Fact Sheet

The U.S. Environmental Protection Agency (EPA)

Proposes to Reissue a National Pollutant Discharge Elimination System (NPDES) Permit to Discharge Pollutants Pursuant to the Provisions of the Clean Water Act (CWA) to:

American Water Military Services Joint Base Lewis McChord

Solo Point Wastewater Treatment Plant

Public Comment Start Date: December 11, 2025

Public Comment Expiration Date: January 27, 2026

THE EPA PROPOSES TO REISSUE THE NPDES PERMIT

The EPA proposes to reissue the NPDES permit for the facility referenced above. The draft permit places conditions on the discharge of pollutants from the wastewater treatment plant to waters of the United States. In order to ensure protection of water quality and human health, the permit places limits on the types and amounts of pollutants that can be discharged from the facility.

This Fact Sheet (FS) includes:

- information on public comment, public hearing, and appeal procedures
- a listing of proposed effluent limitations and other conditions for the facility
- a map and description of the discharge location
- technical material supporting the conditions in the permit
- a listing of substantial changes relative to the previous permit (see Page 8).

CWA § 401 CERTIFICATION

The EPA is requesting that Washington Department of Ecology (Ecology) provide a CWA Certification of the permit for this facility under CWA Section 401. Ecology will public notice the EPA's request for certification pursuant to Section 401 of the Clean Water Act at: https://apps.ecology.wa.gov/aquatics/notices/. Instructions for comments regarding the 401 certification will be included in Ecology's public notice.

CLEAN WATER ACT §401(A)(2) REVIEW

CWA Section 401(a)(2) requires that, upon receipt of an application and 401 certification, the EPA as the permitting authority notify a neighboring State or Tribe with TAS when the

EPA determines that the discharge may affect the quality of the neighboring State/Tribe's waters.

As stated above, Ecology is the certifying authority and is accepting comment regarding the intent to certify this permit. After the EPA receives final certification from Ecology, the EPA will determine whether the discharge may affect the quality of a neighboring jurisdiction's waters (33 U.S.C. § 1341(a)(2)).

PUBLIC COMMENT

Persons wishing to comment on, or request a Public Hearing for, the draft permit may do so in writing by the expiration date of the Public Comment period. A request for a Public Hearing must state the nature of the issues to be raised as well as the requester's name, address and telephone number. All comments and requests for Public Hearings must be in writing and should be submitted to the EPA as described below.

By the expiration date of the public comment period, all written comments and requests must be submitted to EPAR10WD-NPDES@epa.gov with the subject line "Comments on Draft NPDES Permit (WA0021954)".

After the Public Notice expires, and all comments have been considered, the EPA will make a final decision regarding permit issuance. If no substantive comments are received, the tentative conditions in the draft permit will become final, and the permit will become effective upon issuance. If substantive comments are received, the EPA will address the comments and issue the permit. The permit will become effective no less than 30 days after the issuance date, unless an appeal is submitted to the Environmental Appeals Board within 30 days pursuant to 40 CFR § 124.19.

DOCUMENTS ARE AVAILABLE FOR REVIEW

The draft NPDES permit, fact sheet and other information can be downloaded from the internet at https://www.epa.gov/npdes-permits/about-region-10s-npdes-permit-program.

The draft Administrative Record for this action contains any documents listed in the References section. The Administrative Record or documents from it are available electronically upon request by emailing EPAR10WD-NPDES@epa.gov.

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

ACRONYMS

AML	Average Monthly Limit
AWL	Average Weekly Limit
BOD_5	Biochemical oxygen demand, five-day
BMP	Best Management Practices
°C	Degrees Celsius
CFR	Code of Federal Regulations
CV	Coefficient of Variation
CWA	Clean Water Act
DMR	Discharge Monitoring Report
DO	Dissolved oxygen
EFH	Essential Fish Habitat
EPA	U.S. Environmental Protection Agency
ESA	Endangered Species Act
FOTW	Federally owned treatment works
FR	Federal Register
Gpd	Gallons per day
HUC	Hydrologic Unit Code
ICIS	Integrated Compliance Information System
I/I	Infiltration and Inflow
lbs/day	Pounds per day
LC	Lethal Concentration
LTA	Long Term Average
mg/L	Milligrams per liter
mL	Milliliters
ML	Minimum Level
µg/L	Micrograms per liter
mgd	Million gallons per day
MDL	Maximum Daily Limit or Method Detection Limit
MF	Membrane Filtration
MPN	Most Probable Number
N	Nitrogen
NOAA	National Oceanic and Atmospheric Administration
NOEC	No Observable Effect Concentration
NPDES	National Pollutant Discharge Elimination System
O&M	Operations and maintenance
POTW	Publicly owned treatment works

PSES	Pretreatment Standards for Existing Sources
PSNS	Pretreatment Standards for New Sources
QAP	Quality assurance plan
RL	Reporting Level
RP	Reasonable Potential
RPM	Reasonable Potential Multiplier
RWC	Receiving Water Concentration
SIC	Standard Industrial Classification
SS	Suspended Solids
SSO	Sanitary Sewer Overflow
s.u.	Standard Units
TKN	Total Kjeldahl Nitrogen
TMDL	Total Maximum Daily Load
TOC	Total Organic Carbon
TRC	Total Residual Chlorine
TRE	Toxicity Reduction Evaluation
TSD	Technical Support Document for Water Quality-based Toxics Control (EPA/505/2-90-001)
TSS	Total suspended solids
TU_a	Toxic Units, Acute
TU_c	Toxic Units, Chronic
USFWS	U.S. Fish and Wildlife Service
USGS	United States Geological Survey
UV	Ultraviolet
WD	Water Division
WET	Whole Effluent Toxicity
WLA	Wasteload allocation
WQBEL	Water quality-based effluent limit
WQS	Water Quality Standards
WWTP	Wastewater treatment plant

I. Background Information

A. General Information

This fact sheet provides information on the draft NPDES permit for the following entity:

Table 1: General Facility Information

NPDES Permit #:	WA0021954
Applicant:	American Water Military Services Joint Base Lewis McChord Solo Point Wastewater Treatment Plant
Type of Ownership	Federally owned treatment works (FOTW)
Physical Address:	Building 7530 Solo Point Road Fort Lewis, WA 98433
Mailing Address:	7520 Solo Point Road Fort Lewis, WA 98433
Facility Contact:	Jared Hayes Environmental Manager Jared.Hays@amwater.com 253-209-6235
Operator Name:	American Water Military Services
Receiving Water	Puget Sound (Solo Point)
Facility Outfall	47.13611°N 122.63806°W

B. Permit History

The most recent NPDES permit for the Solo Point Wastewater Treatment Plant (WWTP) was issued on February 15, 2012, became effective on April 1, 2012, and expired on April 1, 2017 (previous permit). An NPDES application for permit issuance was submitted by the permittee on September 30, 2016, with revisions received on March 29, 2017. The EPA determined that the application was timely and complete. Therefore, pursuant to Title 40 Code of Federal Regulations (CFR) 122.6, the permit has been administratively continued and remains fully effective and enforceable. As of 2020, the facility is owned and operated by American Water's Military Services Group (under a 50-year contract).

1. Changes Relative to Prior Permit

The draft permit proposes changes relative to the previous permit, as described below:

- The average monthly limit for flow and the mass limits for five-day biochemical oxygen demand (BOD_5) and total suspended solids (TSS) are reduced by 4% because the maximum month design flow of the upgraded

facility (6.7 mgd) is slightly less than the design flow used to calculate such limits in the previous permit (7 mgd).

- Effluent monitoring frequencies for BOD_5 and TSS have been reduced because of overall good performance.
- The draft permit proposes a new technology-based effluent limit (TBEL) for total inorganic nitrogen (TIN).
- The draft permit proposes to increase effluent monitoring frequency for ammonia from monthly to twice per week and add twice per week influent monitoring.
- The draft permit proposes to increase effluent monitoring frequency for nitrate plus nitrite from monthly to twice per week and add monthly influent monitoring.
- The draft permit proposes monthly influent monitoring for total Kjeldahl nitrogen (TKN).
- The draft permit proposes new monitoring for carbonaceous BOD_5 ($CBOD_5$) and total organic carbon (TOC).
- Limits for total petroleum hydrocarbons (TPH) are now stated as both mass and concentration limits.
- The draft permit proposes twice-per-year effluent monitoring for 1,2,4 trichlorobenzene.
- Effluent limits for total residual chlorine have been removed and monitoring has been reduced from daily to monthly.
- The draft permit proposes new enterococci effluent limits.
- The draft permit proposes to discontinue monitoring for ethylene glycol.
- The draft permit proposes to require source identification and control for polybrominated diphenyl ethers (PBDE).
- Phosphorus monitoring frequency change
- The draft permit proposes to discontinue monitoring for propylene glycol.
- The draft permit proposes annual WET monitoring, increased from four times during the permit term.
- The draft permit proposes quarterly monitoring of Per- and Polyfluoroalkyl Substances (PFAS) in influent, effluent and sludge.
- The draft permit proposes annual monitoring required for renewal for pollutants that are not listed in Appendix J, Table 2 of 40 CFR 122 but for which there are applicable water quality-standards.

C. Tribal Consultation

The EPA consults on a government-to-government basis with federally recognized Tribal governments when the EPA actions and decisions may affect Tribal interests. Meaningful Tribal consultation is an integral component of the federal government's general trust relationship with federally recognized Tribes. The federal government recognizes the right of each Tribe to self-government, with sovereign powers over their members and their territory. Executive Order 13175 (November 2000) entitled "Consultation and Coordination with Indian Tribal Governments" requires federal agencies to have an accountable process to assure meaningful and timely input by Tribal officials in the development of regulatory policies on matters that have Tribal implications and to strengthen the government-to-government relationship with Indian Tribes. In December 2023, the EPA issued the "EPA Policy on Consultation with Indian Tribes" which updated national guidelines and institutional controls for consultation.

The Solo Point WWTP is located within the usual and accustomed areas of the Nisqually, Puyallup, and Yakama Tribes. The EPA has offered government-to-government consultation to all three of these Tribes. At their request, the EPA has included requirements in the permit to notify the Nisqually Tribe of instances of non-compliance.

II. Facility Information

A. Treatment Plant Description

1. Service Area

American Water Military Services Joint Base Lewis McChord owns and operates the Solo Point WWTP located in Fort Lewis, WA. The collection system has no combined sewers. The facility serves a resident population of 66,751 as of 2022.

According to the 2023 annual pretreatment report, there are a total of 64 industrial users (IUs) of the treatment works, of which 2 are non-categorical significant industrial users (SIUs) and one is a categorical industrial user (CIU).

2. Treatment Process

The maximum month design flow of the facility is 6.7 mgd. The actual flows reported from the facility between September 2016 and March 2025 range from 1.73 mgd to 6.4 mgd (average monthly flow). American Water Military Services completed an infiltration and inflow report for calendar year 2022 and found that inflow and infiltration were not excessive.

The influent to Solo Point WWTP is from a sanitary sewer collection system consisting of approximately 240 miles of gravity sewer in six basins covering a total area of approximately 90,000 acres. The wastewater is then screened and passes through an aerated grit chamber, primary sedimentation with scum and primary sludge removal, bioreactors for four-stage Bardenpho biological nutrient removal with optional supplemental carbon (methanol) addition for nitrogen removal,

secondary clarifiers with scum and recycled activated sludge (RAS) pumping, and ultraviolet (UV) disinfection. Solids are thickened using gravity belt thickeners, anaerobic digestion and dewatered using a belt filter press and then stored under cover until they are hauled for land application.

Major upgrades to the facility were completed in August 2016 to replace the trickling filter treatment system with a four-stage Bardenpho treatment system for biological removal and UV disinfection. The upgrades included a new headworks with influent pumping, screening and grit removal, new primary settling tanks, pressure membrane filtration, replacement of chlorine disinfection with a UV system, and a new solids management system. A pre-screen station was also installed in April 2023. The facility is not currently operating the tertiary membrane filtration system. The filters were initially installed to obtain Class IV treatment for reuse potential, however, there is insufficient infrastructure and demand for recycled water.

A schematic of the wastewater treatment process and a map showing the location of the treatment facility and discharge are included in Appendix A. The EPA has used post-upgrade data to determine reasonable potential to exceed water quality criteria (see Section IV.A.3 below).

The facility is considered a major facility.

B. Outfall Description

The outfall is a 24-inch diameter cast iron pipe terminating at a depth of 70 feet below mean lower low water (MLLW) and a distance of 600 feet offshore. The diffuser is approximately 140 feet in length and has 14 six-inch diameter ports, spaced 10 feet apart, at the end of the pipe. Each diffuser includes a 90-degree angle at the end to aid diffusion.

C. Effluent Characterization

To characterize the effluent, the EPA evaluated the facility's application form, discharge monitoring report (DMR) data, and additional data provided by the Solo Point WWTP. The EPA only considered effluent data after the major facility upgrades were completed in August 2016. The effluent quality is summarized in Table 2. Data are provided in Appendix B. Below is a description of each source of effluent data:

- Application resubmittal: Expanded effluent testing data are required in Form 2A Part D for major facilities. These data were included in the revised application submitted on March 29, 2017. Pollutants with results reported above the minimum level (ML) or with state water quality standards (WQS) are shown in Table 2. Only the mean and maximum were reported for the pollutants in the expanded effluent testing. Accordingly, no individual data points are provided in the Appendix.

- Pretreatment monitoring: Quarterly data were submitted per the pretreatment report requirements. These samples were processed by two different labs during different years. One of the labs did not report results if they fell under Ecology's Reporting Level (RL). The other lab reported all results over the method detection limit (MDL). Accordingly, in some cases a result of <1 ug/L (RL = 1 ug/L), for example, was reported on one day, while a smaller exact result (<RL but >MDL) was reported on another. Summary statistics below (except for count) exclude the non-detect and <RL values. An alternate maximum value was determined (shown in Appendix F), representing the maximum if any values reported as "<RL" were set to equal the RL. In order to be conservative, these values were used for reasonable potential analysis.
- DMRs: Data collected between September 2016 and March 2025.
- PBDE monitoring: The previous permit required quarterly PBDE monitoring in the first and last years of the permit term. Additional PBDE data were collected on February 19, 2018, after the facility upgrades were completed. The 2018 data only are considered for effluent characterization.

Table 2: Effluent Characterization

Parameter	Units	Minimum	Mean	Maximum	95th Percentile	Count	Source
1,2,4-trichlorobenzene	µg/L	—	1.08	2.5	—	6	Application resubmittal
2,4-dinitrophenol	µg/L	20	20	20	20	3	Application resubmittal
Acetone	µg/L	<2.5	—	8.54	—	3	Pretreatment monitoring

Total petroleum hydrocarbons (daily max.)	mg/L	0.00	2.48	10	10	37	DMRs
Zinc	µg/L	19	43	110	86	11	Pretreatment monitoring

D. Compliance History

A list of effluent violations between September 2016 and March 2025 is provided in Table 3. The facility is unable to provide an explanation for the significant chlorine daily maximum exceedance in 2016, as the current management did not take over operations until 2021. However, it is an outlier compared to the rest of the data.

Additional compliance information for this facility, including compliance with other environmental statutes, is available on Enforcement and Compliance History Online (ECHO). The ECHO web address for this facility is: https://echo.epa.gov/detailed-facility-report?fid=WA0021954&sys=ICP

Table 3: Effluent Violations (September 2016 – March 2025)

Monitoring Period End Date	Parameter Code	Parameter Description	Statistical Base Type	DMR Value	DMR Value Unit	Limit Value	Limit Value Unit	% Exceedance	Days with Exceedances
12/31/2016	400	pH	INST MIN	4.8	SU	6	SU	—	1
12/31/2016	50060	Chlorine, total residual	MO AVG	0.48	mg/L	0.36	mg/L	33	31

7/31/2024	00530	Solids, total suspended	WKLY AVG	54.6	mg/L	45	mg/L	21	7
1/31/2025	00310	BOD, 5-day	WKLY AVG	67	mg/L	45	mg/L	49	7

The EPA conducted inspections of the facility on May 24, 2022, and September 30, 2024. The inspections encompassed the wastewater treatment process, records review,

operation and maintenance, and the collection system. Areas of concern noted during the 2022 inspection were the TSS percent removal exceedance in January 2022 (Table 3), the absence of reportable BOD or TSS sampling results on October 14, 2021, the absence of reportable fecal coliform sampling results on October 27, 2021, addition of dog food prior to the influent composite sampler in January 2022[1], late submittals of DMRs in July 2020, August 2019, and June 2019, and several bypass events, listed below:

- On May 28, 2019, approximately 70,000 gallons of treated wastewater was discharged without disinfection due to a SCADA control failure.
- On December 1, 2019, approximately 48,000 gallons of treated wastewater was discharged without disinfection due to an unknown failure with the UV system.
- On January 8, 2020, approximately 260,000 gallons of treated wastewater was discharged without disinfection due to a UV system failure. The UV system's open flow monitors were showing incorrect water levels.
- On October 25, 2021, due to a power outage and subsequent equipment failure of the Facility's backup generator, approximately 181,000 gallons of effluent was discharged without UV disinfection.
- On October 29, 2021, due to an equipment failure at the UV channel, approximately 130,000 gallons of effluent was discharged without UV disinfection.
- On January 8th-9th, 2022, approximately 3,000,000 gallons of effluent was discharged without disinfection due to an equipment controls failure.

Areas of concern noted during the 2024 inspection were the TSS exceedances in June and July 2024 (Table 3), the lack of records of the last testing and calibration of the influent and effluent mag-meters, and a single bypass event: on November 3, 2023, approximately 70,000 gallons of effluent was discharged without UV disinfection due to a SCADA control failure. The testing and calibration and issue leading to bypass have been addressed since the inspection.

III. Receiving Water

In drafting permit conditions, the EPA must analyze the effect of the facility's discharge on the receiving water. The details of that analysis are provided in the Water Quality-Based Effluent Limits (WQBEL) section in Part IV.A.3. This section summarizes characteristics of the receiving water that impact that analysis.

[1] The facility noted that dog food is occasionally added at different locations within the treatment process to supplement the microbiology by providing a carbon source in the bioreactor when the influent BOD loading is less than the minimum day design loading (caused by high flows and diluted influent). On one occasion in January 2022, the Operations Supervisor made an unauthorized addition of dog food prior to the influent composite sampler, which skews the representative influent samples. The Operations Supervisor was terminated, and the facility notified the EPA when they became aware of the incident.

This facility discharges to Puget Sound (Solo Point) near Fort Lewis, WA, south of Ketron Island.

A. Water Quality Standards

CWA § 301(b)(1)(C) requires the development of limitations in permits necessary to meet Water Quality Standards (WQS). 40 CFR 122.4(d) requires that the conditions in NPDES permits ensure compliance with the WQS of all affected States. A State's WQS are composed of use classifications, numeric and/or narrative water quality criteria and an anti-degradation policy. The use classification system designates the beneficial uses that each water body is expected to achieve, such as drinking water supply, contact recreation, and aquatic life. The numeric and narrative water quality criteria are the criteria deemed necessary to support the beneficial use classification of each water body. The anti-degradation policy represents a three-tiered approach to maintain and protect various levels of water quality and uses.

1. Designated Beneficial Uses

Ecology lists use designations for specific marine waters in WAC 173-201A-612. This facility discharges to Puget Sound through Admiralty Inlet and South Puget Sound, south and west to longitude 122°52'30"W (Brisco Point) and longitude 122°51'W (northern tip of Harstine Island) in the Chambers-Clover water resource inventory area (WRIA 12). At the point of discharge, Puget Sound is protected for the following designated uses:

- Extraordinary quality aquatic life use
- Primary contact recreation
- All harvest uses

B. Receiving Water Quality

The water quality for the receiving water is summarized in Table 4. Data were retrieved from Ecology's Environmental Information Management (EIM) database[2], the Water Quality Portal[3], and the Washington Department of Health (WA DOH) Commercial Shellfish Map Viewer[4]. The complete data can be found in Appendix C. 1,2,4-trichlorobenzene, 2-nitrophenol, and naphthalene were all non-detect and are not included in the Appendix.

Table 4: Receiving Water Quality Data

Parameter	Units	Minimum	Mean	Maximum	90th Percentile	Count
1,2,4-trichlorobenzene[1]	All results non-detect					6

[2] https://apps.ecology.wa.gov/eim/search/default.aspx
[3] https://www.waterqualitydata.us/
[4] https://fortress.wa.gov/doh/oswpviewer/index.html

Parameter	Units	Minimum	Mean	Maximum	90th Percentile	Count
2,4-dinitrophenol[2]	µg/L	0.00205	0.00755 (geo mean = 0.00556)	0.01454	0.01454	6
2-nitrophenol[1]	All results non-detect					6

1. Water Quality Limited Waters

The State of Washington's 2018 Integrated Report Section 5 (CWA § 303(d)) lists the grid cell of Puget Sound (Solo Point) to which the facility discharges as impaired by enterococci bacteria.

While the specific area of discharge is not impaired for dissolved oxygen (DO), low levels of DO have been measured throughout Puget Sound. Ecology has identified

nitrogen as a primary human source contributor to DO depletion and, with their Salish Sea Model, determined that all WWTPs discharging to Puget Sound may contribute to impairments elsewhere in the Sound.

IV. Effluent Limitations and Monitoring

Table 5, below, presents the effluent limits and monitoring requirements proposed in the draft permit. The existing effluent limits and monitoring requirements can be found in Appendix D.

The draft permit includes several changes to the effluent limitations and monitoring requirements. These are listed in Part I.B.1, above, with additional detail below.

Table 5: Draft Permit - Effluent Limits and Monitoring Requirements

Parameter	Units	Effluent Limits			Monitoring Requirements		
		Average Monthly	Average Weekly	Maximum Daily	Sample Location	Sample Frequency	Sample Type
Parameters with Effluent Limits							
Flow	MGD	6.7	—	Report[1]	Effluent	Continuous	Measure

Sludge Monitoring for Land Application							
Abide by the limitations and monitoring requirements established by 40 CFR Part 503.							

1. Report daily flows on days when collecting total ammonia and nitrate plus nitrite samples (and calculating TIN)
2. The monthly average percent removal must be calculated from the arithmetic mean of the influent values and the arithmetic mean of the effluent values for that month using the following equation: (average monthly influent concentration – average monthly effluent concentration) ÷ average monthly influent concentration x 100. Influent and effluent samples must be taken over approximately the same time period.
3. Quarters are defined as: January 1 to March 31; April 1 to June 30; July 1 to September 30; and October 1 to December 31.
4. TPH samples must be taken as a grab sample set (one grab for NWTPH-Gx and one grab for NWTPH-Dx).
5. TIN (mg/L) as N = Total Ammonia (mg/L as N) + Nitrate plus Nitrite (mg/L as N).
6. See Permit Part I.B.7.
7. Pollutants in Table 2, Appendix J of 40 CFR Part 122. See Part II.C.7 of the Permit for specific instructions.

Parameter	Units	Effluent Limits			Monitoring Requirements		
		Average Monthly	Average Weekly	Maximum Daily	Sample Location	Sample Frequency	Sample Type
8. The required sample type is 24-hour composite, except for cyanide, volatile organics and phenols, which must be taken as a minimum of 2 grab samples and separately analyzed in place of each 24-hour composite. Cyanide grab samples shall consist of a minimum of two samples collected at intervals of 15 minutes or greater within a 24-hour period (with the maximum of the two values reported). 9. Additional Effluent Testing – see NPDES Permit Application Form 2A, Tables B and C, and Permit Part I.B.6 for the list of pollutants to be included in this testing. The Permittee must use sufficiently sensitive analytical methods in accordance with Permit Part I.B.3. Where applicable, effluent monitoring required by other conditions of this permit may be used to satisfy this requirement.							

A. Basis for Effluent Limits and Monitoring Requirements

In general, the CWA requires that the effluent limits for a particular pollutant be the more stringent of either TBELs or WQBELs. TBELs are set according to the level of treatment that is achievable using available technology. A WQBEL is designed to ensure that the WQS applicable to a waterbody are being met and may be more stringent than TBELs.

CWA § 308 and federal regulation 40 CFR 122.44(i) require monitoring in permits to determine compliance with effluent limitations. Monitoring may also be required to gather effluent and surface water data to determine if additional effluent limitations are required and/or to monitor effluent impacts on receiving water quality.

Monitoring frequencies are based on the nature and effect of the pollutant, as well as a determination of the minimum sampling necessary to adequately monitor the facility's performance. Permittees have the option of taking more frequent samples than are required under the permit. These samples must be used for averaging if they are conducted using EPA-approved test methods (generally found in 40 CFR 136) or as specified in the permit.

1. Pollutants of Concern

Pollutants of concern are those that either have TBELs or may need WQBELs. The EPA identifies pollutants of concern for the discharge based on those which:

- Have a TBEL
- Have an assigned wasteload allocation (WLA) from a Total Maximum Daily Load (TMDL)
- Had an effluent limit in the previous permit
- Are present in the effluent monitoring. Monitoring data are reported in the application and DMR and any special studies
- Are expected to be in the discharge based on the nature of the discharge

The wastewater treatment process for this facility includes both primary and secondary treatment and UV disinfection. While not currently in use, the facility also has tertiary membrane filtration. Pollutants expected in the discharge from a facility

with this type of treatment, include but are not limited to: BOD_5, TSS, *E. coli* bacteria, total residual chlorine, pH, ammonia, temperature, phosphorus, and DO.

Based on this analysis, pollutants of concern are as follows:

- 1,2,4-trichlorobenzene
- 2,4-dinitrophenol
- Acetone
- Ammonia
- Antimony
- Arsenic
- BOD_5
- Cadmium
- $CBOD_5$
- Chlorine
- Chloroform
- Chromium
- Copper
- Dissolved oxygen (DO)
- Enterococci bacteria
- Ethylene glycol
- Fecal coliform bacteria
- Lead
- Mercury
- Molybdenum
- Naphthalene
- Nickel
- Nitrate + Nitrite
- PBDEs
- PFAS
- pH
- Phosphorus
- Propylene glycol
- Silver
- Temperature
- TKN
- TOC
- Total petroleum hydrocarbons
- TSS
- Whole Effluent Toxicity
- Zinc

2. Technology-Based Effluent Limits (TBELs)

a. Federal Secondary Treatment Effluent Limits

The CWA requires publicly owned treatment works (POTWs) to meet performance-based requirements based on available wastewater treatment technology. CWA § 301 established a required performance level, referred to as "secondary treatment," which POTWs were required to meet by July 1, 1977. The EPA has developed and promulgated "secondary treatment" effluent limitations, which are found in 40 CFR 133.102. These TBELs apply to certain municipal WWTPs and identify the minimum level of effluent quality attainable by application of secondary treatment in terms of BOD_5, TSS, and pH. The

federally promulgated secondary treatment effluent limits are listed in Table 6. For additional information and background refer to Part 5.1 *Technology Based Effluent Limits for POTWs* in the EPA's NPDES Permit Writers' Manual (2010a).

The JBLM Solo Point WWTP is an FOTW, not a POTW. Where effluent guidelines have not been promulgated by the EPA, the CWA § 402(a)(1) and 40 CFR § 125.3 require the permit writer to establish technology based effluent limits on a case-by-case basis based on Best Professional Judgment (BPJ). Since the JBLM Solo Point WWTP's treatment process and wastewater sources are nearly identical to a POTW, the EPA has applied the POTW secondary treatment effluent limits to this permit, based on BPJ.

Table 6: Secondary Treatment Effluent Limits

Parameter	30-day average	7-day average
BOD_5	30 mg/L	45 mg/L
TSS	30 mg/L	45 mg/L
Removal for BOD_5 and TSS (concentration)	85% (minimum)	--
pH	within the limits of 6.0 - 9.0 s.u.	
Source: 40 CFR 133.102		

i. *Mass-Based Limits*

40 CFR 122.45(f) requires that effluent limits be expressed in terms of mass, except under certain conditions. 40 CFR 122.45(b) requires that effluent limitations for POTWs be calculated based on the design flow of the facility. Since the JBLM Solo Point WWTP's treatment process and wastewater sources are nearly identical to a POTW, the EPA has used the design flow to calculate mass limits for this facility. The mass-based limits are expressed in pounds per day and are calculated as follows:

Mass based limit = concentration limit (mg/L) × design flow (mgd) × 8.34[5]

Since the design flow for this facility is 6.7 mgd, the technology-based mass limits for BOD_5 and TSS are calculated as follows:

Average Monthly Limit = 30 mg/L × 6.7 mgd × 8.34 = 1,676 lbs/day

Average Weekly Limit = 45 mg/L × 6.7 mgd × 8.34 = 2,515 lbs/day

ii. *Monitoring*

The draft permit proposes to reduce the monitoring frequency for BOD_5 and TSS from daily to five times per week.

The average effluent concentrations of BOD_5 and TSS are 22% and 15%, respectively, of the average monthly effluent limits (30 mg/L). Based on

[5] 8.34 is a conversion factor equal to the density of water in pounds per gallon.

these ratios of average discharges to average monthly limits, the EPA's Interim Guidance for Performance-Based Reduction of NPDES Permit Monitoring Frequencies (1996) states that monitoring frequencies could be reduced from daily, in the previous permit, to once per week. However, the recommended minimum monitoring frequency for BOD_5 and TSS in Chapter 13, Section 2.1.3 of Ecology's Water Quality Program Permit Writer's Manual (2018), for activated sludge POTWs with design flows greater than 5 mgd, is 5 times per week. The EPA proposes revised monitoring frequencies for BOD_5 and TSS consistent with the recommended minimum monitoring frequencies for POTWs of similar size to the JBLM Solo Point WWTP in Ecology's Permit Writer's Manual.

b. Nutrients

As established in Part IV.A.1, several forms of nitrogen and DO are pollutants of concern. TIN, the combination of ammonia and nitrate plus nitrite, is the primary bioavailable component for algal growth, which drives eutrophication and DO depletion in Puget Sound.

Under 40 CFR 125.3(c), technology-based treatment requirements may be imposed on a case-by-case basis where the EPA has not promulgated effluent limitations for the specific pollutant. The permit writer must apply the factors set forth in 40 CFR § 125.3(d)(3) which includes the consideration of appropriate technology for the category or class of point sources of which the applicant is a member, based upon all available information, and any unique factors relating to the applicant. In setting best professional judgement (BPJ) case-by-case limitations based on best available technology (BAT) pursuant to 40 CFR 125.3(c), the EPA considered the following factors:

(i) The age of equipment and facilities involved;

(ii) The process employed;

(iii) The engineering aspects of the application of various types of control techniques;

(iv) Process changes;

(v) The cost of achieving such effluent reduction; and

(vi) Non-water quality environmental impact (including energy requirements).

A discussion of each of the factors is presented below.

<u>The age of equipment and facilities involved</u>

As stated in Part II.A.2 above, substantial upgrades to the facility, including biological nutrient removal and tertiary membrane filtration, were completed in August 2016. These facilities are within their useful lives; thus the age of the equipment and facilities involved is not a barrier to meeting TBELs for TIN.

The process employed

As stated in Part II.A.2 above, the facility uses bioreactors for four-stage Bardenpho biological nutrient removal with optional supplemental carbon (methanol) addition for nitrogen removal, and tertiary membrane filtration. These processes are specifically designed to remove nitrogen from municipal wastewater. The supplemental application materials received on March 29, 2017, state that the facility's design nitrogen removal rate is 90%.

The engineering aspects of various types of control techniques

As stated above, the existing facility is engineered to remove 90% of the nitrogen from the influent. Section 8.4 of the EPA's *Nutrient Control Design Manual* (2010b) states that the four-stage Bardenpho process can achieve effluent total nitrogen concentrations between 3 and 5 mg/L. Note that this includes organic nitrogen, which is excluded from the proposed effluent limitation for TIN.

Process changes

As stated above, the existing treatment process is engineered to remove 90% of the nitrogen from the influent. No process changes will be necessary to achieve the proposed TIN limit.

The cost of achieving such effluent reduction

Because the existing treatment process is engineered to remove 90% of the nitrogen from the influent and no process changes will be necessary to achieve the proposed TIN limit, costs of achieving effluent reductions will be limited to potentially higher operating and chemical (e.g., methanol) costs relative to those necessary to comply with the previous permit. There will also be costs associated with more frequent monitoring of TIN (ammonia, nitrate plus nitrite) to determine compliance with the new TIN effluent limitations. Unlike POTWs, federal facilities obtain their funding through appropriations, not through ratepayer fees. Thus, FOTWs do not need to rely upon increasing ratepayer fees for increased monitoring or other operational costs.

Non-water quality environmental impact (including energy requirements)

The EPA does not anticipate any significant non-water quality environmental impacts as a result of the new TBEL for TIN. Energy considerations for nutrient removal are discussed in Sections 2.9.1 and 8.2.6 of the EPA's *Nutrient Control Design Manual* (2010b).

Establishment of TBEL for TIN

Based on the above discussion, the EPA concludes that a TBEL of 3 mg/L TIN (monthly average) is BAT for the Solo Point WWTP. Consistent with 40 CFR 122.45(f), a mass limit has also been calculated based on the design flow of the FOTW as follows:

Average Monthly Limit = 3 mg/L × 6.7 mgd × 8.34 = 168 lbs/day

i. *Monitoring*

As a result of their findings described in Part III.B.1, Ecology issued the Puget Sound Nutrient General Permit in 2021. On June 18, 2025 Ecology proposed for public comment revisions to the PSNGP, which was previously invalidated "insofar as it is mandatory", that make coverage under the permit optional. The original and draft modified PSNGP exclude coverage of federal facilities, which are permitted by the EPA. The EPA proposes nutrient monitoring at JBLM Solo Point that mirrors the monitoring requirements in the PSNGP. The draft permit includes twice weekly effluent monitoring for the components of TIN (ammonia, nitrate plus nitrite), twice weekly influent ammonia monitoring, and monthly influent nitrate plus nitrite monitoring. Since very little nitrate plus nitrite is found in wastewater influent, the draft permit proposes less frequent monitoring than for ammonia.

The four-stage Bardenpho process involves the oxidation of ammonia to nitrite and then nitrate (nitrification), and reduction of nitrate to nitrogen gas (denitrification), effectively removing nitrogen from the system. Microorganisms within the treatment process convert inorganic nitrogen into organic nitrogen, and the biomass is retained by settled solids. Excess biomass is removed through wasting sludge. TIN in the effluent represents the ammonia, nitrate, and nitrite that remains after treatment.

Total Kjeldahl Nitrogen (TKN) is an important parameter for understating nitrification efficiency and provides the facility with the ability to evaluate the biological treatment system. Comprised of ammonia plus total organic nitrogen, TKN allows the amount of organic nitrogen in a wastewater sample to be quantified. Generally, the secondary treatment process converts most of the dissolved organic nitrogen to ammonia where it is available to the biota of the treatment system. Settling removes most of the particulate organic carbon. This parameter is also valuable for use in Salish Sea Model scenarios. The EPA proposes monthly influent and effluent TKN monitoring.

Carbonaceous BOD ($CBOD_5$), a subset of BOD_5, measures the amount of DO required for biological oxidation of carbon compounds in a wastewater sample. Unlike BOD_5, the $CBOD_5$ analysis excludes the oxygen demand for nitrogen species and is more appropriate where plants have an incomplete conversion of ammonia to nitrate. When coupled with the BOD_5 monitoring requirement in permittee's individual NPDES permits, this parameter provides a more complete picture of the treatment performance and carbon removal. The permittee can use BOD_5 and $CBOD_5$ to track operation efficiencies by calculating percent removal using influent and effluent concentrations.

Total Organic Carbon (TOC) provides the EPA with the ability to quantify the amount of organic, carbon containing pollution discharged from the facility.

Ecology's Environmental Assessment Program has identified carbon as a secondary nutrient driving eutrophication in the Salish Sea. The EPA intends this once per month effluent monitoring to develop correlations with BOD_5/$CBOD_5$. Salish Sea Model scenarios utilize BOD as a surrogate for available carbon. Measurements of TOC will help to refine the relationship between BOD_5/$CBOD_5$ and available carbon.

c. Total Petroleum Hydrocarbons

Because at least one sizeable petroleum hydrocarbon slug made its way into the treatment plant in the past, and TPH continues to be detected in the effluent, the draft permit includes a TPH limit. The previous permit established a BPJ TBEL of 10 mg/L (maximum daily limit), based on the ability of simple oil/water separator technology to recover free product from water, as described in Ecology's Stormwater Management Manual for Western Washington (2024). The draft permit proposes to carry forward this TBEL. The EPA will reconsider the need for a limit at the next permit reissuance.

Federal regulations state that effluent limits shall have limitations, standards or prohibitions expressed in terms of mass, with certain exceptions – none of which are applicable to the TPH limit for the Solo Point WWTP (40 CFR 122.45(f)). Thus, the draft permit proposes a mass limit for TPH in addition to the concentration limit from the previous permit.

Maximum Daily Limit = 10 mg/L × 6.7 mgd × 8.34 = 559 lbs/day

3. Water Quality-Based Effluent Limits (WQBELs)

a. Statutory and Regulatory Basis

CWA § 301(b)(1)(C) requires the development of limitations in permits necessary to meet WQS. Discharges to State or Tribal waters must also comply with conditions imposed by the State or Tribe as part of its certification of NPDES permits under CWA § 401. 40 CFR 122.44(d)(1) implementing CWA § 301(b)(1)(C) requires that permits include limits for all pollutants or parameters which are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State or Tribal WQS, including narrative criteria for water quality. Effluent limits must also meet the applicable water quality requirements of affected States other than the State in which the discharge originates, which may include downstream States (40 CFR 122.4(d), 122.44(d)(4), see also CWA § 401(a)(2)).

The regulations require the permitting authority to make this evaluation using procedures which account for existing controls on point and nonpoint sources of pollution, the variability of the pollutant in the effluent, species sensitivity (for toxicity), and where appropriate, dilution in the receiving water. The limits must be stringent enough to ensure that WQS are met and must be consistent with

any available wasteload allocation for the discharge in an approved TMDL. If there are no approved TMDLs that specify wasteload allocations for this discharge; all of the WQBELs are calculated directly from the applicable WQS.

b. Reasonable Potential Analysis and Need for WQBELs

The EPA uses the process described in the *Technical Support Document for Water Quality-based Toxics Control* (*TSD*) (USEPA, 1991) to determine reasonable potential. To determine if there is reasonable potential for the discharge to cause or contribute to an exceedance of water quality criteria for a given pollutant, the EPA compares the maximum projected receiving water concentration to the water quality criteria for that pollutant. If the projected receiving water concentration exceeds the criteria, there is reasonable potential, and a WQBEL must be included in the permit.

In some cases, a dilution allowance or mixing zone is permitted. A mixing zone is a limited area or volume of water where initial dilution of a discharge takes place and within which certain water quality criteria may be exceeded (USEPA, 2014). While the criteria may be exceeded within the mixing zone, the use and size of the mixing zone must be limited such that the waterbody as a whole will not be impaired, all designated uses are maintained and acutely toxic conditions are prevented.

The Washington WQS at WAC 173-201A-400 provides Washington's mixing zone policy for point source discharges. The EPA's proposed mixing zones based on this policy are the same as those authorized in the previous permit. All dilution factors were calculated with the effluent flow rate set equal to the design flow of 6.7 mgd. The proposed mixing zones and dilution factors are summarized in Table 7. If there is any subsequent change in the mixing zones that results in a change to the permit limits, the EPA will determine if an additional comment period is necessary.

Table 7: Mixing Zones

Criteria Type	Mixing Zone Radius (ft)	Dilution Factor
Acute Aquatic Life	27 feet along the major axis and 23 feet along the minor axis	45.5
Chronic Aquatic Life	270 feet along the major axis and 230 feet along the minor axis	88.0
Human Health Carcinogen		88.0

The RPA and WQBEL calculations were based on mixing zones shown in Table 7. If Ecology revises the allowable mixing zone in its CWA Section 401 certification of this permit, RPA and WQBEL calculations will be revised accordingly.

The pollutants of concern are listed in Part IV.A.1. The applicable WQS for pollutants of concern are shown in Table 8, below.[6]

Table 8: Applicable Water Quality Standards

Pollutant	Designated Use	Criteria
BOD	--	N/A
DO	Aquatic Life Uses (Extraordinary)	7.0 mg/L
TSS	--	N/A
pH	Aquatic Life Uses (Extraordinary)	7.0 – 8.5, within the above range of less than 0.2 units.
Temperature	Aquatic Life Uses (Extraordinary)	13 °C (1-day maximum)
1,2,4 trichlorobenzene	Harvesting (human health organisms only)	0.037 µg/L
2,4-dinitrophenol	Harvesting (human health organisms only)	100 µg/L
2-nitrophenol	N/A	N/A
Acetone	N/A	N/A
Ammonia	Aquatic Life Uses (Extraordinary)	8.09 mg/L acute; 1.22 mg/L chronic (calculated)
Antimony	Harvesting (human health organisms only)	90 µg/L
Arsenic	Harvesting (human health organisms only)	0.14 µg/L (inorganic arsenic)
	Aquatic Life Uses (Extraordinary)	69.0 µg/L acute; 36.0 µg/L chronic (dissolved)
Cadmium	Aquatic Life Uses (Extraordinary)	33.0 µg/L acute; 7.9 µg/L (dissolved)
Chlorine	Aquatic Life Uses (Extraordinary)	13.0 µg/L acute; 7.5 µg/L chronic (total residual)
Chloroform	Harvesting (human health organisms only)	600 µg/L
Chromium VI	Aquatic Life Uses (Extraordinary)	1,100 µg/L acute; 50 µg/L chronic (dissolved)
Copper	Aquatic Life Uses (Extraordinary)	4.8 µg/L acute; 3.1 µg/L chronic (dissolved)
Enterococci	Primary Contact Recreation	Must not exceed a geometric mean value of 30 CFU or MPN per 100 mL, with not more than 10 percent of all samples (or any single sample when less than ten sample values exist) obtained within the averaging period exceeding 110 CFU or MPN per 100 mL.
Ethylene Glycol	N/A	N/A
Fecal Coliform	Shellfish Harvesting	Must not exceed a geometric mean value of 14 CFU or MPN per 100 mL, and not have more than 10 percent of all samples (or any single sample when less than 10 sample points exist) obtained for calculating the geometric mean value exceeding 43 CFU or MPN per 100 mL.
Lead	Aquatic Life Uses (Extraordinary)	210 µg/L acute; 8.1 µg/L chronic (dissolved)
Mercury	Aquatic Life Uses (Extraordinary)	1.8 µg/L acute; 0.025 µg/L chronic
Methylmercury	Harvesting (human health organisms only)	0.03 mg/kg
Molybdenum	N/A	N/A
Naphthalene	Aquatic Life Uses (Extraordinary)	2,350 µg/L acute (from Quality Criteria for Water 1986)
Nickel	Harvesting (human health organisms only)	100 µg/L

[6] WAC 173-201A Part II, except aquatic life criteria for pollutants in 173-201A-240, which have not yet been approved by the EPA. Applicable aquatic life criteria are found here: https://www.epa.gov/system/files/documents/2025-03/wa_wqs_0011_122024.pdf.

Pollutant	Designated Use	Criteria
	Aquatic Life Uses (Extraordinary)	74 µg/L acute; 8.2 µg/L (dissolved)
PBDEs	N/A	N/A
Propylene Glycol	N/A	N/A
Silver	Aquatic Life Uses (Extraordinary)	1.9 µg/L acute (dissolved)
Zinc	Harvesting (human health organisms only)	1,000 µg/L
	Aquatic Life Uses (Extraordinary)	90.0 µg/L acute; 81.0 µg/L chronic (dissolved)
Toxics (Narrative)	N/A	Toxic, radioactive, or deleterious material concentrations must be below those which have the potential, either singularly or cumulatively, to adversely affect characteristic water uses, cause acute or chronic conditions to the most sensitive biota dependent upon those waters, or adversely affect public health.

The RPA results, WQBELs, and related monitoring requirements for specific parameters are summarized below. The calculations are provided in Appendix D.

i. *1,2,4-trichlorobenzene*

1,2,4-trichlorobenzene was measured at quantifiable concentrations in the effluent. Applicable water quality criteria are listed in Table 8. The EPA has determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for 1,2,4-trichlorobenzene, thus no effluent limits are proposed.

However, the maximum reported effluent concentration of 1,2,4-trichlorobenzene (Table 2) was substantially higher than the applicable water quality criterion (Table 8). The draft permit therefore proposes twice-per-year effluent monitoring of 1,2,4-trichlorobenzene. This will result in 10 samples for 1,2,4-trichlorobenzene within the 5-year permit term, enough data to determine a standard deviation and mean with sufficient confidence (*TSD*).

ii. *2,4-dinitrophenol*

2,4-dinitrophenol was measured at a detectable concentration in the effluent. Applicable water quality criteria are listed in Table 8. The EPA has determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for 2,4-dinitrophenol, thus no effluent limits are proposed. The draft permit proposes continued monitoring for 2,4-dinitrophenol for reapplication and pretreatment requirements.

iii. *Acetone*

Acetone was measured at quantifiable concentrations during effluent monitoring to fulfill pretreatment requirements of the previous permit.

However, acetone was not among the list of pollutants required to be monitored. The State of Washington does not have numeric water quality criteria for acetone, and no US state has numeric water quality criteria for acetone which are applicable to saltwater. The most stringent water quality criterion for acetone in any US state is a human health criterion of 3,500 µg/L established by the State of Pennsylvania. The maximum measured effluent concentration of acetone is 8.54 µg/L.

The maximum effluent concentration of acetone is 3 orders of magnitude lower than the most stringent numeric criterion established by any U.S. state for this compound. Therefore, the EPA concludes that the discharge of acetone from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above Washington's narrative criterion for toxic substances (WAC-173-201A-260(2)(a)). No limits are proposed and the EPA does not propose monitoring for acetone.

iv. *Ammonia*

Marine ammonia criteria are based on a formula which relies on the pH, temperature and the salinity of the receiving water, because the fraction of ammonia present as the toxic, un-ionized form increases with increasing pH and temperature and decreases with salinity. Therefore, the criteria become more stringent as pH and temperature increase and less stringent as salinity increases. Table 9, below, details the equations used to determine water quality criteria for ammonia. The calculated ammonia criteria include an acute criterion of 8.09 mg/L and a chronic criterion of 1.22 mg/L.

Table 9: Ammonia Criteria

Marine Un-ionized Ammonia Criteria Calculation

Calculation of seawater fraction of un-ionized ammonia from Hampson (1977). Un-ionized ammonia criteria for salt water are from EPA 440/5-88-004. Revised 19-Oct-93.

INPUT	
1. Receiving Water Temperature, deg C (90th percentile):	14.5
2. Receiving Water pH, (90th percentile):	8.0
3. Receiving Water Salinity, g/kg (10th percentile):	27.7
4. Pressure, atm (EPA criteria assumes 1 atm):	1.0
5. Unionized ammonia criteria (mg un-ionized NH_3 per liter) from EPA 440/5-88-004:	
Acute:	0.233
Chronic:	0.035
OUTPUT	
Using mixed temp and pH at mixing zone boundaries?	No
1. Molal Ionic Strength (not valid if >0.85):	0.567
2. pKa8 at 25 deg C (Whitfield model "B"):	9.311
3. Percent of Total Ammonia Present as Unionized:	2.4%
4. Total Ammonia Criteria (mg/L as NH_3):	
Acute:	9.84
Chronic:	1.48
RESULTS	
Total Ammonia Criteria (mg/L as N)	
Acute:	**8.09**
Chronic:	**1.22**

A reasonable potential calculation showed that the Solo Point WWTP discharge does not have reasonable potential to cause or contribute to an excursion of the water quality criteria for ammonia. Ammonia will be controlled indirectly by the proposed 3 mg/L TBEL for TIN, and twice weekly monitoring is proposed as part of monitoring for TIN (see Part 2.b.).

v. *Chlorine*

Applicable water quality criteria for chlorine are listed in Table 8. The facility now uses UV disinfection; however, chlorine is still measured at quantifiable concentrations in the effluent. According to the facility, the small measurable concentrations are likely a result of mild residual from the distribution water that enters the plant. As discussed in Part II.D, the single maximum daily effluent limit violation chlorine appears to be an outlier. A reasonable potential calculation showed that the discharge from the facility does not have the reasonable potential to cause or contribute to an excursion of the water quality criteria for chlorine. Therefore, the draft permit does not contain a WQBEL for chlorine. Since chlorine continues to be detected in the effluent, the draft permit proposes monthly monitoring for total residual chlorine.

vi. *Chloroform*

Chloroform was measured at a detectable level in the effluent. Applicable water quality criteria are listed in Table 8. The EPA has determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for chloroform, thus no effluent limits are proposed. The draft permit proposes continued monitoring for chloroform only in the requirements for reapplication.

vii. *DO, BOD_5, and Nitrogen*

Natural decomposition of organic material in wastewater effluent impacts DO in the receiving water at distances far outside of the regulated mixing zone. The BOD_5 concentration in an effluent sample indicates the amount of biodegradable material in the wastewater and estimates the magnitude of oxygen consumption the wastewater will generate in the receiving water. Discharges of BOD_5 in compliance with the TBELs are not expected to cause or contribute to an excursion of water quality criteria for DO.

Both Ecology and the EPA have recognized that there are nutrient-related DO impairments in Puget Sound. Ecology has identified nitrogen as a primary human source contributor to reduced DO concentrations. Total inorganic nitrogen (TIN) is the primary bioavailable component for algal growth which drives eutrophication and the existing DO impairments. In July 2017, Ecology launched the Puget Sound Nutrient Reduction Project to work on a collaborative plan to address human sources of nutrients in Puget Sound. In addition, Ecology refined the Salish Sea Model and concluded that all domestic WWTPs that discharge nitrogen to Puget Sound have reasonable potential to exceed the numeric DO criteria. The EPA has determined that the TBEL for TIN proposed in Part IV.A.2.b is sufficient to meet WQS.

viii. *Enterococci bacteria*

Applicable water quality criteria for enterococci are listed in Table 8.

There are no effluent data available for enterococci, as the WQS is new since the last issuance. The previous permit included effluent limits and monitoring requirements for fecal coliform (Table 2). However, the discharge has the reasonable potential to cause or contribute to excursions above WQS for enterococci because it is a discharge of treated sewage.

As stated above, the receiving water is listed as impaired due to elevated concentrations of enterococci. Therefore, there is no assimilative capacity to allow for a mixing zone for enterococci for this discharge and the applicable water quality criteria must be met at the point of discharge.

Regulations at 40 CFR 122.45(d)(2) require that effluent limitations for continuous discharges from POTWs be expressed as average monthly and average weekly limits, unless impracticable. Additionally, the terms "average monthly limit" and "average weekly limit" are defined in 40 CFR 122.2 as arithmetic (as opposed to geometric) averages. It is impracticable to properly implement a geometric mean criterion in a permit using monthly and weekly arithmetic average limits. The geometric mean of a given data set is equal to the arithmetic mean of that data set if and only if all of the values in that data set are equal. Otherwise, the geometric mean is always less than the arithmetic mean.

In order to ensure that the effluent limits are "derived from and comply with" the geometric mean water quality criterion, as required by 40 CFR 122.44(d)(1)(vii)(A), it is necessary to express the effluent limits as a monthly geometric mean limit of 30 CFU or MPN per 100 ml and a limit specifying that no more than 10 percent of samples may exceed 110 CFU or MPN per 100 ml.

ix. *Ethylene Glycol*

The previous permit required monitoring and reporting of ethylene glycol. The maximum effluent concentration of ethylene glycol is listed in Table 2. The State of Washington does not have numeric water quality criteria for ethylene glycol. The only numeric water quality criterion applicable to ethylene glycol in saltwater in the United States is a human health criterion for organisms only in Texas, which is 16,800 mg/L.

Since the maximum effluent concentration of ethylene glycol is 2 orders of magnitude lower than the only numeric criterion established by any U.S. state for this compound in saltwater, the EPA concludes that the discharge of ethylene glycol from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above Washington's narrative criterion for toxic substances (WAC-173-201A-260(2)(a)). No effluent limits are proposed and the EPA proposes to discontinue monitoring for ethylene glycol.

x. *Fecal Coliform*

Applicable water quality criteria for fecal coliform are listed in Table 9.

The State of Washington has promulgated a technology-based treatment standard for fecal coliform in WAC 173-221-040(2): "Fecal coliform limits shall not exceed a monthly geometric mean of 200 organisms/100 milliliters (mL), and a weekly geometric mean of 400 organisms per 100 mL." This standard was applied in the previous permit.

The 95th percentile weekly geometric mean effluent concentration is 26.5 MPN/100 mL and the weekly geometric mean treatment standard is 400 MPN/100 mL. The EPA has determined that even if the facility discharged at the treatment standard, the Solo Point WWTP would not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for fecal coliform.

As discussed above, the draft permit proposes to maintain the state treatment standards for fecal coliform of 200 MPN/100 mL average monthly limit and 400 MPN/100 mL average weekly limit.

xi. *Metals with Numeric Water Quality Criteria*

Antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc (total recoverable) were measured at quantifiable concentrations in the effluent. Applicable water quality criteria are listed in Table 8.

Ambient water quality data are available for arsenic (dissolved and inorganic), cadmium, copper, lead, mercury, and zinc. The EPA has determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for these metals, thus no effluent limits are proposed.

Ambient water quality data are not available for antimony, inorganic arsenic, chromium (III or VI), silver, or nickel. Ecology's Permit Writer's Manual specifies that if reliable background data on chemical concentrations are not available, the permit writer should use zero as a default value. For inorganic arsenic RPA analysis, the EPA assumed all effluent arsenic to be inorganic. With these methods, the EPA determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for antimony, inorganic arsenic, chromium, silver or nickel.

Furthermore, the 95th percentile effluent concentrations for antimony, chromium, and nickel are significantly lower than the criteria (chromium (VI) criteria), and the 95th percentile effluent concentration for silver is roughly half of the acute criterion (therse is no chronic criterion). Accordingly, no effluent limits are proposed.

Continued monitoring is proposed for metals for reapplication and pretreatment requirements.

xii. *Molybdenum*

Molybdenum was measured at quantifiable concentrations in the effluent. There are no numeric state WQS for molybdenum that are applicable to marine waters.

The maximum reported effluent concentration of molybdenum is less than the lowest effect concentration in the Ecotox database for effects to mortality, reproduction or growth of saltwater organisms, which is 31.2 µg/L, reported by Tabouret, et al. (2012) for the growth of great scallops. Therefore, no effluent limits are proposed. The draft permit proposes continued monitoring for molybdenum as part of the pretreatment requirements.

xiii. *Naphthalene*

Naphthalene was measured at quantifiable concentrations in the effluent. Applicable water quality criteria are listed in Table 8. Based on available data, naphthalene was not measured at detectable concentrations in the receiving water, so a receiving water concentration of zero was used in the RPA. The EPA has determined that the discharge from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above the applicable water quality criteria for naphthalene, thus no effluent limits are proposed.

xiv. *PBDEs*

The previous permit required influent and effluent monitoring for PBDE congeners. Only one monitoring event used a sensitive analytical method (EPA Method 1614) and occurred after the facility's 2016 upgrade. Effluent data are listed in Table 2. The state of Washington does not have numeric water quality criteria for PBDE. However, PBDE-47, PBDE-99, PBDE-153 and PBDE-209 have demonstrated human health toxicity, indicated in the EPA's Integrated Risk Information System (IRIS).

Because the PBDE congeners detected in the effluent are toxic but lack applicable water quality criteria that would allow for the calculation of WQBELs, the EPA proposes BMP requirements for PBDE. Specifically, the draft permit requires the facility to identify and control sources of PBDE in industrial discharges to the treatment works.

To track the effectiveness of BMPs to reduce discharges of PBDE, the draft permit proposes twice-per year monitoring of PBDE in the influent and effluent. This will result in 10 samples for PBDE congeners within the 5-year permit term, enough data to determine a standard deviation and mean with sufficient confidence (*TSD*).

xv. *pH*

Applicable water quality criteria, listed in Table 8, require pH values of the receiving water to be within the range of 7.0 to 8.5 while the federal TBELs limit pH in the effluent to 6.0 to 9.0.

The previous permit limited pH in the effluent to a range of 6.0 to 8.5. The effluent pH range (5th percentile to 95th percentile) falls within the range of the previous limits, so the EPA assessed reasonable potential using the lower and upper end of that range. The pH reasonable potential calculations use effluent alkalinity, for which there is no data for the facility. The EPA used an alkalinity value that is an average from Washington major WWTPs.

The EPA determined that there is no reasonable potential to exceed the applicable water quality criteria if the permittee continues to comply with the previous permit's limit. Calculations are shown in Appendix D.

xvi. *Phosphorus*

The previous permit required monthly monitoring and reporting of phosphorus. The State of Washington does not have numeric water quality criteria for phosphorus.

As stated above, TIN has been selected as the nutrient indicator pollutant because TIN is the primary bioavailable component for algal growth in estuarine environments, which drives eutrophication and the existing DO impairments. Thus, the permit does not propose effluent limits for phosphorus. However, studies have suggested that phosphorus may also play a role in marine eutrophication (Conley, et al., 2009; Howarth & Marino, 2006).

POTWs with design flows greater than or equal to 0.1 mgd are required to report data for total phosphorus on the application for renewal of the NPDES permit. Since the JBLM Solo Point WWTP (an FOTW) has a treatment process and wastewater sources nearly identical to those of a POTW, the draft permit proposes twice-per-year effluent monitoring of total phosphorus. This will result in 10 samples for total phosphorus within the 5-year permit term, enough data to determine a standard deviation and mean with sufficient confidence (*TSD*).

xvii. *Propylene Glycol*

The previous permit required monitoring and reporting of propylene glycol. The maximum effluent concentration of propylene glycol is listed in Table 2. The State of Washington does not have numeric water quality criteria for propylene glycol, and no US state has numeric water quality criteria for propylene glycol which are applicable to saltwater.

The maximum effluent concentration is less than the no observed effect concentration in the Ecotox database for effects to mortality, reproduction or growth of saltwater organisms, which is 1000 mg/L, an LC0 (equivalent to an NOEC in this study) in this case reported by Adema (1987) for the leach *Chaetogammarus marinus*. Since the maximum effluent concentration of

propylene glycol is less than the lowest effect concentration in the Ecotox database for effects to mortality, reproduction or growth of saltwater organisms, EPA concludes that the discharge of propylene glycol from the Solo Point WWTP does not have the reasonable potential to cause or contribute to excursions above Washington's narrative criterion for toxic substances (WAC-173-201A-260(2)(a)). Therefore, no effluent limits are proposed and the EPA proposes to discontinue monitoring for propylene glycol.

xviii. *Temperature*

Effluent data for temperature are listed in Table 2, and applicable water quality criteria for temperature are listed in Table 8. The EPA has determined that the discharge of heat from the Solo Point WWTP causes a negligible change in the temperature of the receiving water and therefore does not have the reasonable potential to cause or contribute to excursions above WQS for temperature. Continued daily monitoring is included in the draft permit.

xix. *Total Petroleum Hydrocarbons*

The previous permit required monitoring and reporting of total petroleum hydrocarbons. The maximum effluent concentration of total petroleum hydrocarbons is listed in Table 2. The State of Washington does not have numeric water quality criteria for total petroleum hydrocarbons, and no US state has numeric water quality criteria for total petroleum hydrocarbons which are applicable to saltwater. However, the State of South Dakota does have a total petroleum hydrocarbons criterion of 10 mg/L for fish and wildlife propagation, recreation, and stock watering. This is identical to the TBEL for TPH proposed in the draft permit; therefore, a WQBEL is not proposed for TPH.

xx. *Whole Effluent Toxicity*

EPA and individual states implement three approaches to protect water quality. These approaches include chemical-specific control, toxicity testing control (i.e., whole effluent toxicity testing), and biological criteria/bioassessments (USEPA, 1991).

WET requirements in NPDES permits protect aquatic life from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests use small vertebrate and invertebrate species and/or plants to measure the aggregate toxicity of an effluent. The end point and results of WET tests are typically reported in acute and chronic toxic units, TUa and TUc, respectively. The TUa and TUc test results are treated the same as other reported permit

parameters and used in the same manner in the *TSD* calculations for determining reasonable potential and establishing WQBELs for WET.

As listed in Table 8, Washington WQS require that toxic, radioactive, or deleterious material concentrations must be below those which have the potential, either singularly or cumulatively, to adversely affect characteristic water uses, cause acute or chronic conditions to the most sensitive biota dependent upon those waters, or adversely affect public health. The previous permit required monitoring for whole effluent toxicity (WET). The monitoring results demonstrated no chronic or acute toxicity per the toxicity tests described in the previous permit. However, all of the monitoring occurred prior to the facility's upgrades in 2016. As such, the available WET data are not representative of the current treatment plant's effluent quality. Thus, the EPA has not used the WET data collected under the terms of the previous permit to conduct a RPA for WET.

The *TSD* provides guidance on determining reasonable potential to exceed criteria without effluent data in Section 3.2. Factors to consider include dilution, type of industry, existing data on toxic pollutants, history of compliance problems and toxic impact, and type of receiving water and designated use.

Given that substantial dilution is available (Table 7), that the facility does not have the reasonable potential to cause or contribute to excursions above water quality criteria for any toxic pollutants, there have been no violations of any effluent limits for toxic pollutants since late 2016, and monitoring demonstrated no toxicity prior to facility upgrades, the EPA concludes that the facility does not have the reasonable potential to cause or contribute to excursions above Washington's water quality criterion for toxicity.

Continued effluent monitoring for WET is nonetheless necessary to ensure that representative WET effluent data are available when the permit is reissued. The previous permit required both acute and chronic WET testing for reapplication, however, the draft permit proposes annual chronic WET monitoring. Chronic WET monitoring is required instead of acute because the chronic dilution factor is < 1:100 (Table 7). See the *TSD* at Section 3.3.3. The WET monitoring is required to occur on a rotating quarterly schedule.

c. Antibacksliding

CWA § 402(o) and 40 CFR §122.44(l) generally prohibit the renewal, reissuance or modification of an existing NPDES permit that contains effluent limits, permit conditions or standards that are less stringent than those established in the previous permit (i.e., anti-backsliding) but provides limited exceptions. For explanation of the antibacksliding exceptions refer to Chapter 7 of the EPA's Permit Writers' Manual *Final Effluent Limitations and Anti-backsliding* (2010a).

An anti-backsliding analysis was done for chlorine. The previous permit's chlorine effluent limits were WQBELs. As shown in Exhibit 7-2 of the EPA's Permit Writers' Manual (2010a) effluent limitations based on state standards may be revised based on Sections 303(d)(4) or 402(o)(2) of the CWA.

In this case, CWA Section 402(o)(2)(A) is applicable. After the previous permit was issued, the facility was upgraded with UV disinfection, so chlorine is no longer used to disinfect the effluent. This is a material and substantial alteration to the permitted facility. This alteration justifies the removal of the chlorine effluent limits because the source of chlorine in the discharge has been removed.

The removal of the chlorine limits also complies with antidegradation requirements, because, due to the absence of a source of chlorine in the discharge, the removal of chlorine limits will not result in increased discharges of chlorine, and therefore will not result in lower water quality.

4. Additional Effluent Monitoring

a. PFAS

Per- and polyfluoroalkyl substances (PFAS) are a group of synthetic chemicals that have been in use since the 1940s. PFAS are found in a wide array of consumer and industrial products. Due to their widespread use and persistence in the environment, most people in the United States have been exposed to PFAS. Discharges of PFAS above certain levels may cause adverse effects to human health or aquatic life (USEPA, 2019; USEPA, 2022a). PFAS-related criteria for human health and aquatic life, however, have not yet been developed, thus WQS have not yet been established. As a result, developing numeric effluent limits at this time is infeasible.

In August 2020, JBLM finalized a Preliminary Assessment/Site Inspection report to assess if PFAS have been released to the environment on the base (JBLM, 2020). The Assessment identified 52 known/potential PFAS use, storage or disposal sites, including fire-fighting training, firefighting equipment testing/storage areas, emergency responses in hangars with aqueous film-forming foam (AFFF) fire suppression systems, AFFF storage areas, historical waterproofing operations, vehicle wash rack operations, laundry operations, and landfills. Of the identified areas, vehicle wash rack operations are included among the list of industrial users (IUs) of the treatment works at Solo Point, per past pretreatment reports.

Since PFAS chemicals are persistent in the environment and may lead to adverse human health and environmental effects, consistent with the EPA's Memorandum entitled "Addressing PFAS Discharges in NPDES Permits and Through the Pretreatment Program and Monitoring Programs" (2022b), and because known IUs may discharge PFAS, the draft permit requires that the

permittee conduct quarterly influent, effluent, and sludge sampling for PFAS chemicals.

The draft permit also requires that the permittee inventory the IUs of the treatment works, to identify industrial users of the treatment works that may discharge PFAS chemicals to the collection system. The draft permit proposes to require that the permittee sample the IUs identified as potential PFAS sources at least once per year. The permittee must require IUs with detectable PFAS to implement BMPs to reduce or eliminate PFAS discharges to the facility.

The purpose of these monitoring and reporting requirements is to better understand potential discharges of PFAS from this facility and to inform future permitting decisions, including the potential development of WQBELs or local limits for IUs. The EPA is authorized to require this monitoring and reporting by CWA section 308(a). The permit conditions reflect the EPA's commitments in the PFAS Strategic Roadmap, which directs the Office of Water to leverage NPDES permits to reduce PFAS discharges to waterways "at the source and obtain more comprehensive information through monitoring on the sources of PFAS and quantity of PFAS discharged by these sources."

There is currently no analytical method approved in 40 CFR Part 136 for PFAS. As stated in 40 CFR 122.44(i)(1)(iv)(B), in the case of pollutants or pollutant parameters for which there are no approved methods under 40 CFR Part 136 or methods are not otherwise required under 40 CFR chapter I, subchapter N or O, monitoring shall be conducted according to a test procedure specified in the permit for such pollutants or pollutant parameters. Therefore, the Permit specifies that until there is an analytical method approved in 40 CFR Part 136 for PFAS, monitoring shall be conducted using EPA Method 1633A.

b. Monitoring Requirements for Renewal

The permit also requires the permittee to perform effluent monitoring required by Tables B, C, D, and E of the NPDES Form 2A application, so that these data will be available when the permittee applies for a renewal of its NPDES permit. See also Appendix J to 40 CFR Part 122.

POTW applicants with a design flow of at least 1 mgd or that have or must develop a pretreatment program must sample and analyze for any pollutants with applicable WQS, in addition to the pollutants listed in Table B and Table C of NPDES Application Form 2A (40 CFR 122.21(j)(4)(iv)). Although the JBLM Solo Point WWTP is not a POTW, since its treatment process and wastewater sources are nearly identical to a POTW, the EPA will require the same monitoring.

The previous permit required monitoring for the pollutants listed in Appendix J, Table 2 of 40 CFR 122, but did not require monitoring for some pollutants not listed therein but for which there are applicable WQS. Such pollutants are listed in Table 11, below, and Table 2 of the draft permit. The permittee must sample

and analyze for the pollutants listed in Table 2 of the draft permit and report the results in Table D of Form 2A and on appropriate DMRs.

Table 10: Pollutants with applicable WQS not listed in Appendix J, Table 2 of 40 CFR 122

2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD)	4,4'-DDD
4,4'-DDE	4,4'-DDT
Aldrin	Alpha-BHC
Alpha-endosulfan	Beta-BHC
Beta-endosulfan	Chlordane
Chlorpyrifos	Dieldrin
Endosulfan sulfate	Endrin
Endrin Aldehyde	Heptachlor
Heptachlor epoxide	Lindane
Total polychlorinated biphenyls (PCBs)	Toxaphene

B. Surface Water Monitoring

In general, surface water monitoring may be required for pollutants of concern to assess the assimilative capacity of the receiving water for the pollutant. In addition, surface water monitoring may be required for pollutants for which the water quality criteria are dependent and to collect data for TMDL development if the facility discharges to an impaired water body.

The draft permit requires ambient monitoring for five parameters (Part I.C of the permit). The permittee must conduct monthly monitoring for DO, ammonia, temperature, pH, and salinity within the receiving water from May through October (the critical season) each year, beginning the first May of the permit term. These data will be used to better characterize the immediate receiving water for parameters with no or old ambient data. Specifically, the EPA aims to understand the local DO conditions, calculate more accurate site-specific ammonia criteria, and conduct an RPA for ammonia during the next permit development process.

Surface water measurements must be at a consistent location in the receiving water, nearby, but outside of, the effluent chronic mixing zone (which is described in Table 7).

Table 12 summarizes the proposed surface water monitoring requirements for the draft permit. Surface water monitoring results must be submitted with the DMR.

Table 11. Surface Water Monitoring in Draft Permit

Parameter	Units	Monitoring Frequency	Sample Type
DO	mg/L	1/month, May to October	Grab
Ammonia (as N)	mg/L	1/month, May to October	Grab
Temperature	°C	1/month, May to October	Grab

pH	s.u.	1/month, May to October	Grab
Salinity	ppt	1/month, May to October	Grab

C. Electronic Submission of Discharge Monitoring Reports

The draft permit requires that the permittee submit DMR data electronically using NetDMR. NetDMR is a national web-based tool that allows DMR data to be submitted electronically via a secure Internet application.

The EPA currently conducts free training on the use of NetDMR. Further information about NetDMR, including upcoming trainings and contacts, is provided on the following website: https://netdmr.epa.gov.

D. Sludge (Biosolids) Requirements

EPA Region 10 separates wastewater and sludge permitting. The EPA has authority under the CWA to issue separate sludge-only permits for the purposes of regulating biosolids. The EPA may issue a sludge-only permit to each facility at a later date, as appropriate.

Until future issuance of a sludge-only permit, sludge management and disposal activities at each facility continue to be subject to the national sewage sludge standards at 40 CFR Part 503 and any requirements of the State's biosolids program. The Part 503 regulations are self-implementing, which means that facilities must comply with them whether or not a permit has been issued.

V. Other Permit Conditions

A. Quality Assurance Plan

American Water Military Services Joint Base Lewis McChord is required to update the Quality Assurance Plan (QAP) within 180 days of the effective date of the permit. The QAP must consist of standard operating procedures the permittee must follow for collecting, handling, storing and shipping samples, laboratory analysis, and data reporting. The plan must be retained on site and made available to the EPA upon request.

B. Operation and Maintenance Plan

The permit requires American Water Military Services Joint Base Lewis McChord to properly operate and maintain all facilities and systems of treatment and control. Proper operation and maintenance is essential to meeting discharge limits, monitoring requirements, and all other permit requirements at all times. The permittee is required to develop and implement an operation and maintenance plan for their facility within 180 days of the effective date of the permit. The plan must be retained on site and made available to the EPA upon request.

C. Sanitary Sewer Overflows (SSOs) and Proper Operation and Maintenance of the Collection System

SSOs are not authorized under this permit. The permit contains language to address SSO reporting and public notice and operation and maintenance of the collection system. The permit requires that the permittee identify SSO occurrences and their causes. In addition, the permit establishes reporting, record keeping and third-party notification of SSOs. Finally, the permit requires proper operation and maintenance of the collection system.

The following specific permit conditions apply:

Immediate Reporting – The permittee is required to notify the EPA of an SSO within 24 hours of the time the permittee becomes aware of the overflow. (See 40 CFR 122.41(l)(6))

Written Reports – The permittee is required to provide the EPA a written report within five days of the time it became aware of any overflow that is subject to the immediate reporting provision. (See 40 CFR 122.41(l)(6)(i)).

Third Party Notice – The permit requires that the permittee establish a process to notify specified third parties of SSOs that may endanger health due to a likelihood of human exposure; or unanticipated bypass and upset that exceeds any effluent limitation in the permit or that may endanger health due to a likelihood of human exposure. The permittee is required to develop, in consultation with appropriate authorities at the local, county, tribal and/or state level, a plan that describes how, under various overflow (and unanticipated bypass and upset) scenarios, the public, as well as other entities, would be notified of overflows that may endanger health. The plan should identify all overflows that would be reported and to whom, and the specific information that would be reported. The plan should include a description of lines of communication and the identities of responsible officials. (See 40 CFR 122.41(l)(6)).

Record Keeping – The permittee is required to keep records of SSOs. The permittee must retain the reports submitted to the EPA and other appropriate reports that could include work orders associated with investigation of system problems related to a SSO, that describes the steps taken or planned to reduce, eliminate, and prevent reoccurrence of the SSO. (See 40 CFR 122.41(j)).

Proper Operation and Maintenance – The permit requires proper operation and maintenance of the collection system. (See 40 CFR 122.41(d) and (e)). SSOs may be indicative of improper operation and maintenance of the collection system. The permittee may consider the development and implementation of a capacity, management, operation and maintenance (CMOM) program.

The permittee may refer to the Guide for Evaluating Capacity, Management, Operation, and Maintenance (CMOM) Programs at Sanitary Sewer Collection Systems (EPA 305-B-05-002). This guide identifies some of the criteria used by EPA inspectors to evaluate a collection system's management, operation and maintenance program activities.

Owners/operators can review their own systems against the checklist (Chapter 3) to reduce the occurrence of sewer overflows and improve or maintain compliance.

D. Pretreatment Requirements

The proposed permit requires the implementation of a pretreatment program at JBLM Solo Point. The objectives of the pretreatment program are: 1) to prevent the introduction of pollutants to the treatment system that will interfere with the plant's operation, that could pass untreated through the system and contribute to water quality problems, or otherwise be incompatible with the treatment plant, and 2) to improve opportunities to reclaim and recycle domestic and industrial wastewater and sludges.

During April and May of 2006, records indicate that at least one sizeable petroleum hydrocarbon slug made its way into the treatment plant, impacting the quality of the biosolids. The facility subsequently developed a Memorandum of Understanding with Ecology whereby a pretreatment program would be established at JBLM Solo Point. As noted in the Army Corps of Engineers' Protocol for the Preparation of Installation Pretreatment Programs, Army installations are not required to have pretreatment programs pending further interpretation of the Federal Facility Compliance Act (FFCA). However, JBLM Solo Point has taken the initiative to develop, with assistance from Ecology, a pretreatment program consistent with guidelines for POTWs in 40 CFR Part 403 in order to obtain and maintain compliance with the requirements of Section 108 of the FFCA (FFCA-108).

Under the federal Solid Waste Disposal Act (SWDA), there is an exclusion from the definition of solid waste and therefore the definition of hazardous waste (HW) for mixtures of domestic sewage and other wastes that discharge to a POTW. The EPA further expanded this exclusion (40 CFR 261.4) to include industrial wastewater point source discharges permitted under Section 402 of the Clean Water Act (CWA). FFCA-108 grants conditional HW exclusion for mixtures of HW and domestic sewage discharged to a FOTW when one of several conditions is met, including the condition that the discharge is subject to a pretreatment standard issued under the CWA and it is in compliance with the standard (1992). JBLM Solo Point has modeled its pretreatment program procedures on 40 CFR Part 403, thus meeting the criteria of a pretreatment program as required by the FFCA for the conditional HW exclusion.

In addition to obtaining the conditional HW exclusion for mixtures of HW and domestic sewage discharged to the FOTW, implementing the pretreatment program will help protect the quality of biosolids at the FOTW. Protecting the biosolids with a pretreatment program can decrease sludge disposal costs, achieve a higher classification of biosolids, or simply help to maintain compliance with limits set according to the biosolids rule (40 CFR Part 503).

Furthermore, Army Regulation 200-1 requires that discharges to Army treatment plants comply with pretreatment standards (2007).

Army Regulation 200-1. Chapter 4, Section 4-1.e.(4): Wastewater Program Requirements:

(a) Obtain and comply with NPDES and/or State discharge permits, to include all required plans. (LD: 40 CFR 122);

(b) Ensure that discharges from industrial activities to FOTWs and POTWs comply with the substantive pretreatment requirements applicable to POTWs under the CWA. (LD: 40 CFR 403);

(c) Develop pretreatment programs as required to ensure FOTWs meet NPDES permit requirements and to improve opportunities for reuse of wastewater effluent and sewage sludge. (LD: 40 CFR 403).

The draft permit requires the permittee to implement a pretreatment program in accordance with the general pretreatment regulations at 40 CFR Part 403.

Ongoing pretreatment monitoring of influent, effluent, and sludge is required for parameters confirmed present following priority pollutant effluent scans, as well as TPH and other parameters of particular interest.

Background on the pretreatment program may be found in the *Introduction to the National Pretreatment Program* (USEPA, 2011).

E. Standard Permit Provisions

Permit Parts III, IV, and V contain standard regulatory language that must be included in all NPDES permits. The standard regulatory language covers requirements such as monitoring, recording, and reporting requirements, compliance responsibilities, and other general requirements.

VI. Other Legal Requirements

A. Endangered Species Act

The Endangered Species Act requires federal agencies to consult with the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) if their actions could beneficially or adversely affect any threatened or endangered species. The EPA completed consultation with the Services in 2010 during the previous issuance of the permit.

USFWS concurred with the EPA's determination that the permitted activities "may affect, not likely to adversely affect" bull trout (*Salvelinus confluentus)* and their critical habitat.

NMFS did not concur with EPA's determination that the permitted activities "may affect, not likely to adversely affect" threatened Puget Sound Chinook salmon (*Oncorhynchus tshawytscha*) and their critical habitat, threatened Puget Sound steelhead (*O. mykiss*), and endangered Southern Resident killer whales (*Orcinus orca*) and their critical habitat. In their Biological Opinion (BiOp), NMFS concluded that the proposed action "may

affect, likely to adversely affect" these species and critical habitats. NMFS also concluded that, given the action would occur after the effective listing date for several species of rockfish, the permitted activities "may affect, likely to adversely affect" threatened Puget Sound/Georgia Basin yelloweye rockfish (*Sebastes ruberrimus*), Puget Sound/Georgia Basin canary rockfish (*S. pinniger*), and endangered Puget Sound/Georgia Basin Bocaccio (*S. paucispinis*).

The BiOp included an Incidental Take Statement (ITS), with the following Reasonable and Prudent Measure (RPM) and Terms and Conditions (T&Cs) to implement the RPM.

- RPM 1: Minimize incidental take from exposure to constituents found in the Solo Point Wastewater Treatment Plant effluent being discharged into Puget Sound.
    - T&C 1: Provide NMFS with the PBDE and other effluent constituent monitoring reports, including average flow rates, to ensure that the expected PBDE concentrations in the effluent and consequential PBDE loading into Puget Sound falls within the range and extent of take specified in the ITS.
    - T&C 2: Implement all conservation measures that are part of the proposed action in a timely manner, as specified by the timeline for completion in the conservation measures included in the proposed action.

Based on monitoring provided by the facility, PBDE in the effluent and flow rates are within the range specified by the ITS (0.165 kg/yr and 7 mgd, respectively).

The EPA is currently evaluating updates to the conclusions of the previous consultation and will complete consultation with the Services prior to taking final action on the draft permit.

B. Essential Fish Habitat

Essential fish habitat (EFH) is the waters and substrate (sediments, etc.) necessary for fish to spawn, breed, feed, or grow to maturity. The Magnuson-Stevens Fishery Conservation and Management Act (January 21, 1999) requires the EPA to consult with NMFS when a proposed discharge has the potential to adversely affect EFH (i.e., reduce quality and/or quantity of EFH). A review of the EFH documents shows that the receiving water is EFH for coastal pelagic species and groundfish.

The EFH regulations define an adverse effect as any impact which reduces quality and/or quantity of EFH and may include direct (e.g. contamination or physical disruption), indirect (e.g. loss of prey, reduction in species' fecundity), site specific, or habitat-wide impacts, including individual, cumulative, or synergistic consequences of actions. In its Biological Opinion issued during consultation on the previous permit, NMFS concluded that the permitted activities would have adverse effects to EFH designated for Puget Sound Chinook salmon, Puget Sound/Georgia Basin yelloweye rockfish, canary rockfish, and bocaccio rockfish and provided the EPA with EFH

conservation recommendations. Upgrades to the facility, the proposed permit, and the EPA's consultation procedures in Puget Sound have made progress toward achieving several of the recommendations. Specifically, the facility has transitioned from chlorine to UV disinfection, which fulfills the first recommendation; the proposed permit includes TIN limits that will require the facility to "utilize state of the art treatment that would remove nitrogen, phosphorus, PBDEs and [pharmaceuticals and personal care products] to the greatest extent possible", fulfilling the second recommendation.

The EPA is currently evaluating updates to the conclusions of the previous EFH assessment and will complete consultation with NMFS prior to taking final action on the draft permit.

C. CWA § 401 Certification

CWA § 401 requires the EPA to seek certification before issuing a final permit. As a result of the certification, Ecology may require more stringent permit conditions or additional monitoring requirements to ensure that the permit complies with WQS, or treatment standards established pursuant to any State law or regulation. Since this facility discharges to waters of the state of Washington, Ecology is the certifying authority. The EPA will seek State certification and include any resulting permit conditions (if applicable) in the final documents.

D. Antidegradation

The EPA is required under Section 301(b)(1)(C) of the Clean Water Act (CWA) and implementing regulations (40 CFR 122.4(d) and 122.44(d)) to establish conditions in NPDES permits that ensure protection of state WQS, including antidegradation requirements. The EPA has prepared an antidegradation analysis consistent with Ecology's antidegradation implementation procedures. The EPA referred to Washington's antidegradation policy (WAC 173-201A-300)

There are three tiers of antidegradation protection, as described below:

- Tier I ensures existing and designated uses are maintained and protected and applies to all waters and all sources of pollution.
- Tier II ensures that waters of a higher quality than the criteria assigned are not degraded unless such lowering of water quality is necessary and in the overriding public interest. Tier II applies only to a specific list of polluting activities.
- Tier III prevents the degradation of waters formally listed as "outstanding resource waters," and applies to all sources of pollution.

<u>Tier I</u>

The receiving water for the Solo Point WWTP is Puget Sound (Solo Point) thus the anti-degradation analysis was completed for this receiving water body. Accordingly, the EPA will use the designated criteria for this water body in the draft permit. The discharges authorized by this draft permit will not cause a loss of beneficial uses.

The effluent limits in the draft permit ensure compliance with applicable numeric and narrative water quality criteria. The numeric and narrative water quality criteria are set at levels that ensure protection of the designated uses. As there is no information indicating the presence of existing beneficial uses other than those that are designated, the draft permit ensures a level of water quality necessary to protect the designated uses and, in compliance with WAC 173-201A-310 and 40 CFR 131.12(a)(1), also ensures that the level of water quality necessary to protect existing uses is maintained and protected.

If the EPA receives information during the public comment period demonstrating that there are existing uses for which the receiving water is not designated, the EPA will consider this information before issuing a final permit and will establish additional or more stringent permit conditions if necessary to ensure protection of existing uses.

Tier II

Tier II antidegradation applies to expanded actions. The Washington Tier II Guidance defines an "expanded action" as:

- A physical expansion of the facility (production or wastewater system expansions with a potential to allow an increase the volume of wastewater or the amount of pollution) or activity.
- An increase (either monthly average or annual average) to an existing permitted concentration or permitted effluent mass limit (loading) to a water body greater than 10%.
- The act of re-rating the capacity of an existing plant greater than 10%.

Although the facility has been upgraded since the previous permit was issued, it has not been expanded and there are no limits in the draft permit that are less stringent than those in the previous permit. Chlorine limits have been deleted, but as explained above, there is no longer a source of chlorine in the discharge and the deletion of the limits will not result in an increased discharge. Thus, the reissuance of this permit is not an expanded action and a Tier II antidegradation review is not necessary.

Tier III

A Tier III antidegradation analysis is not necessary because the receiving water has not been designated as an Outstanding Resource Water (WAC 173-201A-330).

E. Permit Expiration

The permit will expire five years from the effective date.

Parameter	Effluent Limitations				Monitoring Requirements		
	Average Monthly Limit	Average Weekly Limit	Maximum Daily Limit	Instantaneous Maximum Limit	Sample Location	Sample Frequency	Sample Type
Whole Effluent Toxicity (WET) Testing	---	---	---	---	Effluent	Acute Tests: January 2013 and July 2013 and Chronic Tests April 2013 and October 2013	24-hr
Pretreatment Parameters, Set 1[f]: Priority pollutant metals, TPH, and cyanide	---	---	10 mg/L, TPH	---	Influent Effluent Digested Sludge	Quarterly[d] Quarterly[d] 1 taken w/in 30 days of inf. sample[g]	Composite (TPH & cyanide grab)[e] Composite (TPH & cyanide grab)[e] Grab
Pretreatment Parameters, Set 2[f]: Priority pollutant organics	---	---	---	---	Influent Effluent Digested Sludge	Annually[d] Annually[d] 1 taken w/in 30 days of inf. sample[g]	Composite[e] Composite[e] Grab
Polybrominated diphenyl ethers (PBDEs)	---	---	---	---	Influent Effluent	Quarterly (during the first full year & year 5 of the 5-yr permit cycle).	Grab
Sludge Monitoring (for land application)	Abide by the limitations and monitoring requirements established by 40 CFR Part 503[k].						

a.) Samples for BOD5 analysis may be taken before or after the disinfection process. If taken after, the sample must be dechlorinated and reseeded.

b.) Average monthly fecal coliform count must not exceed a geometric mean of 200/100 ml. The average weekly fecal coliform count must not exceed a geometric mean of 400/100 ml. See [Permit] Part V for a definition of geometric mean. The fecal coliform sample must be taken concurrently with Total Residual Chlorine (before dechlorination). Reporting is required within 24 hours of a maximum daily limit or instantaneous maximum limit violation. See [Permit] Section I.B.2. and III.G.

c.) Sampled after dechlorination.

d.) The days selected for routine sampling shall be rotated annually or quarterly (e.g., first quarter sample Monday, second quarter sample Tuesday, etc. during normal operating hours). The influent and effluent must be sampled on days when industrial and commercial discharges are occurring at normal to maximum levels.

e.) Cyanide, Volatile Organics and Phenols must be taken as a minimum of 2 grab samples and separately analyzed in place of each 24 hour composite. Cyanide grab samples shall consist of a minimum of two samples collected at intervals of 15 minutes or greater within a 24-hour period (with the maximum of the two values reported). TPH must also be taken as a grab sample set (one grab for NWTPH-Gx and one grab for NWTPH-Dx).

f.) The Set 1 and Set 2 Pretreatment Parameters lists are contained in [Permit] Section I.B.9 below and reflect the priority pollutant wastewater characterization results submitted with the permit application. **Monitoring should also address any additional pollutants expected from nondomestic sources.**

Parameter	Effluent Limitations				Monitoring Requirements		
	Average Monthly Limit	Average Weekly Limit	Maximum Daily Limit	Instantaneous Maximum Limit	Sample Location	Sample Frequency	Sample Type

g.) The timing of the sludge sample relative to the associated influent sample should reflect the solids retention time in the digester. Sludge samples must be analyzed using NWTPH methods as noted in the other TPH monitoring permit requirements.

h.) The effluent nutrient sampling parameters are continued from the previous permit, however the frequency was increased from semi-annual to monthly sampling.

i.) Temperature monitoring should occur during the time of day when effluent temperatures are expected to be at their highest. Report results to the EPA monthly with the DMR.

j.) Where applicable, effluent monitoring required by other conditions of this permit (e.g. equivalent pretreatment monitoring) may be used to satisfy this requirement.

k.) Until future issuance of a sludge-only permit, sludge management and disposal activities at the facility continue to be subject to the national sewage sludge standards at 40 CFR Part 503. These regulations are self-implementing; therefore, permittees must comply with them whether or not a permit has been issued.

l.) Percent removal of BOD and TSS is calculated as follows (concentrations in mg/L): (Average Monthly Influent Concentration - Average Monthly Effluent Concentration) / Average Monthly Influent Concentration.

Appendix E. Reasonable Potential and WQBEL Formulae

A. Reasonable Potential Analysis

EPA uses the process described in the *TSD* to determine reasonable potential. To determine if there is reasonable potential for the discharge to cause or contribute to an exceedance of water quality criteria for a given pollutant, EPA compares the maximum projected receiving water concentration to the water quality criteria for that pollutant. If the projected receiving water concentration exceeds the criteria, there is reasonable potential, and a WQBEL must be included in the permit.

1. Mass Balance

For discharges to non-flowing water bodies, the maximum projected receiving water concentration is determined using the following mass balance equation:

$$C_d = \frac{C_e - C_u}{D} + C_u \qquad \textit{Equation 1}$$

where,

C_d	=	Receiving water concentration downstream of the effluent discharge (that is, the concentration at the edge of the mixing zone)
C_e	=	Maximum projected effluent concentration
C_u	=	95th percentile measured receiving water upstream concentration
D	=	Dilution factor

If the criterion is expressed as dissolved metal, the effluent concentrations are measured in total recoverable metal and must be converted to dissolved metal as follows:

$$C_d = \frac{CF \times C_e - C_u}{D} + C_u \qquad \textit{Equation 2}$$

Where C_e is expressed as total recoverable metal, C_u and C_d are expressed as dissolved metal, and CF is a conversion factor used to convert between dissolved and total recoverable metal.

The above equations for C_d are the forms of the mass balance equation which were used to determine reasonable potential and calculate wasteload allocations.

If a mixing zone is not allowed, dilution is not considered when projecting the receiving water concentration and,

$$C_d = C_e \qquad \textit{Equation 3}$$

2. Maximum Projected Effluent Concentration

When determining the projected receiving water concentration downstream of the effluent discharge, EPA's *TSD* recommends using the maximum projected effluent concentration (C_e) in the mass balance calculation. To determine the maximum projected effluent concentration (C_e) EPA has developed a statistical approach to better characterize the effects of effluent variability. The approach combines knowledge of effluent variability as estimated by a coefficient of variation (CV) with the uncertainty due to a limited number of data to project an estimated maximum concentration for the effluent. Once the CV for each pollutant parameter has been calculated, the reasonable potential multiplier (RPM) used to derive the maximum projected effluent concentration (C_e) can be calculated using the following equations:

First, the percentile represented by the highest reported concentration is calculated.

$$p_n = (1 - \text{confidence level})^{1/n} \qquad \textit{Equation 4}$$

where,

p_n = the percentile represented by the highest reported concentration

n = the number of samples

confidence level = 99% = 0.99

and

$$RPM = \frac{C_{99}}{C_{P_n}} = \frac{e^{Z_{99} \times \sigma - 0.5 \times \sigma^2}}{e^{Z_{P_n} \times \sigma - 0.5 \times \sigma^2}} \qquad \textit{Equation 5}$$

Where,

σ^2 = $\ln(CV^2 + 1)$

Z_{99}	=	2.326 (z-score for the 99th percentile)
Z_{Pn}	=	z-score for the P_n percentile (inverse of the normal cumul distribution function at a given percentile)
CV	=	coefficient of variation (standard deviation ÷ mean)

The maximum projected effluent concentration is determined by simply multiplying the maximum reported effluent concentration by the RPM:

$$C_e = (RPM)(MRC) \qquad \textit{Equation 6}$$

where MRC = Maximum Reported Concentration

3. Maximum Projected Effluent Concentration at the Edge of the Mixing Zone

Once the maximum projected effluent concentration is calculated, the maximum projected effluent concentration at the edge of the acute and chronic mixing zones is calculated using the mass balance equations presented previously.

4. Reasonable Potential

The discharge has reasonable potential to cause or contribute to an exceedance of water quality criteria if the maximum projected concentration of the pollutant at the edge of the mixing zone exceeds the most stringent criterion for that pollutant.

B. WQBEL Calculations

1. Calculate the Wasteload Allocations (WLAs)

Wasteload allocations (WLAs) are calculated using the same mass balance equations used to calculate the concentration of the pollutant at the edge of the mixing zone in the RPA. To calculate the wasteload allocations, C_d is set equal to the acute or chronic criterion and the equation is solved for C_e. The calculated C_e is the acute or chronic WLA. Equation 6 is rearranged to solve for the WLA, becoming:

$$C_e = WLA = D \times (C_d - C_u) + C_u \qquad \textit{Equation 7}$$

Washington's water quality criteria for some metals are expressed as the dissolved fraction, but the Federal regulation at 40 CFR 122.45(c) requires that effluent limits be expressed as total recoverable metal. Therefore, EPA must calculate a wasteload allocation in total recoverable metal that will be protective of the dissolved criterion. This is accomplished by dividing the WLA expressed as dissolved by the criteria translator, as shown in equation __. As discussed in Appendix ___, the criteria translator (CT) is equal to the conversion factor, because site-specific translators are not available for this discharge.

$$C_e = WLA = \frac{D \times (C_d - C_u) + C_u}{CT} \qquad \textit{Equation 8}$$

The next step is to compute the "long term average" concentrations which will be protective of the WLAs. This is done using the following equations from EPA's *TSD*:

$$LTA_a = WLA_a \times e^{(0.5\sigma^2 - z\,\sigma)} \qquad \textit{Equation 9}$$

$$LTA_c = WLA_c \times e^{(0.5\sigma_4^2 - z\sigma_4)} \qquad \textit{Equation 10}$$

where,

σ^2 = $\ln(CV^2 + 1)$

Z_{99} = 2.326 (z-score for the 99th percentile probability basis)

CV = coefficient of variation (standard deviation ÷ mean)

σ_4^2 = $\ln(CV^2/4 + 1)$

For ammonia, because the chronic criterion is based on a 30-day averaging period, the Chronic Long Term Average (LTAc) is calculated as follows:

$$LTA_c = WLA_c \times e^{(0.5\sigma_{30}^2 - z\sigma_{30})} \qquad \textit{Equation 11}$$

where,

σ_{30}^2 = $\ln(CV^2/30 + 1)$

The LTAs are compared and the more stringent is used to develop the daily maximum and monthly average permit limits as shown below.

2. Derive the maximum daily and average monthly effluent limits

Using the *TSD* equations, the MDL and AML effluent limits are calculated as follows:

$$\mathrm{MDL} = \mathrm{LTA} \times \mathrm{e}^{(z_m\sigma - 0.5\sigma^2)} \qquad \textit{Equation 12}$$

$$\mathrm{AML} = \mathrm{LTA} \times \mathrm{e}^{(z_a\sigma_n - 0.5\sigma_n^2)} \qquad \textit{Equation 13}$$

where σ, and σ^2 are defined as they are for the LTA equations above, and,

σ_n^2 = $\ln(CV^2/n + 1)$

z_a = 1.645 (z-score for the 95th percentile probability basis)

z_m = 2.326 (z-score for the 99th percentile probability basis)

n = number of sampling events required per month. With the exception of ammonia, if the AML is based on the LTA_c, i.e., $LTA_{minimum} = LTA_c$), the value of ''n'' should is set at a minimum of 4. For ammonia, In the case of ammonia, if the AML is based on the LTA_c, i.e., $LTA_{minimum} = LTA_c$), the value of ''n'' should is set at a minimum of 30.
