Certification for Integrated Components Eligibility under the Infrastructure Investments and Jobs Act Drinking Water State Revolving Fund Lead Service Line Replacement Appropriation

Given that there is no safe level of exposure to lead in drinking water, the primary intent of the IIJA DWSRF LSLR appropriation is to protect public health by reducing exposure to lead. In certain situations, the financing of replacement or installation of such components may also impact the ability of the community to replace lead service lines. Examples of integrated components include, but are not limited to, water mains, water meters, connectors, and backflow preventers directly connected to lead service lines. The installation and replacement of integrated components are already eligible under the IIJA General Supplemental appropriation and Base program funding. In limited circumstances due to economic stressors, where a project to replace lead service lines would be infeasible without also addressing integrated components, the state may determine that such components are “associated activities directly connected to” the primary lead service line replacement project, and therefore, can also be funded with the IIJA DWSRF LSLR capitalization grant¹.

Please check all three criteria below to confirm eligibility of integrated components under IIJA DWSRF LSLR and include this form in the project file.

- ☐ The state determines that integrated components are sufficiently financially integrated into the LSLR replacement project such that the project could not proceed without their replacement (in other words, replacement of the integrated components is directly connected to the community’s ability to do LSLR),
- ☐ Integrated components needing repair or replacement are directly connected to a lead service line, and
- ☐ Integrated components are in a disadvantaged community as described in SDWA section 1452(d)(3).
