

Release Notes for EMTS v9.3.10

Release Date: May 2026

Introduction

The EPA Moderated Transaction System (EMTS) v9.3.10 release focuses on streamlining transaction error reporting, tightening validation rules, strengthening security posture, and improving Copy of Record behavior for transaction errors. This release also removes outdated workflows and scheduled processes that no longer align with the revised reporting approach, while resolving several user-facing defects that affected search behavior and page rendering.

EMTS v9.3.10 builds on the existing EMTS transaction processing framework by simplifying the error reporting experience, restricting transaction error activity to a configurable reporting window, improving system performance support for quarterly reporting data, and incorporating bug fixes.

Objectives

- Improve transaction error reporting by simplifying navigation, removing obsolete submission paths, and clarifying user instructions.
- Strengthen compliance controls by limiting eligible transaction error activity to a configurable lookback period administered through a global parameter.
- Enhance data integrity by incorporating transaction errors into the Copy of Record and refining CSV upload validation logic.
- Improve usability by correcting transaction log search failures and resolving interface rendering issues on error-detail pages.

Enhancements

Transaction Error Reporting Workflow Updates

- Updated Reports > Transaction Errors to take users directly to the View Reported Errors page, removing the former landing and continuation flow.
- Revised instructional text on the View Reported Errors page to clarify single-error and bulk-upload reporting and to explain that reported transaction errors are added to the quarterly Copy of Record.
- Removed the obsolete “Submit Errors” workflow and its related pages/configuration from EMTS to align the application with the updated reporting process.

Reporting Window and Validation Controls

- Restricted error-search functionality to transactions submitted within the last EPA-defined number of days, managed through a global parameter.
- Updated instruction text to reflect the configurable reporting window and to clarify that a blank search returns all eligible organization transactions within the permitted period.
- Enhanced CSV/Excel upload validation so uploaded transaction errors must reference submission dates that fall within the configured reporting window; out-of-range records now generate validation errors.

Copy of Record and Quarterly Reporting Changes

- Added transaction errors to the Copy of Record for the current quarter based on the add date of the transaction error rather than the original transaction submission date.
- Configured the daily process to generate a new Copy of Record whenever a transaction error is added.
- Ensured users may sign for a compliance quarter multiple times and that each Copy of Record only includes transactions and transaction errors that have not already been signed.
- Added a dedicated Transaction Errors section to the Copy of Record and updated the View Reported Errors grid so it only shows errors not yet signed in a Copy of Record.
- Disabled the standalone Transaction Error Report, including report generation job activity and subscription catalog availability, as this information is now handled through the revised Copy of Record process.

Bug Fixes

- Corrected an EMTS application error that occurred when users searched Fuels ABT Transactions and RFS2 Transactions by Transaction Log ID.
- Fixed overlapping text displayed under the Biogas Feedstock Details section on the Identify Transaction Errors page when editing applicable biogas generate transactions.
