and causing diseases. We must clean up our water, air & soils.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Marcia Jacobs

Sumner, WA 98390

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patrick Sharp (Doc. #2104, SBC-047567)

I strongly support stricter standards for limiting PFAS content in our drinking water. These chemicals have the potential to drastically decrease the average quality of life of every human being on earth. I feel horrible when I think about what it would be like to raise a generation of people prone to debilitating and potentially life-threatening health problems due to the use of certain classes of chemicals.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rian Raby (Doc. #2105, SBC-047569)

America wants clean, safe drinking water. My question is why would anyone with the knowledge that our water is being poisoned allow that to persist Why would anyone protect polluters and allow them to continue to poison our water with harmful substances that cause serious health complications and even death It should be an absolute no brainer to enact measures to ensure America has clean, safe drinking water for all.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges with this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Roland Hofman (Doc. #2106, SBC-047581)

Too many people are being exposed to harmful levels of PFAS chemicals in their drinking water. There have been a number of instances where citizens have had to drink bottled water because of these increased levels. Now we need to also address the emissions of these chemicals into our air. Clean air and clean water should be a right not a privilege. Let us all work toward to reducing our PFAS levels to everyone can have better air and water quality.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Gottfried (Doc. #2107, SBC-046747)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Susan Gottfried

State College, PA 16803

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tina Masterson (Doc. #2109, SBC-047602)

It is of great concern to me and thousands of other people that actions are taken now to support the EPA's proposed limits for PFAS chemicals in drinking water! Prevention is always the best course of action and it's already very late in the game. I urge everyone to do everything in their power to stop these toxic chemicals from invading our water supply in any way. We only have one Earth and we must preserve her to ensure life for us as humans as well as the animals fauna and Flora that we share it with.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

kate siegel (Doc. #2111, SBC-046748)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. I strongly support EPA's proposed drinking water standards which would provide important and long overdue protections against six of these toxic chemicals, and urge you to finalize them as quickly as possible.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. By issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic

Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

kate siegel

Atlanta, GA 30317

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Adams (Doc. #2112, SBC-047527)

I have asthma and COPD and certainly don't need any more problems that PFAS would cause. I have grandchildren and I'm worried about the future of the world if we don't stop poisoning ourselves. Thank you for what you do to protect us from the chemicals that we continue making.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lara Levison (Doc. #2113, SBC-047638)

When people fear that their tap water is not safe to drink, they instead buy bottled water, which is not a good solution. As you know, bottled water isn't necessarily safer, but it is a LOT more expensive than tap water, putting an additional strain on the budgets of low-income people. Further, the empty water bottles create tremendous amounts of plastic pollution. Some go into landfills, some are burned for fuel-to-energy (releasing toxic air pollution), and some escape into the environment. I pulled dozens of plastic water bottles out of a stream on Earth Day, and I was one person out of hundreds and thousands of volunteers trying to clean up trash on Earth Day. Tap water needs to be safe and affordable for everyone.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-

saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Allmart (Doc. #2114, SBC-046749)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible. My husband and I are now elderly, with our bodies reflecting a lifetime of exposures we now know were dangerous (lead mining in the neighborhood; second-hand smoke; fertilizers; PFAS; DDT; Agent Orange, etc.) For the sake of the old like us, but especially for the sake of everyone's grandchildren, and for wildlife, please DO give as much support as possible to the effort to eliminate PFAS from our food, water,...everywhere.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Susan Allmart

Mexico, MO 65265

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Aileen Curfman (Doc. #2115, SBC-047624)

I live in Berkeley County, WV, where several local public water supplies are contaminated with PFAS. One huge spill was the result of misuse of a PFAS-containing fire retardant during a National Guard training exercise. The city of Martiinsburg, WV had to find an alternate source of water when the city's normal source, a spring, showed contamination.

The harmful effects of these chemicals are well-known. The health needs of the public must take precedence over the convenience of the chemical industry, and even over the perceived benefits from using these toxic chemicals that never go away.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document

Doris Cellarius (Doc. #2116, SBC-047519)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals.

Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sue Phelps (Doc. #2117, SBC-046533)

Dear Michael Regan,

Thank you for taking the first step to regulate per- and polyfluoroalkyl substances (PFAS) that have contaminated drinking water supplies for millions of people across the country. EPA's proposed drinking water standards would provide important and long overdue protections against

six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. By establishing strong limits on six widely detected PFAS, the EPA's proposed rule would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We urge you to quickly finalize these drinking water PFAS standards that were committed to under the 2021 PFAS Strategic Roadmap.

Sincerely,

Sue Phelps

Albuquerque, NM 87111

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Bautista (Doc. #2118, SBC-047515)

It is terrifying to think about the state of public health in this country without strong protections against PFAS.

We need to adopt the proposed drinking water limits that the EPA has proposed for six PFAS chemicals.

It is truly shocking to me that Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Blanton (Doc. #2120, SBC-046218)

I strongly support all efforts to reduce the per- and Polyfluoroalkyl substances in our drinking water!!!!!!! These substances are a health risk to everyone.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Monica Mull (Doc. #2121, SBC-046535)

I urge EPA to implement drinking water protections against PFAS contamination. This matter is a local issue for me as we have emergency situation's near Appleton, Wisconsin with PFF's in the drinking water.

We need national standards for PFAS. Expanding protections to six PFAS will protect our drinking water from this toxic contamination and shield Americans from enduring the health risks associated with these dangerous chemicals.

PFAS accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

Monica Mull

Wisconsin resident

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Peterson (Doc. #2122, SBC-046750)

Dear EPA Environmental Protection Agency,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Ms Kathleen Peterson

711 Clifford Ave Akron, OH 44306-2281

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Caleb Merendino (Doc. #2123, SBC-046596)

Dear Honorable Administrator Regan,

Thank you for taking this historic step to keep our drinking water safe from PFAS contamination. For decades, PFAS chemicals have contaminated both public and private drinking water supplies across the country. PFAS contamination exposes communities to serious health risks, including cancers, impacts to the immune and reproductive systems, and other harms. The EPA's proposed drinking water standards would provide long overdue federal protections against six types of highly toxic PFAS. I strongly support this proposed rule and urge EPA to move swiftly to finalize health-protective standards to reduce PFAS in our drinking water.

The PFAS crisis is widespread, contaminating the blood of humans, fish, and wildlife worldwide. Communities of color and low-income communities are particularly impacted by PFAS exposure, where health impacts are often compounded because these communities tend to face cumulative effects from multiple environmental injustices and public health hazards.

EPA's proposal would significantly reduce exposure to PFAS in our drinking water for millions of people by setting strong, science-based drinking water standards for six types of PFAS. While this proposal is an important first step towards addressing PFAS exposure, it is critical that EPA also expedite efforts to prevent these chemicals from entering our waters and environment in the first place, before it even reaches our taps. This includes regulating industrial discharges of PFAS into surface waters, addressing PFAS in permits consistent with EPA's 2022 Clean Water Act guidance, cleaning up PFAS contaminated sites under the Comprehensive Environmental

Response, Compensation, and Liability Act, and preventing current and future use of PFAS chemicals.

I urge you to quickly finalize and implement the proposed PFAS drinking water standards rule to begin federally regulating PFAS in drinking water.

Respectfully,

Caleb Merendino

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For more information on EPA's PFAS Strategic Road Map, please see section 15 of the EPA response in this *Response to Comments* document.

Donna Brown (Doc. #2124, SBC-047596)

I rely heavily on the drinking water supply as water is my primary drink and I love it! I am also a cancer survivor, as are many others, and my immune system is especially vulnerable to all the pollutants in our water. Naturally, I also have grave concerns for children who drink water indiscriminately as well as the rest of the living population of the world to include plants and animals. The great tragedies that have resulted from the abuse of our natural water system hurt my soul!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

M. Christina Amundson (Doc. #2125, SBC-046936)

Dear Administrator Regan:

As a member of The Summit Garden Club, a constituent club of the Garden Club of America, and a resident of New Jersey, I am writing to express my concern about PFAS. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the danger of PFAS.

PFAS are extremely persistent and widespread, and already have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS, including most of densely populated New Jersey. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karen Rice (Doc. #2126, SBC-046937)

Dear Administrator Regan:

Because clean water world wide is becoming scarce and will become even more so in the near future , it is a particular concern of mine that we do everything we can to protect our drinking water.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you for reading this,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cathleen Davis (Doc. #2127, SBC-046938)

Dear Administrator Regan:

How ya gonna live without CLEAN water? Drink oil? Gas? Gold? Or, perhaps just continue promoting cancer, a by product of toxins released in our drinking water so DuPont and other corporations can make shareholders happy?

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jean Beyer (Doc. #2128, SBC-046939)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ann Rauch (Doc. #2129, SBC-046940)

Dear Administrator Regan:

Public awareness of the dangers of PFAS continues to grow. It is long past time to regulate the use of PFAS and it's presence in our water. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Brad Snyder (Doc. #2130, SBC-046941)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS!!

As a Science Teacher/Environmental Educator, Mechanical Engineering (Emphasis: Environmental Science/Engineering), and an extremely concerned citizen, I wholeheartedly insist the EPA develop the strongest rules possible to protect humans and the environment from PFAS chemicals!!

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm!!

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS!! This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year!!

I strongly urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing ALL other types of PFAS!! Thanks!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jean Nandfi (Doc. #2131, SBC-046942)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. But note that across the U.S. there is very little pure drinking water that is now safe from serious pollution due to fracking and bursting oil pipelines that go under major rivers and other causes. The EPA needs increased enforcement capabilities to keep after these constantly increasing causes of pollution, or soon none of us will be safe.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cristina Arnold (Doc. #2133, SBC-046943)

Dear Administrator Regan:

Enough with allowing people to unknowingly harm themselves, their families and environment with RoundUp. It isn't safe and the EPA needs to protect Americans already.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Vera Buk-Bjerre (Doc. #2134, SBC-046944)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a good first step to protecting our families and communities from the scourge of PFAS. Please do the right thing

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Cotts (Doc. #2135, SBC-046435)

Dear Administrator Regan:

As a grandmother I am extremely concerned about the damage to young bodies caused by the PFAS chemicals. I am happy with your six proposals but urge you to tighten restrictions on these and other related chemicals as soon as possible. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Teresa Ladd (Doc. #2136, SBC-046945)

Dear Administrator Regan:

Our family lives in Pittsboro, North Carolina where some of the highest levels PFAS/PFOS in our DRINKING water have been recorded. Anyone in the community who can afford to drink

bottled water does so. That, of course, leaves economically vulnerable families to drink contaminated, carcinogenic water! This is unconscionable and must change now! We don't need more studies. We need clean, chemical free drinking water and protection from upstream polluters who continue to dump toxic chemicals into our waterways. This is an outrage that must change now! Thank you for your service.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Yow (Doc. #2137, SBC-046946)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kevin Bessett (Doc. #2138, SBC-046947)

Dear Administrator Regan:

The damage humans have caused upon Earth is catching up with us. Pollution is everywhere and is killing us in many different ways. Water is the key to life, and it must be cleaned up.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Roberta Waddle (Doc. #2139, SBC-046751)

Dear Michael Regan,

I live less than 10 miles from Dupont/Chemours plant where many of these chemicals are manuafactured and my well water is contaminated to the extent that Chemours will install a 'whole' house filtering system for our well. That will help with our drinking/cooking/bathing water. What it will not do is clean our soil so we can eat vegetables from our garden; it will not give us clean water for our birds and other pets and creatures on our small farm; it will not clean the pond water so we can eat the catfish in it. It does not make up for the pollution in our drinking water over the past 30 years we have lived here before we knew about the pollution. My husband and I cannot prove but suspect some health problems may be linked to our consuming contaminated well water for over 30 years. We believe Chemours owes us clean municipal water.

Chemours incinerated these chemicals and their by-products which put them in the air. They were then deposited on our surface water and our soils contaminating them, also. Drinking water is important, but it is not the whole story. Our soil is contaminated. Some research indicates that plants take these chemicals up and give us another source of contamination.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Roberta Waddle

Fayetteville, NC 28306

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jo Rodgers (Doc. #2140, SBC-046884)

Dear Michael Regan,

Regulating PFAs in our drinking water is critical so that the damage done to health can be stymied. How many people have gotten sick with cancer and other illnesses due to this contaminant in their water? Too many.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jo Rodgers

Allan Weiss (Doc. #2141, SBC-046948)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

If you people at EPA continue to do nothing to correct our polluted water supply, I deem you to be charged with aiding and abetting in the knowingly continuation of polluting our drinkable water supply. This cannot be tolerated any longer. More and more people are being compromised by this practice.

From a concerned 84 year old retired citizen without prejudice. "THE PROOF IS IN THE PUDDING."

Allan Weiss

CC: Wew Jjw Dy

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephanie Wright (Doc. #2142, SBC-046752)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I STRONGLY support the proposed standards, and urge the EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals that persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. And yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Stephanie Wright

Douglasville, GA 30135

Andrew Michaelson (Doc. #2144, SBC-046950)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marguerite Williams (Doc. #2145, SBC-046951)

Dear Administrator Regan:

I live in rural Maine and I know the issue of PFA's is an important one for all of us. We have many farms in our area, everyone has well water, we have coastal fisheries, ponds, and rivers that are all impacted by PFA's in the environment. PLEASE adopt the proposed regulations on PFAs!!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mia DiFelice (Doc. #2146, SBC-046753)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

But EPA must go further to regulate all PFAS, not just these six. Already, news has emerged that replacements for legacy PFAS have similar ill health effects. If EPA does not approve a rule that

covers PFAS as a class of chemicals, the Agency will be playing whack-a-mole with thousands of chemicals that are poisoning us. Chemical corporations' quick buck isn't worth a single cancer diagnosis; yet their pursuit of profit has been linked to thousands and probably untold more.

I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible. I also urge the Agency to implement the most stringent, health-protective rules as quickly as possible, resisting industry efforts to weaken them.

Sincerely,

Mia DiFelice

Pittsburgh, PA 15232

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. As for regulating additional PFAS, the EPA will pursue additional PFAS as sufficient occurrence and health effects data are available based on SDWA requirements. For discussion on incorporating additional PFAS in the future, please see section 4.3.5 of the EPA response in this *Response to Comments* document. For additional information, please see section 15 for the EPA's PFAS Strategic Roadmap and section 6.3 of the EPA response in this *Response to Comments* document for PFAS Co-occurrence. The EPA's PFAS Strategic Roadmap is also discussed in section II.F of the FRN.

Isabella Molina (Doc. #2147, SBC-046504)

Dear Administrator Regan:

The EPA's proposed regulations on six highly toxic PFAS chemicals found in our drinking water are extremely necessary. Finalizing these regulations is the bare minimum.

PFAS are incredibly dangerous. They have severe effects not only on our environment but on our own health.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

I urge you to do the right thing. Not only do you have the responsibility to approve these regulations, you have to push for more regulations that will improve our water's quality and save lives.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

George Ball (Doc. #2148, SBC-046952)

Dear Administrator Regan:

America's chemical manufacturers must be tightly regulated. Too many deadly chemicals have been destroying our biodiversity for years. We live in an organic world and we must keep it that way. Modern science often does more harm than good. Products must be carefully vetted.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Dow (Doc. #2149, SBC-046754)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

I participated in last week's EPA PFAS MCL hearing where a number of ENGOs recommended the following improvements: Polluter pays component for BIPOC communities impacted by PFAS pollution of their drinking water; Precautionary Principle approach for PFAS chemical replacements; addressing PFAS residuals from PFAS treatment technologies; including Environmental Justice concerns in the dialog; addressing PFAS chemicals as a class of over 15,000 isomers.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

David Dow

East Falmouth, MA 02536

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For discussion on incorporating additional PFAS in the future, please see section 4.3.5 of the EPA response in this *Response to Comments* document. For more information on disposal concerns for EJ communities and federal actions to address EJ, please see sections 10.4.3 and 14.10 of the EPA response in this *Response to Comments document*, respectively.

Jill Dahlman (Doc. #2150, SBC-046953)

Dear Administrator Regan:

I am a voting US citizen, born and raised in the US. When I was a child, my father, who was also born and raised in the US and served in the US Navy as a commander, told me the story of a river in Ohio that caught fire due to its unhealthy status. The Cuyahoga River. At the time, Dad told me that it is our duty (with the government's help) to maintain our waterways so that we citizens could have safe drinking water. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS and supports what my Dad envisioned for all citizens (with help from the government) to protect that which is essential for survival: water.

I hold a doctoral degree. While it is not in science, I am smart enough to read articles about these PFAS, which are infamous for their extreme persistence and widespread pollution and have been

linked to a long list of health effects, including cancer, immune suppression, and developmental harm. As a victim of cancer (twice...), I do all I can to ensure that nothing bad gets put into my system so that the cancer does not return. Not everyone in the US has this privilege.

What I noted about the EPA's proposed rule is that it would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This is especially important for those poverty-stricken people who, unlike me, cannot self-educate and cannot afford to purchase expensive systems to filter their water. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. I applaud this.

Please finalize the regulations of these six PFAS chemicals quickly, implement a rule that is health protective for all people, and then begin addressing all other types of PFAS. We humans have caused these problems, so we need to fix them.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judi Beardsley (Doc. #2151, SBC-046954)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I personally understand the dangers of chemicals because I suffer from a horrific condition called Multiple Chemical Sensitivities/MCS along with severe Mast Cell and SIBO - which also cause the same issues. I am genetically predisposed to MCS and also had the misfortune to suffer from 4 toxic black mold exposures in which the last one turned something on in my body which quickly left me intolerant to almost everything in the world. I already suffered from very severe allergies including many medications and environmental factors. I have literally been a prisoner

in my home for nearly 20 years now. I have such severe reactions to most things that I have to pay thousands of times more for pretty much everything my family needs in order to find something I can safely tolerate. I can't even tolerate hardly any foods. These toxic chemicals build up in our system and we are unable to eliminate them like normal people. We all deal with so many Cancers in our world mainly due to toxic chemicals. It is vital that our water be safe and free of toxic chemicals for the health and well-being of all living beings. I wouldn't wish my life on anyone. Once you have MCS, it is a life sentence and the only effective treatment is 100% avoidance of all chemicals. It robs you of any semblence of a normal life and you are forced to such severe isolation that no one could ever fathom it ... or the horrible reactions that are a constant. The reactions affect every system in the body and can be life-threatening.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melody Hamilton (Doc. #2152, SBC-046955)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

I ask you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and begin addressing all other types of PFAS.

Thank You,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ralph D'Alessandro (Doc. #2153, SBC-046956)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Water is the most important and under appreciated resource we have in the US, with many taking clean and abundant water for granted. Expeditious implementation of regulations will help make more water safer for all of America.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Samu (Doc. #2154, SBC-046957)

Dear Administrator Regan:

Thank you for your role in the EPA's proposed national drinking water regulations to limit six PFAS chemicals. This is a very welcome first step to protecting our families and communities.

I am concerned about PFAS because of their extreme persistence and widespread pollution. As you know, they have been linked to a long list of health problems, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I am writing to urge you to quickly finalize the regulations of these six PFAS chemicals. Now is the time to implement a rule that is protects our health, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Adam Hersko-RonaTas (Doc. #2155, SBC-046958)

Dear Administrator Regan,

There's no time to waste. You have an opportunity to make history! The EPA's proposed national drinking water regulations for six PFAS chemicals is a VITAL step to protecting our families and communities from toxins.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thanks for leading the charge on doing the right thing.

Sincerely,

Adam

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pamela Smith (Doc. #2156, SBC-046959)

Dear Administrator Regan:

THESE REGULATIONS MAKE SENSE! WE SHOULD DO ALL WE CAN TO KEEP "FOREVER" CHEMICALS OUT OF OUR LIVES. LET'S GET STARTED NOW... FUTURE GENERATIONS WILL BE "FOREVER" GRATEFUL!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hazel Cope (Doc. #2157, SBC-046960)

Dear Administrator Regan:

Please read the following letter very carefully and consider one thing: How would you feel if your family's water supply was contaminated? Then decide what action you would wish your government to take. The read the message below.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Trish Pool (Doc. #2158, SBC-046961)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kate Cunningham (Doc. #2160, SBC-046962)

Dear Administrator Regan:

I live in a cancer belt, namely the Ohio River Valley. Our local water company wins awards for pure drinking water that meets EPA standards. Unfortunately, current EPA standards are not enough to protect us from PFAS. The water company would not even test for PFAS until EPA set some standards, and current standards, we now know, are not sufficient to protect public health. This is important:

Please implement the strongest possible PFAS standards asap, to protect me and everyone else who drinks water in the US.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dorothy Frisch (Doc. #2161, SBC-046462)

Dear Administrator Regan:

We have a severe problem with PFAS contamination here in Michigan, and I'd like to see the strongest possible regulations to protect the health of Michiganders! Please act quickly to finalize the regulations of the proposed six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Janet Beazlie (Doc. #2162, SBC-046963)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

My mother developed lymphoma in her 80s from her 30-plus years of exposure to Monsantos' RoundUp. She based her use on her belief that her government would never allow businesses to approve and sell dangerous

chemicals.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marya Tyler (Doc. #2163, SBC-046964)

Dear Administrator Regan:

For real! The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting us from PFAS.

Get it done!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cameron Fischer (Doc. #2164, SBC-046464)

Dear EPA:

I will be glad once you institute regulation of the additional PFAS chemicals, and I hope that you do more. Unlike many environmental crises we're facing which, while critical, can theoretically be reversed, the introduction of PFAS chemicals into our environment cannot be undone. Which is why stronger enforcement cannot come soon enough.

-Cameron Fischer

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fran Teresi (Doc. #2165, SBC-046965)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals to preserve residents' health, to reduce health care costs and to secure the health of America's children, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I believe Europe is was ahead of America on this type of action. Catch up!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Janet Smarr (Doc. #2166, SBC-046542)

Dear Administrator Regan:

I support the EPA's proposed national drinking water regulations for six PFAS chemicals to protect our families and communities from the harms of PFAS.

PFAS are dangerous both for their extreme persistence and for their widespread pollution. They have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. Sadly, they are found pervasively and are impossible to avoid; but we can help by at least getting them out of our drinking water.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals and implement a rule that protects our health.

After that, please begin addressing all other types of PFAS.

Thank you for your attention and concern.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Darcy Duda (Doc. #2167, SBC-046888)

Dear Michael Regan,

EPA's proposed drinking water standards would provide important and long overdue protections against six toxic PFAS chemicals. I strongly support the proposed standards. Please finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. And that's only for humans. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. The time is long since passed to limit these l—and many other—substances.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Your

people and the earth urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Darcy Duda

Gardiner, ME 04345

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sean Ross (Doc. #2168, SBC-046966)

Dear Administrator Regan:

First off...the EPA is supposed to PROTECT the citizens of the United States, meaning to do something BEFORE it happens NOT afterwards!! I'm tired of being exposed to chemicals that the EPA should never have approved to begin with. The EPA is a FARCE!!!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elaine Hasbrook (Doc. #2169, SBC-046967)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mark van Rossen (Doc. #2170, SBC-046495)

Dear Administrator Regan:

It is of primary importance that the EPA protect the people it meant to serve.

The EPA cannot sit on its hands in regard to reigning in the spread of PFAs in our environment. PFAs are known to cause serious detrimental health effects, therefore they should be banned from any usage that would present them into the waters of this land.

The corporate control of our governments must be addressed and no amount of campaign cash should influence the policies of the EPA. The American people deserve environmental protections under the law.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lana Huber (Doc. #2171, SBC-047491)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jonathan Lee (Doc. #2172, SBC-046968)

Dear Administrator Regan:

Thank you for serving our great nation.

It's unnerving to think that we are releasing forever chemicals into the environment before understanding their long term consequences or how to break them down. Until we have a better handle on the situation, we should avoid making the problem worse.

-- NRDC message below --

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lauren Luis (Doc. #2173, SBC-046969)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

we need the EPA to do more to protect against PFAS.

Exposure to PFAS – known as "forever" chemicals because they are extremely resistant to breaking down in the environment – has been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

But every day, millions of people across the country drink water contaminated with PFAS. Unfortunately, PFAS are almost impossible to avoid. They are found in our homes, our offices, our supermarkets – practically everywhere. What's worse, manufacturers don't have to disclose to consumers that they're using them. It needs to stop!!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Evenson (Doc. #2174, SBC-046970)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Personally, I am one of hundreds of people who fish the Madison, WI chain of lakes, which is heavily polluted with PFAS. I no longer eat the fish that I catch, but many people still do at great risk. Please help!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jane Twitmyer (Doc. #2175, SBC-046755)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jane Twitmyer

Nellysford, VA 22958

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cheryl Nelson (Doc. #2176, SBC-046223)

Safe drinking water is the lowest bar for government. If we can't trust our water, the US government has failed. Whatever is needed to make our water safe should be done.

EPA Response: The EPA believes this final NPDWR is what is needed to protect our waters from PFAS. Therefore, the EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mark Freitag (Doc. #2177, SBC-046971)

Dear Administrator Regan:

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda V Maloney-Tarvers (Doc. #2178, SBC-046972)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I live in Hawaii on Oahu and we have a huge problem with PFAS in our main acquifer on this island.....AND the Navy admits responsibility after covering up and finally being discovered.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Port (Doc. #2179, SBC-046973)

Dear Administrator Regan:

I am a health care professional, and I urge you to take science-backed protective measures to protect American families and communities. Please advocate for protecting the people based on what we know about the 6 dangerous PFAS. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Noah Goodman (Doc. #2180, SBC-046578)

Dear Administrator Regan:

The Environmental Protection Agency's (EPA) proposition to instigate national drinking water standards for six PFAS chemicals is a significant stride in the right direction. As a parent of three beautiful children, I see this as a vital measure towards shielding my family, and indeed all families, from the harmful effects of PFAS.

PFAS are notorious for their resilience and widespread contamination. Their association with numerous health issues, including cancer, immune system impairment, and developmental harm, is deeply worrying.

The EPA's proposed rule holds the promise of cleaner, safer drinking water for millions of individuals across our nation. This includes communities where the purity of drinking water has been marred by PFAS contamination. The potential impact of this proposition is not to be underestimated - it could save countless lives and ward off tens of thousands of severe PFAS-related illnesses each year.

As a concerned parent, I implore you to expedite the approval of these regulations concerning the six PFAS chemicals. A health-protective rule needs to be implemented promptly, after which we should turn our attention to addressing the remaining types of PFAS. This appeal is driven by a simple yet profound motivation - to ensure the safety and well-being of my three children, and indeed, all children. They are our most precious treasures and their health should be of utmost priority.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chris OMeara Dietrich (Doc. #2181, SBC-046570)

Dear Michael Regan,

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Despite the known serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

I am happy that the EPA is finally taking the first step to regulate PFAS in drinking water.

I live in an area that draws some of its drinking water from wells, which were discovered to be contaminated by PFAS after years of using the water for our community.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals, and I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

The EPA acknowledgement and address of the cumulative impacts on communities who are exposed to multiple PFAS will bring change, and by this proposal, the EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap.

I strongly urge the EPA to quickly finalize these standards and to implement a rule that is the most health-protective, and most importantly, resist industry's efforts to weaken them.

Sincerely,

Chris OMeara Dietrich

San Jose, CA 95148

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul Grove (Doc. #2182, SBC-046433)

To Administrator Regan:

We need the strongest possible protections from PFAS chemicals and we need them NOW.

Please finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Reihn Bailey (Doc. #2183, SBC-046756)

Dear EPA Environmental Protection Agency,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Ms Reihn Bailey

576 Keller St Barberton, OH 44203-1808

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Berthe Ladd (Doc. #2184, SBC-046974)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sarah Stretton (Doc. #2185, SBC-046282)

I want to let the EPA and the US Federal Government know that I fully support any and all efforts to limit toxic chemicals, especially the class of chemicals commonly known as "forever chemicals", in our nation's drinking water. Research has shown that these forever chemicals are linked to a plethora of health problems, including serious and deadly conditions like cancer. Please go forward with limiting the presence of these chemicals in our drinking water supply.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Drew Beck (Doc. #2186, SBC-046271)

Please (please please please!) put these rules into effect. PFAS are the leaded gasoline/lead paint of this generation, they are slowly poisoning us. Drastic action is needed. This rule is a good start. Please test all drinking water for PFAS and take immediate action to ensure safe levels. There is no room for leniency on this issue, PFAS must be eliminated now.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anne Baldwin (Doc. #2187, SBC-046975)

Dear Administrator Regan:

Contamination of our drinking water is not an option, it is a health risk creating issues that are eventually paid for by our economy with job loss and burdens on social welfare.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stanley J. Solomon (Doc. #2188, SBC-046976)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I would add that because of the laws of thermodynamics, global warming will cause all human reactions to proceed at a faster rate. Consequently human reaction to a foreign substance that is a minor problem today will be a much stronger reaction in the future. the only way out is to lower the forein sustance's concentration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Teresa Piccolo (Doc. #2189, SBC-046977)

Dear Administrator Regan:

I am totally supportive of EPA's proposed national drinking water regulations for six PFAS. We must trust that the government will do its duty and insure that our right to have safe drinking water is adhered to. It is now well known that PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

Please finalize the regulations of these six PFAS chemicals, and monitor our water system to outlaw other harmful chemicals in our water system. Thank you for passing legislation which has top priority to protecting our health.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Megan Williamson (Doc. #2190, SBC-046450)

Dear Administrator Regan:

First steps are excellent! So glad the EPA is proposing national drinking water regulations for PFA chemicals!

It is well know what harm these things to to our health - on so many levels! Let's get this regulation through and start addressing other harmful things in our drinking water.

Thank you!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laurel Nakanishi (Doc. #2192, SBC-046262)

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Please finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynn Pique (Doc. #2193, SBC-046978)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme resistance to breaking down in the environment and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The sooner the regulations of these six PFAS chemicals are finalized, the better. I urge you to quickly implement a rule that is health-protective and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Tatus (Doc. #2194, SBC-046979)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I believe that by restricting these harmful chemicals you will cut the hydra of health issues, which are a burden emotionally to families and financially to the nation. It is your responsibility to do so, to protect those who do not have the power or financial means to protect themselves. Only you can stand up to corporate greed to do what is in the best interest of humanity. Thank you.

Elizabeth Tatus

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Pikus (Doc. #2195, SBC-046980)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

THIS so-called first step should have happened years ago. So many people seem perplexed that the population, especially children, are afflicted with serious diseases, autism, cancers, behavioral problems, hormonal problems. Yet, we keep poisoning the water we drink, the food we eat, the produce and the animals we grow, and it goes on and on. Such mysteries! Walk down

an aisle in any major supermarket and you have potential answers, BUT there's too much corporate money and power to change anything.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Meredith Stone (Doc. #2196, SBC-046444)

Dear Administrator Regan:

Please quickly finalize EPA's proposed national drinking water regulations for six PFAS chemicals, as a first step to protecting our families and communities from these toxic forever chemicals. I also hope that EPA will also begin addressing all other types of PFAS.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Henry Pinkerton (Doc. #2197, SBC-046981)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. I would also like information about combating air pollution. Polluters pollute because they believe and act "because we can!" We need to believe and act " because we can"!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Hugo Steensma (Doc. #2198, SBC-046982)

Dear Administrator Regan:

It is IMPERATIVE that you act NOW, to protect th Public Health on this nation, our domestic animals & our wildlife from All toxic chemicals that may contaminate our drinking water -- especially the "forever chemicals" like PFAS's.

The EPA's proposed national drinking water regulations for six PFAS chemicals is an URGENTLY NEEDED first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

My husband & I, & our family, MUST DEMAND that you act to protect our health, & VERY quickly finalize the regulations of these six most prevalent PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

THANKS YOU

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Raphael Rivera (Doc. #2199, SBC-046983)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

The government is supposed to care about its citizens and their health. By continuing to allow all of these different chemicals in our water, it shows us that our own government is against its citizens.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dawn Barry-Griffin (Doc. #2200, SBC-046984)

Dear Administrator Regan:

Last month, the citizens of Vancouver,WA where I live were informed that 3 of 6 water wells had higher than acceptable levels of PFA's and PFOA's. This created HUGE concern in my household and our general community.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynnette Saunders (Doc. #2201, SBC-046518)

Dear Administrator Regan:

I am relieved that the EPA is proposing national drinking water regulations for some of the PFAS chemicals. As you no doubt know, PFAS chemicals are known for their extreme persistence and wide spread and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paula Myles (Doc. #2202, SBC-046985)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

For 60 years on Cape Cod, I swam in clear natural ponds that are now testing positive for PFA's , no longer safe for people or animals.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sarah McUmber-House (Doc. #2204, SBC-046986)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

We live in this environment! We deserve to be protected from these poisons, not see profiteers protected, while we pay the price of losing our health, safety, and even lives.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Zuckerman (Doc. #2205, SBC-046987)

Dear Administrator Regan:

I am pleased that the EPA has proposed national drinking water regulations for six PFAS chemicals which have been proven to effect the health of millions of people in this country.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Suellen Rowlison (Doc. #2206, SBC-046988)

Dear Administrator Regan:

AS A RETIRED PUBLIC HEALTH NURSE, I URGE YOU TO TAKE ACTION TO PROTECT OUR CHILDREN AND ALL OF US. THANK YOU.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Shumay (Doc. #2207, SBC-046989)

I don't even understand how this is up for debate with your completely co-opted agency.

You should be ashamed to not consider this a true crisis, at the very least for the sake of the children. DO THE RIGHT THING AND SHAME ON YOU for bending to the likes of Gates and other disgusting Corporations poisoning Earth and everything on it for profit! Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Howard Higgins (Doc. #2208, SBC-046990)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

The reclassification that lower amounts of PFOA/PFOS cause higher harm means that action must be taken immediately to filter these forever chemicals from our biosphere. The health of our entire world community is at stake!

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laurie O'Rourke (Doc. #2209, SBC-046991)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Additionally, these standards must be applied to all drinking water, and not just larger community supply sources. The ubiquitous dispersion or PFAs around the globe is alarming. It's imperative that standards apply to all bottled water and eventually all wells.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Evan Lloyd (Doc. #2210, SBC-046412)

Dear Administrator Regan:

I urge you to quickly finalize the regulations of PFAS chemicals and implement a rule that is health protective of all types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Vanellis (Doc. #2211, SBC-046992)

Dear Administrator Regan:

As a former high school biology teacher I understand the importance of science in policy and decision making in our government. I'm afraid too often scientific evidence is ignored. It's time to side with science, not big business.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carl Martin (Doc. #2212, SBC-046993)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals are a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I will add that this egregious instance of corporate malfeasance (a damaging invasion of every ecosystem) shows how capitalist profit always involves the offloading and obfuscation of the real costs of production.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Bartenhagen (Doc. #2213, SBC-046994)

Dear Administrator Regan:

PFAS, or 'forever chemicals" are turning up in the soil and water everywhere in this country. These discoveries have damaged the health and livelihood of farmers and others where these chemicals have been found. We must stop using these and similar chemicals, and also aggressively work to address existing and further contamination.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I STRONGLY urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cheryl Najor (Doc. #2214, SBC-046995)

Dear Administrator Regan:

No one should live in a world where PFAS and its accompanying 9,000 counterpart poison should be found in our drinking water and bodies. According to the NIH website, to date, the research conducted reveals possible links between human exposures to PFAS and adverse health outcomes. These health effects include altered metabolism, fertility, reduced fetal growth and increased risk of being overweight or obese, increased risk of some cancers, and reduced ability of the immune system to fight infections.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Glenn Rawson (Doc. #2215, SBC-046516)

Dear Administrator Regan:

PFAS are pervasively dangerous, and I welcome the EPA's proposed national drinking water regulations for six PFAS chemicals as a first step in protecting our communities from this terrible problem.

PFAS are an extremely persistent, widespread pollution that's linked to cancer, immune suppression, developmental harm and more.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to finalize these regulations quickly, implement a rule that protects our health, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joanne Edmundson (Doc. #2216, SBC-046996)

Dear Administrator Regan:

PFAS are a serious threat to Americans. These widespread, dangerous persistent chemicals are nefarious widespread pollutants linked to cancer, immune suppression, and developmental harm.

Our government must be more proactive in protecting the health of our people. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities.

A strong and healthy country depends on the health and safety of its people and the communities where they live and work. The EPA's proposed rule would provide safer drinking water for millions of people in communities across the nation where their drinking water is contaminated by PFAS. Not to take steps to save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year is morally and economically indefensible.

For the sake of my neighbors, grandchildren and fellow Americans across our great country I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Respectfully,

Joanne A. Edmundson

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kayan Sherrer (Doc. #2217, SBC-046997)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals are a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to finalize the regulations of these six PFAS chemicals quickly, implement a health-protective rule, and then begin addressing all other types of PFAS.

WATER is life and should NOT be TOXIC!!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gary Lee (Doc. #2218, SBC-046998)

Dear Administrator Regan:

The EPA's proposed drinking water regulations for PFAS chemicals are a start for protecting our families and communities from the scourge of PFAS.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jan Wright (Doc. #2219, SBC-046999)

Dear Administrator Regan:

Though the EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities, it is not enough!

I am careful to filter my water, but who knows what PFAS get through, and what about people who can't afford to filter their water? PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Shpak (Doc. #2220, SBC-047000)

Dear Administrator Regan:

The EPA's proposed national drinking water regulation for six PFAS chemicals is a welcome first step to protecting people from PFAS exposure.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

Please finalize the regulations of these six PFAS chemicals, implement a rule that is health-protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kate Considine (Doc. #2221, SBC-047001)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a very welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been scientifically linked to a long list of negative health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in all our communities, but especially our low-income and communities of color across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of our lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I strongly urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you for caring about us.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Donna Luna (Doc. #2222, SBC-047002)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

It is imperative that you take action to assure that the American people have safe drinking water without these harmful PFA's. We are aware of the damage caused to the human body by these chemicals, and it makes no sense to continue to allow them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see the section 1.3 of the EPA response in this *Response to Comments* document.

Michelle Eul (Doc. #2223, SBC-046478)

Dear Administrator Regan:

I am an engineer from Wisconsin and a mother of two young children.

Thank you for the EPA's proposed drinking water regulations for six PFAS chemicals! This proposal would provide safer drinking water for the millions of people.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you,

Michelle

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Don Hittle (Doc. #2224, SBC-047003)

Dear Administrator Regan:

I know this is a form letter of sorts, but it does express my own personal views in a way that is direct and reasonable, so I wholeheartedly endorse it. Please continue to do whatever you can to protect or resources and our health. Thank you!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paula Posas (Doc. #2225, SBC-047004)

Dear Administrator Regan:

It is not common knowledge for people to know about PFAS and drinking water concerns. Federal action is needed to help people.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you for starting the task and please make haste to completing it!

Best,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Twentyfive (Doc. #2226, SBC-047005)

Dear Administrator Regan:

The fact that we have to ask for these things to be done is on it's own, troubling. That said, please enforce the strictest rules possible in banning these harmful chemicals from our water. Future generations are counting on you.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sheli Tabachnik (Doc. #2227, SBC-047006)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I'd like to see my children and grandchildren survive cancer and any of horrendous illnesses caused by these chemicals. Wouldn't you????

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elspeth Kerr (Doc. #2228, SBC-047007)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals ARE a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

In Hawaii we are particularly concerned with the safety of our water supply, especially following the difficulties we have had with the Navy & the possibility of oil leaking into our aquifer from "accidental" spillage.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rebekah Creshkoff (Doc. #2229, SBC-046227)

Hats off to the EPA for proposing national drinking water regulations for six PFAS chemicals. Now please go forth and do likewise with all 9,000-15,000 other PFAS. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jean Pullen (Doc. #2230, SBC-046434)

Dear Administrator Regan,

Please protect our nation's health and drinking supply by finalizing the new regulations for these six PFAS chemicals. Move on, then, to regulate other types of PFAS.

Thank you for helping to save thousands of lives.

Sincerely,

Jean Pullen

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Makiewicz (Doc. #2231, SBC-046491)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is long overdue. We need protection for our families and communities from this scourge.

PFAS cause widespread pollution. They have been linked to a long list of detrimental health issues.

The EPA's proposed rule would provide safer uncontaminated drinking water for the millions of people in communities in the USA. Please quickly finalize the regulations of these six PFAS chemicals. The EPA may then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Vogel (Doc. #2232, SBC-047008)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

If a substance, ANY substance, has been shown to be harmful, it should not be in our air, water, food or medicine. We have such lax regulations compared to the EU. Why?

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Christine Miller (Doc. #2233, SBC-046493)

Dear Administrator Regan:

I am encouraged by the EPA's proposal for national regulations on Per- and Polyfluoroalkyl chemicals in drinking water. This proposal has the potential to prevent many thousands of serious PFAS-related health issues each year - included issues of such seriousness that they result in death.

Please finalize this proposal to help save lives as well as greatly improve the lives of the many people whose health and quality of life is seriously affected by ingesting drinking water contaminated by these chemicals.

Sincerely,

C Miller

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jenna Poulin (Doc. #2234, SBC-047009)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I have been studying the forever chemicals trying to get the PUR water project here in Tampa fl stopped. There is plenty of evidence and studies proving how harmful forever chemicals are to not just humans animals as well who drink the water. The government will save over time

on.health care issues banning these chemicals vs treating people for them. I am begging you to plz say no! Thank you for your time and consideration!

With love,

Jenna Jewel Poulin

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Holt (Doc. #2235, SBC-047010)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

It would so wonderful if we could clean up all of our "city" water, but our streams, rivers, lakes and oceans are in dreadful shape too, and need our attention also.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dee Grimsrud (Doc. #2236, SBC-046577)

Dear Administrator Regan:

I live in Madison, Wisconsin, whose water is considered to be safe, according to all past and current standards. But we stopped drinking and cooking with tap water decades ago because of old lead water pipes (now replaced), and continue to do so because of the other toxic chemicals, such as PFAS, that are only now being recognized as causing a long list of health effects, including cancer, immune suppression, and developmental harm.

As far as I'm concerned, the EPA should allow ZERO of such chemicals, so that our water is actually safe to drink out of the tap without users themselves having to regularly buy purified water or purchase and maintain expensive filter systems at home. If that means utilizing high cost infrastructure, then utility companies should receive subsidies from state and federal governments.

Yes, the EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

So I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective. But this should be just the first step in a series of new regulations that address all other types of toxic chemicals.

Safe water should be considered a human right, not a luxury.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melissa McSwigan (Doc. #2237, SBC-046469)

Dear Administrator Regan:

Thanks for the EPA's proposed national drinking water regulations for six PFAS chemicals. I'm concerned about the junk in my drinking/bathing water.

PFAS stick around for way too long and can be linked to diseases.

Please finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bonnie Benjamin (Doc. #2238, SBC-047011)

Dear Administrator Regan:

There are enough things out there that can kill an older woman like me. We can do something about this one. Let's do it.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Linder (Doc. #2239, SBC-047012)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

Children are being born with more disabilities. More rare cancers are being diagnosed in adults and children. PFAS chemicals are being found in human blood. We must stop this cycle.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Herman (Doc. #2240, SBC-047013)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

It would seem to me to be a "no brainer" to implement tighter controls on what is going into our water supply and the fact that these chemicals cause so many health issues. It would save lives as well as money since there would be less health problems, many of which will have to be paid for via Medicare\Medicade. Please pass laws to protect the environment and the lives of the people you are serving.

Thank you,

Mary Herman

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judy Schultz (Doc. #2241, SBC-046526)

Dear Administrator Regan:

As a nurse, I appreciate the EPA's proposed national drinking water regulations for six PFAS chemicals as a first step to protecting our families and communities from toxic PFAS.

As you know, PFAS are extremely persistent, widespread, and are associated with many adverse health effects, including cancer, immune suppression, and developmental harm.

The proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS and save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We simply cannot continue to tolerate these chemicals in our environment, so I implore you to quickly finalize these regulations, implement a rule that is health protective, and address all other types of PFAS.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Pantel (Doc. #2242, SBC-047014)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Please protect the health of my grandchildren. We now know enough to tightly restrict and regulate these chemicals. The time to act is now.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amanda Treat (Doc. #2243, SBC-047015)

Dear Administrator Regan:

As the wife of someone who has suffered from PFA poisoning from his drinking water (he grew up in Parkersburg, WV), I have witnessed the immense physical suffering these chemicals caused my husband, his brother and his mother.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

It is too late to protect my husband, but we can save future generations from these terrible chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Aronson (Doc. #2244, SBC-047016)

Dear Administrator Regan:

Please implement national drinking water regulations for six PFAS chemicals as soon as possible.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Duggan (Doc. #2245, SBC-047017)

Dear Administrator Regan:

Growing up in the 1950's I kept reading about the wonders of modern agriculture. Fast forward seven decades and those wonders have proved to be less than wonderful. As we've learned that the law of unintended consequences was ignored as we rushed into chemical agriculture,, we must try to heal the damage and stop it from occurring. That's your job and the public expects you to do it well.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathy Kahn (Doc. #2246, SBC-047018)

Dear Administrator Regan:

Clean drinking water is necessary for the health of all people. This should be one of the priorities of our government. Water is being affected by plastic pollutants more every day. Is this what we want to leave our children?

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julie Breskin (Doc. #2247, SBC-047019)

Dear Administrator Regan:

Just today, JAMA published a study, linking toxic industrial solvents in drinking water on a military base to Parkinson's disease in Camp Lejeune veterans. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Our veterans deserve it, our children deserve it, and we all deserve healthier, drinking water!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Colonel Williams (Doc. #2248, SBC-046463)

Dear Administrator Regan:

Forever chemicals are creepy. We can't know when they are present. Producers and manufacturers insert these ingredients for their purposes We are unaware and being hurt.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lois Rodenhuis (Doc. #2249, SBC-046568)

Docket !# EPA-HQ-OW-2022-0114

The proposed regulation is critically important both for the health of the American people, and also as a statement that we as a nation and a culture trust the scientific process and we will regulate both private and public activities to first protect the health of our populace. I understand that businesses and agencies that will need to spend considerable funds to implement the proposed regulation have made understandable proposals to moderate or negate the regulations - for the purpose of saving money. The science says that the life of people, and especially the vulnerable, developing children, are at known risk from the PRAS chemicals. The global climate crisis also began from business and public agencies moving forward with new ideas and inventions and not understanding the underlying complexities of their actions. Now we know and are having to work at enormous scales to try and save the planet for our children and grandchildren. The PFAS chemicals have leeched into our systems for decades, but can be

stopped now. The sources are known and confined. Some businesses may not survive, but the people who work there will reinvent, revise, and go forward. The distribution of these chemicals through public water systems can be halted - expensively, but halted.

It must be done, now.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Frances Lamberts (Doc. #2250, SBC-047429)

To the Environmental Protection Agency: on Docket ID No. EPA-HQ-OW-2022-0114

I wish to thank the Environmental Protection Agency for initiating rulemaking on the "forever" PFAS chemicals, and for soliciting public input on it.

We had an incident in our Town, many years ago when, for quite a long stretch within a low-lying wetland area, a tributary to the Little Limestone creek was found to be covered with a thick foam layer, this having resulted from an earlier fire-department drill in the park through which the tributary creek flows, near its bank. By the time the local field office of the Tennessee Department of Environment and Conservation was able to inspect and test the water, the foam was gone and, fortunately, no harm appeared to have resulted to the creek.

From several reports in Science in recent years I gather, however, considerable toxicity of these chemicals in the environment and long-lasting damaging effects from them, and a study at the Harvard School of Public Health, reported last year, reveals their many, serious problems for human health.

Therefore, let me again state strong support for your rulemaking on some of the PFAS chemicals which now go into our drinking-water sources, and I thank the Administration for it.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Daniel Duda (Doc. #2251, SBC-047020)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

Please finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Janet Smarr (Doc. #2252, SBC-047021)

Dear Administrator Regan:

I applaud and support the EPA's proposed national drinking water regulations for six PFAS chemicals to protect our families and communities from the dangers of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, and implement a rule that truly protects our health. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ellen Lane (Doc. #2253, SBC-047022)

Dear Administrator Regan:

I can't believe that nothing has been done to protect American citizens from PFAS all this time and that we all are being poisoned by them w/o our even knowing what they are or where they're found. Why are their manufacture legal in the first place. Please outlaw them now, if not yesterday!!!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Livesay (Doc. #2254, SBC-046552)

Dear Administrator Regan:

Clean water is the most basic human necessity, and we need stronger regulations and better enforcement to protect it. I am pleased to see the EPA is finally taking action on the serious threat posed by PFAs in our drinking water. Please pass the proposed drinking water regulations for six PFAS chemicals as soon as possible. Because these chemicals persist so long, and cause such a wide and serious range of health threats including cancer, immune suppression, and developmental damage, we simply cannot afford any further delay to prevent further contamination of our water supplies and further exposure of our citizens to these dangerous and persistent chemicals.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dorothy Hinman (Doc. #2255, SBC-047023)

Several towns in Iowa already have high levels and are needing to dig deeper wells, after exposing their communities for years.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thousands of children already have high levels in their bodies; the time is now for action!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Han Schoening (Doc. #2256, SBC-047024)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

At 24, I should not have friends younger than me who have died as a result of PFAS contamination. Please make sure no one else has to ensure this pain.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Asra Baig (Doc. #2257, SBC-047025)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals so that 0% of them are allowed in our water.

Regards,

Asra Baig

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Regina Reilly (Doc. #2258, SBC-047026)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

To not take this action is to forsake your responsibility to all of us who need you to get this done, so we can all survive.

Regina

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julie Bernstein (Doc. #2259, SBC-047027)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

Unfortunately, without EPA standards and funding for monitoring and enforcement, even municipalities and states who seek to mitigate the danger of PFAS in our drinking water will not be able to do so.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you,

Julie Bernstein

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Quinn (Doc. #2260, SBC-046290)

Please strengthen our national guidelines for PFAS and other "forever chemicals". I filter the water in my home, not because my local water is in violation of EPA guidelines but because I don't think the guidelines go nearly far enough to provide long-term safety. There are just too many pollutants we've been actively pumping into the environment for far too long, and forever chemicals in particular are very concerning. And while I can filter my water, many people don't have the knowledge or ability to do so – and everyone should be protected.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

S Laverne Coleman (Doc. #2261, SBC-047028)

Dear Administrator Regan:

It has been a long time since I have been willing to drink tap water in this country. I strongly urge you to begin doing whatever it takes to return the US water supply to a safe option. Europe is way ahead of the US in terms of choosing citizen health and safety over corporate interests. PLEASE DO THE SAME.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melissa Tomlinson (Doc. #2262, SBC-047632)

So tired of all the things poisoning us on the daily from the folks in government allowing it. No amount is safe. How do people in government look around and feel like a job has been well done, like how. How is their any semblance of pride for what is going on in the world today as a result of western ideology. Western as in genocidal, western as in racist, western as in profit over everything, western as anti-abortion but pro-gun. You all can and will never make it make sense because it doesnt. Keep the poisons out of our water and foods. Seriously that its taken over two decades for regulationsdo better.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Harris (Doc. #2263, SBC-047029)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Since these are "forever" chemicals, the need to stop them from being in our food and water is immediate and great.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lauren Dvonch (Doc. #2264, SBC-047030)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The health contained in a glass of water we are used to taking for granted. A glass of water is perhaps a symbol of what can be right with our environment, our health, and our life. Water is extremely important. How could ever have lost sight of that?

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Katherine Silsbee (Doc. #2265, SBC-047031)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

I don't think that the public is fully aware of the extent of the problem of PFAS in our nation's drinking water, and it is something we really need to focus on abating for all of our sakes.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kristina Pappas (Doc. #2266, SBC-046437)

Dear Administrator Regan:

Thank you for proposing national drinking water regulations for six PFAS chemicals.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Bills (Doc. #2267, SBC-047032)

Dear Administrator Regan:

Thank you for your proposal that will take a lifesaving first step toward protecting people across the country from some of the PFA's in our drinking water. I look forward to seeing the next step that will protect us from all of the PFAs in the near future.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rosemary Churnside (Doc. #2268, SBC-047033)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Give pause, and consider these important words:

"The earth does not belong to man, man belongs to the earth. All things are connected like the blood that unites us all. Man did not weave the web of life, he is merely a strand in it. Whatever he does to the web, he does to himself."

~ Chief Seattle ~

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alan Benforfd (Doc. #2269, SBC-047034)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Clean fresh water is a human right, or at least should be. As a basic necessity for life, water should be protected from damaging contaminants, and action taken to remove any such contaminants.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Timothy Dungan-Levant (Doc. #2270, SBC-046443)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step.

Please finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anju S. (Doc. #2271, SBC-047035)

Dear Administrator Regan:

PFAS pollution is an issue that I and many others find extremely concerning; the lack of research and regulation thus far, relative to the persistent and widespread harms imposed on all life forms by this class of chemicals, has been perplexing and frustrating. As you are aware, PFAS have been linked to a very long list of health effects, including cancer, immune suppression, and developmental harm.

Industry profit at what cost?

The EPA's proposed national drinking water regulations for six PFAS chemicals is a much appreciated first step to protecting our families and communities from the scourge of PFAS. The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of the six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS with urgency.

Please, do everything in your power to comprehensively address this for ourselves, our planet, and innocent future generations who deserve better.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Ann Graffagnino (Doc. #2273, SBC-047036)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

My husband and I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

FOR THE HEALTH AND WELL-BEING OF ALL CURRENT AND FUTURE GENERATIONS, WILDLIFE AND THE ENVIRONMENT, no more toxic "forever" chemicals in our water! THIS IS THE HEALTHY, RIGHT, FAIR, JUST, HUMANE ACTION TO TAKE!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Sue Barnes (Doc. #2274, SBC-047037)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The rule should be made as stringent as possible. There also needs to be a solution for taking responsibility for damage they have already done. In our area people's homes, which are typically the major part of their holdings, are now worthless because they can't sell them knowing that the water as contaminated the land and they can't even have gardens. Of course they have been using bottled water since this whole mess was discovered. It is shameful.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Krisanne Baker (Doc. #2275, SBC-047038)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. The US has such a lax record compared to Europe when it comes to limiting chemicals in our food, water, and air, so I'm really glad to hear about this!

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nicole Riggs (Doc. #2276, SBC-047039)

Dear Administrator Regan:

I support the EPA's proposed national drinking water regulations for six PFAS chemicals. This is a much needed first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression.

I want the safer drinking water that this proposed rule would protect for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcia Barber (Doc. #2277, SBC-047040)

Dear Administrator Regan:

We live in the foothills of Boulder Colorado.

Our Volunteer Fire Dept used Fire fighting foam for training purposes and thought it was on toxic.

It has polluted the groundwater and some of the private wells in our area.

The state and the EPA are not helping those of us with private wells but we did not polite our own wells. The manufacturers of the foam did by selling toxic products.

All PFOAS need to be eliminated right now! The companies that made them need to be held accountable and they need to pay for clean up.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maura Kelsea (Doc. #2278, SBC-047041)

Dear Administrator Regan:

This long overdue regulation is very important for health of people and planet. I urge you to implement it as soon as possible.

Maura Kelsea

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joanne Bernstein (Doc. #2279, SBC-047042)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Waiting and watching for more cancer diagnoses is not an option. The burden of proof for safety should fall on industry or those profiting, not the American people.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Henry Morgen (Doc. #2280, SBC-047043)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

I hope that the EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal should save thousands of lives and prevent tens of thousands of serious PFAS-related

illnesses each year. Do what you can to make the allowable level as low as practical to minimize the cumulative effect of ingestion over a lifetime.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Connor Godek (Doc. #2281, SBC-047044)

To Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

It is crucial to finalize the regulations on PFAS. In the year 2023, Americans should not have to worry about contaminated drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Leslie Bennett (Doc. #2282, SBC-047529)

It's critical that we have clean water for our children. This is the next generation and we don't want them to come down with cancers that could have been prevented. Also it impacts our wildlife. And costs will soar for medical care if we don't stop putting contaminates in our water.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Smith (Doc. #2283, SBC-047045)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I am ready to see the EPA take action on these pollutants and getting them out of our water system.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Chris Eaton (Doc. #2284, SBC-047046)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Our environment grows more toxic every year as chemical producers continue to formulate new chemicals and fail to test for so many unanticipated reactions because they are determined to make profits and don't want to look for reasons to stop.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Katie Walsh (Doc. #2285, SBC-047047)

Dear Administrator Regan:

My husband & I were thrilled to read about the proposed changes to protect people from forever chemicals. It's a serious problem that needs to be acted on as soon as possible. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you very much. Kathleen Walsh

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sarah Gagne (Doc. #2286, SBC-047048)

Dear Administrator Regan:

We have to have clean water to drink, so we need the strongest of regulations concerning PFAS. I completely agree with the statement below.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lillian Barrett (Doc. #2287, SBC-047049)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

As a mother, I thank you for taking this the risks of PFAS seriously.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Becker (Doc. #2288, SBC-047588)

As an Environmental Science professor at the College of Southern Nevada, I am in strong support of these new standards. This week my Environmental Pollution students are taking their

final exam and many of them indicated that persistent, bioaccumulative, and toxic materials are their number 1 concern. All Americans, regardless of their knowledge and background, should be protected from PFAS chemicals when cooking meals for their families and drinking tap water.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Evelyn Epstein (Doc. #2289, SBC-047050)

Dear Administrator Regan:

PFAS are infamous for their persistence and widespread pollution, and have been linked to many adverse health effects, including cancer, immunity suppression, and developmental harm.

The EPA's proposed national drinking water regulations for six PFAS chemicals would provide safer drinking water for millions of people in communities across the nation and could thereby save many lives and prevent many serious PFAS-related illnesses each year.

Please finalize the regulations of these six PFAS chemicals, implement a rule will protect our health, and then begin addressing other types of PFAS.

Thank you for your consideration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Donlin (Doc. #2290, SBC-047051)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals are a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities nationwide where PFAS contaminates the drinking water. This proposal would save thousands of lives and prevent tens of thousands of PFAS-related severe illnesses each year.

I urge you to finalize the regulations of these six PFAS chemicals quickly, implement a health-protective rule, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James Hubbard (Doc. #2291, SBC-047052)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a necessary first step to protecting our families and communities from the scourge of PFAS, infamous for their extreme persistence and widespread pollution, linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS and would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carolyn Heath (Doc. #2292, SBC-047053)

Dear Administrator Regan:

As a professor of Biology I have long followed the development of knowledge about the insidious threats caused by even the smallest amounts of certain chemicals in our food and water. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rosemary Ross (Doc. #2293, SBC-047054)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is first step to protecting our families from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Deschaine (Doc. #2294, SBC-047055)

Dear Administrator Regan:

PLEASE, PLEASE, PLEASE do what is necessary to remove PFAS from our drinking water. The thought of injesting these dangerous chemicals is appaling.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joseph Hodkin (Doc. #2296, SBC-046236)

We all want safe water. Today's focus must be to prevent future problems by removing harmful chemicals immediately. Now, not in later years after allowing critical safety issues to be ignored. Thank you.

EPA Response: The EPA acknowledges this comment. The EPA believes this final PFAS NPDWR will lead to safer waters and can prevent potential PFAS-related illnesses from drinking water now and in the future. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephen Wyzykiewicz (Doc. #2297, SBC-047056)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

In the 1950's, the slogan was: "make the world better through chemistry!" There was no thought as to the consequences. Now we know the consequences. Don't subject living things to the folly of the 1950's. Protect the planet, and the health of all living things. Regulate PFAS now.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Dietrichson (Doc. #2298, SBC-047057)

Dear Administrator Regan:

PFAS chemicals are an alarming world-wide problem that has been covered up for too long. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you for leading the long-overdue effort to rid us from this forever threat to the health of all people throughout the world.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Betsy Berger (Doc. #2299, SBC-046506)

Dear Administrator Regan:

Like most Americans, I count on the EPA to ensure that my family and I are using safe products. It is distressing to learn that this is not always the case. However, it is a relief to learn of the WPA 's proposed national drinking water regulations for PFAS chemicals in our drinking water.

PFAS have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm, and I do not want my family to be exposed to such dangerous chemicals.

Please finalize the regulations to deal with the six most toxic PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Beth Jones - expat (Doc. #2300, SBC-047058)

Dear Administrator Regan:

Our Environmental Protection Agency's proposed national drinking water regulations for six PFAS chemicals is a verywelcome first step toward finally protecting our families and communities from the pernicious toxins of PFAS.

As you well know, PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

So why in the hell were they ever permitted in the first place?!?

PFAS should have never been permitted and should have been banned long ago!

The EPA's proposed rule would provide SOMEWHAT safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS, potentially saving thousands of lives and preventing tens of thousands of serious PFAS-related illnesses each year.

This means our EPA should finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS as soon as humanly possible.

Thank you for your efforts -- please KNOW that the vast majority of Americans support environmental protection and thus always support your work on our behalf.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Amy St. Peter (Doc. #2301, SBC-047059)

Dear Administrator Regan:

You will most likely receive quite a few of these letters. I am in no way a public speaker or someone who would even matter to the general public. I am just a hard working woman concerned with the health and safety of our country. We are making a mess and a laughing stock of most of what we do lately. While we used to be the tough kid on the block, we are now the

one who cries out "don't bully me." By showing we can take a stand on things without others, we can once again be that leader, the one people listen to for making the tough but right decisions, like the one below.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Loreen Hackett (Doc. #2302, SBC-047060)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Considering I'm from Hoosick Falls, NY, having been dealing with this issue for almost 9 years, as well as finding out recently from test results of our multi-site study that I dreadfully have, in fact, even more of these chemicals in my body and the bodies of my family and community, it's long past time to act. We are, quite literally, sick of it. Industry and/or corporations should not continue to be allowed to buy the health of our communities and families and distort science to pad their profits via lobbyists and lies. Follow the science, listen to and give more credence to

the contaminated communities living this nightmare, and enforce a more sustainable future for our children.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pamela Johnson (Doc. #2303, SBC-047061)

Dear Administrator Regan:

A friend who lives near Chemours Company's PPA plant in NC lost five animals from cancer in close succession. Of course, proving Chemours Company's PPA is responsible is not possible at this time. The dangerous effects of forever chemicals are real.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lucy Hitchcock (Doc. #2304, SBC-047062)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. PFAs are hidden from our view. A silent killer.This proposal would save thousands of lives.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marilyn Lohr (Doc. #2305, SBC-047063)

Dear Administrator Regan

I am writing because the harmful effects of PFAs are truly potentially life threatening and they are so ubiquiious in our environment. A huge source for PFAs is the continuous use of plastic and the resultant litter that ends up

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marilyn Lohr (Doc. #2306, SBC-047064)

Dear Administrator Regan

I am writing to express my concern over the health effects of PFAs which can be life threatening. One of the main sources of PFA pollution is the over production and use of plastic products that frequently end up as litter finding their way into our waterways. This is a serious widespread issue that needs immediate attention. Everyday when I look at plastic trash I think of my health as well as the fish, birds, and other wildlife affected by this pollution.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

US Army (Doc. #2307, SBC-046550)

TO: Administrator Regan:

As a retired Army officer I greatly appreciate the EPA's proposed national drinking water regulations but these protections are not enough. As you know

PFAS are persistent and widespread. They have caused serious and devastating health problems and deaths in this country and around the world.

Please strengthen the EPA's proposed rule and implement them ASAP to provide safe drinking water for the people in communities across the nation where the drinking water is contaminated by PFAS. I lived near the Badger Army Ammunition Plant in Wisconsin and know personally of the community concerns there about PFAS. Citizens for Safe Water Around Badger (CSWAB) is a community organization that has been fighting the U.S. Army for years to have have clean drinking water. I'm sure you are aware that you have the ability with this proposal to save thousands of lives and prevent PFAS-related health conditions that arise in our communities.

I hope you will finalize the regulations of these six PFAS ASAP. There's more work with other PFAS for the Agency to address. I will follow your work with great interest. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Megan LeCluyse (Doc. #2308, SBC-047065)

Dear Administrator Regan:

In the United States, we should be able to trust that our tap water is safe and healthy, not harmful. I am privileged to have had the opportunity to travel around the world, including to

places where people can't just get water from their sink or fridge to drink. Our water here at home should help our bodies, not potentially harm them in the process.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julia Wolny (Doc. #2313, SBC-047452)

Hello,

My name is Julia Wolny and I am currently a student at Loyola University Chicago studying environmental policy. I am also one out of millions of other people in the United States that relies on public drinking water. I, like many others, count on my drinking water to be safe and not a contributor to health issues. Yet as the EPA has stated, PFAS poses various health threats to human health and drinking water remains one way that people may be exposed to PFAS. At this time, there is still no federal regulations on PFAS, and I would like to applaud the EPA for taking action to implement such regulations. However, I would also like to provide further comments and concerns that I have for the proposed Per- and Polyfluoroalkyl substances (PFAS) National Primary Drinking Water Regulation (NPDWR).

To begin, I would like to emphasize the urgent need for the regulation of PFAS on a federal level. While some states have developed their own regulations for PFAS, such action is inconsistent and entirely nonexistent in other states. Various states and local governments may not have the means to address this issue or may not view the regulation of PFAS as a priority. Co-founder of Merrimack Citizens for Clean Water, Laurene Allen, stated that "state by state is just absolutely ridiculous" and stressed that "the progress you have shouldn't be determined by your ZIP code" (Brown, 2022). By implementing federal regulations for PFAS in drinking water, there will be significantly greater chances of seeing a reduction in PFAS in humans. Yet without a (NPDWR), it is unlikely that there would be a significant decrease in PFAS in humans due to the high quantities often found in public drinking water. It is evident that the regulation of PFAS

in drinking water on a national scale is absolutely necessary and I fully support the EPA's initiative to pass such a regulation.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Catherine Swanson (Doc. #2316, SBC-046500)

I strongly support the proposed MCLs for PFAS. PFAS does not belong in our drinking water. The science is clear on the health effects. The EPA is bound by its charter to protect even the most vulnerable of us - not to pander to corporate interests.

The costs for treatment are reasonable, and only a fraction of the taxes that are dumped into the war machine. As humans, we made a mess, now we must pay to clean up. Compared to the costs of healthcare, there is a clear mandate to enforce PFAS treatment.

I thank the EPA for stepping up to the challenge, I and support the proposed MCLs and Hazard Index.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2318, SBC-047303)

As an individual who is currently a sophomore in high school, I am worried about the environmental changes we are experiencing. The proposition of docket EPA-HQ-OW-2022-0114 is influential to me because it provides a way for a cleaner environment. The proposition will also contribute to getting rid of a harmful water supply, which is a concern for numerous individuals. Decreasing perfluorobutane sulfonic acid (PFHxS), hexafluoropropylene oxide dimer acid (HFPO-DA), its ammonium salt (also known as a GenX chemical), perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS) is highly crucial since these chemicals can cause many side effects, so, for these reasons, I do think it is important to regulate the number of chemicals that are contaminating the environment. I also believe that these are not the only chemicals that are worth reviewing. Chemicals like lead, chlorine, mercury, pesticides, and many others, should also be taken into account because of the long-term effects that they have on people and the environment as well, (e.g., a decrease in biodiversity, decreased growth and reproductive rates in plants and animals, slow growth development in little children, damage to the lungs, and more) so again I do think it is crucial, of course, to look at PFAS. This proposition should include a few changes, but I still find what EPA is doing admirable.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathryn Burns (Doc. #2319, SBC-046649)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

I know a lot of people on the right (as in "right-wing") side will fuss and cry. Let them. Water is a necessity, not a luxury, and when we learn that a certain substance in it can be harmful, we need to insist it be removed.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2323, SBC-046312)

It seems like some of the supposed illnesses attributed to PFAS in drinking water exposure are side effects of receiving the Covid19 shot. This seems strange and maybe data should be collected on how many of those in the control group for health damage from PFAS received a Covid shot. Statistically or otherwise it is impossible to declare statistically or any other way that these cancers or other illnesses are a result of exposer to PFAS in drinking water at levels below 70 ppt. This is why in the past the EPA had a health advisory at 70 PPT. This EPA seems to be effected by politics and not science. This rule should be canceled. PFAS are "forever chemicals" and are therefore inert and quite stable. Thus it is difficult to see that at level in PPT range they could definitively be causing health problems in any age group. Obviously the credibility of the EPA and the current administration is suspect.

EPA Response: The EPA disagrees with the statements made in this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. The EPA has provided adequate and science-based health effects evidence for PFAS exposures that are outlined in section IV of the FRN and section 4 of the EPA response in this *Response to Comments* document. The commenter provided no evidence to back up their claims that low levels of PFAS cannot be causing health problems in any age group. The remainder of statements, such as the effects of the COVID-19 vaccine, the influence of politics, and questions on the agency's credibility and the current administration, are all out of scope of this rulemaking and can be addressed in section 15 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2324, SBC-046269)

There is no factual information or evidence in a controlled test that isolates other factors that PFAS accumulates in the blood or can be directly linked to any illness or disease. There is no evidence of the health cost savings from removing PFAS to below 70 PPT. EPA is not credible and has turned into a political organization. Drop this rule and MCL

EPA Response: The EPA disagrees with this comment. The comment did not provide evidence in support of its claims. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Current scientific research and available evidence have shown the potential for harmful human health effects after being exposed to some PFAS. The EPA acknowledges that drinking water is just one of several ways people can be exposed to PFAS. The EPA's examination of drinking water data shows that different PFAS can often be found together and in varying combinations as mixtures. Additionally, decades of research demonstrates that exposure to mixtures of different chemicals can elicit dose-additive health effects: even if the individual chemicals are each present at levels considered "safe," the mixture may cause significant adverse health effects. The high potential for different PFAS to co-occur in drinking water; their potential to cause additive health concerns when present in mixtures; the diversity and sheer number of PFAS; and their general persistence in the environment and the human body are the cause of the environmental and public health challenges the American public faces with PFAS. Please see section IV of the FRN for more information on the health effects of PFAS.

As for the costs, as part of its HRRCA, the EPA evaluated quantifiable and nonquantifiable health risk reduction benefits and costs associated with the final NPDWR. Considering both quantifiable and nonquantifiable costs and benefits of the rule, the EPA is reaffirming the Administrator's determination at the time of proposal, that the quantifiable and nonquantifiable benefits of the final rule justify the quantifiable and nonquantifiable costs. Please see section XII of the FRN for further information about the HRRCA.

Ruth Moore (Doc. #2325, SBC-046650)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. The EPA should address the whole class of PFAS chemicals wherever possible. Many of the thousands of these chemicals in use have been detected in water around the country.

The EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge. I hope that you continue to take action to reduce the spread of PFAS chemicals in our water.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rae Ma (Doc. #2326, SBC-046757)

Dear Michael Regan,

Firstly, I would like to thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country. I would like to have the comfort of knowing that my family and friends are drinking clean water that won't result in health problems for them. The EPA's proposed drinking water standards would provide important and long overdue protections against six toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Thank you for your time and consideration.

Sincerely,

Rae Ma

Portland, OR 97229

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karl Weber (Doc. #2327, SBC-046264)

I think this is one of the best things the epa has ever done and is a critical step in improving the health of Americans and reducing their exposure to cancer linked chemicals. I hope the epa goes further to reduce the production of them in the first place and studies the amount people are exposed to through food and other forms.

EPA Response: The EPA acknowledges this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Terrell Yelverton (Doc. #2328, SBC-046191)

Please ensure these chemicals are kept out of the water supply

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2329, SBC-046536)

Removal of PFAS to 4 PPT is very costly and infrastructure plan money or borrowing is not a sound answer for financing these costs. The EPA has lost credibility and the savings in health care cost are not provable or believable. Cost benefit has to be taken into account , this is why states like New York have not regulated PFAS down to 4 PPT. With over 90% of water not used for ingestion this rule is a waste of resources. PFAS at less than 70 PPT is not responsible for any cancer or ill health effects. There is no proof it accumulates in the blood and like lead drinking water is not the greatest avenue of exposure in humans. Drop this expensive and wasteful resolution, it is not cost effective. The testing for it quarterly alone is a waste of money when people struggle to pay their water bills in Indiana, Michigan and Ohio now.

People can use carbon filters at their house at their own expense to remove PFAS down to 20 Ppt if it is their water system

EPA Response: The EPA disagrees with this commenter. The EPA believes that this NPDWR is vital to protecting public health by removing these contaminants from our nation's drinking water. The commenter did not include references to back up their arguments that the savings are not provable or believable, that 90 percent of water is not ingested once in a home,

and that PFAS at levels less than 70 ppt is not responsible for health effects. Please see section 1.3 of the EPA response in this *Response to Comments* document. For additional evidence on the health effects of PFAS, please see section IV of the FRN, the PFOA/PFOS MCLG document, as well as the Toxicity Assessments (USEPA, 2024c; USEPA, 2024d; USEPA,2024e; USEPA, 2024f).

Vivian Sclafani (Doc. #2330, SBC-046263)

Well I hope you truly do have our health concerns in mind and to protect us from these horrible chemicals in our water public trust has already gone down the drain. And while you're at it why don't you investigate the chem trails that are seeping into our lungs and water supply as well as our farm lands thank you for listening

EPA Response: The EPA acknowledges this comment. This NPDWR has the health of Americans in mind and will protect them from PFAS in their waters. Please see section 1.3 of the EPA response in this *Response to Comments* document.

G. Paul Richter (Doc. #2332, SBC-047561)

As a former resident of WV for 55 years and a chemist whose professional interest and expertise is the non-metals (especially P, N, F, and Cl), I know quite a bit about PFAs , including their ubiquitousness and persistence in the environment and their production. The relevant industries have been too slow in acknowledging the problems with PFAs and taking appropriate, remedial action on PFAs.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cris Corley (Doc. #2333, SBC-047521)

I strongly support lowering PFAS chemicals in our drinking water. Representing the Tennessee Chapter of the Sierra Club as Chair, our club wants to lower the limits of these dangerous chemicals.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-

saving water treatment for communities across the U.S. Therefore the agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lori Olinger (Doc. #2334, SBC-047543)

PFAS are hazardous and harming our health and the environment. Thank you for setting drinking water limits for PFOS, PFOA and 4 other PFAS chemicals. We must do more to limit PFAS in our water. This is a good start. Please move as aggressively as possible to protect our water from PFAS chemicals. I support the proposed drinking water limits.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephen Brown (Doc. #2335, SBC-047640)

Chronic exposures to PFAS chemicals found in drinking water can cause severe health problems, especially in young children. I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. My community's drinking water was contaminated for decades by PFOS, (6:2)-FTS, and other PFAS compounds by a permitted chrome metal plating plant upstream. This was not discovered until the UCMR(3) results were available, and taxpayers here in Ann Arbor spent $1.5M to remediate it. Please regulate PFAS as a chemical class, like PCBs, etc. and demand Total Organic Fluorine measurements as a PFAS Hazard index, until validated health data on individual chemicals determines an acceptable health risk to the public.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Dow (Doc. #2336, SBC-047648)

The Fire Training Area-1 plume from Joint Base Cape Cod underlies the Yearling Meadows development where I live in East Falmouth, Ma. PFAS6 groundwater pollution from Massa. Army National Guard Training threatens Well #2 on the Upper Cape Water Supply nReserve which provides public drinking water to Falmouth and Sandwich. Public Drinking Water Wells in Falmouth and Mashpee have been fitted with Granular Activated Carbon and Ion Exchange Filters to remove the PFAS6 and 1,4-dioxane. Freshwater fish in Johns Pond have high PFAS6 levels which pose health threats to sensitive populations. Seabirds on the Stellwagen Bank have PFAS contamination from airborne transport. Thus EPA and Ma. DEP face serious toxic chemical threats on land and in water bodies via various exposure routes.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joseph Alvarado (Doc. #2337, SBC-047493)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to

multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Barrett (Doc. #2339, SBC-046901)

Dear Michael Regan,

I want to express my thanks to you for taking the first step to regulate PFAS in drinking water. I'm a cancer survivor and know personally how dangerous these chemicals can be. Your agency cannot act too soon to reduce the risks of cancer, developmental and reproductive harm, and other serious diseases which PFAS can cause.

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. And by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Margaret Barrett

Malvern, PA 19355

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jan Ellen Burton (Doc. #2340, SBC-046758)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country. EPA's proposed drinking water standards would provide important and long overdue protections against six of

these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jan Ellen Burton

Salt Lake City, UT 84105

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Walt Garvin (Doc. #2341, SBC-046192)

Please keep these dangerous chemicals out of our environment.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patricia Heithaus (Doc. #2342, SBC-046892)

Dear Michael Regan,

I am encouraged that the EPA is finally taking steps to regulate PFAS in drinking water. I have family members that live in areas where PFAS have contaminated drinking water resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every

individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Patricia Heithaus

Gambier, OH 43022

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alan Montemayor (Doc. #2343, SBC-046759)

Dear Michael Regan,

I am very concerned with PFAS in our drinking water, particularly as I live in San Antonio, TX and there are three known PFAS contaminated sites in our city. These were the result of firefighting foam application at three air force bases. Our local water utility, San Antonio Water System, does not report PFAS content in our water. Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Alan Montemayor

San Antonio, TX 78213

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Matthew Brown (Doc. #2344, SBC-046498)

Dear Michael Regan,

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

If you would finalize the EPA's standards, I would be very grateful.

Sincerely,

Matthew Brown

Easton, PA 18042

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Thomas Seaman (Doc. #2345, SBC-046760)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water... EPA's proposed drinking water standards would provide important, long overdue, and not strong enough protections against six of these toxic chemicals. I support the proposed standards as a start towards more stringent ones, and urge EPA to finalize them as quickly as possible.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States. There are very serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Thomas Seaman

Moscow, ID 83843

Sue Chartock (Doc. #2346, SBC-046761)

Dear Michael Regan,

Clean drinking water is imperative and necessary for the health of all living things. People and animals need it for survival. However the hidden dangers of these forever chemicals in the water can be downright dangerous and unhealthy to consume. Most water filters do not remove all substances from tap water either. Therefore steps to eliminate there presence in the water if at all possible is a big deal and a high priority.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated

drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Sue Chartock

Flushing, NY 11358

Jennifer Hartman (Doc. #2351, SBC-046765)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. We have the data to show the ongoing harm that PFAS does to human and ecological health. As both a mother and a woman in my mid-forties who is already a two time cancer survivor despite no prior family history, I feel strongly that government must protect its citizens when a substance has been shown to be harmful. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every

individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Again, as a cancer survivor and mother, I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Jennifer Hartman

Lexington, MA 02420

Anonymous (Doc. #2352, SBC-046302)

This morning, a local TV news station had a segment on this proposed rule. I read through enough material, until I found this comment section. Of course, the website information about this proposed rule includes a plethora of bureaucracy and mind-numbing details that are amazing! I know how to read and sort it all out, even if it takes time. I hope that our monthly water bill does not increase. It's high enough already. We should have had a water well drilled, during the construction phase of our house. I hope that every government official, who is involved, uses enough educated common sense, to do right by we the people. You serve us, after all. Serve us properly, please!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James T. Field (Doc. #2353, SBC-046766)

Dear Michael Regan,

" PFAS", a class of more than 12,000 chemicals found in everyday products like waterproof jackets, nonstick pans, food wrappers, and personal care products, can persist in the environment for up to hundreds of years, readily spread in the air, soil and water, and can remain in our bodies

for decades. This is why they are known as "forever chemicals." PFAS are linked to serious medical problems, including cancer, infertility, impaired fetal development, and immune system suppression that decreases vaccine effectiveness.

For decades, companies have been allowed to manufacture and use PFAS and release these toxic chemicals into the environment with impunity, contaminating drinking water supplies for approximately 200 million Americans. EPA's proposed drinking water standards are a critical step toward addressing the PFAS drinking water crisis, and helping communities across the country remove these dangerous chemicals from their water.

I strongly urge the EPA to act quickly to finalize its proposed national drinking water regulations. Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Heidi Blanck (Doc. #2354, SBC-046767)

Dear Michael Regan,

Hello. On the heals of Earth Day I thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

I am surprised that despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Heidi Blanck

Decatur, GA 30033

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Steve Liska (Doc. #2355, SBC-047496)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to

cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nan Corliss (Doc. #2356, SBC-046768)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Why are other countries way ahead of this country in banning these chemicals? We should be a leader, not a follower when it comes to protecting our health and that of the planet. It is time to act responsibly and do what needs to be done to protect and preserve our environment, our health and our future.

Sincerely,

Nan Corliss

Andrea Amico (Doc. #3072-5, SBC-046342)

Good Afternoon, my name is Andrea Amico, and I'm from Portsmouth, New Hampshire, which is home to the Former Pease Air Force Base. The old base was redeveloped into a successful Pease Tradeport and Business Park that it is today. I will start by saying I wholeheartedly support the proposed EPA MCLs for PFAS in drinking water. These MCLs are long overdue and will save lives. PFAS are toxic and incredibly low levels cause cancer, and never go away. These regulations are very much needed to protect human health. I moved to Portsmouth, New Hampshire in 2007 when my husband started working for a business at the Pease Tradeport. In 2011, we welcomed our first child, a daughter, and in 2013, we had a son. On the Pease Tradeport and right next door to my husband's work was a brand new, beautiful daycare center. As a mom, it was really hard for me to have to send my kids to daycare. I was not in a financial position to stay home with them, and we did not have family around to help us. We toured so many daycare centers in our area and we asked so many questions about their curriculum, their staffing ratios, were they CPR certified, but I never once questioned the quality of the water. It was just not on my radar. In May of 2014, my life changed forever when I read a newspaper article that said high levels of PFAS were discovered in the water at the Pease Tradeport. My husband worked there, and my two children were attending daycare there. The contamination was so bad that one large drinking water well was shut down immediately. At the time, I had no idea what PFAS were or how harmful they were, but my heart sank because my husband and children were drinking the water every day. I spent countless hours and sleepless nights researching PFAS, and the more I learned, the more scared I became. I often asked myself "How could these chemicals be so toxic, and yet there are no regulations in place to protect people?", and "how could they have been allowed into our products in the first place? Why are they still allowed today, after we know what we know?" This doesn't make sense. I've had nine years of more questions than answers. Nine years of stress, anxiety, and guilt. I worry about the health of my family every day, particularly my children, who drank high levels of PFAS as babies and toddlers, and at critical stages of their growth and development. They were contaminated without consent, poisoned without permission, guinea pigs in an experiment I did not sign up for. I would not wish this pain and devastation on anyone. These MCLs will save lives. Thank you to EPA for proposing standards that protect human health. My hope is that these MCLs become law quickly, and that EPA does not stop there. Please continue to take swift and aggressive action on PFAS; I'd like to see PFAS regulated as a class, because no amount of PFAS are safe for humans, and please hold the polluters accountable. They polluted the planet, the human race, and

have had minimal to no repercussions. That is deplorable and unacceptable. Thank you very much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Connie Kennedy (Doc. #2358, SBC-046769)

Dear Michael Regan,

THANK YOU for taking the first step to regulate PFAS in drinking water.

EPA's proposed drinking water standards will provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Lois Hughes (Doc. #2360, SBC-046771)

Dear Michael Regan,

The water available for everyone on this planet, in every consumable form, affects every person on the planet. Drinking water is not the only form of water that we consume. The effects on the human body of contaminates we've put in that water do not exclude people on the basis of wealth, political or religious beliefs, age, gender or nationality. Everyone involved in making this decision is responsible for choosing to allow these contaminants to harm themselves and their families. This is a personal choice! Ask yourselves if you want to be the ones responsible for allowing these devastating effects to continue to happen or will you step up and say no for yourselves and your families. Corporations are run by people who are not exempt from the harm to their families from these contaminates and must be helped to see that their bottom line must not come before their responsibility to humanity.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to

cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. Gina Hardin (Doc. #2361, SBC-046540)

Dear Michael Regan,

I am relieved to hear that the EPA is taking the first step to regulate PFAS in drinking water.

However, I am wondering why you're proposing placing the burden on municipalities and their water treatment systems (hence taxpayers), to undertake the expensive process of removal of FASs but continue to allow their manufacture and use - for private profit? If companies continue to produce and use and place these in our ecosystems, taxpayers will be engaged in an endless and useless chase of PFAS. I do not understand....

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Sincerely,

Gina Hardin

Laurie Lohrer (Doc. #2362, SBC-046772)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards will provide important protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them asap.

PFAS are long lasting and persist in the environment, our bodies, and cause harm decades after they are released into the environment. There are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for US communities. I urge you to quickly finalize these standards, and to implement a rule that resists industry's efforts to weaken.

Sincerely,

Laurie Lohrer

Lewistown, MT 59457

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joanne Dunlap (Doc. #2363, SBC-046773)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite

the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

This is a good begining. I seem to always have to remind you folks that your mission is to protect the life forms (particularly human but all of them) and not the corporations. Removing PFAS from the usable chemicals for manufacturing will not destroy our world but keeping ti surely will.

Sincerely,

Joanne Dunlap

Rangeley, ME 04970

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maryann Roby (Doc. #2364, SBC-046774)

Dear Michael Regan,

PFAS and other forever chemicals are deadly contaminants in our water. Thank you for taking the first step to regulate PFAS in drinking water. Contaminated waiter poisons all life forms undermining our sources of subsistence. The EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. Please put the proposed standards in place as urgent and quick action is needed.

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

Protect us from severe health consequences from exposure to PFAS despite industry's efforts to weaken them.

Sincerely,

Maryann Roby

Nunda, NY 14517

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Julie Pearson (Doc. #2365, SBC-046488)

Dear Michael Regan,

Thank you for taking this long overdue first step in regulating PFAS in drinking water. Even though of us who weren't scientists couldn't help but wonder what all these products from paint to shampoo and toothpaste were doing to the water, to our health and the health of the plants and animals and insects that share this world with us. Please finalize these rules asap and do not allow the chemical and oil and gas industries to delay or sabotage or weaken these measures.

Sincerely,

Julie Pearson

Tulsa, OK 74112

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kara Masters (Doc. #2366, SBC-046775)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important protections against six of these toxic chemicals that, for decades, have contaminated drinking water for millions of people, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. Please finalize the proposed standards as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in blood and organs, and continue to cause harm decades after they are released. PFAS have contaminated drinking water for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies exposed in utero. Yet, despite the serious health risks associated with PFAS, there are currently no federal limits on their levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens

of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to its commitment under the 2021 PFAS Strategic Roadmap to regulate PFAS in drinking water. Please finalize these standards and implement a health-protective rule, resisting industry's efforts to weaken them. Thank you.

Regina Whitman (Doc. #2368, SBC-046900)

Dear Michael Regan,

The EPA has a fundamental and moral obligation to the General Public over the concerns and profits of big companies. A company that produces , sells and disperses harmful substances that get on our food, into our water supply and air that we breathe does not deserve any protection or

consideration . Over the health and safety of the people of this country. It is Paramount that you keep this mandate forward in your minds and decisions now and forever in the future .

Taking the first step to regulate PFAS in drinking water his commendable, but a small step at best.

It behooves the EPA to remember that once these harmful substances are in our environment, they are in humans for generations to come.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Diane Fails (Doc. #2375, SBC-046779)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. PFAS is implicated in increased rates of cancer, developmental and reproductive harm, and other serious diseases. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

We need clean, safe water, and it's important to every living being that you resist industry's efforts to weaken rules to keep PFAS out.

Thank you.

Sincerely,

Diane Fails

Fremont, OH 43420

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy McRae (Doc. #2376, SBC-046780)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

These chemicals are everywhere. I live in a small Massachusetts community which still has lots of open land and small family farms. However the PFAS problem has been an issue even here. Many households rely on well water and homeowners have been advised to do PFAS testing. Higher levels of PFAS were detected in one of the town's well just last summer and regular monitoring is now on a frequent basis. If PFAS are a concern where I live .. it is problem everywhere.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to

cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Nancy McRae

Pepperell, MA 01463

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Edward Main (Doc. #2377, SBC-046781)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. Please finalize the proposed standards as promptly as possible.

PFAS are a persistent and apparently hazardous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in human blood and organs, and apparently cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of

lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

Please promptly finalize these standards and issue rules that provide the needed human health and environmental protection.

Thank you for your service to our country.

Sincerely,

Edward Main

Houston, TX 77098

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda Agerbak (Doc. #2378, SBC-046782)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Ed Oberweiser (Doc. #2380, SBC-046524)

Dear Michael Regan,

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

I support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a highly dangerous class of chemicals. PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment.

They have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States.

EPA's proposed rule would provide safer drinking water for communities from coast to coast.

The proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Sincerely,

Ed Oberweiser

Fort Bragg, CA 95437

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alicia Mason-Miller (Doc. #2381, SBC-046784)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water by providing important and long overdue protections against six of these toxins. I urge EPA to finalize them as quickly as possible..

They are a public health threat, known as " forever chemicals," because once released into the environment, they build up in our blood and organs, compounding damage over the years. We can't excrete them. It's inexcusable that EPA has neglected to set limits on PFAS in drinking water because of industry pressure.

We as consumers can choose not to buy furniture and clothing that are water and/or stain resistant because their chemical coatings contain PFAS. We can avoid Teflon cookware and fast food with grease-resistant PFAS. But we have no choice when it comes to drinking water. We shouldn't be forced to consume PFAS because the producers of these chemicals don't want to own up to the harm caused to human health. Yet, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would establish strong limits on six widely detected PFAS. The proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling

its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

Please finalize this rule immediately.

Sincerely,

Alicia Mason-Miller

Ranchos De Taos, NM 87557

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Thomas Kemp (Doc. #2382, SBC-046785)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Since PFAS are a large and dangerous class of chemicals, often called "forever chemicals," they persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Thomas Kemp

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Willem VandeKamp (Doc. #2388, SBC-046790)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Willem VandeKamp

Alameda, CA 94501

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Parkinson (Doc. #2389, SBC-046791)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

I am happy that you are limiting these six PFAS but you need to do much much more. Please make this only the beginning of protecting all of us from these chemicals.

Sincerely,

Nancy Parkinson

Warren, NJ 07059

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nicholas Rattner (Doc. #2390, SBC-046898)

Dear Michael Regan,

Don't it feel good on a hot day to pour yourself a glass of water and cool off? Of course, we're a long way from the days when you could refresh yourself from a stream, but one step at a time. We have to ensure that drinking water, what we call it now, remains not just a possibility but an expectation. From there we can start to talk about cleaning our rivers and streams. Seems pretty basic. Really, what's the ethical case for not taking this action? But you have done what many others balked at. So, many many thanks for taking the first step to regulate PFAS in drinking water. Now, keep going!!!!

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Nicholas Rattner

Houston, TX 77025

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

James Schmidt (Doc. #2391, SBC-046890)

Dear Michael Regan,

Thank you for beginning to regulate PFAS in drinking water. For decades, PFAS have contaminated our drinking water supplies, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge EPA to finalize them as soon as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

James Schmidt

Chicago, IL 60640

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bonni McKeown (Doc. #2392, SBC-046554)

I urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions. No wonder a lot of Americans are suffering from poor health!

PFAS are everywhere! That is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless humean communities. The ecology of rivers and lakes- support us and all living things..

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ann Mateo (Doc. #2393, SBC-046792)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

We URGE you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

ann mateo

Wyckoff, NJ 07481

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Buck Schall (Doc. #2394, SBC-046793)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Buck Schall

Asheville, NC 28801

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Kallman (Doc. #2395, SBC-046794)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

Thank you for listening.

Sincerely,

Susan Kallman

Saint Paul, MN 55125

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Shawn Harris (Doc. #2397, SBC-046601)

Hello, my name is Shawn Harris, and I'm proud to serve as Board President for the Piney Woods Conservation Group (PWCG). PWCG is a conservation organization founded in 2018 in Hattiesburg, Mississippi, with the mission of conserving, promoting and protecting the open spaces and green places of environmental and scenic significance in the Pine Belt. Since its inception, PWCG has worked tirelessly alongside the Hattiesburg Tourism Commission, The City of Hattiesburg, Forrest County Board of Supervisors and other community and state partners – public and private – to establish the first blueways in the greater Hattiesburg area. With the recent expansion of 52.3 miles of navigable blueways, the organization has focused more emphasis on conservation-related projects including tactical cleanups in public parks and along the watershed.

We were recently part of a Consumer Reports project that tested the tap water in all 82 Mississippi counties, including my personal tap water. My household's PFAS level was 9.61 ppt, significantly above the interim updated levels issued by the EPA in June 2022. While the full statewide results are still being accumulated, initial discussions lead me to believe this is an issue statewide. I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Johnson (Doc. #2398, SBC-047565)

Clean water! I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Winifred Chambers (Doc. #2399, SBC-046795)

Dear EPA Environmental Protection Agency,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Ms Winifred Chambers

1051 Hillsboro Mile Apt 905 Hillsboro Beach, FL 33062-2129

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Miller (Doc. #2400, SBC-047066)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. The EPA set out to ensure clean water for everyone in this country. No company or group of companies should be able to persuade the EPA to put industrial needs before people's lives.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Theresa Kardos (Doc. #2401, SBC-047067)

Dear Administrator Regan:

As an environmental educator and field biologist, a former public health worker with the New York City and New York State Health Departments, and a parent and grandparent who cares deeply about the health of our planet and all its inhabitants, I support the EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. I may have written before on this issue, but the hazards of PFAS are so frightening and wide-ranging that I believe one cannot say too much on the subject.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is as effective as possible in protecting health, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marilee Corey (Doc. #2402, SBC-047068)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

In my opinion, you all are in the position to prioritize making our water safe for all citizens and all crops and livestock. It is your obligation to protect your constituents, not the dirty industries albeit fossil fuel, chemical or Monsanto.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jeri Ramrath (Doc. #2403, SBC-047069)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Water is our most precious resource and our final frontier. This step to protect our water is crucial in its importance to our health and the health of the planet.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carrie Palmer (Doc. #2404, SBC-047070)

Dear Administrator Regan:

Anything that harms fetuses/children should be given high priority. Children need a good immune system and they are being compromised before they are even born. How can people live with themselves if they don't do something to help?!

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joe Murphy (Doc. #2405, SBC-046519)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a great first step to protect our families and communities from PFAS.

As you know, PFAS have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for millions of people in communities across our nation where their drinking water is contaminated by PFAS. Additionally this proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please move quickly to finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and also begin addressing all other types of PFAS.

Thank you for your efforts.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Roland Goyette (Doc. #2406, SBC-047071)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jerry DiMarco (Doc. #2407, SBC-047072)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for 6 PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are notorious for their extreme persistence and widespread pollution, and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these 6 PFAS chemicals and implement a rule that is health protective. Then it will be time to begin addressing all other types of PFAS. Thank you for your consideration of this very serious matter.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Norma Sasseville (Doc. #2408, SBC-047073)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

We are not a third world nation...Clean drinking water should be a guarantee, not an issue that we have to fight for. Clean water should be at the top of our priorities, along with clean air.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alan Hamilton (Doc. #2409, SBC-047074)

Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their widespread pollution.

The EPA's proposed rule would provide safer drinking water for people across the nation where the drinking water is contaminated by PFAS.

I urge you to pass the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cherie Fernandez (Doc. #2410, SBC-047075)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. These chemicals are proliferating much more rapidly than the technology needed to remove them from drinking water.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. I cannot help but wonder if the severity of the pandemic was worsened due to seemingly healthy people having suppressed immune systems because of the presence of persistent pollutants lingering in their bodies.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Audrey Diehl (Doc. #2411, SBC-047076)

Dear Administrator Regan:

I am very happy to hear about the EPA's proposed national drinking water regulations for six PFAS chemicals. It's so important for our federal government to use its authority to protect communities from PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I hope that you will quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS present in the United States.

Thank you for all that you do to safeguard the health and safety of the American people!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcia Rankin (Doc. #2413, SBC-046470)

Dear Administrator Regan:

Thank you for The EPA's proposed national drinking water regulations for six PFAS chemicals.

The EPA's proposed rule would provide safer drinking water where the drinking water is contaminated by PFAS. It will save thousands of lives and prevent serious PFAS-related illnesses.

I hope that the EPA will also address protective

measures from other types of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ellen Henry (Doc. #2414, SBC-047077)

Dear Administrator Regan:

It's good to hear that the EPA has proposed national drinking water regulations for six PFAS chemicals. This is a welcome first step to protecting our families and communities from the scourge of PFAS.

I urge you to go ahead and finalize this proposal as quickly as possible since the contamination and adverse health impacts are widespread already, and PFAS are essentially non-degradable and hence stay in the environment "forever." Then there are many additional PFAS compounds whose toxicity must be addressed and their use curtailed ASAP.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judith Fraser (Doc. #2415, SBC-047078)

Dear Administrator Regan:

Regulating PFAS in drinking water is long overdue. As time goes on we recognize that practices once accepted are no longer appropriate in today's world.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you for your consideration and action.

Judith Fraser, Hamilton, MT.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharron Coontz (Doc. #2416, SBC-047079)

Dear Administrator Regan:

I'm writing to support a quick finalization of the regulations for six PFAS chemicals.

As you know, PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carrie Acosta (Doc. #2417, SBC-046204)

I support strong safety standards and regulations regarding PFAS and other chemicals in our drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stewart Knoepp (Doc. #2418, SBC-046239)

I am in support of legislation to regulate PFAS (and PFOS and PFOA) in our drinking water. This is a dangerous chemical that has been allowed to be used to carelessly and to spread too much in our water. Thank you

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Debra Hover (Doc. #2420, SBC-047080)

Dear Administrator Regan:

I am relieved to hear that the EPA is proposing national drinking water regulations for six PFAS chemicals to protect our families and communities from PFAS. This topic has been building over the last decade and I am concerned the more I read about it and how prevalent it is. Thank you for not waiting any longer to take action.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dana Ayala (Doc. #2421, SBC-047081)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Please finalize and pass these regulations so all people can have safe water to drink that wont make us sick. It is worrisome these kinds of chemicals are in our water. Thank you for acting on behalf of us all.

Sincerely,

Dana Ayala/Greensboro NC

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2422, SBC-046198)

EPA needs to set strong regulations to protect the public from PFAS in drinking water

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diane Dickinson Selvaggio (Doc. #2423, SBC-047082)

Dear Administrator Regan:

A safe drinking water supply is absolutely critical to our health and safety all across the nation. Presently, there are far too many chemicals on the loose in our overall environment that we have little understanding of. More are added constantly, meaning we are constantly playing catch-up, and our land, water, and air, our health and safety, our quality of life, our finances, our economy are always at risk.

PFAS chemicals are the current poster children for this problem. We have been using them for decades with warnings from knowledgeable scientists being ignored. The story repeats and repeats and repeats...

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the damages of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution. They have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm, while officials have been steadfastly ignoring the warnings.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Please finalize the regulations of these six PFAS chemicals immediately, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you very much.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sarah Edwards (Doc. #2424, SBC-046275)

Please help protect our waters and our children. We must find a solution to reduce and remove PFAS from our most necessary natural resource! I love living in Michigan and our abundance of water sports, but I am increasingly wary of spending so much time in and around the waterse that are likely poisoned with PFAS. Please regulate PFAS in our drinking water, and then move on to regulation on all PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

R Ricardo Garcia (Doc. #2425, SBC-046408)

Dear Administrator Regan:

Would you drink it yourself and serve it to your family?

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carey Creed (Doc. #2426, SBC-047083)

Dear Administrator Regan:

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

These rules, enacted, would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. Acceptance of the whole proposal can save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Romalda Allsup (Doc. #2428, SBC-047084)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Ruth Shanen (Doc. #2429, SBC-047085)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

All new chemicals, created by humans for commercial or non-profit processes, should be reviewed and tested for potential dangers to living organisms, before being approved for commercial or any other useage, Humans are creating new materials, and all of these should be tested carefully before being released anywhere in our environment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Deborah White (Doc. #2431, SBC-046190)

I'm in favor of these lower standards for PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Will Perry (Doc. #2432, SBC-047086)

Dear Administrator Regan:

Water is our most precious resource. Chemicals that harm people and other living things have no place in our water.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Kling (Doc. #2433, SBC-046796)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

People have been drinking toxic water in many areas for far too long. Our children, and all of us, deserve better. The right to clean safe drinking water is basic, and I urge you to take action now.

Sincerely,

Margaret Kling

Englewood Cliffs, NJ 07632

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Katherine Ansbro (Doc. #2434, SBC-047087)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

Richard Vogl highlights the fact that "Water is the medium of life" in his book A Primer of Ecological Principles. Without a doubt, that is the truth. Access to clean water is a basic human right.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Beverley Colgan (Doc. #2436, SBC-046213)

I support the EPA Draft regulations proposed for 6 PFAS chemicals. I urge you to pass these rules and add additional PFAS to the regulations.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Steve Erickson (Doc. #2437, SBC-046797)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water.

We need more at the local permitting level. We are seeing land use permits being considered and granted with no - zero - requirement that groundwater be tested before such permits are granted, even in areas where nearby tests have resulted in extremely high numbers of PFAS. Every department and agency says its not their problem. But of course it is everybody's problem. We seek direction from EPA, that in areas where groundwater is known or suspected to be contaminated, any development permit must be accompanied by 1) a determination that the source of potable water is not contaminated or 2) a requirement for installation of sufficient filters and 3) regular testing and reporting.

For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Steve Erickson

Langley, WA 98260

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Edith Couchman (Doc. #2438, SBC-046246)

Please take action immediately to protect the health of people and other living beings from PFAS exposure by regulating these and allied chemicals vigorously. At the very least, lower the permitted levels in drinking water and foods.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kristy Pace (Doc. #2440, SBC-046798)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. THEY ARE FOREVER POISONS AND WE NEED TO RID OUR BODIES, WATERWAYS AND ENVIRONMENT OF ANY FUTURE CONTACT WITH THEM.

I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

Sincerely,

Kristy Pace

Tarzana, CA 91356

kvpsummer@yahoo.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Melanie Hopkins (Doc. #2441, SBC-046237)

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Deborah Munitz (Doc. #2442, SBC-046281)

I have a private water well that already has PFAs found when testing. Water quality protection requires federal protection because safe water should be a US citizens right and water does not know of municipal and state boundaries. Polluted water can travel through clouds and across borders. This is exactly the kind of problem that requires a federal solution. It is time to get rid of PFA chemicals in the US. Please support strong EPA regulation of PFA chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For specific information regarding private well water, please see section 1.4 of the EPA response in this *Response to Comments* document

Sri Grandmaster Hari Palacio (Doc. #2443, SBC-047500)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA’s proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry’s efforts to weaken them.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Gale Pisha (Doc. #2444, SBC-047278)

My comments are in regard to Docket ID EPA-HQ-OW-2022-0114.

I fully support the EPA's proposed federal regulations for six PFAS chemicals, which will "prevent thousands of deaths and reduce tens of thousands of serious PFAS-attributable illnesses."1

This action by the EPA is very important, as the U.S. has not regulated a single new contaminant in drinking water in nearly 30 years. The Agency's own research, released in June, 2022, showed that some PFAS chemicals are toxic over lifetime exposure at even the lowest detectable levels.2

The proposed regulations would set drinking water standards for PFOA and PFOS at 4 parts per trillion (ppt), and would set combined standards for four more PFAS (PFHxS, HGPO-DA and its ammonium salt, PFNA and PFBS). Filtration and removal would be mandated when levels exceed these thresholds.

I live in Rockland County, NY, where all but one of our water company's more than 60 water sources contain at least one PFAS chemical, with some being hundreds or thousands of times higher than the advisory levels of 0.004 ppt and 0.02 ppt for PFOA and PFOS respectively that EPA issued in June, 2022. New York State's Maximum Contaminant Level of 10 ppt for these two PFAS is higher than the proposed EPA standards of 4 ppt, so if these draft EPA regulations are accepted, more of our water sources in Rockland will be mandated to be cleaned up. While filtration is expensive, considering the human misery and billions of dollars in healthcare costs that result from exposure to single or multiple PFAS over lifetime exposure, these draft regulations are well worth adoption. I agree with the EPA Administrator that the benefits of regulation of these chemicals justify the costs.3

In addition to the proposed Maximum Contaminant Levels of 4 ppt for PFOA and PFOS, I support EPA's expedited approach to the four chemicals it regulates with a hazard index approach (PFHxS, HGPO-DA and its ammonium salt, PFNA and PFBS), which should help prevent cumulative impacts from exposure to multiple PFAS.

Ultimately, PFAS should be regulated as a class, since it takes many years to go through a regulatory process for individual chemicals meanwhile giving the chemical industry time to come up with substitutes with slightly different chemical formulas. The government also needs to ban the continued production and sale of these forever chemicals by not approving new ones and by banning their nonessential uses in consumer products.

The government also needs to restrict emissions from industrial sites into local air and water, not allow dumping of PFAS into wastewater systems (which will then require expensive treatment to

remove them), and limit exposure that comes from the spreading of biosolids (sewage sludge) on crops. This sludge has been proven to contain PFAS as well as other toxins and pharmaceuticals.

Just as with lead, mercury and asbestos, there is no known safe level of PFAS exposure. By banning lead in gasoline and paint, we were able to dramatically reduce blood levels of lead. We can do the same with PFAS, but it will take bold action by both the federal and state governments.

The current draft EPA regulations do not go far enough, but they are a good start, and I urge their adoption and implementation quickly.

Thank your the opportunity to comment.

Paula Morrow (Doc. #2445, SBC-046799)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

Sincerely,

Paula Morrow

Chicago, IL 60606

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Kecskes (Doc. #2446, SBC-046291)

I applaud the USEPA in its proposed PFAS National Primary Drinking Water Regulation Rulemaking. PFAS and its companion compounds are wreaking havoc on drinking water supplies and natural water resources in the United States and around the world. We must

expedite actions to clean up existing PFAS problems and eliminate the potential to require future contamination problems. Equal attention must be focused on the "pathways" that allows PFAS to make its way into the environment, as well as taking action against the producers of these contaminants.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joseph Truhon (Doc. #2447, SBC-047274)

· I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

· I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed.

· Many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

· The New York State Dept. of Health is waiting for EPA's finalized regulations. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

· These regulations will send a strong signal to the chemical industry to invest in safe alternatives now.

· There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class.

· EPA should immediately halt the approval of all new PFAS.

· While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joseph Ryan (Doc. #2448, SBC-046411)

Protect the environment.

If there is a future, it will need filtered water and the curtailment of the chemicals in question.

EPA Response: The EPA acknowledges this comment, and the notion of protecting the environment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Perry Kendall (Doc. #2449, SBC-046560)

Dear Michael Regan,

Decades of contaminated water supplies makes your taking the initial step to regulate PFAS in our drinking water imperative. Millions of us rely on your action to avert the increased rates of cancer, developmental and reproductive harm, and other serious diseases PFAS cause. EPA's proposed drinking water standards would provide crucial long overdue protections against six of these toxic chemicals. We desperately need the EPA to finalize federal limits on PFAS levels to ensure our drinking water is potable.

Nationwide EPA's proposed rule would necessarily provide safe drinking water. Beneficially establishing strong limits on six widely detected PFAS. Annually this meaningful proposal saves 1000's of lives preventing tens of thousands of serious PFAS-related illness. The EPA acknowledges and addresses the cumulative impacts on communities exposed to multiple PFAS. Issuing such a proposal, takes us one step closer to fulfilling your commitment under the 2021 PFAS Strategic Roadmap beginning regulating PFAS in our drinking water. Posthaste we need you to finalize these standards, implementing a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Perry Kendall

Glenside, PA 19038

PearEmail@gmail.com

Janice Gintzler (Doc. #2450, SBC-046800)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

It was years ago that I saw the film "Dark Waters" about the lawsuit in West Virginia against DuPont for killing animals and people along a creek that ran from the DuPont plant manufacturing PFAS. DuPont, I believe, changed its name following the lawsuit. In all these years, PFAS still are produced and are making us ill?

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Janice Gintzler

Crestwood, IL 60418

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

MV Tegel (Doc. #2451, SBC-046465)

I am in favor of your proposal to regulate six PFAS chemicals under the Safe Drinking Water Act (US Environmental Protection Agency, 2023). The EPA proposed to limit drinking water exposure to two PFAS chemicals at 4 parts per trillion (ppt).

This proposal covers only six -- we need to keep going farther on regulation of these toxins.

Sincerely,

MV Tegel

Exeter NH

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Victoria Oltarsh (Doc. #2452, SBC-046244)

With all the taxes I pay, and the money I spend l shopping, living, and paying high rent in Nyack, the least we deserve is fresh and healthy drinking water, not polluted with toxic waste and chemicals. This is a crime.

EPA Response: The EPA acknowledges this comment and agrees that communities deserve safe drinking water. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kristine Atkinson (Doc. #2453, SBC-046801)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. PFAS is contaminating drinking water supplies for millions of people across the country, many unaware that their water supply has caused increased rates of cancer, developmental and reproductive harm, and other diseases. Higher drinking water standards are long overdue protections against the top six of these toxic chemicals. We urge EPA to finalize the proposed standards as quickly as possible, and to ban use in products such as toilet paper, cosmetics and cleansers.

Despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water. We are far safer here in Massachusetts than elsewhere, and residents of states lagging behind should be protected. EPA's proposed rule would provide safer drinking water for communities from coast to coast. There is a cumulative effect on communities exposed to multiple PFAS: this proposal moves EPA one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

Please act quickly to finalize these standards, and be proactive in preventing the sale and use of products that are contaminating water supplies everywhere.

Sincerely,

KRISTINE ATKINSON

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Donovan (Doc. #2454, SBC-046885)

Dear Michael Regan,

Healthy drinking water is very important to me. EPA's proposed drinking water standards would provide important and long overdue protections. I support the proposed standards, and urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities by establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Joan Donovan

Laurie Puca (Doc. #2457, SBC-046334)

I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to finalize these rules as quickly as possible. I live in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells -- unless the draft EPA regulations are passed. Many of Rockland's drinking water sources are

contaminated with multiple PFAS chemicals, possibly resulting in additive or synergistic health impacts. But New York State currently regulates only two chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up. The New York State Dept. of Health is waiting for EPA's finalized regulations. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS. These regulations will send a strong signal to the chemical industry to invest in safe alternatives now. There are over 12,000 PFAS chemicals in all. Moving forward, EPA should extend these regulations as quickly as possible to cover PFAS chemicals as a class. EPA should immediately halt the approval of all new PFAS. While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Donna Fine (Doc. #2458, SBC-047088)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

Having traveled to Africa and seen how much of a difference clean water access could make, it sickens me to think that we would not want our own citizens to at least have access to water that will not make them sick.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pearl Gray (Doc. #2459, SBC-047663)

Clean water is a basic need for all creatures, including humans. Pfas is a toxic carcinogenic chemical that does not belong in our water, air, or land, yet it is there. Let's begin protecting the

citizens of our country and county from unregulated and unfettered pollution that is making our planet toxic to all life only for the purpose of profit. Humans can live without vast wealth, we can not live without vast clean water and vast clean air. It is imperative that the elected and appointed governing bodies protect the people who elected them from being exploited for the irrelevant dollar in a linear consumptive economy. Our planet, our water, is our legacy. Earth's good health and prosperity are irreplaceable and essential for life. Our wealth is in the prudent stewardship of the planet. Protecting and purifying our water without connection to profit is the most valuable decision that can be made with dividends that extend through generation or the debt that will be paid indefinitely.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mark Petzold (Doc. #2460, SBC-046802)

Dear Michael Regan,

Once again, industry has chosen profit over protection. Did we learn nothing from the DDT debacle ?

Once again, the EPA has failed to Protect.

PFAS is everywhere, the lake trout in Seneca lake have high levels and the NYS DOH is silent. Once you upgrade water standards, look at the other sources of PFAS in the food chain.

This overhaul is long overdue. I support the new standards and also call for a hold on approval of any new PFAS chemical, a comprehensive review of all existing chemicals paid for by the industries that use them, and product labeling so consumers know the risks.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated

drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Mark Petzold

Tioga Center, NY 13845

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rosemary K Coffey (Doc. #2461, SBC-047089)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step in protecting our families and communities from the scourge of PFAS.

PFAS, which are notorious for their extreme persistence and widespread pollution, have been linked to a long list of ill-health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation whose drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thank you in advance for your attention to this matter!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Essman (Doc. #2462, SBC-046803)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

The status quo of profit making and the willful ignorance and even the deliberate misinformation by corporations is creating a rapidly increasing toxic world. It is time for creative people to lead us out of this dark ideological mindset of chaos and fear of the future towards a sustainable healthy future for those not yet born.

Do your job while you can or find some one who can lead us out of desperate hateful grasping for straws.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Robert Essman

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Fred Malo (Doc. #2464, SBC-046804)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Don't be intimidated by the SCOTUS. W.V. v EPA & Sackett v EPA severely restricted your authority to protect the American people from dangerous pollutants, but it's what we should expect from this court. You look at the past decisions of the conservatives that have been appointed by a one-term, twice impeached president and they always rule in favor of large corporations over the people. Maintain your stance for the health and safety of the people.

Sincerely,

Fred Malo

V M (Doc. #2465, SBC-047660)

Studies on the impacts of chemicals in our environments have been ignored and slow walked until harms can no longer be ignored. Very little research has ever been done on the cumulative impact of the range of chemicals the human body attempts to adapt to and function amidst. Information about PFAS chemicals is clear. Yet, with all the political and media attention on health care, pandemic response, and climate change - and billions of dollars spent to support the pharmaceutical industry - there have been decades of underwhelming response to make sure our drinking water is free of these chemicals and other problematic toxins.

It is clear to me that the federal agencies tasked to protect the American public have been hijacked. Thankfully, there are still compassionate and intelligent people around the world who actually want to take actions that directly support the quality of health and life of everyone. Let us stand with each other.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lisa Kunkel (Doc. #2466, SBC-046805)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities by establishing strong limits on six widely detected PFAS.

The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting any efforts to weaken them.

Anonymous public comment (Doc. #2467, SBC-046335)

I am a resident of Rockland County, NY where our drinking water is contaminated with multiple PFAS chemicals. There is no question that the cumulative stress of environmental factors such as these chemicals considerably impacts our health. Chronic health issues in our children have been exponentially increasing since the mid 80;s. Little to no research has been done to effectively understand the cumulative harms of the range of chemicals we live amidst on a daily basis. In fact, New York State currently regulates only two PFAS chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up. The New York State Dept. of Health is waiting for EPA's finalized regulations. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS. We need safe alternatives now!! All of us deserve this. There are over 12,000 PFAS chemicals in all. This is only one subset of chemicals. Not only should the EPA extend these regulations as quickly as possible to cover PFAS chemicals as a class, the EPA must immediately halt the approval of all new PFAS. This is common sense. The fact that ignoring these harms has become normalized is a symptom of incredible soullessness, greed, and an ongoing loss of integrity. While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in healthcare costs caused by the health impacts of PFAS chemicals. Stop displacing these corporate costs onto individual lives. This burden dims the entire world. Just stop now. Be someone who changes everything for the better.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Kleppel (Doc. #2468, SBC-047267)

My name is Sharon Kleppel and I am a member of the Catholic Climate Covenant which is working to support the proposed EPA National Primary Drinking Water Regulation which sets enforceable limits on PFAS and other related chemical compounds in public drinking water.

I am concerned that not only for myself, but for all Americans, we do not have guaranteed access to clean drinking water that does not contain harmful PFAS levels. I am particularly concerned in light of the fiasco in Flint Michigan several years ago that many of our smaller cities and rural areas are permitting these chemicals to be in their water.

Therefore, I am writing in support of the NPDWR (EPA-HQ-OW-2022-0114-0027) and its stringent regulations on drinking water. The rule has the potential to lower the presence of dangerous chemicals in the water supply of over 110 million Americans. PFAS chemicals have been repeatedly connected to dangerous health conditions, and the EPA must do something to protect Americans from such contamination.

As a member of a faith community, I take the responsibility I have to creation, and to each other, very seriously. It is from that position that I advocate for this act as a way of bringing about more justice in our society. It is because the benefits of the rule are so great, and, according to the EPA, far outweigh the costs of implementation, that I believe it to be in the best interest of the United States to enact the National Primary Drinking Water Regulation. Thank you for the continued work of the EPA to create better living standards and a more harmonious relationship with nature.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sandy Kirkpatrick (Doc. #2469, SBC-046537)

Dear Michael Regan,

PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. This proposal would bring the EPA one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Mary Mathews (Doc. #2475, SBC-046602)

The EPA's PFAS Strategic Roadmap and its comprehensive approach in addressing PFAS through research, restriction, and remediation is an excellent plan to protect people and the environment. National regulations and enforcement are required to stop widespread polluting of our drinking waters and the adverse health effects caused by "forever chemicals".

This is especially necessary for environmental justice communities which already are burdened with so many other pollutants and possibly multiple sources for PFAS. One such community Waukegan, IL is near my own town. The drinking water for both communities is drawn from Lake Michigan. Currently, the measurable amount is not high, but without action, could be soon. My community is suing 3M for any costs associated with PFAS in the drinking water. Perhaps not all communities are included in the lawsuit, but all communities should receive equitable protection against public drinking water contamination.

Part of the plan, that I strongly support, is the EPAs proposal "Per- and Polyfluoroalkyl Substances National Primary Drinking Water Regulation" which limits six PFAS. This crucial step will help keep these toxic chemicals out of our drinking water and curb some long-lasting harm to people and wildlife.

But that proposal is only a start. I urge the EPA to speed up its process and expand to include all PFAS chemicals, including ones currently classified as inactive. Contamination already is found worldwide, and levels of concentration will only grow until industries are forced to contain or stop their uses.

While some consumers have become aware of PFAS in everyday products such as nonstick pots and food wrappers and choose to avoid those, manufacturers have designed new applications and products where the presence and toxic nature of PFAS are unknown to the public.

An example of this is the use of artificial turf (plastic grass), a growing industry all over the country. My community approved installation of 10 acres of plastic grass next to a stream. Runoff from it and hundreds of thousands of other installations (private yards, school athletic

fields, professional sports fields, etc.) throughout the county will increase the contamination levels of PFAS.

Manufacturers have known about the deadly harm caused by their chemicals for years and have been able to avoid any consequences. This must not continue. Polluters must be held accountable. Please use every enforcement tool available.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

William Ashman (Doc. #2478, SBC-046808)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water! For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jean Naples (Doc. #2479, SBC-047277)

Dear Administrator Reagan,

I am writing as a physician and public health/environmental protection advocate because I am very concerned by the latest news that our waterways that provide drinking water and habitat for wildlife including the belted kingfisher, are contaminated with highly toxic "forever chemicals", PFAS, that persist in our environment, our water, people, and wildlife for a long, long time. These chemicals, known as Per and Poly fluoroalkyl Substances, or PFAS, expose communities and beloved species to serious health risks, including cancers and impacts to the reproductive and immune systems.

Please understand that I strongly support the EPA draft regulations proposed for six PFAS chemicals. I urge you to please finalize these rules as quickly as possible. These comments are in regard to Docket ID: EPA-HQ-OW-2022-0114.

I live in the town of Suffern in Rockland County, where nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells, unless the draft EPA regulations are passed.

I am very concerned because many of Rockland's drinking water sources are contaminated with multiple PFAS chemicals, with the possible result of additive or synergistic health impacts. However, as a physician and public health/environmental protection advocate, I am very disturbed because at this current time, New York State is only regulating ground water contamination of two PFAS chemicals. The draft EPA regulations are written for combined standards, which would require many more of these chemicals to be cleaned up.

Please understand that the New York State Dept. of Health is waiting for EPA's finalized regulations. If EPA's draft regulations are passed, it will make it possible for the states to build on EPA's science and direction to regulate even more PFAS.

At this time, I thank you for your consideration of my letter and my recommendations. It is vital for you to understand that EPA approval of these regulations will send a strong signal to the chemical industry to invest in safe alternatives now. I am also very disturbed by the fact that there are over 12,000 PFAS chemicals in all. Moving forward, I strongly urge the EPA to please extend these regulations as quickly as possible to cover PFAS chemicals as a class. It is also very important that the EPA should immediately halt the approval of all new PFAS.

While the costs of filtration and disposal are high, those costs are far outweighed by the billions of dollars in public healthcare costs caused by the health impacts of PFAS chemicals.

I strongly urge you to please acknowledge that persistent toxic pesticides must be considered to pose an "unreasonable risk to the environment," and these risks to our public health should result in cancellation of their registrations.

Sincerely,

Jean Marie Naples, MD-Ph.D.

Sue Odierna (Doc. #2480, SBC-046332)

I moved to Rockland County 8 months ago and have just learned nearly all of our drinking water is contaminated with toxic PFAS chemicals. Many of our wells and reservoirs are contaminated with PFAS at levels below the current New York State drinking water standards. That means that filtration will not be required for the majority of Rockland's contaminated wells – unless the draft EPA regulations are passed

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judy Schultz (Doc. #2481, SBC-046809)

Dear Michael Regan,

As a nurse, I want to thank you for taking the first step to regulate PFAS in drinking water. As you know, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I implore the EPA to finalize them as quickly as possible.

We simply cannot continue to allow the kind of harmful pollution that PFA's pose simply for the profits of the industries that manufacture and use them. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

As you know, the proposed rule would provide safer drinking water for communities from coast to coast and address the cumulative impacts on communities who are exposed to multiple PFAS. Please finalize these standards as soon as possible and implement a rule that is as robust as possible.

Thank you for your consideration.

Sincerely,

Judy Schultz

San Francisco, CA 94115

heyjudenf@gmail.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Norman Shepard (Doc. #2482, SBC-046810)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

We Gave Known About These Many Health Issues Connected To PFAS Chemicals For Years, Yet They Have Been Allowed To Be Put in Our Water Systems, Used On Our Cooking Pots & Pans & Other Places With Out Restriction !! It's Long Past Time They Were Totally Banned From Any Use That Could Affect Our Health. Please Get It Done - Water Is Just The 1st Step. Our Water Systems

Sincerely,

Norman Shepard

Girard, IL 62640

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Louise Nolta (Doc. #2483, SBC-046811)

Dear Michael Regan,

How can I thank you for taking the first step to regulate PFAS in drinking water? We have waited a long time for this to happen. Drinking water is so essential to every person, so this will make such a difference in the lives of people. It will save lives, it will make a safer environment and will prevent sicknesses. It will not prevent every sickness, but it will prevent what is preventable. I strongly support the proposed standards, and I urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

By doing this you can really make a difference in the lives of so many. Please do make a difference. Thank you

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Louise Nolta

Winnetka, IL 60093

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Long Island Civic Alliance (Doc. #2484, SBC-046299)

Thank you for proposing stricter standards for PFAs contamination. We are NY residents where the current Department of Environmental Conservation levels are 10 parts per trillion. That is 40% of the standards the EPA is proposing. We live near Republic Airport on Long Island, which has been implicated in PFAs contamination by the NYSDEC, but their potential clean-up will only mitigate contamination to their levels. Some NYSDEC mitigation involves paving over contaminated areas, which is completely unacceptable and very dangerous. We hope federal standards will be required of every state environmental agency. Please pass this regulation quickly. Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Ann Kadooka (Doc. #2485, SBC-046812)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

*** Living on the islands of Hawaii, I never dreamed I would have to worry about our pristine ground water quality. But now with the Navy fuel tanks leaking into our ground and the plastics

in the ocean, we need to be diligent about limiting pollutants from our drinking water. The economic health costs for our state has been devastating as our cost of living is one of highest in the country!

I implore you to regulate PFAS in our water!

Mahalo Niu loa"...

Sincerely,

MARY ANN KADOOKA

Honolulu, HI 96817

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jim Tappon (Doc. #2486, SBC-046813)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

As you are well aware, water is the lifeblood of all life - humans, animals, plants - and if continue to allow contaminants, we are in effect allowing all Living creatures to be poisoned. It is your job to be the 'watchdog' for all of us who depend on you and companies that may become more concerned about their bottom line than they are about life on our planet!

Sincerely,

Jim Tappon

Rochester, NY 14609

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Callan (Doc. #2487, SBC-047622)

I do the best I can to limit my family's exposure to PFAS by being an educated consumer, but it isn't enough. I am expecting my second child and recently read about a recent study documenting PFAS in breastmilk! Our bodies are totally contaminated, down to the most natural, life-giving parts of ourselves. It's hard to not feel hopeless that corporations will endlessly and carelessly harm us in the name of profits. Only government has the type of regulatory power needed to make a difference in truly limiting the harm these chemicals pose to our bodies and the wellness of our society.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tim Peterson (Doc. #2489, SBC-046651)

Dear Administrator Regan,

This is a no brainer. So much of the free world/western culture live without the threat of PFAS. This country should not only join them, but be a leader in this important environmental and health issue.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Emily Lewis (Doc. #2490, SBC-046679)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water. EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals.

Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pete O'Malley (Doc. #2491, SBC-046652)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

Many people in my community are experiencing the effects of PFAS in our drinking water and it's tragic to know so many going through the same cancer treatments because of where we live.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

Peter O'Malley

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Chieffe (Doc. #2492, SBC-046273)

I strongly support cleaning our water so it is safe to drink, bathe and use for other household purposes. There is no place for toxic chemicals in our water. I want my children and grandchildren to be safe and healthy. Clean water is a must for our health and livelihood. Polluting companies are responsible for cleaning their toxic messes. The health and wellbeing of people comes before profit.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marcus Maloney (Doc. #2493, SBC-046653)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government must act boldly to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals.

Placing the burden on our communities, our drinking water, and our health will not solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mark Olinger (Doc. #2494, SBC-046654)

Dear Administrator Regan,

The Environmental Protection Agency (EPA) has a chance to make drinking water safer for everyone!

PFAS are found in our drinking water, our air, our soil, and our bodies. Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

The EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Lovelace (Doc. #2495, SBC-047090)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

We will not get a second chance on this problem. Nature cannot heal when we put such large wounds on the system.

Very likely mankind is relying on your actions.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Daniel Vallero (Doc. #2496, SBC-047091)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Exposure to PFAS – known as "forever" chemicals because they are extremely resistant to breaking down in the environment – has been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

But every day, millions of people across the country drink water contaminated with PFAS. Unfortunately, PFAS are almost impossible to avoid. They are found in our homes, our offices, our supermarkets – practically everywhere. What's worse, manufacturers don't have to disclose to consumers that they're using them. It needs to stop.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Theresa Conk (Doc. #2497, SBC-047092)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS. As a parent and health advocate, there is no step I can take personally or advise that others take to minimize exposure. This must be addressed through regulation. This is an issue that affects us all but especially the most marginalized. Industries won't change unless you take action.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Thank you for the work that you do.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cynthia Gerlinger (Doc. #2498, SBC-047093)

Dear Administrator Regan:

In commend your efforts to limit or even ban PFAS. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

My family and I are very converned about PFAS persistence in the drinking water we use. As you know, these forever chemicals have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

My family and I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then continue to prioritize addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Jane Engh (Doc. #2499, SBC-047094)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

Of course you are familiar with the harmful effects of PFAS--and because these chemicals are so long-lasting, their effects accumulate every year that they are still used.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cathy Farris (Doc. #2500, SBC-047095)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. They should not be ingested by anyone!

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

No living creature should ingest PFAS. Stop the breeding!

Without population control, we are doomed! The earth cannot produce enough resources for our endless needs!

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Grace Bartlett (Doc. #2501, SBC-047096)

Dear Administrator Regan:

Clear drinking water is essential for life and health. As you know clean PFAS free water is not an optional extra. The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. This is vital to the wellbeing of all. Thank you for your quick action.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margaret Tilden (Doc. #2502, SBC-046415)

Dear Administrator Regan:

Please make sure the EPA's proposed national drinking water regulations for six PFAS chemicals is passed and enforced as quickly as possible. YOU know why!

Thank you!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathleen Fenton (Doc. #2503, SBC-047097)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our

The EPA's proposal for regulating PFAS would be a step toward saving thousands of lives and preventing tens of thousands of serious PFAS-related illnesses each year.

Please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Judy Hopkins (Doc. #2504, SBC-046551)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals are an important step towards protecting communities from these hazardous substances. It's crucial that such regulations are based on the latest scientific evidence and are robust enough to ensure safe drinking water for everyone.

Additionally, addressing all types of PFAS contamination is critical to protect public health. PFAS chemicals are widely used in many industries, and their persistence in the environment means that they can accumulate in the food chain and pose long-term risks. It's essential to have a comprehensive approach that includes not only regulating PFAS in drinking water but also addressing their use in manufacturing and other applications.

Overall, I agree with the NRDC's call to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. This will require a coordinated effort from policymakers, industry, and the public to ensure that we can effectively address this urgent environmental and public health challenge.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Annetta Winkle (Doc. #2505, SBC-047098)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

The chemical companies have made enough money off of the blood of the people of this country and the world. GREED, GREED.\,GREED isa ll they are and it seems much off this country of insecure little white men haters are too.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maureen Allen (Doc. #2506, SBC-047099)

Dear Administrator Regan:

EPA needs a LOT more money to eliminate mounting environmental threats!

THANK YOU for proposing national drinking water regulations for six PFAS chemicals!

Who even knew they exist? Or the harm they do? Cancer! Immune suppression! Developmental damage!

This first tranche of regulations is such a welcome first step to protecting us from the scourge of PFAS.

Obviously, the faster you can release the final rule, the more illnesses and deaths you will prevent.

Your team may already be working on regulations covering more types of the ubiquitous PFAS. I hope raising public awareness and requiring disclosure of PFAS by the companies who expose us to them are key components of both rules.

And I support EPA receiving budget priority in proportion to the importance of restoring a healthy environment!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Elizabeth Pingree (Doc. #2507, SBC-047100)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

Living in Maine, as my family does, PFAS chemicals have been in recent News reports, thus, very much on the collective minds of people who live here. It has not gone unnoticed just how prevalent, dangerous, and common these PFAS chemicals are in the broader landscape. There are troublesome areas around the state, certainly, but no place is completely immune. It's more than concerning, more like alarming to all of us living here.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Scott Schweizer (Doc. #2508, SBC-047101)

Dear Administrator Regan:

As a Republican I can tell you the environment is not a partisan issue. I urge you to take strong action to safeguard people and our water from forever chemical pollution.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Paul R. Ogushwitz (Doc. #2509, SBC-046417)

Dear Administrator Regan:

I urge you to quickly finalize the regulations of the six PFAS chemicals, implement a rule that is health protective, and then BAN ALL OTHER TYPES OF "PFAS".

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrew Goldstein (Doc. #2510, SBC-047102)

Dear Administrator Regan:

The EPA is tasked with protecting our environment. I am happy to see you have proposed national drinking water regulations for six PFAS chemicals. That is a welcome first step to protecting our families and communities from the scourge of PFAS which will go on for generations.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals and implement a rule that is health protective. Then begin addressing all other types of PFAS. You have to start somewhere but please don't stop there. That is just the tip of the iceberg.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrea Doukas (Doc. #2511, SBC-047103)

Dear Administrator Regan:

Thank you for the EPA's proposed national drinking water regulations for six PFAS chemicals. This is a welcome first step to protect Americans from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Tom Schwegler (Doc. #2512, SBC-047104)

Dear Administrator Regan:

I am writing to you as a supporter of the Natural Resources Defense Council, Earth Justice, the Environmental Defense Fund, the Sierra Club and other environmental organizations.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to please quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you considering this critical environmental protection and human health issue.

Sincerely,

Tom Schwegler

Kansas City, Missouri

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rio Kerr (Doc. #2513, SBC-046499)

Dear Administrator Regan:

Thank you for quickly pushing through the EPA's proposed national drinking water regulations and standards for six PFAS.

This legislation is long overdue and urgently needed.

Any difficulties arising from the implementation of these standards are also needed to make people and polluters see and accept the insidiousness of these chemicals, and force better science to address them.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Thank you,

Rio Kerr

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Charles Beers (Doc. #2514, SBC-046183)

Protect US against PFAS!!!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Theresa Cromeans (Doc. #2515, SBC-047105)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

As a retired health scientist, I am highly concerned about this now and especially for future generations. We have no way to rid the environment of these chemicals and they are far too pervasive already.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rebecca Wells (Doc. #2516, SBC-046196)

We really need this to come as soon as possible. Please see this through.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Borchert (Doc. #2517, SBC-047106)

Dear Administrator Regan:

Remove PFAS chemicals from use now! Stop contaminating our drinking water with chemicals that last forever and damage our bodies! Clean drinking water is a human right! Take action now.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Dave Councilman (Doc. #2518, SBC-047107)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Getting these chemicals out of our water is pro-health, pro-life and Prevention!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nicholas White (Doc. #2519, SBC-047108)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

We are becoming aware that ghe extent of PFAS contamination has been hidden/underestimated/ underreported, and that municipal water supplies in the apparently safest districts are compromised. We know that agricultural land in New England is seriously polluted. It is time for fast strong action to stop things getting worse.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm. I fear that we will be linking this contamination with many more diseases in the next decade or so.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pat Long (Doc. #2520, SBC-047109)

Dear Administrator Regan:

The EPA's proposed national drinking-water regulations for 6 PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these 6 PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jill Levin (Doc. #2521, SBC-047110)

Dear Administrator Regan:

How many requests, pleas and asks must be made to get you and other government agencies to act in the best interests of the American people. Don't keep delaying in protecting our drinking water. PROTECT IT.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jo Hersh (Doc. #2522, SBC-047111)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I consider this a critical public health issue, and urge you to quickly finalize the regulations of these six PFAS chemicals, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Bramley (Doc. #2523, SBC-047112)

Dear Administrator Regan:

There is nothing more fundamental to life than water. But the water must be clear of substances that cause harm. Our industrial world is making it harder and harder to find good, toxin-free drinking water. Fortunately for our country the EPA is finally moving in the right direction.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Stone (Doc. #2524, SBC-047113)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a needed first step to protecting our families and communities from the scourge of PFAS.

PFAS are cannot be removed and degrade so slowly that they are termed 'forever' chemical pollution. Their widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Catherine Haskin (Doc. #2525, SBC-047114)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. While you are working to finalize the regulations, I also urge you to continue to listen to the people who will benefit from these rules, not the producers.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Daria Flores (Doc. #2526, SBC-047115)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

It would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Catherine Cosman (Doc. #2527, SBC-047116)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protect families and communities from the PFAS scourge.

PFAS are infamous for their extreme persistence and widespread pollution and are linked to many health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for millions of people in communities across the USA where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Esther Garvett (Doc. #2528, SBC-047117)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Abigail Holmes (Doc. #2529, SBC-047118)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are well known for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

I live near a military facility where these were used firefighting. while water has been provided to some residents - this is in our ground water now. poisoned water - thats not what we should get from our taps in the US!

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

dont let this be where you stop - historically companies have simply replaced one PFAS with another. start by taking this great first step ,but then I call on you to protect us from future version - its crazy that in this country so many dangerous substances are simply allowed to remain in our water and environment.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Droste (Doc. #2530, SBC-047119)

Dear Administrator Regan:

The sooner these "forever" chemicals are no longer added to the environment the better. Since once they are added they continue to accumulate and the problems they cause will only become worse.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan O'Rourke (Doc. #2531, SBC-047120)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. With water being something we can't live without it's quite shocking that this hasn't been taken care of before now!! How many humans, animals and all things dependent upon drinking water will have to possibly be stricken with a serious and maybe deadly ailment before drinking water is safer for all. Our politicians need to focus more on fixing America's real problems and QUIT FIGHTING WITH EACH OTHER AND NOTHING GETS DONE-we are waiting to see results and so far you are all failing Americans.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Thomas Beck (Doc. #2534, SBC-047121)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting us from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then address all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Arlene Renshaw (Doc. #2535, SBC-047122)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. Human health is at risk all across our country.

Thank you for taking this dangerous water pollution problem seriously and seeking to address it meaninfully.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

N Yvonne Hamilton (Doc. #2536, SBC-047123)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS. My Husband died from Parkinson's and There have been several cases On this Block and I'm not well! Who is responsible?

This is inexcusable!

How many more have to die before it stops!

N Yvonne Hamilton

California

90275

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Crossen (Doc. #2537, SBC-047124)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

We have had a wonderful, clean water source in the Dayton, Ohio area...until we have seen PFAS beginning to show up our test wells. Sources have been identified as fire foam both in use by the the city fire department and those at Wright-Patterson Air Base. Sadly,there are more sources being found. We have a wonderful son, daughter-in-law and precious grandson. We want then to have a safe, water source. PLEASE work in seeing that it a wish come true. Check the water in the areas of your family. You might be surprised by what you find. This isn't just a me problem, it is an US problem.

Thank you from a third generation Irishwoman and life long Democratic supporter.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynne Mehalick (Doc. #2538, SBC-047125)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from pervasive exposure to PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm in humans, and probably all animal life.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year, greatly reducing the burden on the U.S. healthcare system.

PLEASE HELP ELIMINATE THIS VERY SERIOUS THREAT TO HUMAN HEALTH. There are still so many other human health risks to correct, such as pesticide and herbicide contamination in our food supply.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Samantha Herdman (Doc. #2539, SBC-047460)

The goal of the Safe Drinking Water Act of 1974 (SDWA) is to set health standards to protect people from contaminants in drinking water, whether man-made or naturally occurring. Unfortunately, the ability of the Environmental Protection Agency (EPA) to effectively wield the SDWA to respond to public health threats has been under fire (Weinmeyer et al. 2017). Implementing the proposed PFAS National Primary Drinking Water Regulation (NPDWR) is imperative for the safety of citizens across the United States and an excellent opportunity to combat the narrative that the EPA can't adequately protect public health from unsafe drinking water. However, there is more that EPA should do to protect the public from PFAS.

I support EPA's decision to set science-based MCLGs and MCLs for perfluorooctanoic acid (PFOA), perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), GenX chemicals, perfluorononanoic acid (PFNA), and perfluorobutane sulfonic acid (PFBS), and mixtures of these PFAS (EPA 2023). After learning about the negative health effects of PFAS and their ubiquity in manufacturing, I became very concerned about using any products that may result in PFAS contaminated drinking water. I also felt a lot of frustration that protection against PFAS was state-dependent. EPA's decision to monitor these six PFAS is overdue, and I fully support EPA's plan to build upon existing state regulations (EPA 2023).

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Ferm (Doc. #2540, SBC-047126)

Dear Administrator Regan:

Tests have recently shown high levels of PFAs in the HOA well just uphill from us on San Juan Island in Washington State. We are very concerned about this issue and have paid for our own well to be tested, but have yet to receive the results.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nicholas Saltmarsh (Doc. #2541, SBC-046814)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

It is somewhat insulting that these issues aren't taken more seriously. The EPA consistently brags and boasts about climate action but does little to help the everyday American from being exposed to toxic chemicals in their everyday life. The people of our country would recognize the great act of discernment once PFAS are more strictly regulated or banned.

Sincerely,

Nicholas Saltmarsh

Parsonsfield, ME 04047

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

LuAnn Glatzmaier (Doc. #2542, SBC-047127)

Dear Administrator Regan:

When the EPA was just starting as a government agency, my best friend was dating the person who was representing the water department. I was so happy that there was an agency that had been appointed to this most vital dimension of life. I was so proud that in this country that the EPA had emerged. I am still so thankful today that EPA is such an important dimension of our lives, in all aspects of it's protection, and what matters more to us than water, that sustains all life?

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michelle Betz (Doc. #2543, SBC-047579)

I recently finished Erin Brokovich's book, Superman's Not Coming: Our National Water Crisis and What We the People Can Do About It, and am convinced we need stronger regulation around our water quality. Science now confirms the damaging health effects of 'forever chemicals', and the EPA must act to save communities from consuming these damaging toxins. These toxins accumulate over a lifetime and cause irreversible damage- the time to act is now!

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peter Beckman (Doc. #2544, SBC-046425)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is essential!

I've been using a water filter for years which filters most contaminants but fails to properly filter PFAS!

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Cecelia Carreon (Doc. #2545, SBC-047128)

Dear Administrator Regan:

As a young adult, I want to believe I have a future. I want to picture the wonderful prospects I might have in the future. It's not possible, though. Not if there is no clean water available. Not in the sweltering heat. Not when violent storms topple the roof of my house. Not when I won't live to be 40. I urge you to think about addressing climate change in consideration of not just you or your loved ones, but future generations. We, as a species, deserve to flourish in a world that was intricately designed for us. Please consider this message:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Candace Fujikane (Doc. #2546, SBC-047646)

I am an English professor at the University of Hawaii and a water protector.

Over the years I have seen so many threats to our aquifers, through overdevelopment, through the use of pesticides, through the construction of industrial complexes whose wastes leak into our aquifer. We must protect water. It is our most basic necessity. It also costs less to protect water than it will to lose that water to chemical toxins. We can look to places like Calcutta where people wait for hours in line for water, or in other places where people are dying for lack of water. I have heard of mothers giving their babies their saliva to keep them alive. We have the power to do something about the contamination of our waters, and we must do all we can to protect our waters.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sandra Kuritzky (Doc. #2547, SBC-046514)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a first step to protecting our families and communities from harmful PFAS, which are known for their persistence and widespread pollution. They have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ashlea Romano (Doc. #2548, SBC-046202)

Please don't set my children up for failure by contaminating all their drinking water. Protect them!

EPA Response: The EPA acknowledges this comment and believes this PFAS NPDWR will result in increased public health protection from drinking water potentially contaminated with PFAS. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stefan Pacin (Doc. #2550, SBC-046589)

Re: Proposed PFAS National Primary Drinking Water Regulation Rulemaking Docket ID: EPA-HQ-OW-2022-0114

Dear Administrator Regan,

Thank you for taking this historic step to keep our drinking water safe from PFAS contamination. For decades, PFAS chemicals have contaminated both public and private drinking water supplies across the country. PFAS contamination exposes communities to serious health risks, including cancers, impacts to the immune and reproductive systems, and other harms. The EPA's proposed drinking water standards would provide long overdue federal protections against six types of highly toxic PFAS.

I strongly support this proposed rule and urge EPA to move swiftly to finalize health-protective standards to reduce PFAS in drinking water.

The PFAS crisis is widespread, contaminating the blood of humans, fish, and wildlife worldwide.

EPA's proposal would significantly reduce exposure to PFAS in drinking water for millions of people by setting strong, science-based drinking water standards for six types of PFAS. While this proposal is an important first step towards addressing PFAS exposure, it is critical that EPA also expedite efforts to prevent these chemicals from entering our waters and environment in the first place, before it even reaches our taps.

These proposed regulations are long overdue and I fully support this first step of regulating six dangerous PFAS in drinking water. In addition, I encourage the EPA to take a comprehensive approach to regulating the entire class of chemicals in order to reduce overall PFAS exposure, and improve drinking water safety in thousands of communities across the country.

Thank you for your consideration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Charming Evelyn (Doc. #2553, SBC-047585)

Evidence shows that under-served and under-resourced communities are the most likely to suffer from PFAS/PFOA contamination. It's time to reign in polluters and clean up water in these communities. Everyone no matter their economic circumstances, gender, skin color, including ecosystems and the life dependent on them deserve the right to clean, accessible, good quality water. It's time to make polluters pay to clean up their messes and to expedite the process.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Patton (Doc. #2554, SBC-047129)

Dear Administrator Regan:

I am fortunate to drink clean safe water but in the USA not everyone has this basic need met. This is unacceptable. Why do we have to try so hard to look and act like a 3rd world country? Environmental injustice.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal

would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Carl Albers (Doc. #2555, SBC-047302)

I think the proposed regulations are a step in the right direction. In the future I believe the whole class of forever chemicals should be regulated as a group.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Houman Sedaghat (Doc. #2558, SBC-046410)

Dear USA EPA:

I support setting the smallest possible limits for the amount of PFAS chemicals in our drinking water.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2561, SBC-046199)

Please help change the current regulations allowing PFAS in our water system. Thank you!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Grace Kailainathan (Doc. #2562, SBC-046286)

We must put communities ahead of corporations, corporations that pollute must be held to higher standards and fined for causing damage to our environment. Particularly the recent train derailments, the fast fashion industry (clothes made of micro plastics when put in the washing machine pollute the water supply) and coal industry MUST be regulated and adapt sustainable,

environmentally friendly practices. I support the Biden-Harris PFAS regulations. Keep our water clean, healthy, and safe!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joyce Bressler (Doc. #2563, SBC-046285)

I am writing in response to Docket ID EPA-HQ-QW-2022-0114. thank you for taking the time to read my comments. I urge you to follow through with the planned regulations of PFAS chemicals and clean-up in our water. these chemical have proven to be serious and dangerous to public health, producing cancers and other illnesses. Do not succumb to pressure from the industries that produce, manufacture and sell these chemicals in everyday products that end up in our water and inour bodies.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Zachary Bouricius (Doc. #2566, SBC-046655)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

How many Flint, Michigan's do we need before ? Its going to hurt you in the election if more people are POISONED! You were on a knife's edge in Michigan and Wisconsin. cmon'.

Sincerely,

Zach Bouricius

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Andrew Lazur (Doc. #2567, SBC-046656)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Additionally, to help educate consumers whose health is negatively affected by these contaminants, legislation requiring all products sold in the US to include distinct labelling notice of PFAS presence/content, should be established. Consumers, are unaware of the presence and risk associated with PFAS that is found in hundreds of products used daily. Laeblling will facilitate better informed decisions and selection of safer products, thereby in the long term signalling to manufacturers to remove PFAS from their products.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diana Cowans (Doc. #2568, SBC-046657)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

I know of no other species that deliberately poisons itself. Clean water is required for all life on this planet and humans should be the responsible stewards of the environment.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use

and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Thank you for taking action to protect our water.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Linda White (Doc. #2570, SBC-046458)

I am an active-duty Army spouse, mother of three, voter and 20 year plus resident of Hawaii.

My family and I fully support regulating per- and polyfluoroalkyl substances in our drinking water without reservation, regardless of the financial costs of the state and corporations of adhering to such limits. Long overdue and I applaud the EPA for this.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Stephen Levine (Doc. #2573, SBC-046887)

Dear Michael Regan,

PFAS are so pernicious, they even exist in our raindrops.

As a cancer survivor, I feel really scared about the terrible damage these have been shown to do to us humans.

It's crucial we need to consider the life quality our grandchildren will inherit.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Stephen Levine

Overland Park, KS 66213

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Perez (Doc. #2574, SBC-046414)

Dear Administrator Regan:

I urge you to finalize the regulations of these six PFAS chemicals quickly, implement a health-protective rule, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ed Dornheim (Doc. #2575, SBC-046659)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should quickly finalize these Safe Drinking Water Act regulations, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use, and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of the EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail the use of PFAS chemicals. Placing the burden on our communities, drinking water, and health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Michael Moran (Doc. #2576, SBC-046311)

I want to encourage the EPA to adapt as strict of limitations as possible on PFAS in our drinking water. I fear for the millions of American's that are unwittingly exposed to these pervasive, dangerous chemicals and what could be perhaps generational damage to our collective well-being. I can't accept the bargain plastics manufacturers propose - we should accept a certain amount of pollution in order to enjoy the use of plastics in our lives. The profits they earn through the manufacture and sale of plastics sully their voice in this conversation - we won't be able to count on them to pay for the damage caused to communities affected by PFAS. The recent train derailments and chemical spills are clear examples of inadequate regulation. Clean water is a fundamental right and we must do everything in our power to protect this right and to punish those that infringe upon it. Please protect our waters

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Leda Beth Gray (Doc. #2577, SBC-046815)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. I live in Maine and we are finding it in organic farmland and products, in wildlife and in wells and public drinking water. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and we urge you to finalize them as quickly as possible.

I wish PFAS had never been approved for industrial uses-- they are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Leda Beth Gray

Blue Hill, ME 04614

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

SL Triolo (Doc. #2578, SBC-046272)

For too long the desires of corporations and their so-called "rights" to destroy nature and pollute people and animals have been primary. This PFAS regulation and all subsequent EPA evaluations of current practices should put people and the environment over corporate profits. Stop the madness! How can any practice that is a known harm be an "acceptable level of harm"? Come on!

EPA Response: The EPA acknowledges this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document. For further information regarding the SDWA rulemaking process and how the EPA followed all requirements under SDWA, please see section 1.1 of the EPA response in this *Response to Comments* document.

Tristan Sophia (Doc. #2580, SBC-046816)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals.

We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Sincerely,

Tristan Sophia

Butte, MT 59701

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Diana Bain (Doc. #2581, SBC-046817)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

There are currently NO federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Emily Keltonic (Doc. #2582, SBC-046818)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

We need this protection to stop cororations and stock holder interests continuing to harm the future of our planet. As a former, microbiologist and middle school science teacher, I was always concerned about the safety of new chemicals on all life. DDT was a m perfect example!!!

Sincerely,

Emily Keltonic

Norwich, CT 06360

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Mathews (Doc. #2583, SBC-046819)

Dear Michael Regan,

We have to get rid of PFAs as quickly as possible. The harm they do is proven and universal. All of us are affected. We are killing ourselves and nature. I do not want my children and grandchildren to develop any of the health conditions associated with these forever chemicals. Right now, it is impossible to protect them from these toxic substances which are everywhere and don't need to be.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections

against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Judy Harris

Richmond, TX 77469

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Richard Van Aken (Doc. #2585, SBC-046821)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge

you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

The science says these chemicals are deadly and are reluctant to break down causing all kinds of medical problems. The question is why has this been allowed to happen and what is the government going to do about the thousands of these chemicals now in use?

Sincerely,

Richard Van Aken

Southampton, PA 18966

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Thompsen (Doc. #2586, SBC-046510)

Dear Michael Regan,

I am concerned about our drinking water having toxic chemicals (PFAS) in it. It's great that the EPA has proposed some limits on six PFAS that have been a problem for a long time. Too many people don't know of the bad effects these chemicals can have, such as contributing to the development of cancer and other serious illnesses, infertility, and immune system damage.

Thank you for taking this critical step to address the crisis around PFAS and to help communities remove these dangerous chemicals from their drinking water.

Please try to finalize these proposed standards as quickly as possible. And I urge you to oppose industry's efforts to weaken them. Thanks very much!

Sincerely,

Sharon Thompsen

West Chester, PA 19382

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Juli Kring (Doc. #2587, SBC-046822)

Dear Michael Regan,

As a mother and a grandmother, I am very concerned for the health and viability of the planet our children and future generations will inherit. We have a duty to our communities, families and

most importantly, children to ensure their safety and well being through environmentally sound and sustainable policies, including clean air, water, etc. That duty will always be more important than politics or profit.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Juli Kring

Houston, TX 77099

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ken Kurtz (Doc. #2588, SBC-046588)

Dear Michael Regan,

I wanted to discuss a topic that I think is important for all of us: regulating PFAS in drinking water.

PFAS, or "forever chemicals," have been contaminating our drinking water for decades, affecting millions of people and causing cancer, developmental and reproductive harm, and other serious diseases. It's alarming that despite these serious health risks, there are currently no federal limits on PFAS levels in drinking water.

That's why I'm grateful that the EPA has proposed drinking water standards that would provide long overdue protections against six of these toxic chemicals. This is a crucial step in the right direction, and I strongly support these proposed standards.

These chemicals are highly dangerous and can persist in the environment, building up in our blood and organs and causing harm for years to come. They have contaminated the drinking water of approximately 200 million people in the US, including newborn babies who are exposed in utero.

The proposed rule would provide safer drinking water for communities across the country and save thousands of lives by preventing tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges the cumulative impacts on communities exposed to multiple PFAS, and I believe it's time to take action to protect everyone's health.

So, I urge you to support these standards and to resist any efforts to weaken them. We need to take care of ourselves and each other, and regulating PFAS in drinking water is a crucial step in that direction. Thank you for listening, and let's work together to create a safer and healthier future.

Sincerely,

Ken Kurtz

Chandler, AZ 85249

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Martha King (Doc. #2589, SBC-047310)

PFAS have been known to be used since the 1940's. Health issues have resulted. It is now 2023 and it is being proposed that there be a "maximum contaminant level goal for the 6 PFAS" where there is "no known or anticipated negative effect on an individuals health". Knowing what we already know...there should be NO allowance for ANY PFAS in our water system. PFAS have no place in our communities. Placing a "rule on limiting any 'mixture' containing one or more of these chemicals" is only asking for further harm to the health of our citizens. Many, I dare say, most, of our water systems are under staffed and outdated. And even if the "hazard index" indicated a problem and the public was "notified" then the harm has already been done. The MCLG is "health based (what does that mean and who determines this?) and non-enforceable"

which is just another way of allowing another "loop hole" for companies to continue defiling our environment and harming our citizens.

EPA Response: The EPA acknowledges this comment in general support of regulating PFAS in drinking water, but that also cites some concerns with the proposed MCLG and Hazard Index. Please see section 1.3 of the EPA response in this *Response to Comments* document. In accordance with the SDWA, MCLGs are based on findings from the Toxicity Assessments supporting documents (USEPA, 2024a; USEPA, 2024b) and are health-based and do not account for other factors, including feasibility. Once MCLGs are determined, the EPA then determines feasibility (as defined in the SDWA). Feasibility includes an evaluation of the BATs and the costs for applying those BATs when trying to treat to the MCLGs. Unlike MCLGs, MCLs are enforceable. This NPDWR is setting enforceable levels of six PFAS in drinking water. For additional information on the MCLG determinations and health-based approach followed by the MCLs, please see section IV and V of the FRN.

Diane Ryerson (Doc. #2590, SBC-046823)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. I strongly support the proposed standards to regulate six of the most common PFAS contaminants of our waters. Because these long-lasting toxic chemicals accumulate in our bodies and have significant health impacts, I urge EPA to finalize these proposed standards as quickly as possible. Please serve the people by not letting the industry weaken the standards or prolong finalization. Thank you.

Sincerely,

Diane Ryerson

Arcata, CA 95521

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alexa Ross (Doc. #2591, SBC-046501)

It is the duty of EPA to implement drinking water protections against PFAS contamination.

PFAS are ubiquitous in commerce, and accumulate in people, water, wildlife, aquatic life, plants, everywhere. It is outrageous that these toxic "forever chemicals," are allowed to contaminate us with cancer, liver and kidney disease, reproductive and immunity problems, and hormonal disruptions.

It is criminal to allow these poisons to proliferate when they are practically impossible to remove. Strict regulations are overdue to protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Acker (Doc. #2593, SBC-046431)

I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

PLEASE support the badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Juli Kring (Doc. #2594, SBC-046584)

As a mother and a grandmother, I am very concerned for the health and viability of the planet our children and future generations will inherit. We have a duty to our communities, families and most importantly, children to ensure their safety and well being through environmentally sound and sustainable policies, including clean air, water, etc. That duty will always be more important than politics or profit.

So I urge EPA to immediately implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathryn Ryan (Doc. #2595, SBC-046573)

I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities. These rules and regulations will help prevent further damage. We need to plan and figure out how these horrendous chemicals can be removed from our water. Also, those that perpetrated the damage need to clean. It. Up.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kathryn Burns (Doc. #2596, SBC-046561)

I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

We all must drink water. Allowing these chemicals to remain in our supply is inexcusable.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Thank you,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Beverly Richards-Smith (Doc. #2597, SBC-046579)

I am writing to urge EPA to implement protections for drinking water against contamination by per- and polyfluoroalkyl substances (PFAS) as quickly as possible. These ubiquitous chemicals include compounds known or suspected to cause cancer, infertility, birth defects, liver and kidney disease, immune deficiencies, and endocrine disorders in humans, livestock, and wild animals. (Their endocrine disrupting properties may be responsible for the increased incidence of transsexuality in younger human generations.) The carbon-fluorine bonds that are the defining property of these compounds, among the strongest bonds encountered in organic chemicals, make them highly resistant to degradation and thus persistent long-term in the environment -- thus their nickname, "forever chemicals."

National standards for PFAS are sorely needed. Expanding protections to six PFAS, as well as to combinations of PFAS, will help to reduce contamination of our drinking water by this toxic class of chemicals, and thus, our exposure to their health risks.

PFAS' ubiquity is the reason we need to act soon -- and decisively. Finalizing these regulations would protect drinking water for countless communities and would protect not only those of us living today, but future generations.

I urge your support for these badly needed regulations to better protect our rivers, oceans, lakes, wildlife, and human communities from PFAS contamination.

Thank you,

Beverly Ridhards-Smith

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mr.Derlin Clair (Doc. #2598, SBC-046576)

Dear EPA, Hello,I'm Mr.DerIin G.Clair.I am writing today to most Strongly please urge the EPA to Please Truswiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to Truly act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

Therefore,I most Strongly urge your honest to dear God total support for these badly needed regulations toTruly better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Well Thank you,my dear friends,and God bless you.Mr.Derlin G.Clair,131 Beinville Dr.,Sldiell,La.70458;E-Mail:derlinclair@yahoo.com

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Maria Celia Hernandez (Doc. #2599, SBC-046582)

EPA

Sub: Expand Drinking Water Protections Against PFAS Contamination

With due respects,

Today, I am writing today to urge EPA to swiftly implement drinking water protections against PFAS contamination.

We need national standards for PFAS. Expanding protections to six PFAS, as well as the combination of different PFAS, will protect our drinking water from this toxic contamination and keep countless Americans safe from enduring the health risks associated with these dangerous chemicals.

PFAS, which are used to manufacture a range of goods, break down very slowly over long periods of time and instead accumulate in people, wildlife, aquatic life, plants, and the environment. This contamination poses a direct threat to our health and our ecosystems. Also known as "forever chemicals," PFAS are pervasive contaminants that are linked to serious health conditions such as cancer, liver and kidney disease, reproductive issues, immunodeficiencies, and hormonal disruptions.

PFAS' ubiquity is why we need to act fast and decisively. Finalizing these regulations would protect drinking water for countless communities.

I urge your support for these badly needed regulations to better protect people and our rivers, oceans, lakes, and communities from PFAS contamination.

Expand Drinking Water Protections Against PFAS Contamination because Everyone needs to drink clean water; Water is Live.

Thank you,

Ms. Maria Celia Hernandez 4-17-2023

54 Orleans St. Apt. 317

Boston, MA.02128

her84754@verizon.net

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mark Meeks (Doc. #2600, SBC-046660)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. I strongly support stringent efforts to protect our environment from these chemicals. I fear our way of life is taking a quite harmful toll on the earth on which we depend and that will return in many harmful ways to impact our lives. I hope we can be far more diligent in limiting such impacts.

Indeed, the EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bryn Hammarstrom (Doc. #2601, SBC-046661)

Dear Administrator Regan,

As a father and RN, thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. In 1946 my father, a chemist, was working with vinyl chloride, and in 1947 I was born with an undescended testicle [a known result from my father's work with that chemical]. The EPA has a DUTY to protect OUR EARTH from PFAs and ALL harmful chemicals.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan English (Doc. #2602, SBC-046662)

Dear Administrator Regan,

My son lives in Wilmington, NC and we have been buying bottled water for him since he moved there because of concern about PFAS in the water.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Lynne Lambert (Doc. #2603, SBC-046663)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Don't let the companies who make plastic. And those that use it. Win against the public health of our country. They are called forever chemicals for a reason. Let help the next generation

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Ben Burrows (Doc. #2604, SBC-046193)

The PFAS chemicals are not biodegradable and must be eliminated

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nadine Godwin (Doc. #2605, SBC-046511)

Please approve these proposed nationwide standards designed to significantly curtail our exposure to PFAS in our drinking water.

The New York Times, citing a 2020 study, reported that as many as 200 million Americans are exposed to PFAS in their tap water. Many of these people have been exposed to these so-called "forever chemicals" for a long time, making it urgent that these standards be implemented soonest.

I will just add that once we can put a lid on the amount of PFAS in our drinking water, we must also take steps to dramatically reduce the amounts of PFAS produced by industry and ensure that these chemicals are no longer dumped into our waterways as a byproduct of production or under any circumstance.

Thank you for making this proposal.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marilyn Gooch (Doc. #2606, SBC-046467)

PFAS are harmful to human health. Seriously harmful. I believe we have an obligation to one another to do whatever we can to get dangerous pollutants out of our lives.

The current EPA proposal for minimum acceptable levels of PFAS in drinking water is one of those things we can and should do.

In fact, I think it is vital.

Please implement these proposed standards as soon as feasible.

Thank you.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Edward Thornton (Doc. #2607, SBC-046664)

Dear Administrator Regan,

See, what EPA actually is responsible to do is protect all Citizens. EPA can adopt policies that help industry to protect all Citizens. But what it cannot do is help industry but at the expense and harm of the rest of us. Thank you for moving forward on safe drinking water.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Derlin Gerard Clair (Doc. #2608, SBC-046665)

Dear Administrator Regan, Hello,I,m Mr.Derlin G.Clair,a very,veyr concerned American citizen.Thank you kindly for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible,my dear Administrator Regan,including the Hazard Index approach for four PFAS chemicals.Thousands of PFAS chemicals are in use and many are very Unmfortunately found in mixtures in water around ourcountry.Therefore,EPA should Truly address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government Truly need to take equally bold action to stop PFAS pollution,Truly hold polluters accountable,and curtail uses of PFAS chemicals,my dear Adm.Regan.Just Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Margot Backus (Doc. #2609, SBC-046541)

Dear Administrator Regan,

I want to thank you for proposing limits on PFAS chemicals in drinking water that reflect the latest scientific information on the health effects of these chemicals!

The EPA needs to work quickly to finalize these Safe Drinking Water Act regulations. The one thing we know for sure about drinking water around the US is that we don't know how bad the situation is in how many communities. There are thousands of PFAS chemicals in use, and many are found in mixtures in water around the country. The EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is, as I am sure is apparent to everyone who gives thought to this issue, an appalling betrayal of the whole idea of a government that represents the interests of the people, not of corporations.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rose Johnson (Doc. #2610, SBC-046666)

Dear Administrator Regan,

We have seen over and over the evidence that PFAS chemicals are harmful to human health. And it is scary that we may not even know the full impact these chemicals may be having. So, THANK YOU for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

I urge you to finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sarah Abbruzzese (Doc. #2612, SBC-046194)

Please stop this harmful substance from causing any more damage.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Terry Skinner (Doc. #2614, SBC-046824)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water! For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and I urge the EPA to finalize them as quickly as possible.

Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet, incredibly, despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water!

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. Please quickly finalize these standards and implement the rule (and please resist industry's efforts to weaken it). Thank you!

Sincerely,

Terry Skinner

Buena Park, CA 90620

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Marilyn Harris (Doc. #2615, SBC-046487)

Dear Administrator Regan,

Thank you for acting with the EPA to limit PFAS chemicals in drinking water, and thank you for listening to science on this.

Please finalize the Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for PFAS chemicals that are known to cause adverse health effects. Please lead the EPA in addressing the whole class of PFAS chemicals wherever possible.

Our drinking water, and our health (and that of those to come) is in your hands.

Sincerely,

Marilyn Harris

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

John Lent (Doc. #2616, SBC-046668)

Dear Administrator Regan,

As you know, PFAS chemicals are very dangerous for human health and they are everywhere. It is not acceptable that people must continue to be exposed to these dangerous chemicals in their daily lives. Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects. EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Karin Hemmingsen (Doc. #2617, SBC-047600)

I write as a family physician and public health professional who has watched for some decades now as the US government has allowed the greed of corporations to run roughshod over the public health of our citizens. We keep asking when will enough be enough in regard to guns (a very legitimate question), but there does not seem to be a similar urgency to the question when it concerns environmental pollutants that can harm us all and that have been accumulating for decades. The EPA needs to do its job.

I strongly support the proposed drinking water limits EPA has proposed for six PFAS chemicals. Due to the slow pace of regulatory agencies, many Americans have been drinking harmful amounts of PFAS chemicals for decades. These rules will speed the implementation of life-saving water treatment for communities across the U.S. Therefore the Agency must finalize these rules as quickly as possible.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Rachel Neurath (Doc. #2618, SBC-046669)

Dear Administrator Regan,

I am a mother and a scientist. I care deeply about safe water not only for my children but also for future generations. Water is one of our most valuable resources. All life depends on it. The overwhelming evidence to the dangers of PFAS and pervasiveness within our water make it clear that it is time - now - to act.

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Patrick Hughes (Doc. #2619, SBC-046527)

Dear Administrator Regan,

Americans' health begins with our environment. The food we eat, the air we breath, and the water we drink have been damaged by PFAS. First, stop the PFAS production as soon as possible. Then hold any producer that hid the dangerous effects of PFAS accountable. We should test our water regularly for PFAS and redesign any aspect of our production that cannot avoid PFAS. Americans are injecting huge amounts of PFAS, the physical & potential mental damage to our bodies may not be completely known for decades. It's imperative that we take all necessary steps to eliminate PFAS. Cleaning our drinking water is a step but only one step of a long journey. The journey becomes longer every day we allow the PFAS to continue to be produced. Please take all action to save the health and well being of all mankind. The PFAS are 'forever', we are not.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jondi Gumz (Doc. #2620, SBC-047299)

I reported on Santa Cruz County's epic fire, CZU lightning fire in August 2020 that destroyed more than 900 homes, for Scotts Valley Times. Fire retardant containing PFAS was dropped. This is a common practice. Eight of the 10 largest fires in California have taken place in the past 6 years. Dropping fire retardant containing PFAS is the go-to strategy. Huge swaths of the state are affected. https://en.wikipedia.org/wiki/List_of_California_wildfires

EPA Response: This comment is outside the scope of this NPDWR, please see section 15 of the EPA response in this *Response to Comments* document.

John December (Doc. #2622, SBC-046276)

I support the EPA enacting the proposed federal drinking water regulations (EPA-HQ-OW-2022-0114-0027). These are an essential first step in protecting the public from dangerous chemicals.

Support setting the maximum contaminant level in drinking water for the two most common PFAS compounds (PFOA and PFOS) at 4 parts per trillion (ppt) and create a health hazard scoring index to assess the cumulative risk from 4 other chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joan Janus (Doc. #2623, SBC-046266)

I'm urging you to protect public health by not backing down from regulations that will require harmful chemicals be removed from our drinking water. As drinkable water becomes more of a national and world wide issue these regulations are so important. I'm particularily concerned about the impact these chemicals have on infants and young children.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2624, SBC-046413)

After Flint and countless other water catastrophes, please just be on the right side of history here.

Clean water is a human right.

Finalize the drinking water standards.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2625, SBC-046208)

I wholeheartedly support this regulation. Please do the right thing and protect the public health of all Americans.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Aiden Finckbone (Doc. #2626, SBC-046428)

Dear Michael Regan,

I am in constant fear on how these chemicals will effect my life in the future. I'm fifteen years old and am told that forever chemicals are in everything and it's un-avoidable. Please help.

Sincerely,

Aiden Finckbone

Ypsilanti, MI 48198

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Joelle Strom (Doc. #2627, SBC-046309)

I would like to voice my support, as a concerned citizen, of highly strict regulations on PFAS, both at the source of production and in water treatment. There are too many studies demonstrating evidence of direct harm by these chemicals to become lax in the amount we allow the population to be exposed to them. In addition to holding manufacturers accountable for keeping these compounds out of waterways, we should invest in upgrades to water treatment plants where necessary to remove as many PFAS from drinking water as possible, or educate citizens as to how they may protect themselves. I would appreciate as a form of penalty against violators of these regulations, an easily accessible list of ways I can use my consumer power to support companies that are maintaining their duty to protect our water supply by limiting their use of PFAS and/or properly disposing of these chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jerry Tobe (Doc. #2629, SBC-046670)

Dear Administrator Regan,

Thank you for proposing health-protective limits for PFAS chemicals in drinking water that reflect the latest scientific information on their health effects.

EPA should finalize these Safe Drinking Water Act regulations as quickly as possible, including the Hazard Index approach for four PFAS chemicals. Thousands of PFAS chemicals are in use and many are found in mixtures in water around the country. EPA should address the whole class of PFAS chemicals wherever possible.

All parts of EPA and the federal government need to take equally bold action to stop PFAS pollution, hold polluters accountable, and curtail uses of PFAS chemicals. Placing the burden on our communities, our drinking water, and our health is not the right way to solve the PFAS challenge.

May you do ONLY that which is truly best for the environment and the vast majority of people living in America as well as its territories and possessions, and cause those people as little harm as humanly possible.

Thank you for reading my comments and prayer.

Sincerely,

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Baumgartner (Doc. #2630, SBC-046475)

Regarding Docket ID No. EPA-HQ-OW-2022-0114,

I ask the EPA to establish meaningful and actionable maximums for these chemicals in our water supplies.

We must limit their production and their release as a society. For those already loose in the environment, we must do what we can to remove them and/or restrict their affects.

Federal limits will push states to understand the importance of dealing with these chemicals and do so.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Grinker (Doc. #2632, SBC-046513)

We need to protect our water supply. Human life can not be sustained without clean drinking water. This is the challenge of our era, to learn how to live healthfully with the planet and with our scientific knowledge and modern conveniences, without destroying ourselves. I believe that we are smart enough to do this. And I believe we are also smart enough to govern ourselves thoughtfully. A society is judged by how it cares for its most vulnerable citizens. All people need access to clean drinking water.

We need legislation to limit dangerous chemical contaminants (PFAS/PFOS and related) from our water. These chemicals are found throughout our waterways and we must do whatever we can to limit them so that we can continue to live healthful lives.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Eva Kranjc (Doc. #2633, SBC-046566)

Dear Michael Regan,

As a mother, I am extremely concerned about what PFAS means for the current and future health of my child, not to mention the health of my husband and I. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water.

There is no time to lose on these forever chemicals; please take action on this matter as soon as possible.

Sincerely,

Eva Kranjc

Westerly, RI 02891

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Susan Herold (Doc. #2634, SBC-046825)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades,

EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. I strongly support the proposed standards, and urge EPA to finalize them as quickly as possible.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment

under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. I urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Susan Herold

Kansas City, MO 64111

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

David Hempel (Doc. #2635, SBC-046496)

Dear Michael Regan,

Thanks for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

Sincerely,

David Hempel

Iowa City, IA 52245

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

KT Morice (Doc. #2636, SBC-046197)

Please protect the people, animals and invertebrates and pass this water regulation

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Caitlin Lisko (Doc. #2638, SBC-046315)

After years of inaction, the U.S. Environmental Protection Agency (EPA) has finally proposed health standards for 6 of the most widely detected PFAS chemicals in our drinking water. These

chemicals have contaminated the drinking water supply for over 200 million people nationally. They are so prevalent, that they are in the blood of every single American, including newborn babies. PFAS is known to cause increased rates of cancer, developmental and reproductive issues, and other serious diseases. The proposed federal drinking water regulations (EPA-HQ-OW-2022-0114-0027) are an important first step in protecting the public from these dangerous chemicals. EPA set the maximum contaminant level in drinking water for the two most common PFAS compounds (PFOA and PFOS) at 4 parts per trillion (ppt), and created a health hazard scoring index to assess the cumulative risk from 4 other chemicals. We need to take action now! Please take this concern seriously and make a change!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Robert Jones (Doc. #2639, SBC-046826)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. By establishing strong limits on six widely detected PFAS, the proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year. The EPA acknowledges and addresses the cumulative impacts on communities who are exposed to multiple PFAS, and by issuing this proposal, EPA is one step closer to fulfilling its commitment under the 2021 PFAS Strategic Roadmap to begin regulating PFAS in drinking water. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Living in the most corrupt nation in human history, the Divided States of Corporate America, is an early death sentence for all life in it. If I had one wish, it would be to get the fuck as far away

from this piece of shit, shithole nation as quickly as possible. Death to the USA will be welcomed worldwide.

Sincerely,

Robert Jones

Salem, OR 97302

EPA Response: Please see section 1.3 of the EPA response in this *Response to Comments* document. Regarding the comment's statements about the United States, please see section 15 of the *Response to Comments* document for out-of-scope topics.

Mary Hood (Doc. #2640, SBC-046827)

Dear Michael Regan,

Due to a number of health issues, I drink only water--60 oz. per day. Because I'm an ardent environmentalist, I won't buy bottled water, the biggest scam of our lifetime. I drink Delco (Delaware County) water from my tap. Having clean, safe, pure water to drink matters intensely to me personally, and should be an inalienable right for every American.

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible.

PFAS are a large, long-lasting, and highly dangerous class of chemicals. Often called "forever chemicals," PFAS persist in the environment, build up in our blood and organs, and continue to cause harm decades after they are released into the environment. PFAS have contaminated drinking water supplies for approximately 200 million people and the blood of nearly every individual in the United States, including newborn babies who are exposed in utero. Yet despite the serious health risks associated with PFAS, there are currently no federal limits on PFAS levels in drinking water.

EPA's proposed rule would provide safer drinking water for communities from coast to coast. We urge you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Mary Hood

Plain City, OH 43064

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Martha Booz (Doc. #2641, SBC-046828)

Dear Michael Regan,

Thank you for taking the first step to regulate PFAS in drinking water. For decades, PFAS have contaminated drinking water supplies for millions of people across the country, resulting in increased rates of cancer, developmental and reproductive harm, and other serious diseases. EPA's proposed drinking water standards would provide important and long overdue protections against six of these toxic chemicals. We strongly support the proposed standards, and we urge EPA to finalize them as quickly as possible, and to implement a rule that is the most health-protective. And you must resist industry's efforts to weaken them.

Sincerely,

Martha Booz

El Sobrante, CA 94803

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Jane Hendley (Doc. #2642, SBC-046261)

Dear EPA, I am glad that the EPA is at least proposing strict regulations for some PFAS chemicals. They are so dangerous to health and persistent in the environment. But ALL the PFAS chemicals are dangerous and should be regulated also and no more allowed to be developed. Thank you for considering! Sincerely, Jane Hendley

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sandra Portko (Doc. #2643, SBC-046580)

Dear Michael Regan,

Hello, I want to thank all of you for working to protect our environment and urge you to stay strong in your actions. Push back hard against corporations whose greed is influencing many members of Congress to weaken regulatory standards. Enforcing necessary standards would improve the health of our planet and its inhabitants. Please continue to increase the regulatory standards to protect our water, soil, and land. The initial step to improve our water supply is appreciated and more is needed. Michigan is surrounded by 3 of the 4 Great Lakes and it is frightening to know that fish in all those lakes are contaminated with PFAs in addition to all our drinking water. However, realizing that all of our nation's (and other nations' as well) drinking water is filled with those same 'forever chemicals' is terrifying!

There is a large body of evidence that demonstrates the harm these chemicals cause in humans and animals ranging from developmental damage in growing organisms to various cancers in adult organisms. The only way to change this pattern is to implement stringent standards now, so that the level of contamination doesn't get any worse. I beg you to quickly finalize these standards, and to implement a rule that is the most health-protective, resisting industry's efforts to weaken them.

Sincerely,

Sandra Portko, PhD

Developmental Psychologist and Child Developmental Specialist

Sincerely,

Sandra Portko

Grand Rapids, MI 49534

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Helen Fields (Doc. #2645, SBC-046270)

Please ban all PFAS and PFOA chemicals, as Europe has done, and lower the allowable amount to the lowest possible number. We have friends and coworkers who have lost homes, neighborhoods, and family members to this chemical in Bennington, Vermont. We do not need the chemicals; we have the right to "Protect the Common Welfare" of all; that is YOUR JOB. DO IT.

EPA Response: The EPA acknowledges this comment. Please see section 1.3 of the EPA response in this *Response to Comments* document. This comment's discussion about the ban of PFAS and PFOA chemicals and Europe are outside the scope of this rulemaking. Please see section 15 of the EPA response in this *Response to Comments* document for out-of-scope topics.

Joan B Groff (Doc. #2646, SBC-047130)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Petrochemicals must be deterred more...they certainly are creating widespread pollution and breathing problems daily! We are intelligent human beings, able to adapt to using less plastic every day! Government seems to be needed to remind our of that!

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Peter Macfarlane (Doc. #2647, SBC-047131)

Dear Administrator Regan:

Most of us have no access to data on the quality of the water we drink. The EPA's proposed national drinking water regulations for six PFAS chemicals are therefore a welcome first step to protecting us all from these toxins.

PFAS are infamous for their extreme persistence and have been linked to several adverse health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people across the nation for whom it is currently contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations regarding these six PFAS chemicals, and then begin addressing all other types of PFAS.

Thank you for your consideration.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Laura Kelly (Doc. #2648, SBC-046456)

Dear Administrator Regan:

I am glad to hear of the EPA's proposed national drinking water regulations for six PFAS chemicals.

With the PFAS cancer connection growing, it only makes sense to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Barbara Miller (Doc. #2649, SBC-047132)

Dear Administrator Regan,

EPA's proposed national drinking water regulations for six PFAS chemicals are a welcome first step to protecting Americans from the scourge of PFAS. PFAS are infamous for their extreme persistence and widespread pollution. They have been linked to many health issues, including cancer, immune suppression, and developmental harm.

EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Nancy Williamson (Doc. #2650, SBC-047133)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

These PFAS chemicals are probably hurting helpful insects like bees, birds & wild animals more than we will ever know. There is no need for these chemicals. Please enforce using safe alternatives.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bob Edwards (Doc. #2651, SBC-047134)

Dear Administrator Regan:

The proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bryant Wong (Doc. #2659, SBC-047141)

Dear Administrator Regan:

As an environmental engineer, I am writing you to express my support of the EPA's proposed national drinking water regulations for 6 PFAS chemicals.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Alison Boyle (Doc. #2660, SBC-047142)

Dear Administrator Regan:

We are all equally affected by these chemicals. Please do all that you can to outlaw them. I would like to also see filtration systems used universally to remove them.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Pat Egleston (Doc. #2661, SBC-047143)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS and it must be adopted immediately for the health of our country.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I strongly urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Sharon Tkacz (Doc. #2662, SBC-047144)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

The EPA's proposed rule would provide safer drinking water for the millions of people.

I urge you to quickly finalize the regulations of these six PFAS chemicals.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Kara Shaw (Doc. #2664, SBC-047145)

Dear Administrator Regan:

Please help protect our planet and our lives, this has gone too far! Please start with the suggestions below and DONT STOP until we have eliminated all toxic chemicals.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Anonymous (Doc. #2665, SBC-046207)

This is such a great cause. I am glad we are taking steps towards providing clean drinking water for our country.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Bette Korber (Doc. #2666, SBC-047146)

Dear Administrator Regan:

Clean water for drinking and for our environment is a critical resource for our people now and in the future generations. Thank you for advancing these steps to safeguard our drinking water.

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Teena Halbig (Doc. #2667, SBC-047510)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

Renee Ewing (Doc. #2668, SBC-047147)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.

The EPA's proposed rule would provide safer drinking water for the millions of people in communities across the nation where the drinking water is contaminated by PFAS. This proposal would save thousands of lives and prevent tens of thousands of serious PFAS-related illnesses each year.

I urge you to quickly finalize the regulations of these six PFAS chemicals, implement a rule that is health protective, and then begin addressing all other types of PFAS.

This is an extremely important issue to me as PFA's are already being found in our bodies. We are killing ourselves and endangering future generations. Please take action to regulate these dangerous chemicals.

Thank you so much for your consideration in this matter.

EPA Response: The EPA acknowledges and appreciates this comment in general support of the final PFAS NPDWR. Please see section 1.3 of the EPA response in this *Response to Comments* document.

Mary Suagee-Beauduy (Doc. #2669, SBC-047148)

Dear Administrator Regan:

The EPA's proposed national drinking water regulations for six PFAS chemicals is a welcome first step to protecting our families and communities from the scourge of PFAS.

PFAS are infamous for their extreme persistence and widespread pollution and have been linked to a long list of health effects, including cancer, immune suppression, and developmental harm.
