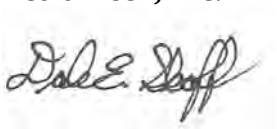
Subject: Application For EPA UIC Class II-D Well (Commercial) Permit
Catalyst Energy, Inc. Lot 580-1 Well
API# 37-083-46237
McKean County, Pennsylvania

Dear Mr. Rectenwald:

Enclosed please find three (3) copies of the Underground Injection Control (UIC) Class II-D Well (Commercial) permit application for the Catalyst Energy, Inc. (Catalyst) Lot 580-1 well located in McKean County, Pennsylvania. The application was prepared by Tetra Tech, Inc. (Tetra Tech) on behalf of Catalyst. As indicated in "Section 6.0 – Financial Assurance", Catalyst will provide under separate cover documentation that Catalyst has the necessary resources to properly plug and abandon the well. An electronic copy of the application has also been submitted to you by email.

Prompt EPA review of the application would be greatly appreciated. If you have any questions or comments, please feel free to contact Paul Rodgers, Catalyst CEO at (412) 325-4350, prr@catalystenergyinc.com or me at (724) 766-5987, dale.skoff@tetratech.com.

Sincerely,
Tetra Tech, Inc.



Dale E. Skoff, P.G.
Sr. Project Manager

INTRODUCTION

This UIC Class IID Permit application was prepared by Tetra Tech, Inc. (Tetra Tech) on behalf of Catalyst Energy, Inc. (Catalyst) for conversion of the Catalyst Lot-580-1 Well (API# 37-083-46237) to a commercial brine disposal well. The Lot 580-1 well is located in Keating Township of McKean County, Pennsylvania. The well was drilled by Belden and Blake Corporation in 1990 to a TD of 5420 ft and completed in the Onondaga Reef Formation through perforations from 5170 to 5188 ft. The Lot 580-1 has very high cumulative production for a conventional well totaling approximately 2.6 billion cubic feet of gas with 6,500 barrels of oil. As a result the well is highly depleted with low reservoir pressure indicating substantial potential for brine disposal. An injection volume of 100,000 barrels per month is proposed. This application has been developed to meet all pertinent requirements of EPA Form 7520-6 and 40 CFR Sections 144 and 146.

1.0 ATTACHMENT A – MAPS AND AREA OF REVIEW (AOR)

1.1 Part 1 – Well Location

The surface location of the proposed injection well, Catalyst Energy Lot 580-1 well, is adequately described by the latitude and longitude coordinates on the attached EPA Form 7520-6. The well is a conventional (vertical) well located near Cyclone in Keating Township of McKean County, Pennsylvania.

1.2 Part II - Area Of Review Size Determination (40 CFR § 146.6)

The Area of Review (AOR) utilized in this application is a ¼ mile fixed radius from the proposed injection well per 40 CFR § 146.6(b).

1.3 Part III. Map(s) (40 CFR §§ 144.31 & 146.24)

The mapping presented in this section is based upon the EPA Region 3 "Clarification of Maps required for Class II Permit Application" developed to address requirements of 40 C.F.R. §§ 144.21(e)(7) & 146.24(2). Oil and gas well locations and other well information referenced in this section were obtained from the Pennsylvania Geologic Survey Exploration and Development Well Information Network (EDWIN). In addition, an historic Pennzoil base map was reviewed for locations of historic oil and gas wells drilled in the area. The Pennzoil base map was utilized as a base layer in Figures 1-1 and 1-2, which show oil and gas well locations based on the EDWIN well information. Water well information was obtained from the Pennsylvania Ground Water Information System (PAGWIS) database and from PADEP staff (for the Pithole Water Association municipal water supply well). Table 1-1 provides available information on producing and plugged wells in the referenced mapped areas. Available completion reports and documentation of plugging and abandonment for wells in the AOR are included in Appendices A and B, respectively.

Figure 1-1 - Topographic map showing the AOR and the following items within the AOR:

- Producing oil or gas wells – As indicated on Table 1-1, there are two wells identified in the EDWIN database as producing oil or gas wells in the AOR:
  - The Catalyst Lot 580-1 well (API# 083-46237), the proposed injection well, was drilled in 1990 to a Total Depth of 5,420 ft and perforated in the Onondaga Reef Formation at a depth of 5170 to 5188 ft.
  - The Catalyst Energy Amoco-Witco #1 (API# 083-30629) is located approximately 1000 ft southeast of the proposed injection well. The well was drilled in 1974 to a depth of 7015 ft, plugged back to 6448 ft and perforated in the Onondaga Reef Formation from 5184 to 5270 ft. The well was the discovery well for the Onondaga Reef play in McKean County. (As discussed in Section 4.0 of this application, this well is proposed for use as a monitoring well.)

- Abandoned oil or gas wells

Wells to injection interval - There was one plugged and abandoned oil and gas well identified in the AOR which penetrated the injection interval: the Enervest Lot 581-1 well (API# 083-40667) which is located approximately 900 ft to the southwest of the proposed injection well. The well, which was a redrill of an older shallow well, was drilled in 1982 to a Total Depth of 5439 ft as a dry hole. According to information obtained by Catalyst the well was plugged and abandoned.. The completion report for the well is included in Appendix A. As discussed in Section 2.2, 3-D seismic data and production information on wells in the reef area indicates that the Onondaga Formation in this well is not hydraulically connected to the main reef structure where the injection will take place. As such it is expected that there would be little to no migration of brine into this off-reef structure area from injection into the Lot 580-1 well located well within the reef structure.

- Shallow oil and gas wells – The EDWIN database included 19 abandoned shallow oil and gas wells in the AOR as shown on Table 1-1. As indicated these wells ranged in depth from 2077 to 2104 ft and were oil wells or enhanced recovery wells in the Bradford Sands. The Certificates of Plugging for these wells are included in Appendix B. In addition there are numerous old oil and gas wells which were plotted on the Pennzoil map (black dots shown on Figure 1-1). In many cases the well numbers are not legible. Research into the EDWIN historical database records for available data on wells which could be identified indicated these wells ranged in depth from 1700 to 2300 ft, which is consistent with the depth of the above-referenced Pennzoil wells. As discussed in Section 2.0 of this application, there is approximately 3000 ft of confining interval between the Bradford Sands (target of the old wells) and the injection interval, the Onondaga Formation; therefore, the shallow oil and gas wells should not be impacted by the brine to be injected at depths greater than 5,000 ft.

- Dry holes – There are no dry holes referenced in the EDWIN database (other than the above-referenced plugged and abandoned Enervest Lot 581-1 well).

- Injection wells – No UIC Class IID injection wells were identified in the AOR. There were some historic injection wells referenced as part of the Bradford Sands enhanced oil recovery.

- Drinking water wells– No drinking water wells identified within the AOR.

- Springs and surface water bodies – No surface water features were identified in the AOR.

- Mines (surface and subsurface), quarries –No mines or quarries were identified within the AOR.

- Residences – The surface owners of properties within 1/4 mile of the injection well are shown on Figure 1-4. Table 1-2 lists the owners and addresses for the subject parcels.

- Schools - No schools were identified in the AOR.

- Hospitals – No hospitals were identified in the AOR.

- Roads – Summit Road transects the AOR in a general northeast-southwest direction. Woodard Road also runs through the AOR located northeast of Summit Road.

- Faults – There were no faults identified in the AOR based on information available to Tetra Tech including the surface geologic map (included in Section 2..0).

Figure 1-2 - Topographic map that extends ¼-mile beyond the facility property boundary (a radius of ½ mile from the proposed injection well was reviewed)

- Producing oil or gas wells – There were four producing oil wells in the reviewed area in addition to the gas wells identified above in the AOR. The oil wells are shown on Figure 1-2 and listed on Table C-1 in Appendix C.

- Abandoned oil or gas wells – In addition to the one plugged and abandoned oil and gas well referenced above (Enervest Lot-580-1 well) to the injection interval and the 19 shallow abandoned Pennzoil wells in the AOR, there were 48 additional plugged oil and gas wells identified in the EDWIN database. The EDWIN database also included 4 abandoned wells on the DEP Abandoned List. The above-referenced wells are shown on Figure 1-2 with a number identifier tied to Table C-1 and well records in Appendix C. A review of available depth information in these records indicates a similar depth as for the shallow wells in the AOR - approximately 2100 ft. As for the AOR there were various old Pennzoil oil and gas wells in the reviewed area with no additional information available. It is assumed that these wells are of similar depth to the other shallow wells in the area for which data were available (i.e., approximately 2100 ft TD and former Bradford Sand wells.)

- Dry holes – There were no dry holes in the reviewed area other than the above-referenced plugged and abandoned Enervest Lot 581-1 well.

- Injection wells – No UIC Class IID injection wells were identified in the reviewed area. There were some historic injection wells referenced as part of the Bradford Sands enhanced oil recovery.

- Drinking water wells– As summarized in Table 1-3 and presented on Figure 1-2, the following drinking water wells were identified in the reviewed area:

    - Residential water well PA ID# 130920 which is located approximately 1800 ft to the northeast of the proposed injection well. This well was drilled to a Total Depth of 172 ft and produces water from the Pennsylvanian Pottsville Formation.

- The Pithole Water Association Municipal Water Supply Well, which is located approximately 2000 ft to the northeast of the proposed injection well, was drilled in August 2014. The well has a Total Depth of 265 ft and has a permitted flow rate of 30 gpm.

- Springs and surface water bodies – There are the upper portions of intermittent streams shown on the USGS topographic map to the west and east of the proposed injection well at distances of approximately 1600 ft in each direction. There is a pond shown in upper portion of the intermittent stream to the west.

- Mines (surface and subsurface), quarries – No mines or quarries were identified in the reviewed area.

- Residences – The surface owners of properties within 1/4 mile of the injection well are shown on Figure 1-4. Table 1-2 lists the owners and addresses for the subject parcels.

- Schools- No schools were identified in the reviewed area.

- Hospitals – No hospitals were identified in the reviewed area.

- Roads – Summit Road transects the reviewed area in a general northeast-southwest direction. Woodard Road also runs through the reviewed area located northeast of Summit Road. Pithole Road is located in the northern portion of the reviewed area.

- Faults – There were no faults identified in the reviewed area based on information reviewed by Tetra Tech including the surface geologic map (included in Section 2.0).

Figure 1-3 - Topographic map extending one mile beyond the facility property boundary (a radius of 1.25 miles from the proposed injection well was reviewed)

- Project injection well(s), well pad(s) and/or project area – The proposed injection well, Catalyst Lot 580-1 well, is shown on the map.

- Applicable AOR – the ¼ mile AOR is shown.

- All outcrops of injection and confining formations – Based on the surface geologic map for the reviewed area, there were no outcrops of the injection or confining formations.

- All surface water intake and discharge structures – No surface water intake or discharge structures were identified in the reviewed area.

- All hazardous waste treatment, storage, or disposal facilities – No such facilities were identified in the reviewed area.

1.4 Part IV. Area of Review Wells and Corrective Action Plans (40 CFR §§ 144.55 & 146.24)

As discussed above, two oil and gas wells (in addition to the proposed injection well) were identified as present within the AOR which had penetrated the Onondaga Formation, the injection interval. The Catalyst Energy Amoco-Witco #1 is located approximately 1000 ft southeast of the proposed injection well, and as indicated on Table 1-1 was drilled to a depth of 7015 ft then plugged back to 6448 ft. The well was the discovery well for the Onondaga Reef play in McKean County. As discussed in Section 4.0, the Amoco-Witco #1 will be a monitoring well for the proposed injection well. The second well in the AOR which penetrated the injection interval is the above-referenced Enervest Lot 581-1 well, which is located approximately 1000 ft southwest of the proposed injection well.

As discussed above, the AOR includes historic oil and gas wells drilled to the shallow Bradford Sands; however, there is approximately 3000 ft of confining interval between the Bradford Sands (typical well depth of 2100 ft) and the injection interval, the Onondaga Formation. Based on this great thicknesses of unimpacted confining interval, no additional remediation of these shallow wells is considered necessary relative to the proposed UIC well permitting project.

Based on the above, no corrective action is deemed necessary for any of the shallow or deep wells in the AOR.

2.0 ATTACHMENT B – GEOLOGICAL AND GEOPHYSICAL INFORMATION

2.1 Part I. Geological Data (40 CFR § 146.24)

2.1.1 USDW Determination

The project site lies within the Deep Valleys Section of the Appalachian Plateaus Physiographic province. As indicated by Figure 2-1, the geologic map for the site area, the Pennsylvanian Pottsville and Mississippian and Devonian Shenango Formation through Oswayo Formation undivided (MDso) are the bedrock units closest to the surface.

The Pennsylvania Geologic Survey "Ground Water Inventory System" (GWIS) database was accessed to determine sources of groundwater in the site area. It is noted that the well reporting requirement, which was established in 1968, is not considered to be a complete record of water wells and other wells which may be present. (Pennsylvania Topographic and Geologic Survey, February 7, 2019). The database contained only one groundwater well within a one-mile radius of the site as follows:

- Residential water well PA ID# 130920 which is located approximately 1800 ft to the northeast of the proposed injection well. This well was drilled to a Total Depth of 172 ft and produces water from the Pennsylvanian Pottsville Formation.

In addition, a local municipal water supply well was identified within a one-mile radius of the site:

- The Pithole Water Association Municipal Water Supply Well, which is located approximately 2000 ft to the northeast of the proposed injection well, was drilled in August 2014. The well has a Total Depth of 265 ft and has a permitted flow rate of 30 gpm. The producing formation was not identified but is interpreted to be the Pennsylvania Pottsville Sandstone or perhaps underlying Shenango Formation.

The location of these wells are shown on Figure 1-2 and data summarized in Table 1-3.

The depth of the deepest well in the vicinity of the Lot 580-1 is 265 ft. To be conservative, 85 ft was added to result in an estimate of the base of the lowestmost USDW of 350 ft.

2.1.2 Structural Geology

Regional Geologic Setting

From a regional perspective, the Lot 580-1 is located in the Appalachian Plateau Geologic Province. As mentioned above, the Pennsylvania Pottsville Formation is shown as being the uppermost bedrock formation in the immediate vicinity of the well. As shown on Figure 2-1, Geologic Map, the well is situated between an anticline to the northwest and a syncline to the southeast. There are no faults indicated on the geologic map suggesting that there are no significant faults extending to the surface.

Figure 2-2 is a structural geologic map on top of the Onondaga Formation for the Lot 580-1 area. As indicated, the Lot 580-1 is positioned on a local structural high. No faults were identified in the mapped area as part of information reviewed by Tetra Tech.

Reef Structure Based on Seismic Profile Data

Attached is a structure map on top of the Onondaga formation based on 3-D seismic profile data. This 3-D image depicts the reef and its boundaries. This is the reef proposed for brine injection via the Lot 580-1 Well (API # 083-46237). A total of two wells were drilled into the productive portion of the reef. The first well, drilled in 1974 was the Amoco Witco #1 well (API #083-30629). Later, during 1982 the Lot 581-ON1 (API #083-40667) was drilled but missed the reef which was present northeast of the well. During 1990, the Lot 580-1 well (proposed injection well) was drilled and was successfully completed.

This 3-D seismic clearly shows that the dry hole, #083-40667, missed the reef and thus is not hydraulically connected to the reef's hydrocarbons. As such it is expected that there would be little to no migration of brine into this off-reef structure area from injection into the Lot 580-1 well located well within the reef structure.

The subject structure contour map was developed by Mr. Jim Morris, who was the Senior Geophysicist for Belden and Blake at the time when the dry hole was drilled. Mr. Morris held several positions as an exploration geophysicist in the northeastern U. S. prior to founding Zero Phase Geophysical Consultant, LLC in 2019. He served as the Director of Geophysics with Range Resources, who pioneered the Marcellus Shale. His publications and presentations primarily focused on seismic structural and/or stratigraphic studies related to northeastern U. S. Mr. Morris performed seismic interpretation, processing and acquisition of over 1,000 miles of 3-D seismic.

When Mr. Morris worked on the subject reef prospects in McKean County he held the position of Chief Geophysicist at Belden and Blake. In addition to the Cyclone Reef prospect, Mr. Morris explored the Oriskany, Trenton, Knox and other Onondaga prospects throughout the Appalachian Basin. Mr. Morris served as a Vice President at Quaker State E&P Company and as District Geophysicist for Pennzoil Exploration and Production Division.

2.1.3 Injection and Confining Interval Characteristics

Injection and Confining Zones

As discussed above, the proposed injection interval for the Lot 580-1 is the Middle Devonian Onondaga Formation. The Onondaga in the Lot 580-1 well is approximately 97 ft thick and occurs at a depth of approximately 5169 to 5266 ft with 18 ft of the upper portion of the formation perforated (5170 to 5188 ft). The gamma ray / borehole compensated sonic log indicates a porosity for the completed interval averaging approximately 15%.

Figure 2-3 is the portion of the log through the Onondaga and adjacent formations. A copy of the entire log is included in Appendix D.

The perforated interval in the Lot 580-1 was acidized with 500 gallons of 15% HCL According to the completion report the well had 0 MCF natural open flow. The after treatment open flow was not gauged; the after treatment rock pressure was 1440 psi. The Lot 580-1 had a very high cumulative production for a conventional well with reported total 2.6 BCF gas with 6500 bbl oil. The reservoir in the well area is highly depleted with recent well head pressures of approximately 90 psi.

Figure 2-4 is a generalized stratigraphic column for the Onondaga and adjacent stratigraphic units in McKean County, PA (Source: Figure 12, Oil and Gas Developments in Pennsylvania in 1975. Commonwealth of Pennsylvania, Department of Environmental Resources, Bureau of Topographic and Geologic Survey, Progress Report 1989, 1976.) As indicated, the Onondaga Formation has four members with the "reef" facies as encountered in the Lot 580-1 developing in the Edgecliff Member.

Figure 2-5 is a generalized stratigraphic column for the area which shows the Onondaga Formation and overlying units. Also shown are the following underlying units identified in the Lot 580-1 and nearby wells: Bois Blanc, Helderberg, Bass Island, Salina, Lockport, Clinton, Tuscarora and Queenston Formations. Injection, oil and gas producing and confining intervals are identified on the stratigraphic column. As indicated on Figure 2-5, there is a thick package of rocks of approximately 3000 feet between the Onondaga Formation and Upper Devonian Bradford Sandstone which include the Marcellus Shale and other Middle and Upper Devonian shales. The Upper Devonian Bradford Sandstone, which occurs at a depth of approximately 2100 to 2300 ft in the site area has produced oil and gas since the 1800s and was subsequently the subject of enhanced recovery efforts. (The locations of identified Bradford Sandstone wells in the Lot 580-1 area are summarized on maps and tables in Section 1.0.) In addition to the thick confining interval between the Onondaga Formation and the Bradford Sandstone, there are Upper Devonian shales between the Bradford and the lowestmost USDW.

In summary, there is a substantial thickness of shale confining intervals between the Onondaga Formation and the lowestmost USDW (estimated at a depth of approximately 350 ft). There are also confining intervals beneath the Onondaga including the Silurian Salina Formation which includes evaporites and dolomite.

Figure 2-6 is a geologic cross-section A-A' which traverses the site area in a general southwest to northeast direction with the line of cross-section shown on Figure 2-7. The cross-section, which is stamped by a Professional Geologist, includes the following:

- Vertical & horizontal scale
- Disposal well & injection formation
- Location of the Salina Group
- Location of Basement rock

- Location of confining layers above and below the injection formation
- Geologic structure

It is noted that the geologic structure depicted on the cross-section is based on publicly available information (e.g., well completion reports and geophysical logs for included wells) and surface geologic information.

2.2 Evaluation of Potential For Induced Seismicity

Faulting is known to occur in the Appalachian Plateau region, particularly associated with anticlinal structures. Many researchers consider the potential for induced seismicity related to injection wells to be greater when injected fluids and pressures interact with faults which extend to Precambrian basement rocks. As discussed in the "Geology of Pennsylvania" (Pennsylvania Geological Survey and Pittsburgh Geological Survey, 1999) in describing the typical faults occurring in the Appalachian Plateau structures, "These faults die out in the overlying Devonian Shales." It is also reported in published literature that in the Appalachian Plateau such faults often "ramp out of" the Salina salt. According to the PA DCNR "Precambrian Basement Map of the Appalachian Basin and Piedmont Province in Pennsylvania" http://www.dcnr.state.pa.us/cs/groups/public/documents/document/dcnr_016250.pdf) the depth to Precambrian basement in the site vicinity is estimated at approximately 3200 meters (or approximately 10,500 feet) below sea level (Figure 2-8). The base of the Onondaga Formation at the Lot 580-1 well is approximately 3,100 ft. below sea level, or approximately 7,400 ft (roughly 1.4 miles) above the estimated top of Precambrian basement.

According to the PADCNR map viewer website http://www.gis.dcnr.state.pa.us/maps/index.html?geology=true, the closest listed earthquake to the Lot 580-1 well occurred in 1995 near Russel, Pennsylvania approximately 25 miles to the northwest with a 2.4 magnitude.

The PASEIS website, which is operated by Penn State, http://paseis.geosc.psu.edu/events.html, was also reviewed for evidence of earthquakes in the site vicinity. The PSU website lists and presents on a map the 25 most recent seismic events within Pennsylvania. As of May 27, 2020, the nearest event was near Liberty approximately 100 miles to the southeast of the Lot 580-1.

The USGS Seismic Hazards Map for Pennsylvania (Figure 2-9) indicates that the Lot 580-1 well is situated in the lowest seismic risk area.

The potential for induced seismicity to be associated with operation of the Lot 580-1 was evaluated with regard to the USEPA Region 3 "Framework for evaluating seismic potential associated with UIC Class II permits". This document states that, " Seismic activity induced by Class II wells is likely to occur only where all of the following conditions are present: (1) there is a fault in a near-failure state of stress; (2) the fluid injected has a path of communication to the fault; and (3) the pressure exerted by the fluid is high enough and lasts long enough to cause movement along the fault line."

The following evaluates conditions pertaining to the Lot 580-1 well and site area, relative to key statements in the USEPA Region 3 document. The key statements are in italics followed by an overview of operational or site conditions.

"Therefore, limiting the rate and volume of the fluids injected limits the potential for seismicity." The proposed injection rate (100,000 barrels/month) is a relatively low rate (e.g., compared to injection wells in Texas, Oklahoma, etc.).

"Because of the likelihood of greater permeability and the reduction in pore pressure, injecting into formations with a significant history of oil and gas production is unlikely to cause seismicity." The Onondaga Reef wells in the proposed injection well area have very high cumulative production:

- Lot 580-1 (drilled and completed in 1990) – 2.6 BCF gas and 6500 bbl oil
- Amoco-Witco #1 (drilled and completed in 1974) - Onondaga Reef discovery well, located approximately 1000 feet to the southeast of the proposed injection well - 2.9 BCF gas and 11,500 bbl oil

Recent wellhead pressure measurements indicate very depleted conditions at these wells with current wellhead pressures only in the 90 psi range, resulting in highly under-pressured conditions further decreasing the risk of induced seismicity.

"Further, history of past, as well as currently active, injection for disposal and enhanced recovery wells (as opposed to production wells) into a formation without induced seismicity is also supporting evidence that seismicity is unlikely, either because no faults are present or because increases in formation pore pressure due to injection have not caused sufficient pressure changes for movement to occur along the fault." There are no other injection wells to the Onondaga Formation in the site area to enable an evaluation relative to the above criteria.

"Finally, to minimize conduits for fluid to potentially contaminate underground sources of drinking water (USDWs), operating conditions in an injection well permit can expressly limit the injection pressure to prevent fracturing (or cracking of the rock) of the injection zone. Limiting injection pressure provides the secondary benefit of preventing fractures that also could act as conduits through which fluid could flow and act upon an existing fault." The proposed MAIP is below the breakdown pressure of the overlying Marcellus Shale confining interval.

In summary, based on the overall low seismic risk in the region of the Commonwealth where the Lot 580-1 is located and the favorable evaluation relative to the EPA Region 3 framework for evaluating seismic potential for UIC Class II well permits, the potential risk of significant induced seismicity resulting from injection operations at the Lot 580-1 is considered extremely low.

2.3 Part II . Proposed Formation Testing Program (40 CFR § 146.22)

No formation testing program is planned for the Lot 580-1 well at this time

3.0 ATTACHMENT C – WELL CONSTRUCTION/CONVERSION INFORMATION

3.1 PART 1 – Well Schematic Diagram (40 CFR § 146.24)

Figures 3-1 and 3-2 are well construction diagrams for the existing and converted well, respectively. The primary difference between the two figures is that the converted well will have tubing and packer installed along with an annular pressure gauge. The completion report for the well is included in Appendix A. The following features are shown on Figure 3-2:

- Underground Source of Drinking Water (USDW) – As discussed in Section 2.0 Attachment B – Geological and Geophysical Information, the base of the USDW is estimated at 350 ft based on the depth of drinking water wells in the area and regional hydrogeologic conditions.
- Confining and Injection Zones - The injection interval, the Onondaga Reef Formation, is overlain by over 2700 ft of confining interval which is predominantly Middle and Upper Devonian shales. The Onondaga Reef Formation is perforated from 5170 to 5188 ft,
- Casing and Cementing Details. The 11 ¾ inch surface casing extends to a depth of 425.9 ft, which is approximately 75 ft below the base of the USDW (a minimum of 50 ft is required by EPA).
- As indicated in the well completion report, there were cement returns to surface during cementing the surface casing. The calculated top of cement for the 4 ½ inch production casing is 3427 ft, which is 1,757 ft above the top of the injection interval (a minimum of 50 ft is required by EPA). The cement top calculation is attached.
- Tubing and Packer – The tubing will be 2 3/8 inch diameter, and the packer will be set at approximately 5150 ft, which is approximately 20 ft above the injection interval.
- Pressure Gauges: As indicated there will be a well head pressure gauge as well as an annular pressure gauge continually monitoring the pressure between the tubing and production casing for any pressure changes indicative of mechanical failure in the tubing/packer or casing.

3.2 PART II - Well Construction or Conversion Procedures (40 CFR §§ 144.52, 146.22, & 146.24)

The primary change related to the conversion of the existing well to an injection well will be the placement of tubing and packer system along with an annular pressure and well head pressure gauge as shown on Figure 3-2. Alarm and shut-down systems for the well related to pressures approaching the Maximum Allowable Injection Pressure (MAIP) (Surface) and annular pressure changes indicative of mechanical integrity failure are discussed in Section 4.0 Attachment D – Injection Operation and Monitoring Program. The Borehole Compensated Sonic Log is included in Appendix D.

4.0 ATTACHMENT D – INJECTION OPERATION AND MONITORING PROGRAM (40 CFR §§ 146.23 & 146.24)

Upon obtaining all necessary permits, Catalyst Energy proposes to operate the UIC Class IID well facility as summarized in this section.

4.1 Facility Layout and Operation

Figure 4-1 is the UIC facility layout schematic which shows the following elements:

- Two independent triplex pumps on 3' x 3' skids
- One filtration system
- A pump house surrounding the filtration system and two triplex pumps
- Three unloading terminals
- 62' x 62' x 2.75' (33") Galvanized Steel Containment with Epoxy Liner (raw capacity with 1" of freeboard equals 1,821 barrels which is more than 110% of the required maximum tank capacity which is equivalent to 550 barrels)
- One 500 Barrel wheelie tank for Raw Water
- One 500 Barrel wheelie tank for Filtered Water
- One 50 Barrel waste tank
- One gunbarrel separator
- 343' of fence line and a gate
- One 10' x 15' office building

Produced water will arrive on location via truck and pumped into a gun barrel tank for any oil/water separation, with water then fed to the raw water tank for additional sediment settling. From the settling tanks the water is pumped thru cannister filters and into a filtered water tank, from which the water is then pumped to the Catalyst UIC well and down hole.

4.2 Injection Fluid

Catalyst proposes to inject flowback and produced water generated from its oil and gas related operations as well as approved oil and gas related wastewaters from other conventional and unconventional oil and gas well operators. Other oil and gas related wastewaters associated with the production of oil and natural gas or natural gas storage operations, which are approved by EPA for injection under a UIC Class II D injection well, may also be injected. According to Title 40 Chapter I Sec. 144.6 (b)(1), such fluids include those "Which are brought to the surface in connection with natural gas storage operations, or conventional oil or natural gas production and may be commingled with waste waters from gas plants which are an integral part of production operations, unless those waters are classified as a hazardous waste at the time of injection."

Catalyst anticipates the Specific Gravity of the injected fluid will be approximately 1.16 based on the high end of Specific Gravity testing results for produced water from its Bradford Sand and Marcellus Shale produced water. Attached are laboratory analytical results for produced water

from Catalyst's Bradford Sand and Marcellus Shale produced water. The samples are considered representative of the types of brine which will be injected into the Lot 580-1.

4.3 Injection Rate

The proposed monthly injection rate for the Lot 580-1 is 100,000 bbls/mo, which is considered an achievable rate based on the well's very high cumulative production and depleted conditions. The average and maximum daily injection rate are anticipated to be 3300 bbls and 4000 bbls/d, respectively.

4.4 Maximum Allowable Injection Pressure

Maximum Allowable Injection Pressure (MAIP)(Surface) calculations based on EPA-approved equations are attached. Since the Onondaga Reef wells in the area were not frac'd (only acidized) Instantaneous Shut-In Pressure (ISIP) or breakdown pressure data for the formation from nearby wells to the injection formation was not available. Therefore as agreed by EPA Region 3 UIC staff, the calculations were based on the calculated frac gradient for the Marcellus Shale, the confining interval situated immediately above the Onondaga. This is consistent with the following federal UIC well regulations stating that the maximum injection pressure must not cause fractures in the confining interval:

'§ 146.23 Operating, monitoring, and reporting requirements.

(a) Operating requirements. Operating requirements shall, at a minimum, specify that:

(1) Injection pressure at the wellhead shall not exceed a maximum which shall be calculated so as to assure that the pressure during injection does not initiate new fractures or propagate existing fractures in the confining zone adjacent to the USDWs. In no case shall injection pressure cause the movement of injection or formation fluids into an underground source of drinking water'

The frac gradient was calculated based on shut-in pressure data for the Catalyst Energy MROC Pad B 4H(A) (API# 37-083-55072) horizontal Marcellus Shale well located approximately 5 miles to the north of the Lot 580-1. The well was originally drilled and completed by Triana in 2008. There are 8 frac stages referenced with shut-in pressure data ranging from 3317 to 4180 psi. Applying the lowest shut-in pressure to the frac gradient calculation, results in a frac gradient of 1.061. Applying the FG of 1.061 into the MAIP calc along with the SG of 1.16 results in a MAIP (surface) of 2889 psi. The Bottom Hole Pressure (BHP) associated with the proposed MAIP (surface) is 5486 psi. The MAIP and BHP calculation is attached. The completion report for the Catalyst MROC Pad B 4(H)A well is included in Appendix A.

4.5 Monitoring of Injection Fluid Samples and Well Integrity Monitoring of Injection Fluid Samples and Well

The following identifies the UIC Class II underground injection well regulatory requirements and operational procedures which will be conducted to meet the subject requirements:

1. **Monitoring of the nature of injected fluids at time intervals sufficiently frequent to yield data representative of their characteristics**. An initial sample of fluid will be collected and analyzed from initial loads proposed for disposal from new formations / areas. In addition, samples will be collected for analysis from new types of sources (e.g., from different geologic formations, geographic regions, etc.) which would be expected to differ significantly from brine previously characterized for disposal at the facility. Samples will be analyzed for the following parameters at a minimum: specific gravity, total dissolved solids and pH. In addition, Catalyst will measure the specific gravity of each truckload of fluid delivered to the facility for injection. The sample for specific gravity measurement will be collected prior to unloading to confirm the specific gravity is consistent with permit conditions and MAIP requirements.

2. **Observation of injection pressure, flow rate, and cumulative volume at least weekly based on the regulatory requirements for produced fluid disposal operations.** Injection pressures, annular pressure, injection rate, and cumulative volume will be continuously monitored and recorded electronically.

3. **A demonstration of mechanical integrity pursuant to 40 CFR Sec. 146.8 during the life of the injection well.** A mechanical integrity test will be performed prior to initiating injection and at least once every five years.

4. **Maintenance of the results of all monitoring until the next permit review.** All monitoring records will be maintained throughout the life of the well.

4.6 Plan for Well Failures

General System Design and Monitoring

The system being utilized for monitoring and control will function with the use of pressure switch gauges with adjustable limit switches in the PLC. The gauges provide a sensing device for changes in pressure conditions, and if the limit switches are reached, they will send responses to activate the PLC controller for injection flow and pressure relief. All monitoring data described below will be stored and transmitted via a SCADA system and will be continuously monitored remotely (24/7/365). In addition to the automated portion of the system, the manual operation of all pumping equipment as well as the continual inspections of the pumping and monitoring equipment provide additional safeguards for appropriate actions necessary in case of well failures.

Injection Pressure Limit Monitoring

The primary safeguard to prevent over pressuring is the automated shutdown on the pumping equipment at which the Maximum Allowable Injection Pressure (MAIP) (Surface) will be set as a limit at which all pumping will cease. Additional switch gauges and the PLC will be utilized by reading the gauges at the wellhead to monitor pressure changes that would be caused by tubing or casing failures and the appropriate valve will be activated to cease injection.

Tubing and Packer Monitoring

With the monitoring switch gauge connected to the tubing, there will be a secondary system to prevent over pressuring of the tubing. When the MAIP is sensed, a response is sent to a PLC which will stop additional injection into the tubing.

Tubing to Casing Annulus Monitoring

This annular space will be monitored for both increase and decreases in pressure. The switch gauge will have both a low and high shutdown tab limit. When either of the limits is reached, the sensor will send a response to the PLC for shutting down flow. The lower limit will be used to monitor damage to the casing which allows fluid to leave the casing, and the high limit will sense a pressure increase in the annular space that may be caused by communication with the tubing or flow into the annular space. Both of these limits when reached will send responses shutting down the injection cycle.

Under the monitoring provided above, well failures will either be identified by the automated equipment and switch gauges or by visual inspection during injection operations or at other times. Should any failure occur, all injections will cease and EPA will be verbally notified within 24 hours and notified in writing within 7 days. Analysis of the failure will take place and the necessary repairs to be implemented along with any equipment replacement will be coordinated with the EPA.

4.7 Monitoring Wells

The well head pressure and fluid levels in the Catalyst Energy Amoco-Witco #1 will be measured and recorded semi-annually, at a minimum. The well is located approximately 700 ft southeast of the proposed injection well. Figure 4-2 is the well construction diagram for the Catalyst Energy Amoco-Witco #1. As indicated the well is perforated in the Onondaga Reef Formation from 5184 to 5270 ft. The Gamma Ray – Compensated Neutron Density Log for the well is included as Figure 4-3. The monitoring well location is shown on Figure 1-2 and the well completion report is included in Appendix A.

4.8 Reporting Requirements

An annual report will be submitted to EPA summarizing the results of the required monitoring, including monthly records of injected fluids, and any major changes in characteristics or sources of injected fluid.

4.9 Proposed Annulus Fluid

The proposed annulus fluid for the injection well will consist of fresh water mixed with Multi-Chem's MC MX 6-2960 Corrosion Inhibitor at 2% by volume of the annular capacity. The corrosion inhibitor will be mixed in accordance with the manufacturer's recommendations then loaded into the well annulus prior to conducting injection operations. Product information for the above-referenced corrosion inhibitor is attached. A similar type product may be used instead of the example product referenced.

Exhibit 4-A

Maximum Allowable Injection Pressure (MAIP) Calc

Maximum Injection Pressure (MIP) Calculation
Catalyst Energy Lot 580-1 (McKean County, PA)
Onondaga Reef

1) Frac Gradient (FG)
Based on FG for Marcellus Shale (confining unit) - Catalyst MROC Pad B Well 4HA (API# 37-083-55072)
FG = [ISIP + (0.433 X SG X D)] /D
Where:
ISIP = 3317 psi - From lowest of shut-in pressure from 8 stage Marcellus frac*
SG = 1.0 (frac fluid)
D = 5281 ft - Top of Marcellus referenced in the well Completion Report

ISIP (psi)	Hydrostatic Factor (psi/ft)	SG	D (ft)	Fracture Gradient (psi/ft)
3317	0.433	1	5281	1.061

*Based on shut-in pressures for 8 stages per the Catalyst MROC Pad B Well 4HA completion report.

2) Maximum Injection Pressure (MIP) Calculation

MIP = [FG - (0.433XSG)] X D
FG = 1.061 (Frac Gradient for Marcellus Shale confining interval - calculated above)
SG = 1.16 (brine) - Est. for brine for injection (high end of estimated range)
D= 5170 ft top of Onondaga Reef perf interval

	Hydrostatic Factor (psi/ft)	SG	D (ft)	Fracture Gradient (psi/ft)	**MIP (Surface)**
-	0.433	1.16	5170	1.061	**2889**

Bottom Hole Pressure

Hydrostatic Factor (psi/ft)	SG	D (ft)	Hydrostatic Pressure	MIP (Surface)	
0.433	1.16	5170	2597	2889	**5486**

Emergency Telephone Number: 1-866-519-4752 or 1-760-476-3962
Global Incident Response Access Code: 334305
Contract Number: 14012

2. Hazards Identification

2.1 Classification in accordance with paragraph (d) of §1910.1200

Skin Corrosion / Irritation	Category 1 - H314
Serious Eye Damage/Irritation	Category 1 - H318
Skin Sensitization	Category 1 - H317
Reproductive Toxicity	Category 1B - H360
Specific Target Organ Toxicity - (Repeated Exposure)	Category 1 - H372
Acute Aquatic Toxicity	Category 1 - H400
Chronic Aquatic Toxicity	Category 2 - H411

Flammable liquids.	Category 4 - H227

2.2. Label Elements

Hazard Pictograms

Signal Word: Danger

Hazard Statements

H227 - Combustible liquid
H314 - Causes severe skin burns and eye damage
H317 - May cause an allergic skin reaction
H318 - Causes serious eye damage
H360 - May damage fertility or the unborn child
H372 - Causes damage to organs through prolonged or repeated exposure
H400 - Very toxic to aquatic life
H411 - Toxic to aquatic life with long lasting effects

Precautionary Statements

Prevention

P201 - Obtain special instructions before use
P202 - Do not handle until all safety precautions have been read and understood
P210 - Keep away from heat/sparks/open flames/hot surfaces. - No smoking
P260 - Do not breathe dust/fume/gas/mist/vapors/spray
P264 - Wash face, hands and any exposed skin thoroughly after handling
P270 - Do not eat, drink or smoke when using this product
P272 - Contaminated work clothing should not be allowed out of the workplace
P273 - Avoid release to the environment
P280 - Wear protective gloves/protective clothing/eye protection/face protection

Response

P301 + P330 + P331 - IF SWALLOWED: rinse mouth. Do NOT induce vomiting
P302 + P352 - IF ON SKIN: Wash with plenty of soap and water
P303 + P361 + P353 - IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water/shower
P363 - Wash contaminated clothing before reuse
P304 + P340 - IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
P310 - Immediately call a POISON CENTER or doctor/physician
P305 + P351 + P338 - IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
P370 + P378 - In case of fire: Use CO2, dry chemical, or foam
P391 - Collect spillage

Storage

P403 + P235 - Store in a well-ventilated place. Keep cool
P405 - Store locked up

Disposal

P501 - Dispose of contents/container in accordance with local/regional/national/international regulations

2.3 Hazards not otherwise classified

None known

3. Composition/information on Ingredients

The specific chemical identity of the composition has been withheld as proprietary. The exact percentage (concentration) of the composition has been withheld as proprietary.

4. First Aid Measures

4.1. Description of first aid measures

Inhalation If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Eyes In case of contact, immediately flush eyes with plenty of water for at least 30 minutes. Remove contact lenses after the first 5 minutes and continue washing. Seek immediate medical attention/advice. Suitable emergency eye wash facility should be immediately available

Skin In case of contact, immediately flush skin with plenty of soap and water for at least 30 minutes and remove contaminated clothing, shoes and leather goods immediately. Get medical attention immediately.

Ingestion Following ingestion, onset of symptoms may be delayed by 12 to 24 hours. Admission to hospital should be the first priority even if symptoms are absent.

4.2 Most important symptoms/effects, acute and delayed

Causes severe skin irritation with tissue destruction. Causes severe eye irritation which may damage tissue. May cause allergic skin reaction. Potential reproductive hazard. May cause birth defects. May cause damage to organs through prolonged or repeated exposure.

4.3. Indication of any immediate medical attention and special treatment needed

Notes to Physician Gastric lavage or emesis should be performed as soon as possible to minimize absorption, and is recommended within 4 hours of ingestion. Ethanol may be given intravenously to prevent build-up of toxic effects of methanol metabolites. Visual disturbances and metabolic acidosis may occur and dialysis, preferably hemodialysis may be employed to treat these complications.

5. Fire-fighting measures

5.1. Extinguishing media

Suitable Extinguishing Media

Water fog, carbon dioxide, foam, dry chemical.

Extinguishing media which must not be used for safety reasons

Do NOT spray pool fires directly with water. A solid stream of water directed into hot burning liquid can cause splattering.

5.2 Specific hazards arising from the substance or mixture

Special exposure hazards in a fire

Decomposition in fire may produce harmful gases.

5.3 Special protective equipment and precautions for fire-fighters

Special protective equipment for firefighters

Full protective clothing and approved self-contained breathing apparatus required for fire fighting personnel.

6. Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

Ensure adequate ventilation. Use appropriate protective equipment. Do not breathe dust/fume/gas/mist/vapors/spray. Remove sources of ignition. Take precautionary measures against static discharges All equipment used when handling the product must be grounded Avoid contact with skin, eyes and clothing.
See Section 8 for additional information

6.2. Environmental precautions

Prevent from entering sewers, waterways, or low areas.

6.3. Methods and material for containment and cleaning up

Dike far ahead of liquid spill for later disposal. Soak up with inert absorbent material. Pick up and transfer to properly labeled containers. Remove ignition sources and work with non-sparking tools.

7. Handling and storage

7.1. Precautions for safe handling

Handling Precautions

Do not breathe dust/fume/gas/mist/vapors/spray. Ensure adequate ventilation. Use appropriate protective equipment. Remove sources of ignition. Ground and bond containers when transferring from one container to another. Avoid contact with eyes, skin, or clothing.

Hygiene Measures

Handle in accordance with good industrial hygiene and safety practice.

7.2. Conditions for safe storage, including any incompatibilities

Storage Information

Store in a cool well ventilated area. Keep from heat, sparks, and open flames.

8. Exposure Controls/Personal Protection

8.1 Occupational Exposure Limits

Substances	CAS Number	OSHA PEL-TWA	ACGIH TLV-TWA
Ethylene glycol	107-21-1	Not applicable	Not applicable
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Not applicable	Not applicable
Pyridinium Salt	Proprietary	Not applicable	Not applicable
Ammonium bisulfite	10192-30-0	Not applicable	Not applicable
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	Not applicable	Not applicable
Complex Phosphate Ester Compounds	Proprietary	Not applicable	Not applicable
Complex Amine Compound	Proprietary	Not applicable	Not applicable
Isopropanol	67-63-0	TWA: 400 ppm TWA: 980 mg/m^3	TWA: 200 ppm STEL: 400 ppm
2-Mercaptoethanol	60-24-2	Not applicable	Not applicable
Methanol	67-56-1	TWA: 200 ppm TWA: 260 mg/m^3	TWA: 200 ppm STEL: 250 ppm
Diethylenetriamine	111-40-0	Not applicable	TWA: 1 ppm
Triethylenetetraamine	112-24-3	Not applicable	Not applicable

8.2 Appropriate engineering controls

Engineering Controls Ensure adequate ventilation, especially in confined areas

8.3 Individual protection measures, such as personal protective equipment

Personal Protective Equipment If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the

specific application of this product.

Respiratory Protection	If engineering controls and work practices cannot keep exposure below occupational exposure limits or if exposure is unknown, wear a NIOSH certified, European Standard EN 149, AS/NZS 1715:2009, or equivalent respirator when using this product. Selection of and instruction on using all personal protective equipment, including respirators, should be performed by an Industrial Hygienist or other qualified professional.
Hand Protection	Use gloves which are suitable for the chemicals present in this product as well as other environmental factors in the workplace.
Skin Protection	Wear impervious protective clothing, including boots, gloves, lab coat, apron, rain jacket, pants or coverall, as appropriate, to prevent skin contact.
Eye Protection	Safety glasses with side-shields. If splashes are likely to occur, wear: Goggles, Face-shield.
Other Precautions	Eyewash fountains and safety showers must be easily accessible.

9. Physical and Chemical Properties

9.1. Information on basic physical and chemical properties

Physical State:	Liquid	**Color**	Clear to Slightly Hazy , Light Amber to Dark Amber
Odor:	Pungent	**Odor Threshold:**	No information available

Property Remarks/ - Method	Values
pH:	5.0-7.0 (10% in 1:1 IPA:H2O)
Freezing Point / Range	-12.2 °C / 10 °F
Melting Point / Range	No data available
Boiling Point / Range	No data available
Flash Point	69.4 °C / 156.9 °F (SFCC)
Flammability (solid, gas)	No data available
Upper flammability limit	No data available
Lower flammability limit	No data available
Evaporation rate	
Vapor Pressure	No data available
Vapor Density	No data available
Specific Gravity	1.0236-1.0486 (20 °C/68 °F)
Water Solubility	No data available
Solubility in other solvents	No data available
Partition coefficient: n-octanol/water	No data available
Autoignition Temperature	No data available
Decomposition Temperature	No data available
Viscosity	No data available
Explosive Properties	No information available
Oxidizing Properties	No information available

9.2. Other information

VOC Content (%)	No data available
Liquid Density	8.53 - 8.74 lbs/gal

10. Stability and Reactivity

10.1. Reactivity

Not expected to be reactive.

10.2. Chemical stability
Stable

10.3. Possibility of hazardous reactions
Will Not Occur

10.4. Conditions to avoid
Keep away from heat, sparks and flame.

10.5. Incompatible materials
Strong oxidizers.

10.6. Hazardous decomposition products
Carbon oxides. Oxides of nitrogen.

11. Toxicological Information

11.1 Information on likely routes of exposure
Principle Route of Exposure Inhalation. Ingestion. Eye contact. Skin contact.

11.2 Symptoms related to the physical, chemical and toxicological characteristics
Acute Toxicity

Inhalation May cause central nervous system depression including headache, dizziness, drowsiness, incoordination, slowed reaction time, slurred speech, giddiness and unconsciousness.

Eye Contact Causes serious eye damage.

Skin Contact Causes severe burns. May cause an allergic skin reaction.

Ingestion Ingestion of this product may cause blindness due to the presence of methanol. Causes burns of the mouth, throat and stomach.

Chronic Effects/Carcinogenicity May cause birth defects. Contains known or suspected reproductive toxins. Causes damage to organs through prolonged or repeated exposure.

11.3 Toxicity data

Toxicology data for the components

Substances	CAS Number	LD50 Oral	LD50 Dermal	LC50 Inhalation
Ethylene glycol	107-21-1	4000 mg/kg (Rat) 7712 mg/kg (Rat) > 10000 mg/kg (Rat) 1670 mg/kg (Cat) 1400 – 1600 mg/kg (Human)	9530 µL/kg (Rabbit) > 3500 mg/kg (Mouse)	> 2.5 mg/L (Rat) 6h (saturated concentration)
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	304.5 mg/kg (Rat)	930 mg/kg (rat)	No data available
Pyridinium Salt	Proprietary	1377 mg/kg bw (rat) (similar substance)	1000 mg/kg-bw (rabbit) (similar substance)	2.67 mg/L (rat, 4h, vapor) (similar substance)
Ammonium bisulfite	10192-30-0	11200 mg/kg 2610 mg/kg (Rat) (similar substance)	> 2000 mg/kg (Rat) (similar substance)	> 5.5 mg/L (Rat) 4h (similar substance)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No data available	No data available	No data available
Complex Phosphate Ester Compounds	Proprietary	> 2000 mg/kg < 5000 mg/kg (Rat) (similar substance)	No data available	No data available
Complex Amine Compound	Proprietary	1990 mg/kg (Rat) (similar substance)	> 5000 mg/kg (Rabbit) (similar substance)	> Saturated Vapors (Rat) 8h (similar substace)
Isopropanol	67-63-0	5840 mg/kg-bw (rat)	12870 mg/kg-bw (rabbit)	72.6 mg/L (Rat, 4h, vapor)

2-Mercaptoethanol	60-24-2	98 - 336 mg/kg (Rat)	112-251 mg/kg (Rabbit)	2 mg/L (Rat) 4h
Methanol	67-56-1	300 mg/kg-bw (human) < 790 to 13,000 mg/kg (rat)	1000 mg/kg-bw (human) 17,100 mg/kg (rabbit)	10 mg/L (human, 4h, vapor)
Diethylenetriamine	111-40-0	1553 mg/kg (Rat)	678 mg/kg (Rabbit)	0.07 mg/L (Rat, 4h, aerosol)
Triethylenetetraamine	112-24-3	2500 mg/kg (Rat)	550 mg/kg (Rabbit)	> Saturated concentration (Rat, 4h, vapour)

Substances	CAS Number	Skin corrosion/irritation
Ethylene glycol	107-21-1	Non-irritating to the skin (Rabbit)
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Causes burns (Rabbit)
Pyridinium Salt		Skin, rabbit: Causes moderate skin irritation. (similar substances) Irritating to skin.
Ammonium bisulfite	10192-30-0	Not irritating to skin in rabbits.
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	May cause moderate skin irritation.
Complex Phosphate Ester Compounds		Causes severe skin irritation with tissue destruction.
Complex Amine Compound		Not irritating to skin in rabbits.
Isopropanol	67-63-0	Non-irritating to the skin (Rabbit)
2-Mercaptoethanol	60-24-2	Skin, rabbit: Causes moderate skin irritation.
Methanol	67-56-1	Non-irritating to the skin (Rabbit)
Diethylenetriamine	111-40-0	Corrosive to skin (Rabbit)
Triethylenetetraamine	112-24-3	Causes severe skin irritation with tissue destruction. (Rabbit)

Substances	CAS Number	Serious eye damage/irritation
Ethylene glycol	107-21-1	Non-irritating to the eye (Rabbit)
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Causes eye burns (Rabbit)
Pyridinium Salt		Causes severe eye irritation (similar substances) Causes moderate eye irritation Eye, rabbit:
Ammonium bisulfite	10192-30-0	Eye, rabbit: Causes mild eye irritation. (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	May cause moderate eye irritation.
Complex Phosphate Ester Compounds		Causes severe eye irritation (Rabbit) (similar substances)
Complex Amine Compound		Eye, rabbit: Causes moderate eye irritation
Isopropanol	67-63-0	Causes moderate eye irritation (Rabbit)
2-Mercaptoethanol	60-24-2	Eye, rabbit: Causes severe eye irritation. Will damage tissue.
Methanol	67-56-1	Non-irritating to the eye (Rabbit)
Diethylenetriamine	111-40-0	Corrosive to eyes (Rabbit)
Triethylenetetraamine	112-24-3	Causes severe eye irritation which may damage tissue. (Rabbit)

Substances	CAS Number	Skin Sensitization
Ethylene glycol	107-21-1	Did not cause sensitization on laboratory animals (guinea pig) Patch test on human volunteers did not demonstrate sensitization properties
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Did not cause sensitization on laboratory animals (guinea pig)
Pyridinium Salt		May cause sensitization by skin contact (mouse) (similar substances)
Ammonium bisulfite	10192-30-0	Did not cause sensitization on laboratory animals (mouse) (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		Did not cause sensitization on laboratory animals (guinea pig) (similar substances)
Complex Amine Compound		Did not cause sensitization on laboratory animals (guinea pig) (similar substances)
Isopropanol	67-63-0	Did not cause sensitization on laboratory animals (guinea pig)
2-Mercaptoethanol	60-24-2	Skin sensitizer in guinea pig.
Methanol	67-56-1	Did not cause sensitization on laboratory animals (guinea pig)
Diethylenetriamine	111-40-0	Skin sensitizer in guinea pig.
Triethylenetetraamine	112-24-3	Skin sensitizer in guinea pig.

Substances	CAS Number	Respiratory Sensitization

Ethylene glycol	107-21-1	No information available
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	No information available
Pyridinium Salt		No information available
Ammonium bisulfite	10192-30-0	No information available
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		No information available
Complex Amine Compound		No information available
Isopropanol	67-63-0	No information available
2-Mercaptoethanol	60-24-2	No information available
Methanol	67-56-1	No information available
Diethylenetriamine	111-40-0	No data of sufficient quality are available.
Triethylenetetraamine	112-24-3	No information available

Substances	CAS Number	Mutagenic Effects
Ethylene glycol	107-21-1	In vitro tests did not show mutagenic effects. In vivo tests did not show mutagenic effects.
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Did not show mutagenic effects in animal experiments
Pyridinium Salt		While some in vitro tests were positive and/or equivocal, in vivo results were negative. (similar substances)
Ammonium bisulfite	10192-30-0	Did not show mutagenic effects in animal experiments (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		In vitro tests did not show mutagenic effects (similar substances)
Complex Amine Compound		In vitro tests did not show mutagenic effects In vivo tests did not show mutagenic effects. (similar substances)
Isopropanol	67-63-0	In vitro tests did not show mutagenic effects. In vivo tests did not show mutagenic effects.
2-Mercaptoethanol	60-24-2	The weight of evidence from available in vitro and in vivo studies indicates that this substance is not expected to be mutagenic.
Methanol	67-56-1	The weight of evidence from available in vitro and in vivo studies indicates that this substance is not expected to be mutagenic.
Diethylenetriamine	111-40-0	In vitro tests did not show mutagenic effects In vivo tests did not show mutagenic effects.
Triethylenetetraamine	112-24-3	While some in vitro tests were positive and/or equivocal, in vivo results were negative.

Substances	CAS Number	Carcinogenic Effects
Ethylene glycol	107-21-1	Did not show carcinogenic effects in animal experiments
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Did not show carcinogenic effects in animal experiments
Pyridinium Salt		No information available
Ammonium bisulfite	10192-30-0	Did not show carcinogenic or teratogenic effects in animal experiments (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		Did not show carcinogenic effects in animal experiments (similar substances)
Complex Amine Compound		No information available
Isopropanol	67-63-0	Did not show carcinogenic effects in animal experiments
2-Mercaptoethanol	60-24-2	No information available
Methanol	67-56-1	No data of sufficient quality are available.
Diethylenetriamine	111-40-0	Did not show carcinogenic effects in animal experiments
Triethylenetetraamine	112-24-3	Did not show carcinogenic effects in animal experiments

Substances	CAS Number	Reproductive toxicity
Ethylene glycol	107-21-1	Fetotoxic and teratogenic effects observed in experimental animals at concentrations that did not produce maternal toxicity.
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Not a confirmed teratogen or embryotoxin.
Pyridinium Salt		Animal testing did not show any effects on fertility. Did not show teratogenic effects in animal

		experiments. (similar substances)
Ammonium bisulfite	10192-30-0	Animal testing did not show any effects on fertility. (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		Not a confirmed teratogen or embryotoxin. (similar substances)
Complex Amine Compound		Animal testing did not show any effects on fertility. Did not show teratogenic effects in animal experiments. (similar substances)
Isopropanol	67-63-0	Animal testing did not show any effects on fertility.
2-Mercaptoethanol	60-24-2	Animal testing did not show any effects on fertility. Did not show teratogenic effects in animal experiments.
Methanol	67-56-1	Experiments have shown reproductive toxicity effects on laboratory animals
Diethylenetriamine	111-40-0	Did not show teratogenic effects in animal experiments.
Triethylenetetraamine	112-24-3	Animal testing did not show any effects on fertility. Did not show teratogenic effects in animal experiments.

Substances	CAS Number	STOT - single exposure
Ethylene glycol	107-21-1	No significant toxicity observed in animal studies at concentration requiring classification.
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Causes moderate respiratory irritation.
Pyridinium Salt		No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
Ammonium bisulfite	10192-30-0	No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	May cause respiratory irritation.
Complex Phosphate Ester Compounds		May cause respiratory irritation. (similar substances)
Complex Amine Compound		No information available
Isopropanol	67-63-0	May cause headache, dizziness, and other central nervous system effects.
2-Mercaptoethanol	60-24-2	May cause respiratory irritation.
Methanol	67-56-1	May cause disorder and damage to the Central Nervous System (CNS)
Diethylenetriamine	111-40-0	May cause respiratory irritation. May cause disorder and damage to the (Liver) Kidney Respiratory system.
Triethylenetetraamine	112-24-3	May cause respiratory irritation.

Substances	CAS Number	STOT - repeated exposure
Ethylene glycol	107-21-1	Causes damage to organs through prolonged or repeated exposure: Kidney
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	None under normal use conditions
Pyridinium Salt		No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
Ammonium bisulfite	10192-30-0	No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds		No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
Complex Amine Compound		No significant toxicity observed in animal studies at concentration requiring classification.
Isopropanol	67-63-0	No significant toxicity observed in animal studies at concentration requiring classification. (similar substances)
2-Mercaptoethanol	60-24-2	Causes damage to organs through prolonged or repeated exposure: (Liver) Heart
Methanol	67-56-1	No data of sufficient quality are available.
Diethylenetriamine	111-40-0	No significant toxicity observed in animal studies at concentration requiring classification.
Triethylenetetraamine	112-24-3	No significant toxicity observed in animal studies at concentration requiring classification.

Substances	CAS Number	Aspiration hazard
Ethylene glycol	107-21-1	Not applicable
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	No information available
Pyridinium Salt		Not applicable
Ammonium bisulfite	10192-30-0	Not applicable

Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	Not applicable
Complex Phosphate Ester Compounds		Not applicable
Complex Amine Compound		Not applicable
Isopropanol	67-63-0	Not applicable
2-Mercaptoethanol	60-24-2	Not applicable
Methanol	67-56-1	Not applicable
Diethylenetriamine	111-40-0	No information available
Triethylenetetraamine	112-24-3	Not applicable

12. Ecological Information

12.1. Toxicity

Ecotoxicity effects

Very toxic to aquatic life. Toxic to aquatic life with long lasting effects.

Substance Ecotoxicity Data

Substances	CAS Number	Toxicity to Algae	Toxicity to Fish	Toxicity to Microorganisms	Toxicity to Invertebrates
Ethylene glycol	107-21-1	EC50 6500 - 13000 mg/L (Pseudokirchneriella subcapitata) TGK (8d) > 10000 mg/L (Scenedesmus quadricauda) EC50 (72h) 6500 mg/L (Selenastrum capricornatum)	LC50 41000 mg/L (Oncorhynchus mykiss) LC50 (96h) 72860 mg/L (Pimephales promelas) LC50 (96h) 8050 mg/L (Selenastrum capricornatum) NOEC (7d) 15380 mg/L (mortality) (Pimephales promelas)	TTC (16h) > 10000 mg/L (Pseudomonas putida) EC20 (30 m) > 1995 mg/L (activated sludge, domestic) (similar substance)	EC50 46300 mg/L (Daphnia magna) EC50 (48 h) 7170 mg/L (Daphnia magna) NOEC (7d) 8590 mg/L (reproduction) (Ceriodaphnia dubia)

12.2. Persistence and degradability

Substances	CAS Number	Persistence and Degradability
Ethylene glycol	107-21-1	Readily biodegradable (100% @ 10d)
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	Biodegradable.
Pyridinium Salt	Proprietary	Not readily biodegradable. (56.6% @ 28d)
Ammonium bisulfite	10192-30-0	The methods for determining biodegradability are not applicable to inorganic substances.
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	Readily biodegradable
Complex Phosphate Ester Compounds	Proprietary	Not readily biodegradable (58.7%% @ 28d) (similar substances)
Complex Amine Compound	Proprietary	Readily biodegradable (96% @ 18d)
Isopropanol	67-63-0	Readily biodegradable (53% @ 5d)
2-Mercaptoethanol	60-24-2	Product is not biodegradable (15-21% @ 28d)
Methanol	67-56-1	Readily biodegradable (95-97% @ 20d)
Diethylenetriamine	111-40-0	Readily biodegradable (> 96% @ 10d)
Triethylenetetraamine	112-24-3	(0% @ 28d)

12.3. Bioaccumulative potential

Substances	CAS Number	Log Pow
Ethylene glycol	107-21-1	-1.36
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	No information available
Pyridinium Salt	Proprietary	2.1 - 2.52 (similar substance)
Ammonium bisulfite	10192-30-0	No information available
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds	Proprietary	4.48
Complex Amine Compound	Proprietary	-1.16 (similar substance)
Isopropanol	67-63-0	0.05
2-Mercaptoethanol	60-24-2	-0.056
Methanol	67-56-1	-0.77 BCF = 1.0 – 4.5 (Cyprinus carpio)

		BCF < 10 (Leuciscus idus melanotus)
Diethylenetriamine	111-40-0	-1.58
Triethylenetetraamine	112-24-3	-1.4

12.4. Mobility in soil

Substances	CAS Number	Mobility
Ethylene glycol	107-21-1	No information available
n-Benzyl dimethyl cocoamine, C12-C18 quaternary salt	61789-71-7	No information available
Pyridinium Salt	Proprietary	No information available
Ammonium bisulfite	10192-30-0	No information available
Fatty acids, tall-oil, reaction products with diethylenetriamine, acetates	68153-60-6	No information available
Complex Phosphate Ester Compounds	Proprietary	No information available
Complex Amine Compound	Proprietary	KOC = 0.17
Isopropanol	67-63-0	No information available
2-Mercaptoethanol	60-24-2	KOC = 1.325
Methanol	67-56-1	No information available
Diethylenetriamine	111-40-0	KOC = 2582 - 36,658
Triethylenetetraamine	112-24-3	No information available

12.5 Other adverse effects

No information available

13. Disposal Considerations

13.1. Waste treatment methods

Disposal methods Disposal should be made in accordance with federal, state, and local regulations.
Contaminated Packaging Dispose of container according to national or local regulations.

14. Transport Information

US DOT

UN Number UN1760
UN proper shipping name: Corrosive Liquid, N.O.S. (Contains Quaternary ammonium compound, Complex Phosphate Ester Compounds)
Transport Hazard Class(es): 8
Packing Group: III
Environmental Hazards: Marine Pollutant
NAERG: NAERG 154

Canadian TDG

UN Number UN1760
UN proper shipping name: Corrosive Liquid, N.O.S. (Contains Quaternary ammonium compound, Complex Phosphate Ester Compounds)
Transport Hazard Class(es): 8
Packing Group: III
Environmental Hazards: Marine Pollutant

IMDG/IMO

UN Number UN1760
UN proper shipping name: Corrosive Liquid, N.O.S. (Contains Quaternary ammonium compound, Complex Phosphate Ester Compounds)
Transport Hazard Class(es): 8
Packing Group: III
Environmental Hazards: Marine Pollutant
EMS: EmS F-A, S-B

IATA/ICAO

UN Number UN1760
UN proper shipping name: Corrosive Liquid, N.O.S. (Contains Quaternary ammonium compound, Complex Phosphate Ester Compounds)
Transport Hazard Class(es): 8
Packing Group: III
Environmental Hazards: Marine Pollutant

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable
Special Precautions for User None

15. Regulatory Information

US Regulations

US TSCA Inventory All components listed on inventory or are exempt.

TSCA Significant New Use Rules - S5A2

Substances	CAS Number	TSCA Significant New Use Rules - S5A2

Additional information
For additional information on the use of this product, contact your local Halliburton representative.

For questions about the Safety Data Sheet for this or other Halliburton products, contact Chemical Stewardship at 1-580-251-4335.

Key or legend to abbreviations and acronyms used in the safety data sheet
bw – body weight
CAS – Chemical Abstracts Service
d - day
EC50 – Effective Concentration 50%
ErC50 – Effective Concentration growth rate 50%
h - hour
LC50 – Lethal Concentration 50%
LD50 – Lethal Dose 50%
LL50 – Lethal Loading 50%
mg/kg – milligram/kilogram
mg/L – milligram/liter
mg/m^3 - milligram/cubic meter
mm - millimeter
mmHg - millimeter mercury
NIOSH – National Institute for Occupational Safety and Health
NTP – National Toxicology Program
OEL – Occupational Exposure Limit
PEL – Permissible Exposure Limit
ppm – parts per million
STEL – Short Term Exposure Limit
TWA – Time-Weighted Average
UN – United Nations
w/w - weight/weight

5.0 PLUGGING AND ABANDONMENT PLAN

At the point when the Lot 580-1 Well is no longer used, the well will be abandoned in accordance with EPA and PADEP regulations. With regard to PADEP regulations, this currently includes providing a "Notice of Intent to Plug a Well" no less than 3 days and no more than 30 days prior to abandoning the well, to allow a PADEP inspector to be present during the plugging procedure. The PADEP may waive the notification period. The notification will include well location plat, and available well logs, production logs, injection logs, construction details, and proposed abandonment method. After receiving approval from PADEP to proceed, the well will be abandoned and the abandonment procedures will be documented on a "Certificate of Plugging".

The USEPA will be notified of the plugging activity at least 45 days prior to commencing activities. This notification will include USEPA Form No. 7520-19 which is attached.

The well will be completed as detailed in the DEP Chapter 78 78a.91 b), plugging a well in a non-coal area when the surface and production casing is cemented. This well will be plugged using the tubing balanced plug placement method. All plugs will be set through tubing at the desired locations with a gel spacer between each plug. The cement to be used will be class A common cement mixed to 15.6 #/gal with a yield of 1.18 cubic feet per sack. An excess of 10% will be pumped for each plug.

The cement top in the annulus between the 4.5 inch pipe and the 7.875 hole was calculated to be 3,402 feet. The depth of the top of cement may be field adjusted as field data is gathered at the time of plugging. The 4.5" casing will be cut at a depth of 3,000 feet which is 496 feet below the 8.625 casing seat. The following plugs will be placed to cover all required intervals:

- 450 foot cement plug (37 sacks) to cover the injection interval (5,170 – 5,188 feet) from a depth of 5,420 to 4,970 feet. To be tagged.
- 2,466 foot Gel spacer (38 Bbl) from a depth of 4970 to 2504 feet.
- 1,489 foot cement plug (487 sacks) to cover the 4.5 inch stub at 3,000 feet, 8.625 inch casing seat, and shallow oil / gas production zones (3,000 – 1,511 feet).
- 986 foot Gel spacer (63 Bbl) from a depth of 1,511 to 525 feet.
- 200 foot cement plug (67 sacks) to cover the 11.75 inch casing seat. Depth of 525 to 325 feet.
- 225 foot Gel spacer (14 Bbl) from a depth of 325 to 100 feet.
- 100 foot cement plug (14 sacks) from 100 feet to surface.

Any remaining equipment will be removed and the location will be restored and seeded.

The information on Form 7520-19 may be modified prior to plugging in order to meet the requirements at the time of the plugging activity. Based on the attached service company estimates, the total contractor estimate to plug and abandon the well according to the above procedures is $40,100.

[ ] Class V	Date Work Ended	

Provide a narrative description of the work planned to be performed, or that was performed. Use additional pages as necessary. See instructions.

This well will be plugged using the tubing balanced plug placement method. All plugs will be set through tubing at the desired locations with a gel spacer between each plug. The cement to be used will be class A common cement mixed to 15.6 #/gal with a yield of 1.18 cubic feet per sack. An excess of 10% will be pumped for each plug.

The cement top in the annulus between the 4.5 inch pipe and the 7.875 hole was calculated to be 3,402 feet. The depth of the top of cement may be field adjusted as field data is gathered at the time of plugging. The 4.5" casing will be cut at a depth of 3,000 feet which is 496 feet below the 8.625 casing seat. The following plugs will be placed to cover all required intervals.

- 450 foot cement plug (37 sacks) to cover the injection interval (5,170 – 5,188 feet) from a depth of 5,420 to 4,970 feet. To be tagged.
- 2,466 foot Gel spacer (38 Bbl) from a depth of 4970 to 2504 feet.
- 1,489 foot cement plug (487 sacks) to cover the 4.5 inch stub at 3,000 feet, 8.625 inch casing seat, and shallow oil / gas production zones (3,000 – 1,511 feet).
- 986 foot Gel spacer (63 Bbl) from a depth of 1,511 to 525 feet.
- 200 foot cement plug (67 sacks) to cover the 11.75 inch casing seat. Depth of 525 to 325 feet.
- 225 foot Gel spacer (14 Bbl) from a depth of 325 to 100 feet.
- 100 foot cement plug (14 sacks) from 100 feet to surface.

Any remaining equipment will be removed and the location will be restored and seeded.

Certification

I certify under the penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment. (Ref. 40 CFR § 144.32)

6.0 ATTACHMENT F - FINANCIAL ASSURANCE (40 CFR § 144.52)

Catalyst will provide a Letter of Credit to meet financial assurance requirements for properly plugging and abandoning the well per the cost estimate provided in Section 5.0 Attachment E – Plugging and Abandonment Plan. This documentation will be provided under a separate cover at a later date.

7.0 ATTACHMENT G - SITE SECURITY AND MANIFEST REQUIREMENTS (COMMERCIAL WELLS ONLY)

7.1 Site Security

The Catalyst UIC Well facility will be surrounded by an 6 foot high chain link fence with a locking gate as depicted in the facility layout drawing in Section 4.0 Injection Operation and Monitoring Program. In addition security cameras will monitor the facility. Catalyst staff will be onsite during operational hours anticipated to be 7AM to 5 PM Monday through Friday.

7.2 Manifest Requirements

Catalyst will maintain a record of every load of fluid received. The record will include the following:

- Hauler's name
- Producing well operator's name
- Location from which the load was obtained
- Volume of the load
- Whether the load was delivered as a split load
- If the load was a split load, each operator's name and location will be listed and the volumes from each operator documented.
- Specific gravity of the load

8.0 ATTACHMENT I - EXISTING EPA PERMITS (40 CFR § 144.31)

Catalyst is not applying for any other federal permits or construction approvals related to the Lot 580-1 UIC Class IID well and facility. Catalyst is applying for a state UIC permit for the Lot 580-1 well under the Pennsylvania Department of Environmental Protection (PADEP) UIC well program.

9.0 ATTACHMENT J – DESCRIPTION OF BUSINESS (40 CFR § 144.31)

Catalyst Energy, Inc. (Catalyst) plans to construct and operate a commercial UIC Class IID facility in McKean County, Pennsylvania to dispose of wastewater associated with the production of oil and gas. Wastewater from conventional and unconventional wells from Catalyst operations and Third Party's operations will be accepted at this facility. Catalyst produces hydrocarbons from conventional Upper Devonian wells and unconventional wells within the Commonwealth of Pennsylvania in McKean and other various counties in Pennsylvania. It is anticipated that the disposed wastewater will be primarily produced water associated with the extraction of oil and gas conventional and unconventional wells. It is expected that the wastewater will be trucked to this facility by third party trucking companies.

WELL RECORD AND COMPLETION REPORT

1. In accordance with 25 Pa. Code 78.122(a), a Well Record must be submitted to the Department within 30 calendar days of cessation of drilling or altering a well.
2. In accordance with 25 Pa. Code 78.122(b), a Completion Report must be submitted within 30 calendar days after completion of the well. In addition, the information on land application of tophole water and disposal of residual waste (including contaminated drill cuttings) in a pit is to be filed with the Completion Report (see ER-OG-75).

I do hereby certify to the best of my knowledge, information and belief that the well identified on this Well Record has been properly cased and cemented in accordance with the requirements of 25 Pa. Code Chapter 78 and any conditions contained in the permit for this well. In addition, I do hereby certify that any casing which is attached to a blow-out preventer with a pressure rating greater than 3,000 psi has passed a pressure test in accordance with 25 Pa. Code §78.84(f). I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

DTT 6.8 FEET SGTE 31.9 FEET
SLTL 16.2 FEET

PARAMETERS

PARAMETER	VALUE	UNIT
SMB - Sonic Memory Board	DISA	
TOCA - TO Correction Status	DISA	
RATE - Firing Rate	15	HZ
DG - Downhole Gain	/5	
DETE - Detection	E2	
AMPL - Sonic Amplitude	2	
CBL - Cement Bond Log Amplitude	UT	
WFM - Waveform Mode	1	
SS - Sweep Speed	FAST	
TOD - TO Delay	DISA	
RPSE - Receiver Pair Select	LONG	
DTF - Delta-T Fluid	189.000	US/F
DTM - Delta-T Matrix	56.0000	US/F
CDTS - Correction for Delta-T Shale, Empirical	100.000	
SPFS - Sonic Porosity Formula Select	R-H	
PP - Playback Processing	NORM	
DO - Depth Offset for Logical Unit LI1	0.0	F
WMUD - Weight of Mud	8.34000	LB/G
DWCO - Digitizer Word Count	512	
DSIN - Digitizer Sample Interval	5	US
DDEL - Digitizing Delay	200	US
SPSO - Sonic Porosity Source Option	DT	
ITTS - Integrated Transit Time Source	DTL	
TDL - Total Depth - Logger	5419.00	F
STEM - Surface Temperature	50.0000	DEGF
MRT - Maximum Recorded Temperature	105.000	DEGF
BSAL - Borehole Salinity	-50000.0	PPM
DFD - Drilling Fluid Density	8.34000	LB/G
RMFS - Resistivity of Mud Filtrate Sample	1.01000	OHMM
RMS - Resistivity of Mud Sample	1.35000	OHMM
MST - Mud Sample Temperature	55.0000	DEGF
MFST - Mud Filtrate Sample Temperature	55.0000	DEGF
BS - Bit Size	7.87500	IN
RW - Resistivity of Water	.0350000	OHMM
BHS - BoreHole Status (Open or Cased)	OPEN
