

TRIBAL CWA 106 REPORTING REQUIREMENTS

RTOC

OCTOBER 22, 2025

PRESENTATION OVERVIEW

1. CWA 106 Reporting Requirements
2. Water Quality Monitoring
 - QAPP Requirements and Methods
 - Data Reporting and Retrieval
3. Assessment Reporting and Results
 - Region 9 Template
 - ATTAINS Project
4. Tools and Guidance

CWA SECTION 106 REPORTING REQUIREMENTS

1. Monitoring Strategy/QAPP
2. Water quality data submitted into EPA's Water Quality Exchange (WQX)
3. Water Quality Assessment Report (WQAR)

Quality Assurance Project Plan

- All EPA-funded grant projects which include the collection of environmental data **MUST** have an EPA-approved Quality Assurance Project Plan (QAPP) **BEFORE** any monitoring can begin.
- QAPP usually includes monitoring strategy (i.e. rationale for monitoring)
- **Note:** EPA recently updated its QA requirements so updating a previously approved QAPP will involve more edits than usual
 - https://www.epa.gov/system/files/documents/2024-04/quality_assurance_project_plan_standard.pdf
 - <https://www.epa.gov/quality/quality-assurance-project-planning-epas-pacific-southwest-region-9>

QAPP Approval Process

- Orange: Tribe
- Red: Project Officer
- Green: QA Office

Clean Water Act Section 106 Tribal Guidance

Water Quality Exchange (WQX)

2023 CWA 106 Tribal
Guidance:

Water quality data
submitted into EPA's
Water Quality Exchange
(WQX)

- Implementation of grant award term and condition began in FY24-25 grants
- Note: Exceptions allowed with approved waiver from PO

Water Quality Exchange (cont.)

Three Categories of Data

- **Projects** (*Why data were collected*)
 - Brief summary of monitoring plan
- **Monitoring Locations** (*Where data were collected*)
 - Describe where monitoring takes place
- **Results** (*When, How and What were collected*)
 - Measurements of what were monitored

Confirm Sample Collection Method
Please confirm the SCM you are entering here is also in WQX.

If this cell is highlighted (based on your Activity Type) then it must be populated in order to submit to WQX.

Import Completed (with errors)

Step 1 of 3 completed.

The dataset has been imported, but there are errors that need to be resolved (step 2), and then the dataset needs to be submitted to CDX (step 3). If you submit to CDX before resolving all errors, then only the valid records will be included.

A dataset only becomes permanent after it has been submitted to CDX.

Import Event

Start Time: 05-01-2025 02:31:54 PM

End Time: 05-01-2025 02:32:03 PM

File Name: Copy of Physical Chemical Template KP.xlsx

Event Log: [View all validation errors and warnings](#)

Message Type	Total	Resolved	Event Log	Resolution
Required Value Missing	3	0	View Log	Resolve Online
Value or Format Invalid	3	0	View Log	Resolve Online
Domain Value Invalid	12	0	View Log	Resolve Online
Message	7	7	View Log	N/A

Dataset is ready to be submitted to CDX

Step 1 of 2 completed.

The dataset has been imported (step 1). Now the dataset needs to be submitted to CDX (step 2).

A dataset only becomes permanent after it has been submitted to CDX.

Submission to CDX Successful!

The final step in this process has completed and the WQX database has been updated. It may take up to four days for this data to be published and become available from the Water Quality Portal.

Custom Import Configurations

Translations

- Helps WQX read your data if you use different characteristic/parameter names

Configurations

- Can help WQX interpret wide/tidy data formats into the required “tall format”

Translations

Return Save Cancel Add New Enable Expert Mode

	Priority	When Column P ...	Then	Characteristic Name	
 	1	Equals	Water Temperature	Use these values	Temperature, water

Shows the Translations that have been created for the results found in Column P
Converts 'Water Temperature' to 'Temperature, water'

We can add additional translations for this field as well...

When Column P :

Then:

Characteristic Name

These are ROUGH
guidelines. Monitoring and
data management can be
very case specific!

Deciding water quality data management

MANAGING TRIBAL WATER QUALITY MONITORING DATA WITH WQX

Dakota Perez

Pinoleville Pomo Nation Water Resource Specialist

Region 9 RTOC - Central CA Representative

BACKGROUND

My passion for water quality stems from my Tribal roots in Klamath, CA. Water quality degradation has impacted my way of life and the lives of many Tribal citizens around the world, as well as the livelihood of the general population. Today I work as a Water Quality Specialist for the Pinoleville Pomo Nation in Ukiah, CA. I bring my passion to my everyday work, investing much time and effort to monitor and protect the water quality and water resources of the Tribe.

- Yurok Tribal Member, Pomo Descendant
- 4.5 years experience in Water Quality Monitoring
- Protector of waterways and salmonids

WQX OVER THE YEARS...

ASSESSING THE DATA

Review the data prior to uploading to WQX

Assess trends/spikes in monitoring data

Look for potential inaccuracies in collected field data, you want to be uploading accurate data.

WQX is a good way to store and fill in gaps in water quality data

STRATEGIES FOR GROWTH

Navigating the future

CAPACITY BUILDING

- Attend WQX Data Management trainings offered by EPA
- Work with WQX Help Desk to create custom data import templates that are best tailored to your program and data management
- Reach out to other folks working with WQX, ask questions
- Collaborate with neighboring Tribes on coordinating trainings/workshops to build capacity
- Attempt uploads, it will go to a 'stage' before being uploaded.
- Read WQX error messages, it will offer solutions for corrections

A series of light blue dashed lines on a white background, curving and flowing from the top left towards the bottom left, resembling a stylized topographic map or a representation of water flow.

THANK YOU

Dakota Perez

Which datapoints need further review?

Date	pH (standard units)	Field comment
June 1	6.9	Cloudy
June 14	7.1	
June 23	6.8	Sunny but cool
July 8	5.2	
July 15	7.1	Windy
July 20	7.1	
July 29	7.0	Overcast
August 2	6.9	
August 8	6.8	No pH 7 calibration solution
August 16	7.1	
August 23	8.2	Drizzling
August 31	7.2	

Dissolved Oxygen Assessment

- Salmon and trout spawning water criteria
 - 7-day average of the daily mean dissolved oxygen: 11 mg/L
 - Minimum: 9.5 mg/L

pH Criteria

- A measure of acidity and alkalinity of the water
- Criteria require keeping pH within a specific range
 - To protect human health, the pH must be within the range of 5 to 9
 - To protect aquatic life, the pH must be within the range of 6.5 to 9.0 for freshwater and 6.5 to 8.5 for saltwater

Making Designated Use Impairment Decisions: Hypothetical Example and Exercise

- Assess water quality at a hypothetical site: Salamander Creek
- Identify the designated uses
- Identify the water quality criteria parameters needed to evaluate each designated use
- Apply the criteria to the water quality data to make a use impairment decision
- Integrate the impairment information into an assessment
- Discuss next steps based on assessment findings

Salamander Creek: Numeric Criteria

Salamander Creek is designated for four uses that have the following numeric criteria:

Parameter	Unit	Type	Statistic	Exceedance	Aquatic Life Other Than Fish	Irrigation Water Supply	Public Drinking Water Source	Warmwater Habitat
Conductivity	uS/cm	Max	Instantaneous	10%	750	2,500	1,000	1,500
Dissolved oxygen	mg/L	Min	Instantaneous	None	5.0	--	--	5.0
Nitrate	mg/L	Max	Average*	None	1.5	100	10*	1.0
pH	SU	Range	Instantaneous	None	6.5<pH<9	--	--	6.5<pH<9
Total phosphorus	mg/L	Max	Average	None	0.1	--	--	0.3

** The nitrate criterion is instantaneous for the public drinking water source.*

Salamander Creek: Aquatic Life Other Than Fish

Ten samples were collected and evaluated

Aquatic life other than fish
has five numeric criteria

Parameter	Unit	Type	Stat.	Exceeded	Criterion
Cond.	uS/cm	Max	Inst.	10%	750
DO	mg/L	Min	Inst.	None	5.0
Nitrate	mg/L	Max	Avg	None	1.5
pH	SU	Range	Inst.	None	6.5 – 9.0
TP	mg/L	Max	Avg.	None	0.1

Date	Cond. (uS/cm)	DO (mg/L)	Nitrate (mg/L)	pH (SU)	TP (mg/L)
May 23	600	10	0.8	7.1	0.08
Jun 9	800	9	0.9	7.0	0.09
Jun 24	1,000	10	1.2	7.0	0.14
Jul 1	600	10	1.6	6.9	0.15
Jul 15	575	9	1.8	6.8	0.19
Jul 29	550	7	1.3	6.7	0.23
Aug 6	450	6	1.7	6.8	0.29
Aug 15	750	6	1.9	6.7	0.32
Aug 23	1,600	7	1.3	6.8	0.35
Sep 3	950	6	0.9	6.9	0.30
Average	788	8	1.3	6.9	0.21

Water Quality Parameter Fact Sheets

FACTSHEET ON WATER QUALITY PARAMETERS

Temperature

Water temperature expresses how warm or cold the water is. It is defined as the amount of average kinetic energy in water molecules and is measured in degrees Fahrenheit (°F) or Celsius (°C).

Why do we measure temperature?

Water temperature influences the majority of physical, biological, chemical, and ecosystem processes in aquatic environments. Altered stream temperature is a significant cause of water quality impairment in the U.S. and influences other water quality parameters. Measuring temperature helps to understand the magnitude and variability of temperature fluctuations and anticipate the consequences for water quality and ecosystem health (Figure 1).

Figure 1. Measuring temperature in the field. Credit: Photo courtesy of USGS.

Table 1. Potential effects of short- and long-term increases in temperature on aquatic life.

Short-term summer heat stress	Long-term temperature increases
- Reduced or blocked sexual maturation - Inhibited or blocked critical stages of larval development - Reduced feeding and reduced growth of juveniles and adults - Increased susceptibility to predation - Reduced productivity of macroalgae and seagrasses - Increased death, organisms forced to leave, and increased incidence of disease or parasitism	- Loss of aquatic species whose survival and breeding are temperature dependent - Change in the abundance and spatial distribution of aquatic species and reduced populations of some species - Increase in rates of evaporation from surface water, causing increased salinity and waterbody shrinkage, resulting in a loss of habitat

For factsheets on other water quality parameters, visit epa.gov/awma/factsheets-water-quality-parameters.

FACTSHEET ON WATER QUALITY PARAMETERS

pH

pH is the concentration of hydrogen ions (H⁺) in a sample. pH is measured to determine the acidity of the water.

Why do we measure pH?

pH is an important indicator of chemical, physical, and biological changes in a waterbody and plays a critical role in chemical processes in natural waters. pH values are on a scale from 0 to 14, with 7.0 considered neutral. Figure 1 shows typical pH values of common liquids. Solutions with a pH below 7.0 are considered acidic, and those with a pH above 7.0 are considered basic. The pH scale is logarithmic, meaning that every one-unit change in pH represents a ten-fold change in acidity. In other words, pH 6.0 is ten times more acidic than pH 7.0; pH 5.0 is one hundred times more acidic than pH 7.0.

Figure 1. Typical pH values of common liquids. Adapted from Water on the Web (2002).

pH is a key factor in water chemistry and toxicity. A change in pH can alter the concentrations and forms of toxic chemicals in water. Metals such as aluminum, lead, mercury, copper, and arsenic are generally more soluble at a lower pH. Therefore, higher concentrations can be absorbed into the tissues of organisms, rendering these metals more toxic to aquatic life. In more basic waters (pH > 8.5), the conversion of the nontoxic form of ammonia to the toxic form is increased.

pH also plays a key role in aquatic health by affecting biochemical processes and the metabolism of aquatic organisms. Generally, if water is too acidic or too basic, damage can occur to an organism's gills, exoskeleton, fins, and other critical components. Of particular concern are pH-sensitive macroinvertebrates (small organisms without a backbone), fish eggs (most fish eggs cannot hatch at a pH less than 5), and juvenile fish.

Organisms vary in the pH ranges they can tolerate. Figure 2 illustrates the pH values at which key organisms may experience die-off or avoidance. Furthermore, even though an organism itself may tolerate a more extreme pH, its food source may not.

Figure 2. Critical pH values below which key aquatic organisms may be lost. Source: USGS (2002).

FACTSHEET ON WATER QUALITY PARAMETERS

Macroinvertebrates

Macroinvertebrates are small organisms without a backbone that are visible to the naked eye and large enough to be easily collected. Analyzing the macroinvertebrates in a waterbody can help recognize signs of ecosystem health.

Why do we measure macroinvertebrate communities?

Insects are the most common macroinvertebrates in aquatic systems, living in water as nymphs or larvae at least until they reach their adult stages. Common insects in aquatic systems include dragonflies, caddisflies, stoneflies, beetles, midges, and mayflies. Others, such as aquatic worms, leeches, and small crustaceans (crayfish and fairy shrimp), live entirely in water. Most species live in the bottom sediments of the waterbody or attached to rocks, vegetation, logs, and sticks. Lifespans range from a few weeks to several years. Macroinvertebrates are most frequently used for biological monitoring, or "biomonitoring," because of their prevalence in aquatic habitats and their differing sensitivities to chemical pollution and physical disturbances. Biomonitoring is the use of organisms to assess the overall quality of their environment or habitat. Because they generally have limited mobility and cannot escape pollution, macroinvertebrates better reflect the long-term water quality of a site compared to a single sample of chemical constituents that only provides a snapshot in time. Table 1 shows examples of generalized pollution sensitivity (tolerant or intolerant of pollution) for several common macroinvertebrates.

Knowing the typical variety and abundance of macroinvertebrates in a healthy waterbody in a region can help indicate signs of poor ecosystem health. Generally, healthy waterbodies support a diverse population of macroinvertebrates. Samples yielding only pollution-tolerant species, a low abundance of organisms, or very little diversity (primarily one or two species) might indicate a degraded waterbody. Figure 1 shows an example of a mayfly, a type of pollution-sensitive macroinvertebrate.

Figure 1. The mayfly, a type of insect, under the view of a microscope. Credit: Photo courtesy of USGS.

An assessment of macroinvertebrates helps to determine whether a stream's designated uses related to aquatic life are supported (protection and propagation of fish, shellfish, and wildlife). Unlike other parameters, macroinvertebrates offer a direct measurement of the condition of the biological community within a waterbody.

Table 1. Examples of macroinvertebrates and their pollution sensitivity levels.

Macroinvertebrate	Pollution Sensitivity
Stonefly	Intolerant
Mayfly	Intolerant
Crayfish	Moderately Tolerant
Leech	Tolerant
Aquatic worm	Tolerant
