Part IV. Summary of Information Collected and Analyzed

Each year the Taunton Department of Public Works, US Filter, and Taunton River Watershed Alliance conduct water quality monitoring activities and include the data in an annual report. The Annual Water Quality Report For the City of Taunton – Taunton River & Tributaries – 2003 was completed in early 2004 and contained a variety of information.

A total of sixteen sites were sampled during the year 2003. Samples are taken at bridges due to safety considerations and accessibility of parking. These sites were chosen to cover a representative area of the City's waterways, to include any known problem areas or areas of critical concern, and to target areas where no previous water quality data existed. Monitoring parameters include temperature, total Phosphorus, fecal coliform bacteria, dissolved oxygen, nitrate-nitrogen, total suspended solids and pH. Measurable goals for the water quality monitoring activities are identified in BMP 2-4. One of the measurable goals indicates that high fecal coliform counts will be reported to the responsible parties. Included in this section, are the monitoring locations and a summary of the fecal coliform bacteria counts taken during 2003.
