

# Priority Climate Action Plan

## Atlanta Metropolitan Statistical Area

March 5, 2024

**PREPARED FOR:**

State and Local Climate and Energy Program

U.S. Environmental Protection Agency

**PREPARED BY:**

ONE  
**great**  
REGION

## Vision

# ONE great REGION

## Mission

*Foster thriving communities for all within the Atlanta region through collaborative, data-informed planning and investments.*

## Goals

**Healthy, safe, livable communities** in the Atlanta Metro area.

**Strategic investments** in people, infrastructure, mobility, and preserving natural resources.

Regional services delivered with **operational excellence** and **efficiency**.

**Diverse stakeholders engage** and take a regional approach to solve local issues.

**A competitive economy** that is inclusive, innovative, and resilient.

## Values

**Excellence** – A commitment to doing our best and going above and beyond in every facet of our work allowing for innovative practices and actions to be created while ensuring our agency's and our colleague's success.

**Integrity** – In our conduct, communication, and collaboration with each other and the region's residents, we will act with consistency, honesty, transparency, fairness and accountability within and across each of our responsibilities and functions.

**Equity** – We represent a belief that there are some things which people should have, that there are basic needs that should be fulfilled, that burdens and rewards should not be spread too divergently across the community, and that policy should be directed with impartiality, fairness and justice towards these ends.

ARC is the regional planning and inter-governmental coordination agency for the 11-county Atlanta region.

ARC helps the region's leadership focus attention, collaboration, and resources on critical issues affecting our collective future. We're here to make the region work for everyone – regardless of age, ethnicity, income, education, background, or ability.

*This project has been funded wholly or in part by the United States Environmental Protection Agency (EPA) under assistance agreement number 5D-02D56523-0 to the Atlanta Regional Commission. The contents of this document do not necessarily reflect the views and policies of the EPA, nor does the EPA endorse trade names or recommend the use of commercial products mentioned in this document.*

## Key Definitions and Acronyms Used in this Document

**Atlanta-Sandy Springs-Alpharetta Metropolitan Statistical Area (Atlanta MSA):** the 29-county geographic area as defined by the US Census 2020 MSA population. A list of MSAs eligible to participate in the Climate Pollution Reduction Program can be found in Appendix 15.2 of the EPA's [CPRG: Formula Grants for Planning, Program Guidance for States, Municipalities, and Air Control Agencies](#).

**Atlanta Regional Commission (ARC):** the regional planning and inter-governmental coordination agency for the 11-county Atlanta region. ARC serves as the lead agency for Climate Pollution Reduction Grant planning for the Atlanta Metropolitan Statistical Area.

**Climate Pollution Reduction Grant (CPRG):** a US EPA program that provides \$5 billion in grants to states, local governments, tribes, and territories to develop and implement ambitious plans for reducing greenhouse gas emissions and other harmful air pollution. Authorized under Section 60114 of the Inflation Reduction Act, this two-phase program provides \$250 million for noncompetitive planning grants, and approximately \$4.6 billion for competitive implementation grants.

**Comprehensive Climate Action Plan (CCAP):** a narrative report that provides an overview of the CPRG planning grantee's significant GHG sources/sinks and sectors, establishes near-term and long-term greenhouse gas emission reduction goals, and provides strategies and identifies measures that address the highest priority sectors to help the grantee meet these goals.

**Greenhouse Gas (GHG):** a gas that traps heat in the earth's atmosphere, including carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), and fluorinated gases such as hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, and nitrogen trifluoride.

**Low Income and Disadvantaged Communities (LIDACs):** communities with residents that have low incomes, limited access to resources, and disproportionate exposure to environmental or climate burdens. EPA-recommended tools, such as the [Climate and Economic Justice Screening Tool](#) and the [Environmental Justice Screening and Mapping Tool](#), were used to identify Atlanta MSA LIDACs by assessing indicators for categories of burden: air quality, climate change, energy, environmental hazards, health, housing, legacy pollution, transportation, water and wastewater, and workforce development.

**Priority Climate Action Plan (PCAP):** a narrative report that includes a focused list of near-term, high-priority, and implementation ready measures to reduce GHG pollution and an analysis of GHG emissions reductions.

## 1 Introduction

Across the Atlanta-Sandy Springs-Alpharetta Metropolitan Statistical Area (Atlanta MSA), as throughout the Southeast United States, communities are experiencing more frequent and intense storms, flooding, heat waves, droughts, and other impacts of climate change (USGCRP, Fifth National Climate Assessment, 2003).<sup>1</sup> As the lead organization for the MSA's Climate Pollution Reduction Grants planning process, the Atlanta Regional Commission (ARC) takes seriously its responsibility to develop climate action plans that will set up the region and its individual communities to best mitigate greenhouse gas (GHG) emissions in conjunction with protecting human health, increasing economic mobility, and creating a competitive economy that benefits everyone.

This Atlanta MSA Priority Climate Action Plan (PCAP) was developed as part of a US EPA Climate Pollution Reduction Grant (CPRG) program, a four-year planning initiative authorized by the Inflation Reduction Act. It builds on the existing climate-related work of ARC, including the [Green Communities](#) program, [Livable Centers Initiative](#), and the ongoing transportation planning and policy work undertaken by the ARC [Metropolitan Transportation Plan](#). It also builds on the climate, clean energy, and sustainability work of many of metro Atlanta's local governments. This PCAP, the first deliverable required by the CPRG program, is intended to serve as a resource and guide for applicants seeking CPRG Phase 2 Implementation grants, not as a comprehensive list of policy and program recommendations for the Atlanta MSA to reduce its emissions to net zero.

### 1.1 Climate Pollution Reduction Grant Overview

The CPRG program provides \$5 billion in grants to states, local governments, tribes, and territories to develop and implement ambitious plans for reducing GHG emissions and other harmful air pollution. Authorized under Section 60114 of the Inflation Reduction Act, this two-phase program provides \$250 million for noncompetitive planning grants (of which \$1 million was awarded to ARC) and approximately \$4.6 billion for competitive implementation grants.

The CPRG program is part of the Biden Administration's Justice40 initiative, which sets a goal that 40 percent of the benefits of certain federal investments flow to disadvantaged communities that are "marginalized, underserved, and overburdened" by pollution.

Phase 1 of the CPRG program provides flexible support to states, local governments, tribes, and territories at all stages of climate planning and implementation process. Planning grant recipients have used the funding to design climate action plans that incorporate measures to reduce GHG emissions in six key sectors: electricity generation/consumption, industry, transportation, buildings, agriculture/natural and working lands, and waste management. ARC applied to be the lead agency for the Atlanta MSA CPRG Phase 1 planning and received its planning grant award on August 28, 2023. ARC must submit the following deliverables to EPA:

---

<sup>1</sup> USGCRP, 2003: Fifth National Climate Assessment. Crimmins, A.R., C.W. Avery, D.R. Easterling, K.E. Kunkel, B.C. Stewart, and T.K. Maycock, Eds. U.S. Global Change Research Program, Washington, DC, USA. <https://doi.org/10.7930/NCA5.2023>

- Priority Climate Action Plan (PCAP) -- due March 1, 2024
- Comprehensive Climate Action Plan (CCAP) – due August 28, 2025
- Status Report at the end of the 4-year grant period – due August 28, 2027

Through the grant, EPA seeks to achieve three broad objectives for Phase 1:

- Tackle damaging climate pollution while supporting the creation of good jobs and lowering energy costs for families;
- Accelerate work to address environmental injustice and empower community driven solutions in overburdened neighborhoods and,
- Deliver cleaner air by reducing harmful air pollution in places where people live, work, play and go to school.

The EPA has launched two CPRG implementation grant competitions. Eligible entities, whether they received planning grants in Phase 1 or not, can apply to implement measures outlined in their PCAPs. Individual grants will range between \$2 million and \$500 million. Additional information on the PCAP elements can be found in EPA’s [CPRG: Formula Grants for Planning, Program, Program Guidance for States, Municipalities, and Air Control Agencies](#).

The CCAP, due in 2025, will consists of several key components, such as a comprehensive GHG inventory, projections for GHG emissions, clearly defined GHG reduction targets, specified measures for GHG reduction, and a thorough benefits analysis covering the entire geographic scope and population addressed by the plan.

The final Status Report, due in 2027, will include information about the implementation status of GHG reduction measures included in the PCAP and CCAP, relevant updates to CCAP analyses and projections, and any next steps or future needs for funding or staffing.

Developing the PCAP, CCAP, and final Status Report require interagency and intergovernmental coordination, and stakeholder and community engagement. Section 1.4, “Approach to Developing the PCAP,” describes ARC’s approach to coordination and engagement for the development of the PCAP.

## 1.2 Priority Climate Action Plan Overview

The PCAP is the first required deliverable to EPA under Phase 1, the planning grant phase. It is a narrative report that includes a focused list of near-term, high-impact, implementation-ready actions that will reduce GHGs. It also includes a quantitative analysis of GHGs that will be reduced by implementation of those actions. The PCAP is intended to lay the groundwork for ARC’s and other local governments’ applications to access the Phase 2 implementation funding grants. This PCAP highlights

measures and actions that are best suited for the competitive funding opportunity and demonstrates that the Atlanta MSA and its communities are ready to use this federal funding to meet the EPA's objectives.

EPA requires multiple elements be included in the PCAP:

- A simplified GHG inventory
- Quantified GHG reduction measures
- A low-income and disadvantaged communities benefits analysis
- A review of authority to implement

The PCAP also supports investment in policies, practices and technologies that reduce emissions, create high-quality jobs, spur economic growth, and enhance the quality of life for all those who live, work, and play in the Atlanta MSA.

### 1.3 Scope of the PCAP and MSA Context

Figure 1 - Map of the Atlanta MSA

This PCAP applies to the Atlanta MSA shown in Figure 1. The MSA consists of 29 counties and 150 municipalities. With a US Census Bureau-estimated population of 6,144,050 as of July 1, 2021, the MSA represents 57 percent of Georgia’s population. It covers the spectrum of community types, from its urban core, to the surrounding suburban counties, followed by an outer ring of more rural towns and counties.

ARC is the regional planning and inter-governmental coordination agency for the 11-county Atlanta region, as well as the federally-designated Metropolitan Planning Organization for the 20-county region. ARC helps the region’s leadership focus attention, collaboration, and resources on critical issues affecting our collective future. The agency is well accustomed to working with varying geographies to address regional issues and has brought its experience convening diverse perspectives to develop this PCAP and its strategies that will be effective across the MSA.

The scope of the PCAP is focused on laying the necessary groundwork in preparation for potential Phase 2 CPRG Implementation Grant applications due to EPA on April 1, 2024. Therefore, the PCAP does not represent an exhaustive list of measures that are needed to meet the MSA’s GHG reduction goals. Omission from the PCAP does not negate the importance of that work but rather indicates that it may not align as closely to the EPA guidance for Phase 2. Beyond the PCAP, ARC is working towards the next deliverable, the CCAP. More information on the CCAP can be found in the “Next Steps” section of this document.

## 1.4 Approach to Developing the PCAP

This PCAP is built upon the existing climate-related work of ARC, including the [Green Communities](#) program, [Livable Centers Initiative](#), and the ongoing transportation planning and policy work undertaken by the [Metropolitan Transportation Plan \(MTP\)](#), as well as the climate, clean energy, and sustainability work of many of metro Atlanta’s local governments. In February 2024, ARC completed the MTP process required by law. The MTP is a long-range blueprint that details the investments that will be made through 2050 to ensure metro Atlanta’s future success and improve the region’s quality of life. Three of the four near-term initiatives outlined in the plan have climate-mitigating impacts:

- Mobility plans addressing freight, electrification, and access to health services, among others;
- Environmental plans related to carbon reduction and GHG emissions;
- Understanding disruptive and transformative technologies.

In addition to ARC’s climate-related plans, the PCAP process analyzed GHG inventories and GHG mitigation strategies from several local government plans as well as Drawdown Georgia, a statewide initiative working to catalyze a Georgia beyond carbon. The local government plans and initiatives reviewed include:

- City of Atlanta Clean Energy Plan
- City of Atlanta Climate Action Plan
- City of Chamblee Sustainability Plan
- City of Decatur Clean Energy Plan
- City of Decatur 2020 Strategic Plan
- City of Woodstock 2020 Sustainability Plan
- Cobb County Sustainable Practices Policy
- DeKalb County Green Focus Energy Website
- Fulton County Sustainability Plan
- Gwinnett County Sustainable Community Policies

Development of the PCAP prioritized programs and initiatives best aligned for CPRG implementation funding. This follows guidance from EPA. The PCAP also prioritizes measures and actions that:

- Have existing authority to implement;
- Have ability to achieve quantifiable GHG reductions in the next five years
- Have clear co-benefits; and
- Are ready for implementation.

The PCAP also includes measures that could be scaled to benefit multiple communities throughout the MSA, particularly in or near LIDACs as defined by EPA. The intention of the PCAP is to be all-encompassing and provide necessary ambiguity that allows for local adaptations regarding projects that can help reduce GHGs, improve carbon sinks, and provide additional benefits. The inclusion of or reference to specific projects does not favor specific projects over others that may not be included or referenced.

ARC used feedback from a series of online stakeholder webinars, one-on-one conversations with stakeholders, existing community events, and online surveys to inform this plan. Other state agencies and local jurisdictions provided input and shaped the PCAP as well. ARC also collaborated with the Georgia Environmental Protection Division (EPD) Air Protection Branch to align goals and avoid duplication of actions since EPD is leading the State's CPRG effort. A more comprehensive description of engagement activities that have supported the development of this PCAP can be found in the Stakeholder Engagement Activities Summary in [Appendix A](#).

## 2 PCAP Elements

The main elements included in this PCAP are:

- A simplified GHG inventory;
- Quantified GHG reduction measures;
- A LIDAC benefits analysis;
- A review of authority to implement;
- A Workforce Planning discussion; and
- Next steps.

Each element is outlined in the sections that follow.

### 2.1 Greenhouse Gas Inventory

#### Scope, Data, and Methods

ARC's simplified GHG inventory captures emissions within the 29-county Atlanta MSA for the 2019 base year. It quantifies direct emissions from the residential, commercial, industrial, transportation, and agriculture sectors, and indirect emissions associated with electricity consumed in the residential, commercial, and industrial sectors. While data limitations prevent direct inclusion of the waste sector, its emissions are included for reference and estimated to be accounted for within the commercial and industrial sectors.

ARC's GHG inventory utilizes [Drawdown Georgia's GHG Emissions Tracker](#) for sector-specific data. Drawdown Georgia's GHG Tracker expresses GHG emissions in metric tons of carbon dioxide equivalent (CO<sub>2</sub>e) units. This standardized unit ensures consistent comparisons across various GHGs.

#### Measuring and Reporting Greenhouse Gases

Different types of GHGs (CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFCs, PFCs, SF<sub>6</sub>, NF<sub>3</sub>, etc.) have different global warming potentials (GWP). GWPs were developed to allow comparisons of the warming impacts of different GHGs. A GWP measures how much energy the emissions of 1 ton of a gas will absorb over a given time, relative to the emissions of 1 ton of carbon dioxide. The larger the GWP, the more that gas warms the Earth compared to CO<sub>2</sub> over the given time. GWPs allow for a common unit of measurement across all GHGs, regardless of their radiative efficiency or lifespan in the atmosphere. GWPs are used to convert emissions of all GHGs into CO<sub>2</sub> equivalent (CO<sub>2</sub>e). The conversion used is emissions of the gas multiplied by its GWP. Throughout this PCAP, emissions are measured by the weight of the gas emitted in metric tons (MT) carbon dioxide equivalent (MTCO<sub>2</sub>e).

## GHG Emission Results by Sector and Gas

In 2019, the Atlanta MSA generated approximately 75,361,851 metric tons of carbon dioxide equivalents (MTCO<sub>2</sub>e). Within the MSA, approximately 4,914,770 MTCO<sub>2</sub>e were removed from the atmosphere in 2019 via forest uptake and wood sequestration, resulting in a net GHG emissions of 70,447,080 MTCO<sub>2</sub>e. The three largest sources of GHG emissions in 2019 were buildings (commercial and residential combined), transportation, and industrial buildings/processes, which collectively account for 99 percent of the gross GHG generated by the Atlanta MSA. 2020 per capita net GHG emissions for the MSA are estimated to be 11.54 MTCO<sub>2</sub>e. Table 1 and Figures 2 - 4 summarize 2019 Atlanta MSA GHG emissions by source category. Electricity consumption is broken out for Commercial, Residential, and Industrial to show the impact it has on GHG emissions for those sectors.

Table 1 - Atlanta MSA 2019 GHG baseline emissions in metric tons CO<sub>2</sub>e by Economic Sector

Sector	Total (MTCO <sub>2</sub> e)	Percent of Total Emissions
<b>Agriculture</b>	<b>727,762</b>	<b>1%</b>
<b>Transportation</b>	<b>30,689,454</b>	<b>41%</b>
<b>Commercial and Residential Total (including consumed electricity)</b>	6,879,654 ( <b>33,655,909</b> )	9% ( <b>44%</b> )
<b>Industrial (including consumed electricity)</b>	2,579,471 ( <b>10,288,727</b> )	3% ( <b>14%</b> )
Commercial (including consumed electricity)	2,033,703 (15,323,910)	3% (20%)
Residential (including consumed electricity)	4,845,951 (18,331,998)	6% (24%)
Consumed Electricity (captured above, not included separately in Total Emissions) <sup>1*</sup>	34,485,510	46%
Waste <sup>2*</sup>	1,781,860	
<b>Total Emissions (Sources)<sup>3*</sup></b>	<b>75,361,851</b>	<b>100%</b>
Forest Uptake and Wood Sequestration	-4,914,770	---
<b>Net Emissions (Sources and Sinks)</b>	<b>70,447,080</b>	---
<p>1 Consumed Electricity represents indirect GHG emissions associated with electricity purchased and used within Commercial, Residential, and Industrial sectors.</p> <p>2 Waste values are included for reference. Values were calculated from waste facilities in the industry and commercial sectors and are excluded from table totals.</p> <p>3 Total emissions calculated using the values from the bolded lines above</p>		

Figure 2 - Atlanta MSA 2019 GHG Baseline Emissions by Economic Sector (Consumed Electricity within sectors)

Figure 3 - Atlanta MSA 2019 GHG Baseline Emissions by Economic Sector

Figure 4 - Atlanta MSA 2019 GHG Baseline Emissions by Economic Sector (Consumed Electricity separate)

Further information on the scope, methodology, and results of the Atlanta MSA PCAP GHG inventory can be found in the GHG Inventory Technical Support Document included as [Appendix B](#) of this plan.

## 2.2 GHG Reduction Measures

The Atlanta MSA GHG emissions inventory shows that the highest contributing sectors are transportation, buildings (residential, commercial, and industrial), and waste. Therefore, this PCAP focuses on GHG emissions from these sectors.

EPA seeks ambitious measures that will achieve significant cumulative GHG reductions by 2030 and beyond, measures that will achieve substantial community benefits, and measures that can be scaled up across multiple jurisdictions.

This section identifies “priority measures” for the sole purpose of pursuing funding through CPRG Phase 2 implementation grants. This list is not exhaustive of all measures that could potentially reduce GHG; rather, the priority measures included in this PCAP meet the following criteria, as stated in the CPRG Phase 2 Notice of Funding Opportunity:

- The measure is implementation- ready, meaning that the design work for the policy, program, or project is complete enough that a full scope of work and budget can be included in a CPRG implementation grant application.

- The measure can be completed in the near term, meaning that all funds will be expended, and the project completed, within the five-year performance period for the CPRG implementation grants.
- The measure has positive impacts on LIDACs.

Table 1 summarizes this PCAP's priority measures by sector, and it includes example projects submitted by respondents to emission reduction measure identification surveys.

*Table 2 - Atlanta MSA Priority GHG Reduction Measures*

Strategy	Sector	Example Projects
Electrify Fleets	Transportation	Local Government Fleet Transition: Fossil Fuel to Electric Vehicle (EV)  University Fleet Transition  Facilities to Maintain EV Fleets
Expand EV Charging Infrastructure	Transportation	Local Government Community-Wide EV Charging Stations  Charging Stations for Fleets  Seed Funding for EV Charging Stations
Incentivize Use of Electric Bikes (E-Bikes)	Transportation	Regional E-Bike Rebate Program
Encourage Transportation Mode Shifts	Transportation	Universal Mobility Wallet  Multiuse Trail Construction
Transition to Energy Efficient Transit Railcars	Transportation	MARTA Railcar Replacement Program
Convert Fleet Vehicles from Diesel to Cleaner Fuels	Transportation	Local Government Fleet Transition: Diesel to Propane
Electrify Buildings	Buildings	Electrification of Heating/Cooling Systems  Home Electrification Program

Increase Energy Efficiency in Industrial and Commercial Buildings (including Multifamily)	Buildings	<p>Energy Audit &amp; Energy Retrofits</p> <p>Commercial Building Energy Benchmarking Ordinance</p> <p>Sustainable Building Ordinance for Local Government Buildings</p> <p>Building Performance Standards</p>
Increase Energy Efficiency in Single Family Homes	Buildings	Residential Weatherization & Energy Retrofits
Increase Use of Solar Photovoltaics (PV)	Buildings	<p>Solar-Powered Central Energy Plant</p> <p>Solar PV on Local Government Facilities &amp; University Campuses</p> <p>Solar Panels on Homes</p> <p>Seed Funding for Solar PV Installation</p>
Increase Community-Based Solar	Buildings	<p>Distributed Energy Grants for Municipal Utilities &amp; Energy Co-Ops</p> <p>Roadside Community Solar</p> <p>Seed Funding for Community Solar</p>
Increase Use of Wastewater Biogas to Energy	Waste Management	Regional Organics Energy Center for Integrated Biosolids and Zero Waste
Increase Diversion of Waste from Landfills	Waste Management	<p>Zero Waste University Campus</p> <p>Landfill Diversion Program</p> <p>Community Composting</p> <p>Circular Economy Development Program</p>
Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs	All Sectors	Enhanced Green Communities Program

In the remainder of this section, additional details about each priority measure are described, including:

- Applicable sector (e.g. transportation, waste management, buildings, etc.)
- Estimate of quantifiable GHG emissions reductions (through 2030 & 2050)
- Co-benefits
- Implementing agency or agencies
- Implementation schedule and milestones
- Geographic location
- Metrics for tracking progress

GHG emissions reductions for priority measures are quantified based on the corresponding outputs those actions could reasonably be expected to produce. The GHG emissions reductions stated in each of the following measures are estimates based on available data and tools, which may be subject to revisions or updates as needed. The GHG Reduction Technical Support Document details all assumptions, tools, citations, datasets, and methods used to estimate and quantify GHG emissions. This can be found in [Appendix C](#).

While a measure may be referenced within only one specific sector many measures have co-benefits and could impact GHG emissions across several sectors.

The priority measures are meant to cover a broad array of strategies and projects that were captured through extensive outreach to solicit input for inclusion in this PCAP. ARC and the State circulated Emission Reduction Measure Identification surveys to capture ideas and specific details about potential projects that may be submitted for CPRG implementation grant funding. However, not being included specifically in the example list of projects does not exclude the project from being relevant to one or more of the priority measures in this plan.

## **Transportation Measures**

The transportation sector is the second largest source of GHGs in the Atlanta MSA, contributing 41 percent of the overall emissions. Additionally, this sector also contributes to localized criteria pollutants, such as fine particulate matter and nitrogen oxides, and toxic air pollutants such, as diesel particulate matter, that represent an on-going public health challenge for communities nearest to roadways.

Measures that will reduce GHG emissions and improve health impacts include: electrifying fleets, expanding EV charging infrastructure, incentivizing use of electric bikes, encouraging transportation mode shifts, switching to energy efficient transit railcars, and converting fleet vehicles from diesel to cleaner fuels.

Table 3 - GHG Reduction Measure: Electrify Fleets

Electrify Fleets	
<p>The electrification of fleet vehicles is a key strategy for organizations to reduce GHG emissions and promote a cleaner, more sustainable transportation system. Fleet electrification can encompass a wide range of vehicles and equipment, such as sedans, light-duty trucks, maintenance vehicles, sanitation trucks, transit and school buses, heavy-duty and medium-duty trucks, construction equipment, and landscaping and maintenance equipment.</p> <p>When transitioning fleets to EVs, it is important to upgrade the facilities and equipment needed to charge and maintain the EV fleet. Maintenance and charging needs should be considered and included in project plans and budgets.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 646,800 MTCO<sub>2</sub>e through 2030</li> <li>• 12,700,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Zero tailpipe GHG emissions and zero criteria air pollutants (NO<sub>x</sub> and PM 2.5)</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDAC communities who are at greater risk due to increased exposure.</li> <li>• <u>Reduced noise pollution:</u> EVs are quieter than combustion vehicles.</li> <li>• <u>Lower lifetime costs:</u> Fewer parts than combustion vehicles. Electricity costs less than gasoline and diesel.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Transit agencies, Universities and colleges</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number of fleet vehicles transitioned from combustion to EV</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

Table 4 - GHG Reduction Measure: Expand EV Charging Infrastructure

Expand EV Charging Infrastructure	
<p>EV charging infrastructure is growing within the Atlanta MSA but is not always readily accessible outside of major corridors. Increasing the number of EV chargers that are available within the MSA supports the growing number of EV drivers and allays range-anxiety fears that discourage some consumers from switching to EVs.</p> <p>Additionally, transitioning local government, transit, and university fleets to EVs will also require EV charging stations. Some of these chargers may be positioned and configured to allow for public charging as well, especially during times when they are not being used by public agencies.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 0 MTCO<sub>2</sub>e through 2030</li> <li>• +3,200 MTCO<sub>2</sub>e through 2050</li> </ul> <p>Note: The EV charging infrastructure measure resulted in increased GHG emissions in the long-term (2025-2050) due to the manufacturing and utilization of EV chargers. The reduction in GHG emissions from adoption of EV vehicles is captured in the EV Fleet Transition measure.</p>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Zero tailpipe GHG emissions and zero criteria air pollutants (NO<sub>x</sub> and PM 2.5)</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Access to chargers in LIDAC communities:</u> charger placement within LIDAC areas will be prioritized in many projects.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Transit agencies, Universities and colleges</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number and type of EV chargers installed</li> <li>• Number and type of EV chargers installed in LIDAC areas</li> <li>• Amount of GHG emissions eliminated</li> </ul>

Table 5 - GHG Reduction Measure: Expand Use of Electric Bikes

Incentivize Use of Electric Bikes	
<p>Since 2019, E-bikes have emerged as the one of the most popular mobility options in the United States, outpacing electric car sales. Sales topped \$1.3 billion in 2022. E-bikes can replace short car trips and transport cargo or children efficiently.</p> <p>An E-Bike is a two- or three-wheeled bicycle that is equipped with a small, rechargeable battery-powered electric motor to assist while the rider pedals. Some models have throttles that can be used without pedaling up to 20 mph. Range varies anywhere from 20 miles to 50 miles or more per charge. A special license or registration is not required to operate.</p> <p>When transitioning from cars to E-Bikes, it is important to consider charging needs, safety equipment and training, locations for secure locking/storage, as well as usefulness as a last-mile option to/from transit. These considerations may be included in project plans and budgets.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>1,900 MTCO<sub>2</sub>e through 2030</li> <li>13,200 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li><u>Improved air quality:</u> E-Bikes, and especially e-cargo bikes, are a proven replacement for short car trips, which can lower GHG emissions and zero criteria air pollutants (NO<sub>x</sub> and PM 2.5)</li> <li><u>Public health benefits:</u> E-Bikes require exercise to use, and often lead to longer bike trips. This may improve long-term cardiovascular health for users.</li> <li><u>Reduced noise pollution:</u> E-Bikes are significantly quieter than combustion vehicles.</li> <li><u>Lower lifetime costs:</u> E-Bikes are cheaper to own and operate and maintain than an automobile, and they reduce future road maintenance costs for municipalities.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li><u>Implementing Agencies:</u> ARC, Local Governments, Local Bike Shops</li> <li><u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>Number of e-bikes purchased through the program</li> <li>Number of low-income users purchasing e-bikes</li> <li>Amount of GHG emissions eliminated</li> <li>Amount of criteria air pollutants eliminated</li> </ul>

Table 6 - GHG Reduction Measure: Encourage Transportation Mode Shifts

Encourage Transportation Mode Shifts	
<p>Mode shift from single occupancy vehicle trips to more sustainable modes, such as transit, biking, and walking, is a key method to reduce GHGs. Incentivizing transit use through reduced or free transit passes can generate these benefits throughout the region, especially within the MARTA service area. Providing multiuse paths that link people to transit stations, neighborhoods, and retail can make it easier for them to choose biking or walking over a car.</p> <p>These kinds of incentives can lead residents to choose walking, biking, and transit over driving alone due to the lower cost, lower stress, and environmental benefits. Residents who already ride transit services may utilize the systems more often due to the cost burden being reduced or removed. This can create a virtuous cycle of increased ridership, increased federal funding for transit, and sustained public support for these systems.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 17,100 MTCO<sub>2</sub>e through 2030</li> <li>• 74,300 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Zero tailpipe GHG emissions and zero criteria air pollutants (NO<sub>x</sub> and PM 2.5)</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Cost-savings:</u> There can be significant cost-savings for people who shift from driving to walking, biking, or transit.</li> <li>• <u>Transit funding:</u> Increased transit ridership can pull down more federal formula dollars for regional transit agencies.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Implementing Agencies:</u> Local governments, Transit agencies, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Miles of new multiuse paths created</li> <li>• Number of users who receive transit subsidies</li> <li>• Number of new riders who choose transit over driving alone</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

Table 7 - GHG Reduction Measure: Transition to Energy Efficient Transit Railcars

Transition to Energy Efficient Transit Railcars	
<p>The Metropolitan Atlanta Rapid Transit Authority (MARTA) has begun to transition its older fleet of railcars to newer, more energy efficient rail cars. Additional funding is needed to aid in a more rapid transition, leading to GHG reduction at a quicker pace.</p> <p>Compared to the legacy fleet of trains, the new MARTA fleet will boast 70-80% of additional energy efficiency. That means the cars use, on average, 70% less energy with much higher level of performance. The new traction motors and converters will be nearly 50% more efficient than old ones. Unlike the older equipment's brake resistors, which dissipate energy as heat, the new fleet is equipped with regenerative braking, which can capture 60-70% of the energy of braking. MARTA's new cars will use regenerative breaking and feed that energy back into the system approximately 90 % of the time.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>37,000 MTCO<sub>2</sub>e through 2030</li> <li>139,500 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li><u>Cooler temperatures:</u> Heat dissipation from braking is reduced and therefore not contributed to ambient air temperature heat island effect.</li> <li><u>Better rider experience:</u> The new cars will be equipped with WIFI, charging stations, wider aisles, and will be easily accessible for persons with reduced mobility.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li><u>Potential Implementing Agencies:</u> MARTA</li> <li><u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> MARTA Service Area (Fulton, DeKalb, and Clayton Counties)</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>Number of new energy efficient transit railcars put into service</li> <li>Amount of GHG emissions eliminated</li> </ul>

Table 8 - GHG Reduction Measure: Convert Fleet Vehicles from Diesel to Cleaner Fuels

Convert Fleet Vehicles from Diesel to Cleaner Fuels	
<p>According to the Department of Energy's Alternative Fuels Data Center, "compared with vehicles fueled by conventional diesel and gasoline, propane vehicles can produce lower amounts of some harmful air pollutants and greenhouse gases. Propane fuel has a lower carbon content than conventional gasoline and diesel fuel."</p> <p>In some instances, local governments and other organizations that require light-, medium-, and heavy-duty vehicles for their specific operational needs may choose to convert their fleets from conventional fuels to propane, especially if their budget or infrastructure cannot accommodate conversion to EVs.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 24,700 MTCO<sub>2</sub>e through 2030</li> <li>• 180,400 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Lower tailpipe criteria air pollutants (NO<sub>x</sub> and SO<sub>x</sub>)</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDAC communities who are at greater risk due to increased exposure.</li> <li>• <u>Ease of operation:</u> Propane vehicles are fueled and operated more similarly to gas vehicles, so driving and upkeep are an easy shift for operators.</li> <li>• <u>Lower cost &amp; petroleum use potential:</u> Propane typically costs less than gas, therefore the return on investment can be quicker than that of a conventional vehicle purchase. When derived as a byproduct of natural gas production, propane reduces petroleum use by 99%.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Transit agencies, Universities and colleges</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number of fleet vehicles transitioned from combustion to propane</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

## **Buildings Measures**

The buildings sector – a combination of commercial and residential sectors – is the largest source of GHGs in the Atlanta MSA, contributing 44 percent, including the electricity buildings consumed. When such electricity is not included, buildings contribute 9 percent of the overall GHG emissions. Including the industrial sector (buildings and processes) into the mix brings these numbers to 58 percent and 12 percent respectively.

Heating and cooling buildings accounts for a substantial portion of the energy consumed and of emissions contributed. Funding is needed to encourage the electrification of buildings as well as to incentivize energy efficiency improvements via building weatherization, energy audits, upgraded appliances, and retrofitting building systems, energy benchmarking, and building performance standards. Funding to incentivize users to switch to renewable energy, such as rooftop solar and community solar, is also needed to reduce the GHG emissions contributed by the buildings sector.

Substantial co-benefits can also be realized from improving the energy efficiency of buildings and switching to renewable sources of energy, including reductions in air pollution leading to public health benefits, cost savings from reduced energy use, indoor air quality improvements, increased comfort in cold and warm seasons, and job creation.

Measures that will reduce GHG emissions and improve health impacts include electrifying buildings, increasing energy efficiency in industrial and commercial buildings (including multifamily), increasing energy efficiency in single family homes, increasing the use of solar PVs, and increasing community-based solar.

Table 9 - GHG Reduction Measure: Electrify Buildings

Electrify Buildings	
<p>Increasing the use of electricity, instead of fuels like oil or gas, in buildings, appliances, heating systems, and other machines is a key strategy for organizations to reduce GHG emissions and promote a cleaner, more sustainable built environment over time.</p> <p>Electrifying buildings may encompass retrofitting existing building systems and appliances from fossil fuel-based to electricity-based (fuel switching) and gradually transitioning new construction to all-electric. It is important to note that as the electricity grid decarbonizes, the GHG impact of all-electric buildings will continue to decrease.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 1,500,000 MTCO<sub>2</sub>e through 2030</li> <li>• 21,000,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Air quality for individuals working/living in and around the fossil-fueled based systems is improved by switching to electric systems, especially when paired with renewable energy.</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes.</li> <li>• <u>Reduced noise pollution:</u> Electric systems tend to be quieter than fuel-based systems.</li> <li>• <u>Safer:</u> Decreasing the demand for natural gas lines to/within buildings also eliminates the risks from fire, explosion, and carbon monoxide poisoning.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Universities and colleges, Building owners, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number of heating/cooling systems switched to electric</li> <li>• Number and type of appliances switched to electric</li> <li>• Number of building electrification codes/ordinances adopted</li> <li>• Amount of GHG emissions eliminated</li> </ul>

Table 10 - GHG Reduction Measure: Increase Energy Efficiency in Industrial & Commercial Buildings

Increase Energy Efficiency in Industrial & Commercial Buildings (including Multifamily)	
<p>According to the Department of Energy's Office of Energy Efficiency and Renewable Energy, "energy efficiency is the use of less electricity to perform the task or produce the same result. Energy-efficient homes and buildings use less energy to heat, cool, and run appliances and electronics, and energy-efficient manufacturing facilities use less energy to produce goods." Energy-efficient buildings use less electricity, which is often derived from high GHG emitting fossil fuels.</p> <p>Energy-efficient buildings are also better equipped to switch to renewable energy, such as solar PV, which does not produce GHG emissions or criteria air pollutants.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 4,700,000 MTCO<sub>2</sub>e through 2030</li> <li>• 58,700,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Fewer GHG emissions and criteria air pollutants produced as a result of less electricity used by the buildings.</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Increased comfort:</u> Insulation installed during energy retrofits can also result in increased indoor comfort during cold and hot seasons.</li> <li>• <u>Lower energy costs:</u> The more energy saved through efficiency measures, the lower the electricity bill, especially impactful for LIDAC areas who often experience increased energy burden.</li> <li>• <u>Less Load on the Electric Grid:</u> Energy-efficiency reduces amount of electricity on the grid at one time, known as load, minimizing congestion and stress on the electric grid. Less load prevents power disruptions.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Transit agencies, Universities and colleges, Building owners, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number and type of buildings implementing energy efficiency retrofits</li> <li>• Number and type of buildings adopting building performance standards</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

Table 11 - GHE Reduction Measure: Increase Energy Efficiency in Single Family Homes

Increase Energy Efficiency in Single Family Homes	
<p>Local governments can reduce energy consumption in their jurisdictions and help homeowners save on their energy bills, and lower greenhouse gas emissions with residential energy efficiency policies and programs. Energy-efficient homes are better equipped to switch to renewable energy, such as solar PV.</p> <p>Communities can adopt a range of policies and programs to encourage energy efficiency in new construction, existing homes, and new homes. To support the programs, local governments can develop financing options to help lower the cost of making energy efficiency improvements in new or existing homes, coordinate with electric and gas utilities, regional energy efficiency organizations, trade groups (e.g., home builders, home energy raters, contractors, energy services companies, etc.), product retailers, and others to share information and leverage existing efforts.</p> <p>For the purposes of this PCAP, residential energy efficiency programs may include, but is not limited to residential weatherization and energy retrofits to existing homes.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 100 MTCO<sub>2</sub>e through 2030</li> <li>• 9,900 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Fewer GHG emissions and criteria air pollutants produced as a result of less electricity used by the buildings.</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Increased comfort:</u> Insulation installed during energy retrofits can also result in increased indoor comfort during cold and hot seasons.</li> <li>• <u>Lower energy costs:</u> The more energy saved through efficiency measures, the lower the electricity bill, especially impactful for LIDAC areas who often experience increased energy burden.</li> <li>• <u>Less load on the electric grid:</u> Energy efficiency reduces amount of electricity on the grid at one time, known as load, minimizing congestion and stress on the electric grid. Reduced power load prevents power disruptions.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Transit agencies, Universities and colleges, Building owners, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number and type of buildings implementing energy efficiency retrofits</li> <li>• Number and type of buildings adopting building performance standards</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

Table 12 – GHG Reduction Measure: Increase Use of Solar Photovoltaics

Increase Use of Solar Photovoltaics	
<p>According to the Department of Energy’s Office of Energy Saver, “solar energy is sustainable, renewable, and plentiful. As the cost of using solar to produce electricity goes down each year, many American homes and businesses are increasingly switching to solar.” By increasing the use of solar PV (also known as solar panels) as a source of renewable energy across the Atlanta MSA, GHG emissions will be significantly reduced.</p> <p>For the purposes of this PCAP, solar PV use may include, but is not limited to solar-powered central energy plants; solar PV on local government facilities &amp; university campuses; solar panels on single- and multifamily-homes; seed funding for solar PV installation on local government facilities. Solar PV systems may be installed with or without battery storage.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 1,800,000 to 17,500,000 MTCO<sub>2</sub>e through 2030</li> <li>• 3,400,000 to 40,900,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality</u>: Zero GHG emissions and zero criteria air pollutants (NO<sub>x</sub>, SO<sub>x</sub>, and PM 2.5) compared to fossil-fuel based electricity sources.</li> <li>• <u>Public health benefits</u>: Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Reduced water consumption</u>: Because they do not require water to create energy, such as through steam or cooling processes, solar panels are a long-term water saving solution. This is especially important to the Atlanta MSA.</li> <li>• <u>Decreased electric bills</u>: The more energy by solar PV, the lower the electricity bill, especially impactful for LIDAC areas who often experience increased energy burden.</li> <li>• <u>Increased property values</u>: Solar panels are viewed as upgrades, like a renovated kitchen or a finished basement, so purchasing a solar PV system will likely increase a building’s value.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies</u>: Local governments, Transit agencies, Universities and colleges, Building owners, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones</u>: Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number and size of solar PV systems installed</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

Table 13 – GHG Reduction Measure: Increase Community Based Solar

Increase Community-Based Solar	
<p>According to the National Community Solar Partnership, “community solar as any solar project or purchasing program, within a geographic area, in which the benefits of a solar project flow to multiple customers such as individuals, businesses, nonprofits, and other groups. Community solar programs make solar more accessible, particularly to those with low-to-moderate incomes, renters, and other community members for whom traditional rooftop solar is unavailable. Rather than putting solar on their own home or building, community solar allows energy users to subscribe to a shared system of solar panels, often located within their community.”</p> <p>For the purposes of this PCAP, community solar might encompass, but is not limited to, distributed energy grants for municipal utilities &amp; energy co-ops; roadside community solar installations; and seed funding for community solar.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 1,200,000 MTCO<sub>2</sub>e through 2030</li> <li>• 4,500,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Creating energy from clean, renewable sources like solar leads to improved air quality.</li> <li>• <u>Public health benefits:</u> Improved air quality leads to reduced asthma, heart attacks, and strokes, especially in LIDAC residents who are at greater risk due to increased exposure.</li> <li>• <u>Lower electricity costs:</u> Community solar that is offered for purchase on electricity bills is cheaper to produce and should lead to lower energy bills. This is especially important in reducing the energy burden on LIDAC residents.</li> <li>• <u>Pollinator habitat and improved water quality:</u> Growing pollinator-friendly plants under community solar installations can provide habitat for birds, bees, butterflies, and other beneficial insects. Such plantings can also increase stormwater infiltration and prevent runoff and soil erosion.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Departments of Transportation, Nonprofit organizations</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number of community solar projects installed</li> <li>• Number of community solar subscribers</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of criteria air pollutants eliminated</li> </ul>

## **Waste Management Measures**

The waste management sector contributes approximately 1,781,860 MTCO<sub>2</sub>e of GHG emissions within the Atlanta MSA. While this is a small amount compared to Transportation and Buildings, emissions from this sector have been growing over time. There are readily available ways that can reduce GHG emissions from this sector, such as food waste recovery; community composting programs; diverting household, commercial, and construction waste from landfill; reducing the consumption of single-use plastics; and using biogas from the wastewater treatment process to create energy.

Potential co-benefits from these actions include an increase in available free/low-cost compost to farmers and urban gardens; use of biogas to energy offsets the amount of energy purchased to operate wastewater treatment plants, resulting in lower energy costs and potential income if it is sent to the electric grid; less plastic waste along roadsides and in streams extended landfill life, which prevents the need for new landfills that are often sited near LIDACs.

Measures that will reduce GHG emissions and provide community benefits include but are not limited to increasing usage of wastewater biogas to energy and increasing diversion of waste from landfills.

Table 14 - GHG Reduction Measure: Increase Use of Wastewater Gas to Energy

Increase Use of Wastewater Biogas to Energy	
<p>According to the EPA, “anaerobic digestion occurs naturally, in the absence of oxygen, as bacteria break down organic materials and produce biogas. The process reduces the amount of material and produces biogas, which can be used as an energy source. This technology is commonly used throughout the United States to break down sewage sludge at wastewater treatment facilities. In the past few years, there has been a movement to start adding food waste and biosolids to anaerobic digesters already in place at wastewater treatment facilities, which has the benefits of decreasing the amount of methane – a potent GHG - produced at landfills, reduced energy costs; opportunity to divert materials from landfills and preserve landfill space for other materials.</p> <p>For the purposes of this PCAP, this measure includes, but is not limited to, a Regional Organics Energy Center for Integrated Biosolids and Zero Waste.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 34,200 MTCO<sub>2</sub>e through 2030</li> <li>• 262,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Decreased methane emissions:</u> Diversion of food waste from landfills into wastewater biodigesters captures methane that would be emitted from the landfill and turns it into an energy source.</li> <li>• <u>Extends planned-life of landfills:</u> Diversion of food waste from landfills saves space, preventing the need for new landfills, which are often sited near LIDACs.</li> <li>• <u>Cost savings:</u> Cost savings from incorporating food waste into anaerobic digesters include reduced energy costs due to production of on-site power and increased collection of tipping fees for accepting the food waste and fats, oils, and grease (FOG) at wastewater treatment facilities.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments and Wastewater Utilities</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> City of Atlanta, Fulton County, Clayton County</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Amount of energy produced from biogas</li> <li>• Amount of GHG emissions eliminated</li> <li>• Amount of food waste diverted from landfills</li> </ul>

Table 15 - GHG Reduction Measure: Increase Diversion of Waste from Landfills

Increase Diversion of Waste from Landfills	
<p>According to the EPA Report on the Environment, “municipal solid waste landfills are the third-largest source of human-related methane emissions in the U.S., accounting for 15.5 percent of these emissions in 2021.” Methane emissions are more potent than carbon emissions, trapping 20 times more solar radiation than carbon dioxide. However, by diverting waste, the amount of methane and CO<sub>2</sub>, another GHG produced by landfills, can be decreased. Additionally, some methods of diverting waste from landfills, such as reuse, can reduce GHG emissions by preventing the need to produce new products.</p> <p>Diversion of waste from landfills for the purposes of this PCAP may include but is not limited to reuse, recycling, composting, and use of organic materials for biogas energy production.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 700,000 to 8,700,000 MTCO<sub>2</sub>e through 2030</li> <li>• 7,700,000 to 103,500,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Acidic gases and particulate matter produced by landfills can be reduced through waste diversion.</li> <li>• <u>Public health benefits:</u> Improved air quality can lead to reduced nose/throat irritation, asthma attacks, respiratory infections, and other illnesses, especially in LIDACs that are often located near landfills.</li> <li>• <u>Extends planned-life of landfills:</u> Diversion of food waste from landfills saves space, preventing the need for new landfills.</li> <li>• <u>Cost savings and local economy:</u> Cost savings from reduced tipping fees at landfills as well as potential revenue through recycling materials, additionally benefiting local markets such as glass and aluminum recycling industries.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments, Universities and colleges, Nonprofit organizations, Business owners, ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Amount and types of materials diverted</li> <li>• Amount of GHG emissions eliminated</li> </ul>

## All Sectors Measure

Local governments can have a broad impact on GHG emissions produced by a variety of sectors, such as transportation, buildings, and waste. Additionally, local government actions can increase the number of trees and greenspaces available to serve as GHG sinks, sequestering carbon that would otherwise contribute to climate change. In 2019 alone, forest uptake and wood sequestration led to a reduction in 4,914,770 MTCO<sub>2</sub>e from the Atlanta MSA GHG emissions profile. These actions may be focused inward on local government operations, buildings, and fleets, but also outward toward the broader community.

Measures that will reduce GHG emissions and improve health impacts include incentivizing local governments to adopt climate mitigating policies, ordinances, and programs.

Table 16 - GHG Reduction Measure: Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs

Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs	
<p>There is a lot that can be done to address climate change in our own communities. Local governments voluntarily participating in the ARC's Green Communities certification program have been reducing their GHG emissions through environmental sustainability-focused actions for over 10 years.</p> <p>Such actions include but are not limited to, conducting energy audits on their facilities and making retrofits; incorporating high performance building and energy benchmarking requirements into their codes of ordinance; adopting no-net-loss of trees policies; developing greenspace plans and greenspace goals; encouraging the diversion of waste from landfills through recycling and composting of yard waste materials, transitioning their fleets to alternative-fuel and EVs; expanding EV charging infrastructure and requiring EV chargers in new developments; encouraging transportation mode shifts through pedestrian and bike planning as well as participation in nation bike/walk friendly programs; and incentivizing these actions through seed grants.</p>	<p><b>GHG Reduction Potential:</b></p> <ul style="list-style-type: none"> <li>• 4,500,000 MTCO<sub>2</sub>e through 2030</li> <li>• 48,100,000 MTCO<sub>2</sub>e through 2050</li> </ul>
	<p><b>Co-Benefits:</b></p> <ul style="list-style-type: none"> <li>• <u>Improved air quality:</u> Zero tailpipe GHG emissions and reduced criteria air pollutants are achieved by many of these actions, resulting in improved air quality.</li> <li>• <u>Public health benefits:</u> Improved air quality will lead to reduced asthma, heart attacks, and strokes, especially in LIDACs who are at greater risk due to increased exposure.</li> <li>• <u>Lower costs:</u> Several of these actions result in energy and fuel cost savings, as well as increase stormwater retention, saving local governments money over time.</li> <li>• <u>Increase community pride:</u> Participation in ARC's Green Communities program fosters civic pride, creates a positive image of a place to live or conduct business, sets an example for business and organizations seeking to reduce their environmental impacts, and leads to greater quality of life.</li> </ul>
	<p><b>Implementation:</b></p> <ul style="list-style-type: none"> <li>• <u>Potential Implementing Agencies:</u> Local governments and ARC</li> <li>• <u>Estimated Implementation Schedule and Milestones:</u> Implementation Funding Proposal Submitted: April 1, 2024 CPRG Funding Awarded by EPA: August 2024 Project Implemented: September 2024 – September 2029</li> </ul>
	<p><b>Geographic Location:</b> Atlanta MSA</p>
	<p><b>Metrics for Tracking Progress:</b></p> <ul style="list-style-type: none"> <li>• Number of local governments participating in ARC's Green Communities certification program</li> <li>• Number of local governments with a high percentage of LIDACs served through Green Communities technical assistance</li> <li>• Amount of money saved by local governments through participation in the Green Communities program</li> <li>• Amount of GHG emissions eliminated</li> </ul>

## 2.3 Low Income and Disadvantaged Communities Benefits Analysis

The implementation of the priority emission reduction measures contained in this plan will not only provide reductions in GHG emissions but will also provide benefits to local communities, including LIDACs in the Atlanta MSA. Many of the priority emission reduction measures included in this plan contain co-benefits that will be realized by local communities near where the measures are implemented. Examples of these co-benefits include benefits from reductions in emissions of criteria air pollutants such as fine particulate matter (PM-2.5) and ground level ozone (O<sub>3</sub>) concentrations which contribute to a wide variety of adverse health effects. These adverse health effects include inflammation and damage to airways, an increase in the frequency of asthma attacks, premature death in people with heart or lung disease, and nonfatal heart attacks.

The Atlanta region must meet the continuously tightening air quality standards set by the EPA. These standards focus primarily on the criteria air pollutants mentioned above, ozone and fine particulate matter. Reductions in criteria air pollutant emissions will have the added benefit of helping the region in continuing to attain these air quality standards, which has both public health and economic benefits for the region.

Co-benefits of the priority emissions reductions measures could include:

- Improved air quality and improved public health due to reduced air pollution;
- Increased regional resiliency to extreme weather events;
- Establishment of community microgrids;
- Improved public access to services and critical resources in times of emergency;
- Decreased energy usage and decreased energy costs;
- Decreased home repair and improvement costs;
- Improved housing quality, comfort, and safety;
- Improved indoor air quality;
- Improved energy efficiency;
- Reduction of exposure to harmful transportation-related emissions;
- Access to affordable electric vehicles, charging stations, and purchase programs;
- Improvement in public transportation accessibility, reliability, and options;
- Reduced food waste sent to landfills;
- Increased bicycle and walking paths;
- Reduced noise pollution; and
- Creation of high-quality jobs and workforce development opportunities.

## Identification of LIDACs

For the purposes of the EPA CPRG program, a low-income and disadvantaged community is any community that is identified as being disadvantaged by the Climate and Economic Justice Screening tool (CEJST) or the EPA's Environmental Justice Screening and Mapping Tool (EJScreen). The CEJST is a federal tool that identifies disadvantaged census tracts across the nation, including the Atlanta MSA region. Based on the CEJST tool, a census tract is categorized as disadvantaged if it meets the thresholds for at least one of the tool's categories of burden, or if they are on land within the boundaries of Federally Recognized Tribes. The 25 categories of burden within the CEJST tool include climate change, energy, health, housing, legacy pollution,

transportation, water and wastewater, and workforce development. ARC combined results from the CEJST and EJScreen tools to develop the LIDAC analysis for the Atlanta MSA. A list of low-income and disadvantaged communities within the Atlanta MSA by census tract ID numbers is provided in [Appendix D](#).

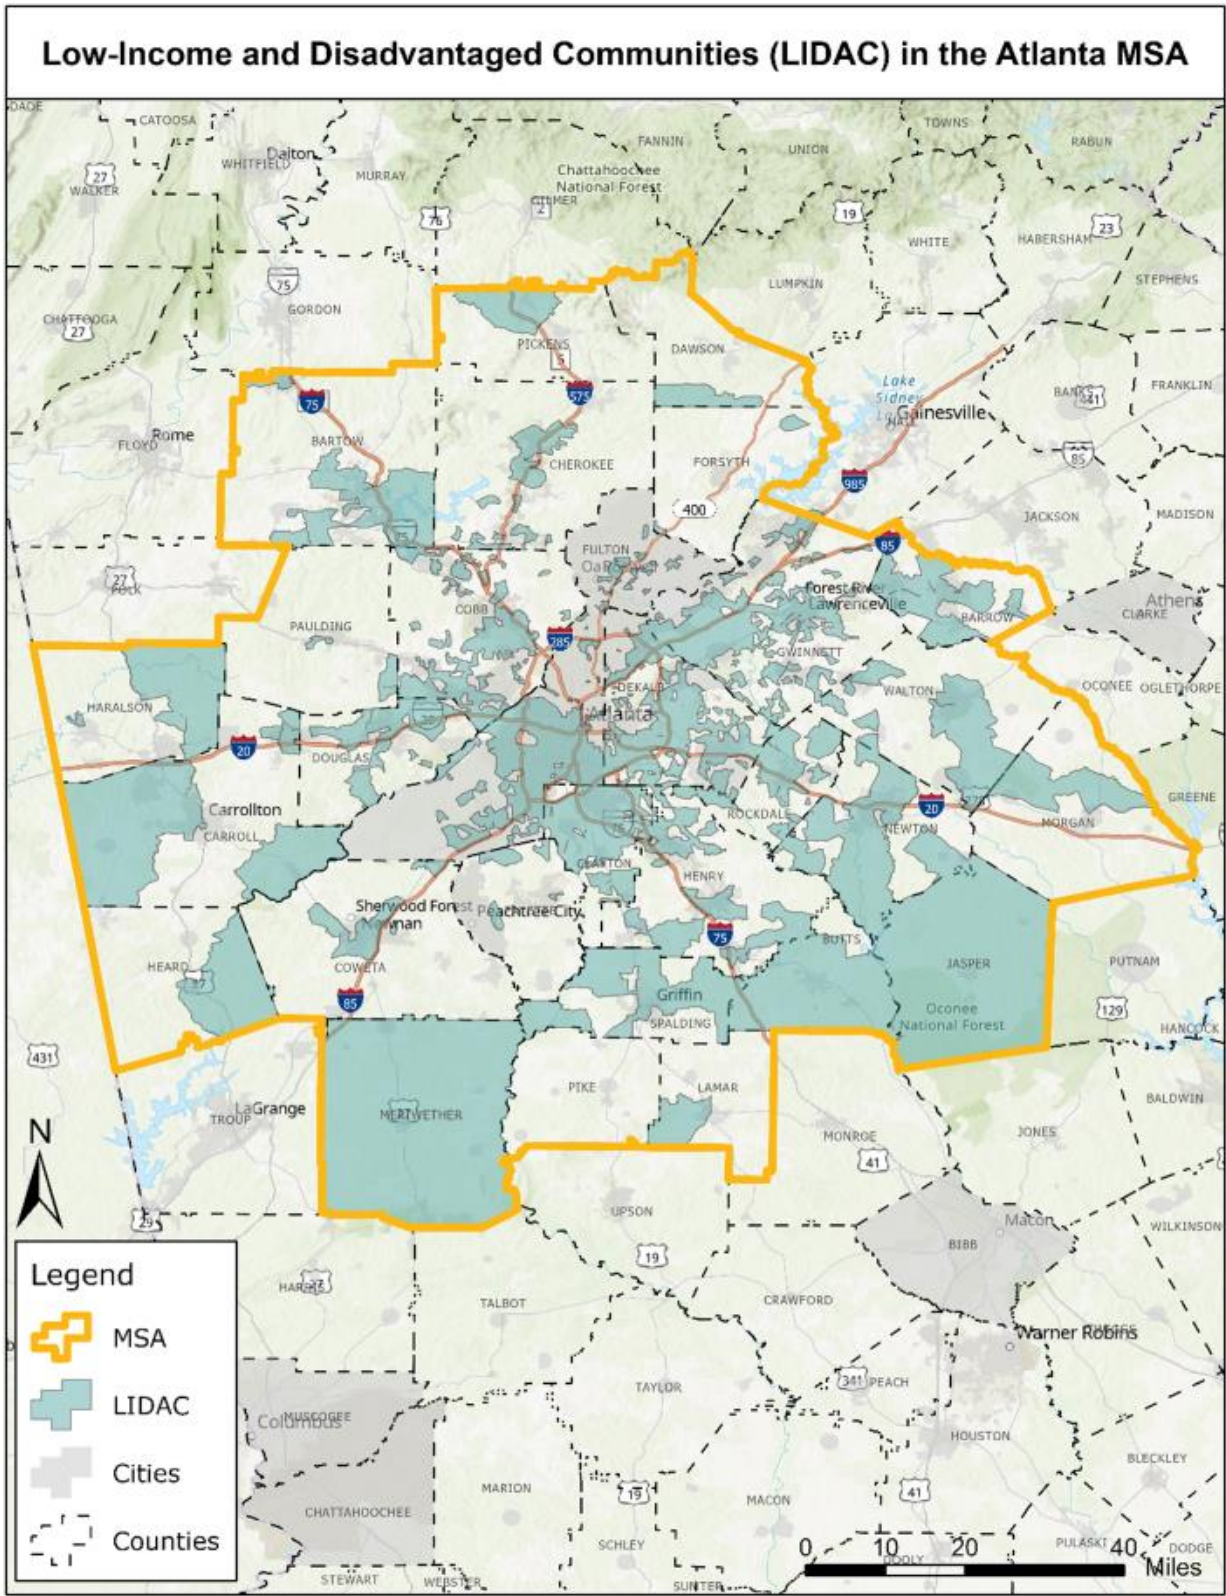

Figure 5 – Map of LIDAC communities in the Atlanta MSA

County snapshots of total population and the population within LIDACs in the Atlanta MSA are shown in Table 17. While the EJScreen uses Census block group data from U.S. Census Bureau’s 2020 Census, the CEJST uses Census tract data from the 2010 Census. The percentage of each county’s population that is considered low-income disadvantaged by each tool is shown in Table 17 as well.

Table 17 - Population and Low-Income Disadvantaged Communities in the Atlanta MSA

CEJST (2010 Census)				EJScreen (2020 Census)			
County Name	LIDAC Population	Total Population	% LIDAC	County Name	LIDAC Population	Total Population	% LIDAC
Barrow	17,016	69,367	25%	Barrow	41,489	83,505	50%

Meriwether	21,106	21,992	96%	Meriwether	12,494	20,613	61%
Morgan	0	17,868	0%	Morgan	2,382	20,097	12%
Newton	48,905	99,958	49%	Newton	69,278	112,483	62%
Paulding	7,395	142,324	5%	Paulding	6,646	168,661	4%
Rockdale	20,413	85,215	24%	Rockdale	47,726	93,570	51%
Spalding	21,172	64,073	33%	Spalding	31,568	67,306	47%
Walton	14,329	83,768	17%	Walton	37,089	96,673	38%

The CEJST ranks indicators of burden by Census tract. LIDACs identified using CEJST reflect Census tracts from the 2010 Census that are at or above the 90<sup>th</sup> percentile for at least one of the burden indicators listed in Table 17 on the next page. Following this criteria, 271 LIDAC Census tracts were identified. Using CEJST, it was found that 25 percent of the Atlanta MSA's population, or 1,381,127 people, live in LIDACs (Figure 6).

EJScreen ranks environmental and socioeconomic indicators using percentiles by Census block groups, providing information at a finer geographic scale than the CEJST. LIDACs identified using EJScreen reflect Census block groups from the 2020 Census that are at or above the 90<sup>th</sup> percentile for any of EJScreen's Supplemental Index Environmental Indicators, listed in Table 18 on the next page, when compared to the nation.

Percentile classes calculated for the Supplemental Index Environmental Indicators are a result of multiplying each environmental indicator percentile by the supplemental demographic index. The supplemental demographic index averages the following five socioeconomic factors:

- % low income
- % unemployed
- % limited English speaking
- % less than high school education
- low life expectancy

EJScreen Supplemental Index Environmental Indicators capture community-level vulnerability by identifying Census block groups with the highest intersection between socioeconomic factors and environmental indicators. Following the criteria for using EJScreen, 1,493 Census block groups were identified as LIDAC. LIDAC Census block groups represent 35 percent of the Atlanta MSA's population, or 2,211,983 people (Figure 7).

Figure 6 - Comparison of total & LIDAC populations in the Atlanta MSA (CEJST)

Figure 7 - Comparison of total & LIDAC population in the Atlanta MSA (EJScreen)

Census tracts at or above the 90<sup>th</sup> percentile for CEJST indicators of burden in the Atlanta MSA are shown in Table 18, where indicators of burden are color-coded and grouped into the following eight categories, respectively:

- Health
- Transportation
- Energy
- Climate Change
- Housing
- Workforce Development
- Water and Wastewater
- Legacy Pollution

The top burden indicators among LIDACs identified using CEJST include Housing, Diabetes, Low Median Household Income, Travel Barrier, Life Expectancy, and Poverty.

Table 19 - Atlanta MSA Census Block Groups at or above 90<sup>th</sup> percentile (EJScreen)

EJScreen Supplemental Index Environmental Indicators of Burden	Number of Census Block Groups at or above the 90 <sup>th</sup> Percentile
Air Toxics Respiratory HI	1101
Air Toxics Cancer Risk	1418
Diesel Particulate Matter	555
Particulate Matter 2.5 in Air	896
Ozone	821
Toxic Releases to Air	246
Traffic Proximity	262
Lead Paint	97
Wastewater Discharge	245
Leaky Underground Storage Tanks	304
Superfund Proximity	141
Risk Management Plan Facility Proximity	363
Hazardous Waste Proximity	157

Table 18 - Atlanta MSA Census Tracts at or above the 90<sup>th</sup> percentile (CEJST)

CEJST Indicators of Burden	Number of Census Tracts at or above the 90 <sup>th</sup> Percentile
Diabetes	84
Asthma	44
Life Expectancy	65
Heart Disease	26
Traffic Proximity & Volume	53
Travel Barrier	69
Diesel Particulate Matter	58
Particulate Matter 2.5 in Air	0
Energy Burden	60
Agriculture Loss	5
Building Loss	0
Flood Risk	1
Fire Risk	0
Population Loss	0
Indoor Plumbing	19
Lead Paint	5
Housing	99
Poverty	65
Linguistic Isolation	59
Unemployment	64
Low Median Household Income	82
Wastewater Discharge	17
Leaky Underground Storage Tanks	12
Superfund Sites	0
Risk Management Plan Proximity	58
Hazardous Waste Proximity	0

Census block groups at or above the 90<sup>th</sup> percentile for EJ Screen indicators of burden in the Atlanta MSA are shown in Table 19, where indicators of burden are color-coded and grouped into the following six categories, respectively:

- Air Quality & Health
- Transportation
- Housing
- Water and Wastewater
- Legacy Pollution

The top five burden indicators among LIDACs identified by EJ Screen fall within the Air Quality and Health burden category and include Air Toxics Cancer Risk, Air Toxics Respiratory Hazard Index, Particulate Matter 2.5 in Air, Ozone, and Diesel Particulate Matter.

## Identification of Benefits and Impacts on LIDACs

ARC partnered with Georgia's EPD Air Protection branch to distribute a CPRG stakeholder survey statewide in January 2024. The purpose of the survey was to identify residents' priorities, address their concerns, and gather their ideas on how we can pave the way towards strengthening Georgia's clean energy economy, enhancing workforce training opportunities, and reducing greenhouse gases.

While it was a statewide survey, results for the Atlanta MSA area were shared with the ARC for use in developing the PCAP to identify potential positive benefits and negative impacts from proposed climate reduction strategies included in the plan, especially as they relate to low income and disadvantaged communities. The distribution of the survey responses in relation to Atlanta MSA LIDACs

can be seen in Figure 9. Fifty-four percent of statewide survey respondents identified themselves as being from zip codes within the Atlanta MSA. The top three benefits from climate pollution reduction projects in order of importance to Atlanta MSA respondents were:

- Improved public health resulting from decreased air pollution.
- Transportation improvements (e.g., bike lanes, walking paths, and transit options, electric vehicle charging.)
- Community resilience, or the ability to withstand extreme weather (e.g., water stations to address heat waves, and resilience hubs for people impacted by blackouts or flooding.)

With "Improved public health resulting from decreased air pollution" and "Transportation improvements" receiving nearly equal number of responses.

Figure 8 - Screenshot of ARC's post about the statewide CPRG survey

The top three concerns or challenges related to climate pollution reduction projects in order of importance to Atlanta MSA respondents were:

- Disproportionate impacts and effects in communities.
- Workforce concerns (e.g., loss of established jobs or new skills.)
- Burdensome regulations and applications for assistance.

With “Disproportionate impacts and effects in communities” as the number one concern or challenge identified by 66 percent of respondents.

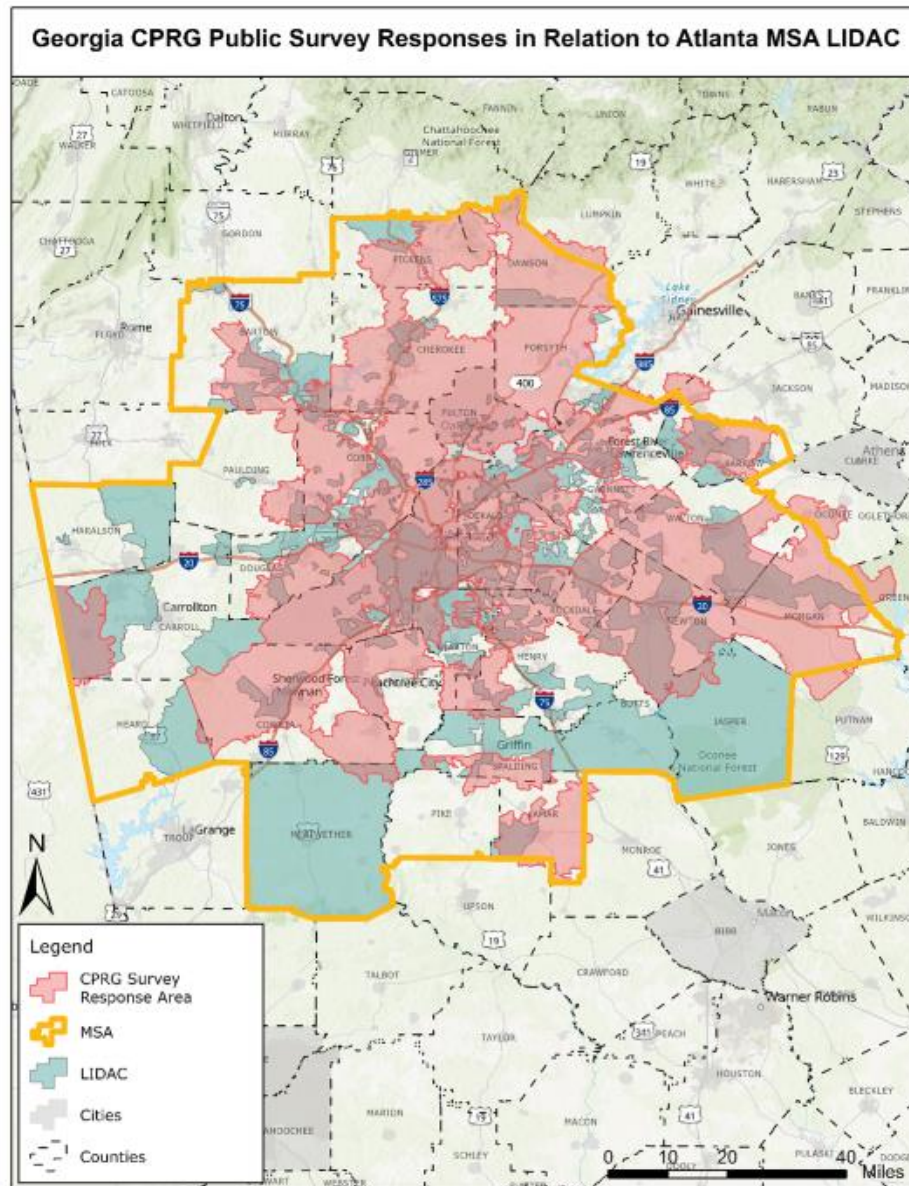

Figure 9 - Geographic distribution of responses from the statewide CPRG survey in relation to LIDACs within the Atlanta MSA

## 2.4 Review of Authority to Implement

Under the EPA CPRG Planning Grants program, each PCAP must include a review of authority to identify if the planning grant recipient or collaborating partners have existing regulatory or statutory authority to implement the applicable priority GHG emissions reduction measures. For this PCAP, ARC has relied upon survey responses from eligible entities within the Atlanta MSA for identification of specific emission reduction programs, policies, and projects they may seek to implement. Within those surveys, ARC requested an identification of any additional authority that may be necessary to implement the applicable measure or group of measures. However, while ARC has relied upon these notifications for this review of authority, there are many eligible entities within the MSA including counties, transit agencies, municipalities, and universities who may have different existing authority.

Any eligible entity wishing to pursue funding for a CPRG Implementation Grant should consult their local laws, rules, and ordinances to see if additional authority is necessary for an applicable PCAP priority GHG emissions reduction measure prior to applying for CPRG implementation funding.

ARC has reviewed existing statutory and regulatory authority to implement each priority measure identified in this plan. This plan is non-regulatory in nature, and the measures contained herein constitute a list of voluntary actions available to local governments, state agencies, and state authorities for CPRG Implementation. No new regulatory authority is given by CPRG, nor is new authority sought by this plan for CPRG Implementation.

## 2.5 Workforce Planning

Implementation of GHG reduction measures has the potential to lead to skilled labor shortages, have impacts on existing jobs and industries, provide opportunities for the creation of high-quality jobs, and expand economic opportunity to underserved workers. While this PCAP does not provide a workforce planning analysis, it is important to include initiatives that are already underway that aim to address some of these concerns while also providing the benefits mentioned above.

### Clean Tech Academy Pilot

By now, it's clear that EVs are an increasing trend. Carmakers are doubling down on the technology, and the federal government has set a goal for half of all new vehicle sales to be electric by 2030. However, EVs require a robust infrastructure system, most notably charging stations that can support the EV transition. And the new technology requires skilled workers who are trained to install and maintain the equipment — a field that barely existed until just a few years ago.

ARC and Goodwill of North Georgia have recently joined forces to help meet this demand and offer residents across the Atlanta region a fast lane toward a new, more lucrative career.

ARC has received a 5-year, \$2 million grant from the U.S. Department of Labor that will enable Goodwill to offer state-of-the-industry training for 250 people to become EV technicians. The grant will help expand Goodwill's pilot Clean Tech Academy to locations across the Atlanta region, including

Atlanta Technical College. The first Clean Tech Academy courses funded with the federal grant are expected to start by early summer 2024.

### **Building Georgia Workforce Partnership**

The purpose of the Building Georgia Workforce Partnership is to foster collaboration across the state between government agencies, the private sector, and the workforce training community to “close the gap” between the current levels of workforce employment in the infrastructure construction sector and what will be needed for Georgia to successfully take advantage of funding provided in the Infrastructure Investment & Jobs Act (IIJA).

Building Georgia’s analysis has identified an approximate “gap” of 136,000 infrastructure construction job openings across the state over the 5-year lifespan of the IIJA. To address this gap, the program – which will be the first in the United States to flex IIJA transportation funding for workforce development – aims to:

- Train labor based on industry needs assessments;
- Match employers with job seekers;
- Reframe and promote skilled trades to students earlier; and
- Identify funding to support long term efforts.

The program is anticipated to be finalized summer of 2024 and launch in late fall 2024.

## **3 Next Steps**

### **Phase 2 CPRG Competitive Implementation Grants**

Applications for EPA’s CPRG Implementation Grants General Competition are due by April 1, 2024. EPA anticipates awarding approximately 30 to 115 grants ranging between \$2 million and \$500 million under the general competition. Grant applications must only seek funding to implement GHG emission reduction programs, policies, or measures identified in an appropriate PCAP created under a CPRG planning grant. CPRG Planning Grants were awarded to ARC and the State of Georgia and eligible implementation grant applicants should refer to the plan that applies to their geographic location when preparing their proposals.

### **CPRG Planning Grant Program**

An Atlanta MSA Comprehensive Climate Action Plan is the next deliverable under the EPA CPRG Planning Grant. ARC is the lead agency for CCAP planning and the plan is due to EPA on August 28, 2025. It must include the following elements:

- A comprehensive GHG inventory;
- Near term and long term GHG emissions projections;
- Near term and long term GHG emissions reduction targets;
- Quantified GHG reduction measures for all measures;

- A benefits analysis for the full geographic scope and population covered by the plan;
- A low-income and disadvantaged communities benefits analysis;
- A review of authority to implement;
- A plan to leverage other federal funding; and
- A workforce planning analysis.

ARC takes seriously its responsibility to develop a CCAP that will set up the Atlanta MSA and its individual communities to best mitigate GHG emissions in conjunction with protecting human health, increasing economic mobility, and creating a competitive economy that benefits everyone. It will continue to engage with the community on this important endeavor and has committed to holding a minimum of six community engagement opportunities for the development of the CCAP. ARC will continue to hold regular stakeholder webinars to share program updates and solicit input from the community on plan development. To stay up to date on ARC's CCAP planning efforts, please visit [atlantaregional.org/cprg](https://atlantaregional.org/cprg).

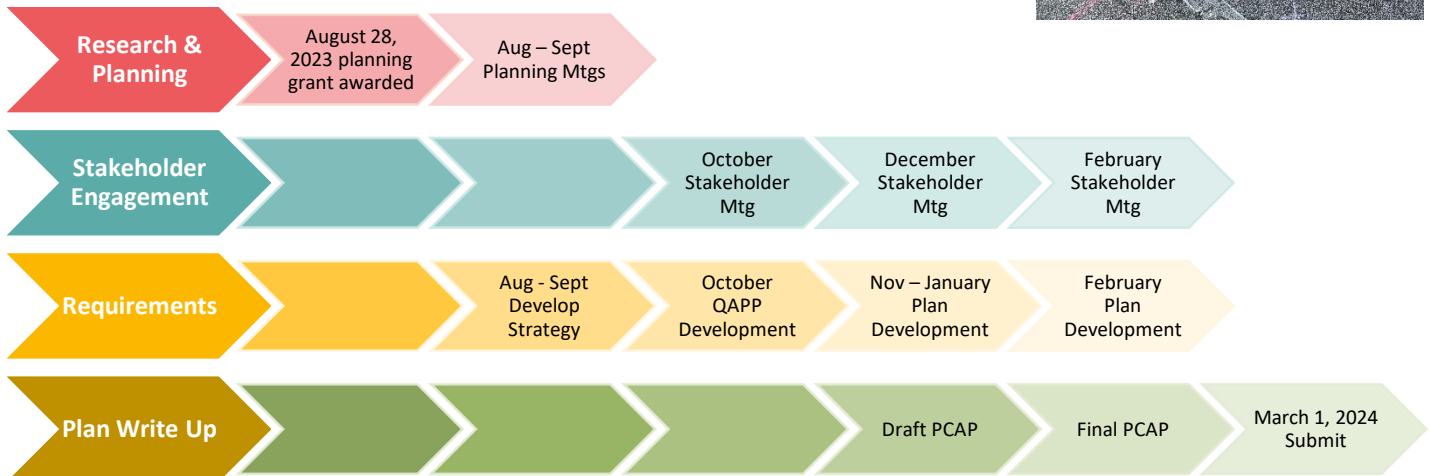

## Appendix A: Stakeholder Engagement Activities Summary

ARC conducted a series of online stakeholder webinars, numerous one-on-one conversations with stakeholders, attended existing community events, and circulated online surveys to inform this plan. Other state agencies and local jurisdictions provided input and shaped the PCAP as well. Collaboration with the Georgia EPD Air Protection Branch was critical to align goals and avoid duplication of actions since EPD is leading the State of Georgia CPRG efforts..

Through a variety of engagement methods, an estimated 30,000+ people heard about the Atlanta MSA CPRG planning efforts over the past 6 months. Twenty-two of the twenty-nine counties within the MSA participated in the stakeholder engagement process.

### PCAP Planning and Engagement Timeline

### Local Government Outreach

On October 2, 2023, a kickoff email was sent to top elected officials and key staff in each of the Atlanta MSA's 29 counties and 150 cities from ARC's Executive Director and CEO, Anna Roach. The email shared information about the CPRG planning grant and invited local governments to participate in the Atlanta MSA CPRG kickoff webinar on October 24, 2023.

Updates about the process were sent to each local government after each webinar, in October, November, and January.

Additionally, local government representatives were updated at a variety of board, committee, and conference meetings with a high number of local government representation including:

- Metropolitan North Georgia Water Planning District Joint Basin Advisory Council
- Metropolitan North Georgia Water Planning District Board
- Georgia Planning Association
- ARC Community Resources Committee
- ARC Energy and Climate Council
- ARC Land Use Coordinating Committee
- ARC Board

Numerous one-on-one conversations were held with local governments via email and Microsoft Teams meetings. Details about these meetings are captured in the table at the end of this section.

## CPRG Stakeholder Survey

The [Atlanta MSA CPRG Stakeholder Survey](#) has been open since May 2023 and has received 124 responses from across the MSA.

Questions were constructed to capture the following information:

- Who do you represent?
- What is your primary interest in the CPRG?
- What is your sector interest in the CPRG?
- In which county are you located?
- Does your organization have a climate, clean energy, or sustainability plan?
- Does your organization or jurisdiction have projects or plans that could be eligible for CPRG implementation funds?

Stakeholders participating in the survey represented a variety of sectors and interests:

Primary Interest in the CPRG Planning Process:

Local Governments Represented in the Stakeholder Survey:

Organization Name	MSA County/Counties Represented
City of Atlanta	DeKalb, Fulton
City of Auburn	Barrow, Gwinnett
City of Chamblee	Dekalb
City of Chattahoochee Hills	Fulton
City of Covington	Newton
City of Decatur	DeKalb
City of Johns Creek	Fulton
City of Lawrenceville	Gwinnett
City of Milton	Fulton
City of Oxford	Newton
City of Roswell	Fulton
City of Sandy Springs	Fulton
City of Stockbridge	Henry
City of Tucker	DeKalb
City of Villa Rica	Carroll, Douglas
City of Woodstock	Cherokee

Cobb County Government	Cobb
Dekalb County Government	Dekalb
Douglas County Government	Douglas
Forsyth County Government	Forsyth
Fulton County Government	Fulton
Georgia General Assembly – State Representatives	DeKalb, Gwinnett
Georgia World Congress Center Authority	Fulton
Henry County Government	Henry
Meriwether County Government	Meriwether
Metropolitan Atlanta Rapid Transit Authority	Clayton, DeKalb, Fulton

## CPRG Emission Reduction Measure Identification Surveys

ARC and EPD each circulated an Emission Reduction Measure Identification Survey to capture ideas and specific details about potential projects that may be submitted to EPA for CPRG implementation grant funding. Information gathered from the surveys was instrumental in helping ARC identify and prioritize potential GHG reduction measures for inclusion in the PCAP. While the ARC and EPD surveys differed slightly, they each sought details about projects, programs, measures, or strategies that organizations developed or supported to reduce GHG emissions or other air pollutants. Information collected included:

- Organization type;
- Project, program, measure, or strategy name;
- Emission sector(s) targeted;
- Targeted pollutants;
- Existence of a LIDAC assessment for the project, program, measure, or strategy;
- Existence of an emission analysis for the project, program, measure, or strategy;
- Project, program, measure, or strategy start and end dates;
- Other project, program, measure, or strategy partners; and
- Intention to apply for CPRG implementation funding.

Respondents included local governments, state agencies and authorities, universities, nonprofits/NGOs, and the private businesses, including Disadvantaged Business Enterprises (DBE). The ARC and EPD shared survey results with each other to ensure data captured could be used for both plans.

## CPRG Stakeholder Webinars

Three webinars were held to inform stakeholders about the CPRG planning grant and its deliverables as well as to invite them to participate further in the process. Webinars and topics covered include:

- October 24, 2023 – Atlanta MSA CPRG Kickoff
- November 28, 2023 – Atlanta MSA CPRG Stakeholder Update & Implementation Grant Overview
- January 30, 2024 – Atlanta MSA PCAP Update & Draft Priority Measures

Presentations and recordings from each webinar can be found on [ARC's Atlanta MSA Climate Pollution Reduction Grant Stakeholder Meetings webpage](#).

# Atlanta MSA Climate Pollution Reduction Grant Stakeholder Meetings

The Atlanta Regional Commission (ARC) has held three stakeholder meetings to share information about the Atlanta Metropolitan Statistical Area (MSA) Climate Pollution Reduction Grant (CPRG) planning process.

As part of the Inflation Reduction Act, the 2-phase CPRG program provides grants to states, local governments, tribes, and territories to develop and implement plans to reduce greenhouse gas (GHG) emissions and other harmful air pollution. On September 21, EPA announced Phase 2 of the CPRG program, which includes two competitions for the implementation grants:

- a general competition for applications from states, municipalities, tribes, tribal consortia, and territories, and
- a competition only for tribes, tribal consortia, and territories.

If you will be pursuing implementation grant funding it is strongly encouraged that you are familiar with these webinars, and critical that you communicate your plans to ARC by January 4, 2024 so that we may

## Community Outreach

In addition to the stakeholder survey, email updates, and webinars, ARC participated in several community events and people's thoughts on climate change were reflected in the ARC Metropolitan Transportation Plan outreach efforts that overlapped with the CPRG PCAP planning timeframe.

### RayDay (over 2,000 engagement touchpoints)

RayDay is an annual celebration that brings people together, encourages conversations and connections, and continues to spread the word about sustainability. It is a celebration of Ray Anderson's legacy – a one-day course on sustainable living, outdoors in a Serenbe country meadow. It's tons of fun for the whole family, with great food and drink and more than 60 sustainability-focused learning booths, and much more.

ARC and the State of Georgia's EPD Air Protection Branch teamed up to bring our CPRG planning outreach to RayDay in October 2023.

### 12 THINGS TO KNOW ABOUT THE ATLANTA REGION'S 2050 MTP

## LISTENING AND LEARNING FROM THE PUBLIC

The 2050 MTP/TIP was informed by extensive public participation. Over 70,000 stakeholder engagement touchpoints, assembled from a variety of regional and local engagement activities, were used to inform the 2050 MTP/TIP Update. These participation activities were conducted between 2020-2023.

GOAL  
Diverse  
Stakeholders  
Engage

Comments received from the public, as well as data collected from public opinion surveys, brought two key themes into focus.

**The future is uncertain** – People are concerned about the future, and a sense of uncertainty about what lies ahead is reflected in both public comments and survey data. Issues such as climate change, housing affordability, and the impact of technology were repeatedly brought forward during 2050 MTP/TIP Update engagement activities.

**Transportation priorities** – Most comments and survey responses showed public support for transit as the best long-term solution for traffic congestion. While support for public transit is very strong, particularly in the region's core counties, the percentage of residents expressing willingness to pay more in taxes to fund expansion of regional public transit is mixed. In addition, survey data about investment priorities shows a plurality of opinions, with road system expansion, operational improvement and maintenance identified as important funding categories.

Broad issues, such as climate change, housing, technology, and electrification, are front and center for ARC's planning work in 2024. These important and foundational planning efforts represent major areas of influence for the next MTP.

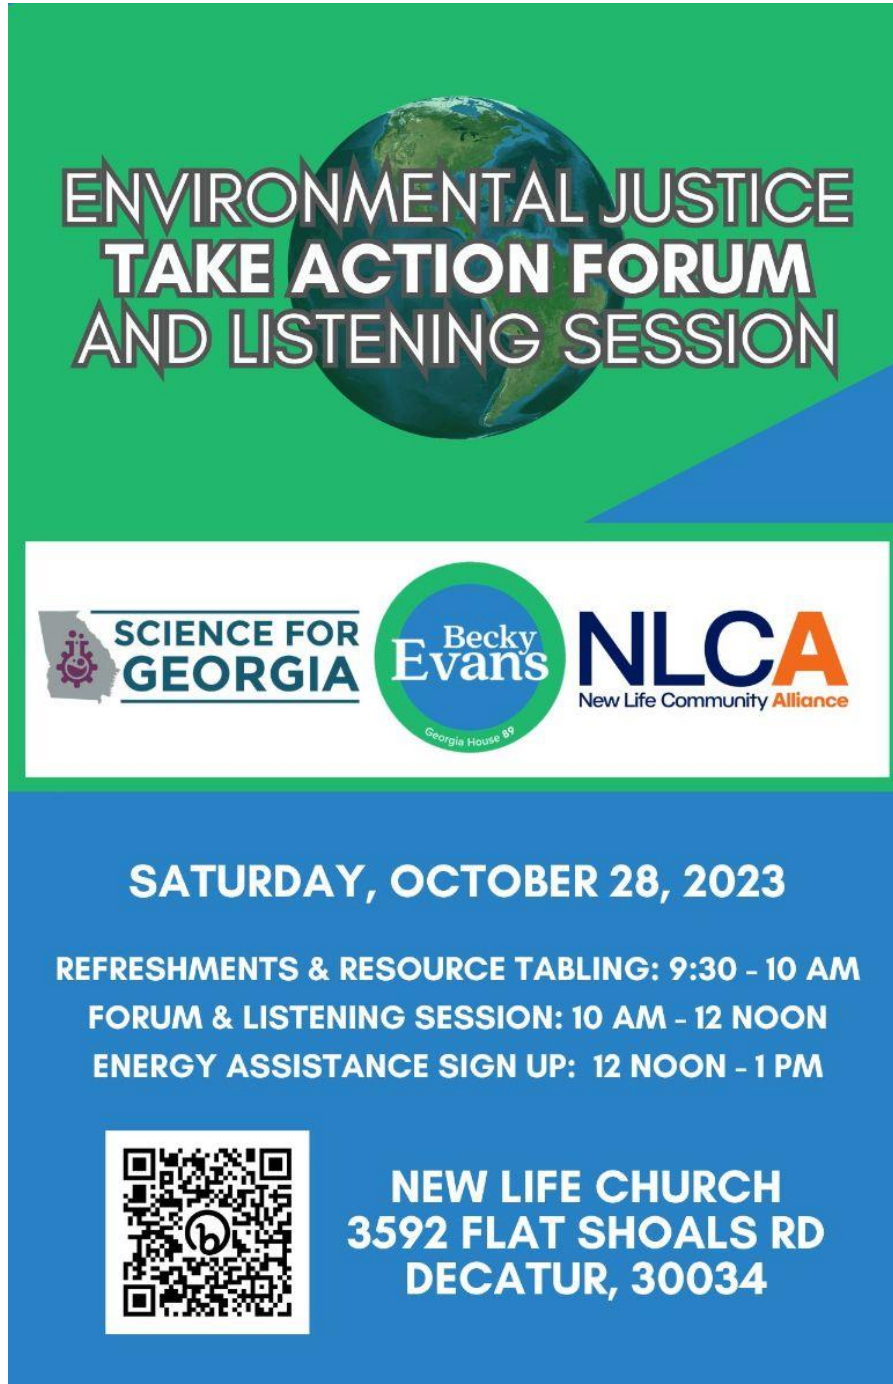

To learn more about how ARC engaged the public in conversations about the region's transportation future throughout the update plan process and what we learned, refer to Volume IV: Public Engagement.

### Environmental Justice Take Action Forum and Listening Session

ARC and the State of Georgia's EPD Air Protection Branch coordinated to bring our CPRG planning outreach to an Environmental Justice Take Action Forum and Listening Session hosted in October 2023 by State Representative Becky Evans, New Life Community Alliance, and Science for Georgia.

The poster features a green background with a blue and white globe in the center. The title "ENVIRONMENTAL JUSTICE TAKE ACTION FORUM AND LISTENING SESSION" is written in large, bold, white capital letters with a black outline, positioned over the globe. Below the title is a white horizontal band containing three logos: "SCIENCE FOR GEORGIA" with a gear icon, a circular logo for "Becky Evans Georgia House 89", and the "NLCA New Life Community Alliance" logo. The bottom section of the poster has a blue background with white text providing the date, times for various activities, and the location. A QR code is located on the left side of this section.

## Appendix B: GHG Inventory Technical Support Document

### Inventory Tool

ARC's simplified GHG inventory utilizes [Drawdown Georgia's GHG Emissions Tracker](#) for sector-specific data. Drawdown Georgia's GHG Tracker expresses greenhouse gas emissions in metric tons of carbon dioxide equivalent (CO<sub>2</sub>e) units. This standardized unit ensures consistent comparisons across various greenhouse gases.

### Background Information

ARC's simplified GHG inventory captures emissions within the 29-county Atlanta MSA for the 2019 base year. It quantifies direct emissions from the residential, commercial, industrial, transportation, and agriculture sectors, and indirect emissions associated with electricity consumed in the residential, commercial, and industrial sectors. While data limitations prevent direct inclusion of the waste sector, its emissions are included for reference and estimated to be accounted for within the commercial and industrial sectors.

### Reporting Sectors

Data sources for each sector are as follows:

1. **Consumed Electricity:** This sector represents indirect emissions associated with electricity consumption in residential, commercial, and industrial sectors. Data is sourced from Drawdown Georgia's platform, which relies on the Energy Information Administration (EIA) Open Data API and state-specific datasets.
2. **Residential:** Direct emissions from residential activities and energy use are captured in this sector. Drawdown Georgia leverages the Census American Community Survey (ACS), EIA Residential Energy Consumption Survey (RECS), NOAA Climate Normals, and EIA Open Data API to gather relevant information.
3. **Commercial:** Direct emissions from commercial buildings and activities are captured in this sector. Drawdown Georgia's methodology incorporates data from EIA Open Data API, Quarterly Workforce Indicators (QWI), Commercial Buildings Energy Consumption Survey (CBECS), and state-wide energy usage data.
4. **Industrial:** Direct emissions from industrial facilities and processes are captured in this sector. Drawdown Georgia uses EIA Open Data API alongside QWI industrial employment data, Manufacturing Energy Consumption Survey (MECS) data, and state-wide emissions information.
5. **Transportation:** Direct emissions from on-road vehicles, including passenger cars, trucks, and buses are included in this sector. Drawdown Georgia's methodology utilizes EIA Open Data API, US Department of Transportation monthly Traffic Volume Trends (TVT), and the Georgia Department of Transportation's Highway Performance Monitoring System (HPMS) data to calculate emissions by road category and county.
6. **Agriculture:** Direct emissions from agricultural activities such as agricultural soil management, enteric fermentation, and manure management are included in this sector. Drawdown Georgia's methodology uses United States Department of Agriculture (USDOA) Census data, Growing Degree Days (GDDs), USDOA animal units, and USDOA manure generation values per animal unit to estimate emissions.
7. **Forestry:** Forest uptake and wood sequestration are quantified in this sector. Drawdown Georgia's methodology utilizes National Land Cover Dataset (NLCD), Oak Ridge National Laboratory (ORNL) Forest Flux Data, EPA State Inventory Tool (SIT) for Forestry Flux, and GDDs to estimate emissions and flux.

8. **Waste:** While not directly included in the inventory due to data limitations, waste sector emissions are estimated to be captured within the commercial and industrial sectors. This estimation is based on filtering waste facilities within the 29-county MSA and year 2019 using Drawdown Georgia’s GHG Emission Tracker dashboard for Large Facility Industrial and Commercial Direct GHG Emissions.

## **Data Sources**

For more information about the data used and calculations made by the Drawdown Georgia GHG Emissions Tracker, see the [GHG Emissions Tracker Documentation Slides](#) and the [GHG Emissions Tracker Documentation Manual](#).

## Appendix C: GHG Reduction Potential Technical Support Document

### INTRODUCTION

This appendix is a supplement to the Atlanta MSA PCAP in support of the EPA's Climate Pollution Reduction Grant Program. This appendix details the methodologies, data, sources, assumptions, and results of quantitative assessments performed in support of the priority measures in the PCAP, including quantifications of estimated GHG emissions reductions. The PCAP contains the following priority measures:

- Electrify Fleets
- Expand EV Charging Infrastructure
- Incentivize Use of Electric Bikes
- Encourage Transportation Mode Shifts
- Transition to Energy Efficient Transit Railcars
- Convert Fleet Vehicles from Diesel to Cleaner Fuels
- Electrify Buildings
- Increase Energy Efficiency in Industrial and Commercial Buildings (including Multifamily)
- Increase Energy Efficiency in Single Family Homes
- Increase Use of Solar Photovoltaics
- Increase Community-Based Solar
- Increase Use of Wastewater Gas to Energy
- Increase Diversion of Waste from Landfills
- Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs

For details on each priority measure, please see the PCAP. This appendix is intended to provide clarity and detail for readers seeking to understand how potential emissions reductions were quantified or conduct a similar analysis in preparation for a CPRG Implementation Grant application.

NOTE: The GHG emissions reductions stated in each of the following measures are estimates based on available data and tools, which may be subject to revisions or updates as needed.

### MEASURING AND REPORTING GREENHOUSE GASES

Different types of GHGs (CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFCs, PFCs, SF<sub>6</sub>, NF<sub>3</sub>, etc.) have different global warming potentials (GWP). GWPs were developed to allow comparisons of the warming impacts of different GHGs. A GWP measures how much energy the emissions of 1 ton of a gas will absorb over a given time, relative to the emissions of 1 ton of carbon dioxide. The larger the GWP, the more that gas warms the Earth compared to CO<sub>2</sub> over the given time. GWPs allow for a common unit of measurement across all GHGs, regardless of their radiative efficiency or lifespan in the atmosphere. GWPs are used to convert emissions of all GHGs into CO<sub>2</sub> equivalent (CO<sub>2</sub>e). The conversion used is emissions of the gas multiplied by its GWP. Throughout this PCAP, emissions are measured by the weight of the gas emitted in metric tons (MT) carbon dioxide equivalent (MTCO<sub>2</sub>e).

## METHODOLOGY AND ASSUMPTIONS FOR EACH PCAP GHG PRIORITY MEASURES

### Electrify Fleets

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Electrify Fleets	646,778	12,687,689

Prepared by: ARC

An [Excel-based CMAQ Calculator](#) was used as a source to estimate emission rates for electrifying public fleet vehicles (primarily administrative fleets). A large local city has a fleet of over 5,000 vehicles, and it is assumed that half are gas trucks and half are gas light duty vehicles. These figures were conflated to the MSA level proportional to population. These additional assumptions were made for their use and replacement rate between 2025-2050:

- 30,206 light duty vehicles
- 30,206 trucks
- Gas truck emission rate = 308.7 g/veh/mile
- Gas light duty truck emission rate = 399.5 g/veh/mile
- EV vehicles = 0 g/veh/mile
- Annual mileage (both) = 40,000 miles
- Light Duty Replacement Rate/yr (2025-2032) = 1,000
- Light Duty Replacement Rate/yr (2033-2050) = 1,500
- Truck Replacement Rate/yr (2025-2032) = 1,200
- Truck Replacement Rate/yr (2033-2050) = 1,750

Replacing the public fleets with this timeline gets the region to a 100% electric fleet by 2050. This analysis only considers the reduction in tailpipe emissions and compares it to a Business As Usual case of maintaining gas vehicles over time. Table 1 shows the 2025-2030 estimates of replacing gas vehicles with propane vehicles. The replacement schedule is compared to a Business As Usual case, and the right-most column includes cumulative greenhouse gas reductions in 2030 and 2050.

Table 1: Greenhouse Gas Reductions from Electrifying Fleets

Year	BAU (MT CO <sub>2</sub> e)	Replacement Plan (MT CO <sub>2</sub> e)	Cumulative Reduction (MT CO <sub>2</sub> e)
2025	855,716	824,917	
2026	855,716	794,118	
2027	855,716	763,319	
2028	855,716	732,520	
2029	855,716	701,721	
<b>2030</b>	855,716	670,922	<b>646,778</b>
2031	855,716	640,124	
2032	855,716	609,325	

2033	855,716	563,744	
2034	855,716	518,163	
2035	855,716	472,582	
2036	855,716	427,001	
2037	855,716	381,420	
2038	855,716	335,839	
2039	855,716	290,258	
2040	855,716	244,677	
2041	855,716	199,096	
2042	855,716	153,515	
2043	855,716	107,934	
2044	855,716	67,218	
2045	855,716	43,246	
2046	855,716	19,274	
2047	855,716	-	
2048	855,716	-	
2049	855,716	-	
<b>2050</b>	855,716	-	<b>12,687,689</b>

#### Expand EV Charging Infrastructure

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Expand EV Charging Infrastructure	0	+3,156

**Prepared by:** EY

**Overview:** This workbook estimates the GHG reduction potential of the “Expand EV Charging Infrastructure” priority measure. This measure is mapped to the most similar priority measures that will be included in the state of Georgia's Priority Action Plan (PAP), and the estimated GHG potential of ARCs priority measures are calculated by scaling down the estimated GHG reduction potential of Georgia's priority measures proportionally using the amount of GHG emissions emitted by the Atlanta MSA relative to the total GHG emissions emitted by the state.

**Notes:**

- To determine the amount of GHG emissions emitted by the Atlanta MSA relative to the state, the Atlanta MSA 2019 GHG emissions baseline and the Georgia 2021 GHG emissions baseline were used.
- Values preceded by a “+” sign in the table above indicate emission increases.
- The electric vehicle charging infrastructure measure resulted in increased GHG emissions in the long-term (2025-2050) due to the manufacturing and utilization of EV chargers.

Table 1. Mapping of ARC Priority Measures to Relevant Georgia Priority Measures

ARC Measure	Measure from Georgia Statewide Plan
Increase EV infrastructure	Electric vehicle charging infrastructure

Table 2. GHG Emission Reductions from Relevant Georgia Priority Measures

Measure from Georgia Statewide Plan	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050
Electric vehicle charging infrastructure	0	+5,000

Table 3. Comparing Georgia Statewide Emissions Inventory to ARC Emissions Inventory

Georgia Net Emissions (metric tons CO <sub>2</sub> e)	111,596,163
Atlanta MSA Net Emissions (metric tons CO <sub>2</sub> e)	70,447,080

Table 4. GHG Emission Reductions from ARC Measures

ARC Measure	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050
Increase EV infrastructure	0	+3,156

**Modeling Assumptions:**

This priority reduction measure was modeled using the Rocky Mountain Institute’s (RMI’s) Energy Policy Simulator (EPS), an “open-source model for estimating the environmental, economic, and human health impacts of hundreds of climate and energy policies.”<sup>2</sup> Environmental, economic, and human health impacts resulting from each measure’s implementation were estimated for two periods: 2025 to 2030 and 2025 to 2050. The impacts for 2025 to 2030 were quantified through December 31, 2024, and the impacts for 2025 to 2050 were quantified through December 31, 2049.

To model the measure in the EPS, a “business-as-usual” (BAU) and a “policy” scenario were developed, projecting out assumptions and key inputs related to the measure to 2050. The BAU scenario assumes no implementation of the reduction measure while the policy scenario assumes full implementation of the measure.

The following section details the scenarios, assumptions, and metrics that served as key inputs to modeling the measure in the EPS.

Estimates of GHG emission reductions resulting from the implementation of the measure in the state of Georgia have been outputted by the EPS modeling tool using the key inputs described below. These estimates have been scaled down in the

<sup>2</sup> Rocky Mountain Institute, [Energy Policy Simulator](#). 2024.

ARC Measures Excel workbook (above) to represent estimates of GHG reductions that would result from the implementation of the similar ARC-provided measure in the Atlanta MSA. The GHG emission reductions estimated from the measure from 2025 to 2030 and from 2025 to 2050 were scaled down proportionally using the amount of GHG emissions emitted by the Atlanta MSA relative to the total emissions emitted by the state.

### Modeling:

This measure focuses on the strategic expansion of electric vehicle (EV) charging infrastructure for light-duty vehicles across Georgia, aiming to increase the availability and accessibility of EV charging stations and thereby supporting the adoption of electric vehicles by reducing range anxiety and enhancing convenience for EV owners.

The modeling looks specifically at the deployment of public level 2 charging ports and public direct current fast chargers (DCFC) across Georgia. The EPS policy “New EV Chargers This Year” is used to quantify the impacts of measure implementation.

The expansion of EV charging infrastructure was modeled under two scenarios: (1) a business-as-usual (BAU) scenario, extending the current state, and (2) policy scenario. Each scenario is defined in detail below. Compared to the BAU scenario, the policy scenario increases the expansion of public level 2 charging stations by 177% and public DCFCs by 66%.

### Current state

In 2022, 9,542,400 light-duty vehicles were registered in the State of Georgia, of which 60,100 (0.63%) were EVs.<sup>3</sup> In 2023, there were 4,977 level 2 charging ports and 1,084 DCFC ports in Georgia.<sup>4</sup>

### Business-as-usual scenario

The business-as-usual scenario assumes a modest growth rate from the current state, reflecting national average increases in EV adoption and corresponding infrastructure needs based on data from the U.S Department of Energy Alternative Fuels Data Center.<sup>5</sup> This data contains projections for level 1, level 2, and direct current fast charging (DCFC) stations. However, the scope of this analysis was limited to level 2 and DCFC stations, as level 1 stations are typically privately owned. Given the above assumptions, the business-as-usual trend for level 2 and direct current fast charging stations is shown in Table 5 below.

Table 5: BAU scenario projection for EV charging in Georgia

Year	Public level 2 charging ports	Public DCFC ports
2022	4,977	1,084
2025	6,232	1,146
2030	8,323	1,248
2040	13,247	1,987
2050	18,171	2,726

### Policy scenario

The policy scenario assumes increased EV uptake and thereby increased need for charging stations.

Projections for the increase in light-duty vehicles in Georgia are based on the “high uptake of Inflation Reduction Act” scenario defined by the Energy Information Administration’s (EIA’s) 2023 Annual Energy Outlook Table 39, as shown in Table 6 below.<sup>6</sup> This scenario projects sales of both EVs and non-EVs.

<sup>3</sup> U.S. Department of Energy, [Alternative Fuels Data Center: Vehicle Registration Counts by State](#). Retrieved February 23, 2024.

<sup>4</sup> U.S. Department of Energy, [Alternative Fuels Data Center: Vehicle Registration Counts by State](#). Retrieved February 23, 2024.

<sup>5</sup> U.S. Department of Energy, [Alternative Fuels Data Center](#). Retrieved February 23, 2024.

<sup>6</sup> U.S. Energy Information Administration. [Annual Energy Outlook 2023, Table 39](#). March 16, 2023.

Table 6: Policy scenario projection for increase in light-duty vehicles in Georgia

	2022	2025	2030	2040	2050
National light-duty vehicles	261,612,793	264,455,627	269,727,356	277,696,228	294,364,471
% increase from 2022	N/A	1.09%	3.10%	6.15%	12.52%
Georgia light-duty vehicles	9,542,400	9,646,093	9,838,381	10,129,048	10,737,027

The “high uptake of Inflation Reduction Act” scenario was also used to project the proportion of light-duty vehicles that are also electric, per Table 7 below.

Table 7: Policy scenario projection for % of light-duty vehicles that are electric

	2022	2025	2030	2040	2050
National % of light-duty vehicles that are EV	0.777%	1.703%	4.306%	9.771%	12.262%

The Department of Energy’s (DOE) Electric Vehicle Infrastructure Projection Tool (EVI-Pro) Lite was used to calculate how many chargers would be required to support this uptake in EVs.<sup>7</sup> For each year, we assumed the following default mix of plug-in electric vehicles: 40% sedans, 35% crossover or SUV, 21% pickup trucks, and 4% vans. It was assumed that 75% of drivers had access to at home charging, assuming the low-end of an estimate.<sup>8</sup>

Additionally, for the policy scenario base year, 2022, light-duty EV registration in Georgia is 60,100, however, the projection tool requires that the number of vehicles required for a result is 1% of the total vehicles. To satisfy this requirement, the base year projection value used was 88,600.

Table 8: Policy scenario projection for level 2 and DCFC charging stations in Georgia

Year	Total GA light-duty vehicles	% EVs	# GA light-duty EVs	Public level 2 ports	Public DCFC ports
2022	9,542,400	0.63%	88,600	4,977	1,084
2025	9,646,093	1.703%	164,273	8,752	1,286
2030	9,838,381	4.306%	423,641	18,785	2,520
2040	10,129,048	9.771%	989,709	40,334	4,126

### Incentivize Use of Electric Bikes

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO2e)	
	2025 - 2030	2030 - 2050
Incentivize Use of Electric Bikes	1,937	13,175

Prepared by: ARC

An Excel-based calculator developed by the Rocky Mountain Institute (RMI) was used to estimate the impacts of an MSA-wide e-bike incentive program. Figure 1 includes many of the assumptions.<sup>9</sup>

Variable	Selected Input
Annual program budget for incentives	\$ 15,000,000.00
Timeline (Years)	4
Income-qualified commuting e-bike incentive	\$ 1,500.00
Income-qualified cargo e-bike incentive	\$ 2,000.00
Market-rate commuting e-bike incentive	\$ 500.00
Market-rate cargo e-bike incentive	\$ 1,000.00
Percent of incentives for income-qualified participants	75%
Percent of incentives for commuting e-bikes	54%
Average miles per week by income-qualified participants	32
Average miles per week by market-rate participants	22

Fig. 1 Assumptions and inputs to RMI E-bike Calculator

The calculator used travel pattern inputs from Replica as intermediate inputs, and the appropriate MSA data was added to the workbook to estimate Atlanta MSA impacts of a regional e-bike incentive program.<sup>10</sup> Table 1 shows the 2025-2029 estimates from the calculator, and an optimistic projection to 2050 using the FORECAST function. The right-most column includes cumulative greenhouse gas reductions in 2030 and 2050.

Table 1: Greenhouse Gas Reductions from an E-bike Incentive Program

	Baseline (MTCO2)	With e-bikes (MTCO2)	Reduction (MTCO2)	Cumulative Reduction (MTCO2)
2025	30,645	30,532	113

#### Encourage Transportation Mode Shifts

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Encourage Transportation Mode Shifts	17,139	74,270

Prepared by: ARC

An Excel-based Clean Mobility Quantification Methodology Calculator developed by the California Air Resources Board was used to estimate the greenhouse gas impact of expanding transit incentives throughout the MSA region.<sup>11</sup> Table 1 describes the inputs and assumptions used for the Clean Mobility Calculator.

Table 1: Assumptions and Inputs to Clean Mobility Calculator

<b>Timeline</b>	2025-2030
<b>Program Funding</b>	\$6,000,000
<b>Number of Annual Subsidies</b>	12,000
<b>Average Value of Subsidy</b>	\$100
<b>Increased Annual Bus Ridership</b>	1,000,000
<b>Average Length of Bus Trip</b>	6.0 mile
<b>Increased Annual Rail Ridership</b>	1,000,000
<b>Average Length of Rail Trip</b>	7.0 mile
<b>Air Basin</b>	San Diego

The Air Basin input is used to pull data on the average emissions from cars, trains, buses, and transit propensity for a specific region. It is assumed that the San Diego region and the Atlanta region are similar in terms of the emissions rates from the regional fleets.

Table 2 shows the 2025-2050 reductions from a transit subsidy program. The assumptions here are that the ridership increase would remain the same even after the program ends. The right-most column includes cumulative greenhouse gas reductions in 2030 and 2050.

#### Transition to Energy Efficient Transit Railcars

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Transition to Energy Efficient Transit Railcars	37,060	139,484

#### Prepared by: MARTA

The GHG reduction estimate method involves calculating the total GHG emissions from a reference case scenario where MARTA's current electric rail cars are not replaced (or if they are replaced, the new cars have the same energy efficiency as the old railcars) and comparing that reference case to the GHG emissions from a project implementation scenario where efficient electric rail cars replace the entire rail car fleet by 2030. The difference in total GHGs between the two scenarios represents the GHG reductions from project implementation.

In terms of durability of reductions, the new rail cars will result in a permanent reduction of cumulative emissions over the lifetime of the new rail cars (30-40 years). This is due to the fact that older or less efficient rail cars would most likely be used if this project is not funded. Because the measured years of GHG reductions do not continue past the lifetime of the rail cars (GHG reductions are calculated for 25 years and not 30-40 years), GHG reductions will continue past the time period of estimated reductions.

Cumulative and annual GHG reductions are in the tables below. IPCC 5<sup>th</sup> Assessment Report Global Warming Potentials were used to calculate metric tons of carbon dioxide equivalent (MT CO<sub>2</sub>e).

Years	Cumulative GHG Emissions (MTCO <sub>2</sub> e)		Cumulative GHG Reductions (MTCO <sub>2</sub> e)
	Reference Case Rail Fleet	Project Implementation Rail Fleet	
2025-2030	109,070	72,011	37,060
2025-2050	245,636	106,152	139,484

Year	Annual GHG Emissions (MTCO <sub>2</sub> e)		Annual GHG Reductions (MTCO <sub>2</sub> e)
	Reference Case Rail Fleet	Project Implementation Rail Fleet	
2025	29,195	25,546	3,649
2026	29,132	21,849	7,283
2027	20,519	12,824	7,695
2028	11,905	5,953	5,953
2029	10,075	3,778	6,297
2030	8,244	2,061	6,183
2031	7,433	1,858	5,574
2032	6,621	1,655	4,966
2033	6,576	1,644	4,932
2034	6,532	1,633	4,899
2035	7,033	1,758	5,275
2036	7,535	1,884	5,651
2037	7,129	1,782	5,347
2038	6,724	1,681	5,043
2039	7,272	1,818	5,454
2040	7,821	1,955	5,866
2041	7,144	1,786	5,358
2042	6,466	1,617	4,850
2043	6,119	1,530	4,590
2044	5,773	1,443	4,329
2045	5,961	1,490	4,471
2046	6,150	1,537	4,612
2047	6,251	1,563	4,689
2048	6,353	1,588	4,765
2049	7,342	1,836	5,507
2050	8,331	2,083	6,248

**Primary Assumptions:**

- Compared to the legacy fleet of trains, the new MARTA fleet will be 70-80% more energy efficient (assuming an average of 75% reduction in electricity usage due to new trains.)
- For reference case scenario, 2022 rail kWh use is held constant every year through 2050.
- Project implementation year is 2025.
- 100% of the rail fleet is being replaced by the efficient rail cars by 2030.
- After 2030, annual electricity reduction from new rail cars is constant at 75%.
- Electricity emissions factors were forecast using ICLEI Local Governments for Sustainability State Grid Intensity Projections tool for the state of Georgia, which is based on NREL's Mid Case Scenario data. Forecast values were available every two years in lb CO2e/MWh (see table below for citation.)
- The electricity emissions factor does not change between the reference case and proposed project.

75%	Electricity reduction of new trains compared to baseline trains
-----	---

Year	% Rail Train Replacement	% Total Rail Train Electricity Reduction due to New Rail*
2024	0%	0%
2025	17%	13%
2026	33%	25%
2027	50%	38%
2028	67%	50%
2029	83%	63%
2030	100%	75%

\*after 2030, annual electricity reduction from new rail cars is constant at 75%

	2025 - 2030	2030 - 2050
Convert Fleet Vehicles from Diesel to Cleaner Fuels	24,661	180,411

### Prepared by: ARC

An Excel-based CMAQ Calculator was used to estimate the impacts of transitioning a number of administrative fleet vehicles from gasoline to propane. Data from a local county assumes that 7 vehicles would be transitioned in 2025, and an additional 5 would transition in 2029.<sup>12</sup> These numbers were proportionally conflated to the MSA level using the population of the county compared to the full MSA. Figure 1 includes assumptions and inputs to the CMAQ calculator.

PROJECT INFORMATION		
Project Title	Forsyth Gas to Propane	
Project ID		
Project Location	Forsyth County	
Project Year	2025-2050	
Project Cost

## Electrify Buildings

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Electrify Buildings	1,500,000	21,000,000

**Prepared by:** Greenlink Analytics

**Brief Description of Intervention:** Home electrification programs and heating and cooling electrification may include multiple approaches within or across jurisdictions. This has been quantified based on one conservative approach that seems to be a reasonable approximation rather than estimate of the exact policy intervention.

**Notes on Intervention Implementation and Methodology:**

- Building electrification is modeled as a building codes policy that begins with consistent implementation of existing Georgia state building codes, improving over time, and eventually resulting in new construction achieving all-electric status.
- Does not account for potential interactions between different interventions.

**Energy Baseline and Forecast Details:**

Our analysis of energy consumption and the associated greenhouse gas emissions focused on the residential, commercial, and industrial sectors. Baseline information for 2020 was collected from the NREL SLOPE tool, which uses a combination of socioeconomic and energy survey data to establish baselines characteristics down to the county level. Greenlink obtained county-level estimates for all sectors noted for the 29 counties that compose the Atlanta Region.

SLOPE uses the EIA AEO forecasts to derive county-level energy forecasts; however, these have not been updated for several years. To provide better estimates, Greenlink aggregated the county-level 2020 baseline data to the region level, then obtained sector-specific growth forecasts out to 2050 for the South Atlantic region from the EIA AEO 2023. This maintains fidelity with the original NREL intent while also providing more accurate, post-COVID, post-Inflation Reduction Act forecasts for us in assessing the impacts of different climate policy options for the region.

**Carbon Baseline and Forecast Details:**

Our analysis of baseline CO<sub>2</sub> emissions begins with capturing recent localized estimates. 2022 baseline emissions for residential, commercial, and industrial sectors were collected at the county level from Drawdown Georgia, the collaborative effort led by researchers at the Georgia Institute of Technology, the University of Georgia, and others.

Carbon intensity is assumed to be a constant for natural gas at 53.02 kgCO<sub>2</sub>/MMBTU, as documented by many federal agencies (EPA, DOE, EIA, etc). Carbon intensity for the electricity sector is a more complex determination. Greenlink used its ATHENIA model forecasts, which captures hourly operations at power plants across the nation and also captures the approved utility-sector plans for capacity additions and retirements. It then uses machine learning to make predictions of the most likely description of energy system operations. The model has been awarded by the Massachusetts Institute of Technology, the Georgia Institute of Technology, and the National Science Foundation, and has been used to support the development of dozens of climate action plans at the state and local level across the United States since its introduction in 2014.

ATHENIA's hourly carbon intensity projections for the SERC region were collapsed to a demand-weighted annual average for the purpose of completing this analysis. Projections were used that extend out to 2050.

**Baseline Floorspace:**

Greenlink's data partner Google provided access to their estimates of floorspace taken from Google Maps, delineated by residential and nonresidential building uses. EIE data available for 23 of the 29 counties in the MSA. Heard, Jasper, Lamar, Meriwether, Morgan, and Pike Counties did not have EIE data available. In these six cases, NREL's SLOPE baseline data for commercial buildings is substituted, which provides an estimate of floorspace and buildings based on economic activity. Residential building estimates and floorspace is estimated from a combination of resources. Average floorspace per single family and multifamily residence (including mobile homes) is taken from the Federal Reserve, at 2100 square feet per single family residence and 1000 square feet per multifamily residence. Data from the American Community Survey and the Greenlink Equity Map were brought together to estimate the number of households in single family and multifamily residences in each county, then multiplied by the average square feet for the appropriate segment noted above. The number of residential buildings was taken from the latest American Community Survey data (table ACS S2504).

	2020	2023	2026	2029	2032	2035
<b>Energy Efficiency (Commercial)</b>	2015 IECC (baseline 0%)	2021 IECC	2024 IECC + amendments to meet 10% better than 2023	2027 IECC + amendments to meet 10% better than 2026	2030 IECC + amendments to meet 10% better than 2029	Max Tech Efficiency
<b>EE (Residential ERI)</b>	47	44.5	42	39.5	37	34.5
<b>Renewable Energy Resources</b>	Not Required	Res Solar Ready/ Comm .25 W/sqft of 3 largest floors	ResComm .5 w/sqft of conditioned floor area	Comm 10%	Comm 20%	Comm 50%
<b>Electrification</b>	EV Charging (current)	Electric Ready	All Electric	All Electric	All Electric	All Electric
<b>Building-Grid Integration</b>	Not Required	ADR and submetering	Storage and Water Heating	All Res. Appliances	Full Bldg/Grid Integration	
<b>Embodied Carbon</b>	NA	Provide EPDs or LCA	Concrete and Steel	Low EC structural	Low EC MEP systems	

#### Policy Options:

Proposed projects include Home Electrification Program and Electrification of Heating/Cooling Systems. To capture the potential effect of these projects that could be applied differently the 29 county area, we use some simplifying assumptions that seem reasonable to serve as a catch all proxy for the range of potential impacts. Building electrification potential is quantified by modeling building codes policy that begins with consistent implementation of existing Georgia state building codes, improving over time and eventually resulting in new construction achieving all-electric status.

For a copy of the full calculations for this measure, contact ARC at [climate@atlantaregional.org](mailto:climate@atlantaregional.org)

#### Increase Energy Efficiency in Industrial and Commercial Buildings (including Multifamily)

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO2e)	
	2025 - 2030	2030 - 2050
Increase Energy Efficiency in Industrial and Commercial Buildings (including Multifamily)	4,700,000	58,700,00

**Prepared by:** Greenlink Analytics

**Brief Description of Intervention:** Improve building energy efficiency through building performance standards, energy audits, and building energy ordinances. The expectation is set to be a 2% energy efficiency improvement per year for the first 10 years and a 1% per year thereafter.

#### Notes on Intervention Implementation and Methodology:

- Based on DOE's Energy Savings Analysis: ANSI/ASHARE/IES Standard 90.1-2016, the savings target (2% improvement per year for 10 years and 1% thereafter) is estimated.
- Does not account for potential interactions between different interventions.

### **Energy Baseline and Forecast Details:**

Our analysis of energy consumption and the associated greenhouse gas emissions focused on the residential, commercial, and industrial sectors. Baseline information for 2020 was collected from the NREL SLOPE tool, which uses a combination of socioeconomic and energy survey data to establish baselines characteristics down to the county level. Greenlink obtained county-level estimates for all sectors noted for the 29 counties that compose the Atlanta Region.

SLOPE uses the EIA AEO forecasts to derive county-level energy forecasts; however, these have not been updated for several years. To provide better estimates, Greenlink aggregated the county-level 2020 baseline data to the region level, then obtained sector-specific growth forecasts out to 2050 for the South Atlantic region from the EIA AEO 2023. This maintains fidelity with the original NREL intent while also providing more accurate, post-COVID, post-Inflation Reduction Act forecasts for us in assessing the impacts of different climate policy options for the region.

### **Carbon Baseline and Forecast Details:**

Our analysis of baseline CO<sub>2</sub> emissions begins with capturing recent localized estimates. 2022 baseline emissions for residential, commercial, and industrial sectors were collected at the county level from Drawdown Georgia, the collaborative effort led by researchers at the Georgia Institute of Technology, the University of Georgia, and others.

Carbon intensity is assumed to be a constant for natural gas at 53.02 kgCO<sub>2</sub>/MMBTU, as documented by many federal agencies (EPA, DOE, EIA, etc). Carbon intensity for the electricity sector is a more complex determination. Greenlink used its ATHENIA model forecasts, which captures hourly operations at power plants across the nation and also captures the approved utility-sector plans for capacity additions and retirements. It then uses machine learning to make predictions of the most likely description of energy system operations. The model has been awarded by the Massachusetts Institute of Technology, the Georgia Institute of Technology, and the National Science Foundation, and has been used to support the development of dozens of climate action plans at the state and local level across the United States since its introduction in 2014.

ATHENIA's hourly carbon intensity projections for the SERC region were collapsed to a demand-weighted annual average for the purpose of completing this analysis. Projections were used that extend out to 2050.

### **Baseline Floorspace:**

Greenlink's data partner Google provided access to their estimates of floorspace taken from Google Maps, delineated by residential and nonresidential building uses. EIE data available for 23 of the 29 counties in the MSA. Heard, Jasper, Lamar, Meriwether, Morgan, and Pike Counties did not have EIE data available. In these six cases, NREL's SLOPE baseline data for commercial buildings is substituted, which provides an estimate of floorspace and buildings based on economic activity. Residential building estimates and floorspace is estimated from a combination of resources. Average floorspace per single family and multifamily residence (including mobile homes) is taken from the Federal Reserve, at 2100 square feet per single family residence and 1000 square feet per multifamily residence. Data from the American Community Survey and the Greenlink Equity Map were brought together to estimate the number of households in single family and multifamily residences in each county, then multiplied by the average square feet for the appropriate segment noted above. The number of residential buildings was taken from the latest American Community Survey data (table ACS S2504).

### **Policy Options:**

The potential is measured by establishing a reasonable target based on known building program impacts. In our analysis, the EE goal is set to be a 2% energy efficiency improvement per year for the first 10 years and a 1% per year thereafter. When we estimate the target savings, we assume that the goal would be achieved through building energy ordinances, energy audits, and benchmarking programs. The target values came from the 2017 energy codes analysis: ANSI/ASHRAE/IES Standard 90.1-2016. All commercial (including multi-family homes) and industrial buildings (not processes) are covered in this policy.

## Increase Energy Efficiency in Single Family Homes

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Increase Energy Efficiency in Single Family Homes	105	9,854

### Prepared by: EY

Overview: This workbook estimates the GHG reduction potential of the “Increase Energy Efficiency in Single Family Homes” priority measure. This measure is mapped to the most similar priority measures that will be included in the state of Georgia's Priority Action Plan (PAP.) and the estimated GHG potential of ARCs priority measures are calculated by scaling down the estimated GHG reduction potential of Georgia's priority measures proportionally using the amount of GHG emissions emitted by the Atlanta metropolitan statistical area (MSA) relative to the total GHG emissions emitted by the state.

**Notes:** To determine the amount of GHG emissions emitted by the Atlanta MSA relative to the state, the Atlanta MSA 2019 GHG emissions baseline and the Georgia 2021 GHG emissions baseline were used.

Table 1. Mapping of ARC Priority Measures to Relevant Georgia Priority Measures

ARC Measure	Measure from Georgia Statewide Plan
Energy efficiency/ weatherization of single family homes	Weatherization for residential buildings

Table 2. GHG Emission Reductions from Relevant Georgia Priority Measures

Measure from Georgia Statewide Plan	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050
Weatherization for residential buildings	166	15,610

Table 3. Comparing Georgia Statewide Emissions Inventory to ARC Emissions Inventory

Georgia Net Emissions (metric tons CO <sub>2</sub> e)	111,596,163
Atlanta MSA Net Emissions (metric tons CO <sub>2</sub> e)	70,447,080

Table 4. GHG Emission Reductions from ARC Measures

ARC Measure	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050
Energy efficiency/ weatherization of single family homes	105	9,854

### Modeling Assumptions:

This priority reduction measure was modeled using the Rocky Mountain Institute's (RMI's) Energy Policy Simulator (EPS), an “open-source model for estimating the environmental, economic, and human health impacts of hundreds of climate and

energy policies.”<sup>13</sup> Environmental, economic, and human health impacts resulting from each measure’s implementation were estimated for two periods: 2025 to 2030 and 2025 to 2050. The impacts for 2025 to 2030 were quantified through December 31, 2024, and the impacts for 2025 to 2050 were quantified through December 31, 2049.

To model the measure in the EPS, a “business-as-usual” (BAU) and a “policy” scenario were developed, projecting out assumptions and key inputs related to the measure to 2050. The BAU scenario assumes no implementation of the reduction measure while the policy scenario assumes full implementation of the measure.

The following section details the scenarios, assumptions, and metrics that served as key inputs to modeling the measure in the EPS.

Estimates of GHG emission reductions resulting from the implementation of the measure in the state of Georgia have been outputted by the EPS modeling tool using the key inputs described below. These estimates have been scaled down in the ARC Measures Excel workbook (above) to represent estimates of GHG reductions that would result from the implementation of the similar ARC-provided measure in the Atlanta MSA. The GHG emission reductions estimated from the measure from 2025 to 2030 and from 2025 to 2050 were scaled down proportionally using the amount of GHG emissions emitted by the Atlanta MSA relative to the total emissions emitted by the state.

### **Modeling:**

The EPS policy ‘Retrofit Existing Buildings’ is used to quantify the impact of the “weatherization program for residential buildings” measure. The EPS policy encompasses three different building types – urban residential, rural residential, and commercial – however, the urban residential and rural residential building types will be the only building types selected due to the nature of Georgia’s Weatherization Assistance Program (WAP) focusing on dwellings owned or occupied by low-income persons. Georgia’s WAP seeks to increase energy efficiency of dwellings owned or occupied by low-income persons using whole house weatherization.<sup>14</sup> Potential weatherization measures include but are not limited to air and duct sealing, wall, floor, and attic insulation, heating, ventilation, and air condition (HVAC) system improvements, energy efficiency improvements in lighting, and water tank and pipe insulation.

### *Current state*

The Georgia Environmental Finance Authority (GEFA), the agency administering Georgia’s WAP, estimated in the weatherization state plan that 305 total dwelling units were to be weatherized and re-weatherized in 2023 and stated 503 total dwelling units were weatherized in 2022.<sup>15</sup> This total number will be used in both the BAU and policy scenarios as the current state. To be eligible for Georgia’s WAP, the resident’s household income cannot exceed 200% of the federal poverty level. Based on the Census Reporter, Georgia households contain on average of 2.6 people per household.<sup>16</sup> The federal poverty line for a 3-person household is \$24,860;<sup>17</sup> therefore, for this analysis, households with a total income below \$50,000 will be considered eligible for Georgia’s WAP. According to the American Community Survey, in 2022, 1,416,231 GA households, accounting for approximately 35% of the total number of households, have a household income below \$50,000, representing the total number of households eligible for Georgia’s WAP. The 503 households that participated in the GA WAP in 2022 represent 0.036% of the total number of WAP eligible households. The “weatherization for residential buildings” measure will be implemented through an increase in funding allocated to the WAP program, expanding the number of eligible households that will be weatherized. The impact of this measure will be observed as the difference in the number of households participating in the WAP program in the policy scenario versus the business-as-usual (BAU) scenario.

GEFA's 2023-2024 Weatherization State Plan calculates that the Georgia WAP resulted in an average of 29.3 MMBtu of energy savings per household in 2022. This calculation aligns with estimated energy savings per household found in a study evaluating the national impact of the DOE's WAP program.<sup>18</sup> The study also evaluated the impact of the DOE's WAP program during a period of increased funding resulting from the American Recovery and Reinvestment Act (ARRA) of 2009 and found that the average number of major measures installed per household was lower in the ARRA period than in the retrospective. In this analysis, the estimated energy savings of 29.3 MMBtu per household will remain constant from 2025 to 2050 in both the business-as-usual scenario and policy scenario as there is no evidence to conclude an increase in funding to Georgia's WAP will increase the average energy savings per household participating in the weatherization program. In addition, in this analysis, it is assumed that the energy savings from Georgia's WAP will be a direct result of building envelope improvements, rather than energy efficiency improvements to appliances. This assumption is reinforced by the study evaluating the DOE's WAP program determining air sealing was found to be the most frequently installed measure of DOE's WAP in both 2008 and 2010.

The Georgia Governor's Office of Planning and Budget is tasked with preparing demographic data for the state and has projected population growth until 2060.<sup>19</sup> Population growth is shown in both the BAU and policy scenario tables below.

#### *Business-as-usual scenario*

In the BAU scenario, it is assumed the fraction of eligible households who participated in Georgia's WAP in 2022 will remain constant from 2025 to 2050 as Georgia's population grows. It is assumed the total number of households is growing at the same rate as the population. Additionally, it is assumed the fraction of households that have a household income of under \$50,000 will remain constant as the total number of households grows. In this analysis, once a household participates in the WAP programs, they are removed from the pool of households eligible to participate as their home no longer would be eligible for the program or benefit from weatherization.

Table 5. BAU scenario for impacts of residential weatherization in Georgia

Item	2022	2025	2030	2040	2050
Georgia's population	10,891,679	11,213,080	11,764,473	12,786,367	13,545,662
Number of WAP eligible households	1,416,231	1,456,484	1,525,420	1,652,092	1,744,027
Number of WAP participating households	503	517	542	587	619
Average annual energy savings of a WAP participating household (MMBtu)	29.3	29.3	29.3	29.3	29.3
Total annual energy savings of Georgia households (MMBtu)	14,738	15,157	15,874	17,192	18,149

#### *Policy scenario*

In the policy scenario, it is assumed the number of households participating Georgia's WAP grows by 5% each year from 2025 to 2050. In this analysis, once a household participates in the WAP programs, they are removed from the pool of households eligible to participate as their home no longer would be eligible for the program or benefit from weatherization.

Table 6. Policy scenario for impacts of residential weatherization in Georgia

Item	2022	2025	2030	2040	2050
Georgia's population	10,891,679	11,213,080	11,764,473	12,786,367	13,545,662
Number of WAP eligible households	1,416,231	1,456,484	1,525,195	1,649,098	1,733,198
Number of WAP participating households	503	517	660	1,075	1,752
Average annual energy savings of a WAP participating household (MMBtu)	29.3	29.3	29.3	29.3	29.3

**Increase Use of Solar Photovoltaics**

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Increase Use of Solar Photovoltaics	Low: 1,800,000 High: 3,400,000	Low: 17,500,000 High: 40,900,000

**Prepared by:** Greenlink Analytics

**Brief Description of Intervention:** Increase rooftop PV capacity. Scenario 1: Achieve 5% of technical potential by 2030 and 20% by 2050. Scenario 2: Achieve 10% of technical potential by 2030 and 50% by 2050.

**Notes on Intervention Implementation and Methodology:**

- Based on the technical potential estimated by Google Project Sunroof (2019), we analyzed two sets of outcome-based targets of 1) Achieve 5% of technical potential by 2030 and 20% by 2050 and 2) 10% by 2030 and 50% by 2050.
- Does not account for potential interactions between different interventions.

**Energy Baseline and Forecast Details:**

Our analysis of energy consumption and the associated greenhouse gas emissions focused on the residential, commercial, and industrial sectors. Baseline information for 2020 was collected from the NREL SLOPE tool, which uses a combination of socioeconomic and energy survey data to establish baselines characteristics down to the county level. Greenlink obtained county-level estimates for all sectors noted for the 29 counties that compose the Atlanta Region.

SLOPE uses the EIA AEO forecasts to derive county-level energy forecasts; however, these have not been updated for several years. To provide better estimates, Greenlink aggregated the county-level 2020 baseline data to the region level, then obtained sector-specific growth forecasts out to 2050 for the South Atlantic region from the EIA AEO 2023. This maintains fidelity with the original NREL intent while also providing more accurate, post-COVID, post-Inflation Reduction Act forecasts for us in assessing the impacts of different climate policy options for the region.

**Carbon Baseline and Forecast Details:**

Our analysis of baseline CO2 emissions begins with capturing recent localized estimates. 2022 baseline emissions for residential, commercial, and industrial sectors were collected at the county level from Drawdown Georgia, the collaborative effort led by researchers at the Georgia Institute of Technology, the University of Georgia, and others.

Carbon intensity is assumed to be a constant for natural gas at 53.02 kgCO2/MMBTU, as documented by many federal agencies (EPA, DOE, EIA, etc). Carbon intensity for the electricity sector is a more complex determination. Greenlink used its ATHENIA model forecasts, which captures hourly operations at power plants across the nation and also captures the approved utility-sector plans for capacity additions and retirements. It then uses machine learning to make predictions of the most likely description of energy system operations. The model has been awarded by the Massachusetts Institute of Technology, the Georgia Institute of Technology, and the National Science Foundation, and has been used to support the development of dozens of climate action plans at the state and local level across the United States since its introduction in 2014.

ATHENIA's hourly carbon intensity projections for the SERC region were collapsed to a demand-weighted annual average for the purpose of completing this analysis. Projections were used that extend out to 2050.

**Baseline Floorspace:**

Greenlink's data partner Google provided access to their estimates of floorspace taken from Google Maps, delineated by residential and nonresidential building uses. EIE data available for 23 of the 29 counties in the MSA. Heard, Jasper, Lamar, Meriwether, Morgan, and Pike Counties did not have EIE data available. In these six cases, NREL's SLOPE baseline data for commercial buildings is substituted, which provides an estimate of floorspace and buildings based on economic activity. Residential building estimates and floorspace is estimated from a combination of resources. Average floorspace per single family and multifamily residence (including mobile homes) is taken from the Federal Reserve, at 2100 square feet per single family residence and 1000 square feet per multifamily residence. Data from the American Community Survey and the Greenlink Equity Map were brought together to estimate the number of households in single family and multifamily residences in each county, then multiplied by the average square feet for the appropriate segment noted above. The number of residential buildings was taken from the latest American Community Survey data (table ACS S2504).

**Policy Options:**

Rooftop solar in the MSA counties has a large untapped potential. According to the 2019 Project Sunroof data, around 76% of the roofs are solar viable. Assuming that the entire viable rooftop spaces would have solar PV, the expected distributed solar capacity would be 24 GW, is regarded as the technical potential of rooftop solar in the MSA counties. Currently, less than 1% of the technical potential is realized. To improve the penetration of the rooftop solar, we set two sets of ramp-up trajectories and estimate how much CO2 emissions would be avoided by each case. The two scenarios are like below:

- Scenario 1: Achieve 5% of the technical potential by 2030 and 20% by 2050
- Scenario 2: Achieve 10% of the technical potential by 2030 and 50% by 2050

## Increase Community-Based Solar

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Increase Community-Based Solar	1,156,574	4,469,973

**Prepared by:** EY

**Overview:** This workbook estimates the GHG reduction potential of the “Increase Community-Based Solar” priority measure. This measure is mapped to the most similar priority measures that will be included in the state of Georgia's Priority Action Plan (PAP), and the estimated GHG potential of ARCs priority measures are calculated by scaling down the estimated GHG reduction potential of Georgia's priority measures proportionally using the amount of GHG emissions emitted by the Atlanta metropolitan statistical area (MSA) relative to the total GHG emissions emitted by the state.

**Notes:** To determine the amount of GHG emissions emitted by the Atlanta MSA relative to the state, the Atlanta MSA 2019 GHG emissions baseline and the Georgia 2021 GHG emissions baseline were used.

Table 1. Mapping of ARC Priority Measures to Relevant Georgia Priority Measures

ARC Measure	Measure from Georgia Statewide Plan
Community-based solar	Distributed renewable energy

Table 2. GHG Emission Reductions from Relevant Georgia Priority Measures

Measure from Georgia Statewide Plan	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050

Table 3. Comparing Georgia Statewide Emissions Inventory to ARC Emissions Inventory

Georgia Net Emissions (metric tons CO <sub>2</sub> e)	111,596,163
Atlanta MSA Net Emissions (metric tons CO <sub>2</sub> e)	70,447,080

Table 4. GHG Emission Reductions from ARC Measures

ARC Measure	Cumulative emission reductions (MT CO <sub>2</sub> e)	
	2025-2030	2025-2050
Community-based solar	1,156,574	4,469,973

### Modeling Assumptions:

This priority reduction measure was modeled using the Rocky Mountain Institute's (RMI's) Energy Policy Simulator (EPS), an “open-source model for estimating the environmental, economic, and human health impacts of hundreds of climate and energy policies.”<sup>20</sup> Environmental, economic, and human health impacts resulting from each measure's implementation

<sup>20</sup> Rocky Mountain Institute, [Energy Policy Simulator](#). 2024.

were estimated for two periods: 2025 to 2030 and 2025 to 2050. The impacts for 2025 to 2030 were quantified through December 31, 2024, and the impacts for 2025 to 2050 were quantified through December 31, 2049.

To model the measure in the EPS, a “business-as-usual” (BAU) and a “policy” scenario were developed, projecting out assumptions and key inputs related to the measure to 2050. The BAU scenario assumes no implementation of the reduction measure while the policy scenario assumes full implementation of the measure.

The following section details the scenarios, assumptions, and metrics that served as key inputs to modeling the measure in the EPS.

Estimates of GHG emission reductions resulting from the implementation of the measure in the state of Georgia have been outputted by the EPS modeling tool using the key inputs described below. These estimates have been scaled down in the ARC Measures Excel workbook (above) to represent estimates of GHG reductions that would result from the implementation of the similar ARC-provided measure in the Atlanta MSA. The GHG emission reductions estimated from the measure from 2025 to 2030 and from 2025 to 2050 were scaled down proportionally using the amount of GHG emissions emitted by the Atlanta MSA relative to the total emissions emitted by the state.

#### **Modeling:**

The EPS policy “Distributed solar carve-out” is used to quantify the increase in electricity generation from distributed renewable energy resources resulting from the measure. The model requires the specified percentage of total retail electricity demand to be generated by distributed solar systems. To enable the modeling of the “distributed renewable energy” measure, the key variable that will be the focus of the analysis will be the difference in electricity generated by distributed renewable energy resources between a business-as-usual scenario and a policy scenario. The scope of the modeling approach of this measure will only focus on electricity generation by solar photovoltaics (PVs); however, it is important to note that distributed renewable energy can also include combined heat and power systems at commercial and industrial facilities. Two types of solar PV generation will be analyzed when calculating total electricity generation from distributed renewable energy resources: 1) small-scale solar PV generation and 2) community solar PV generation.

#### *Current state*

In Georgia, solar photovoltaics generated a total of 7,332,000 MWh of electricity in 2022, with small-scale solar photovoltaics in the industrial, commercial, and residential sectors (PV solar systems less than 1 megawatt in size) producing a total of 385,000 MWh, representing 5% of total generation.<sup>21</sup> As of December 2022, Georgia contained 242 MW of installed small-scale solar PVs. The 242 MW of small-scale solar PV capacity will serve as the current state of small-scale solar PV capacity in both the business-as-usual scenario and the policy scenario.

According to NREL’s Sharing the Sun Community Solar Project, Georgia contains 22 community solar projects with a total generating capacity of 136 MW<sup>22</sup>. These project range between under 1 MW of generating capacity to over 50 MW, with the majority of projects being under 5 MW. The 136 MW of community solar generating capacity will serve as the current state of community solar PV capacity for both the business-as-usual scenario and the policy scenario.

#### *Business-as-usual scenario*

For this analysis, it is assumed the amount of small-scale solar PV generating capacity in Georgia in the BAU scenario will grow at the same rate as the generating capacity of solar PVs in end-use sectors<sup>23</sup> in the US projected by the Annual Energy

---

<sup>21</sup> U.S. Energy Information Administration, [Electricity data browser - Net generation for small-scale solar photovoltaic](#). Retrieved February 23, 2024.

<sup>22</sup> National Renewable Energy Laboratory, [Sharing the Sun Community Solar Project Data](#). Retrieved February 23, 2024.

<sup>23</sup> The EIA defines end-use sectors as including combined-heat-and-power plants and electricity-only plants in the commercial and industrial sectors that have a non-regulatory status. It also includes small on-site generating systems in the residential, commercial, and industrial sectors used primarily for own-use generation, but which may also sell some power to the grid.

Outlook (AEO) 2023's Reference case<sup>24</sup>. The AEO 2023 reference case scenario projects the generating capacity of solar PVs in end-use sectors grows at an average annual rate of 7.4% from 2025 to 2030, 6.1% from 2030 to 2035, 5.2% from 2035 to 2040, 4.5% from 2040 to 2045 and 4.1% from 2045 to 2050. Table 10 below shows these average annual rates of growth applied to Georgia's small-scale PV generating capacity to project electricity generation in the BAU scenario from 2022 to 2050 in the table shown below.

In addition, it is assumed the amount of community solar PV generating capacity in Georgia in the BAU scenario will grow at the same rate as the generating capacity of solar PVs in the electric power sector<sup>25</sup> in the US projected by the Annual Energy Outlook (AEO) 2023's Reference case. The AEO 2023 reference case scenario projects the generating capacity of solar PVs in the electric power sector grows at an average annual rate of 17.1% from 2025 to 2030, 5.7% from 2030 to 2035, 3.7% from 2035 to 2040, 3.4% from 2040 to 2045 and 3.1% from 2045 to 2050. Table 10 below shows these average annual rates of growth are applied to Georgia's community solar PV generating capacity to project electricity generation in the BAU scenario from 2022 to 2050 in the table shown below.

Table 5. Policy projection for electricity generation capacity

Item	2022	2025	2030	2035	2040	2045	2050
End-use sector solar PV generating capacity each year (GW)	48.59	67.56	92.51	120.79	151.89	185.80	224.26
Small-scale PV generating capacity in Georgia each year (GW)	0.24	0.34	0.46	0.60	0.76	0.93	1.12
Electric power sector PV solar generating capacity each year (GW)	74.98	182.28	338.26	434.82	515.31	602.75	694.69
Community solar PV generating capacity each year (GW)	0.14	0.33	0.61	0.79	0.93	1.09	1.26
Total solar PV generating capacity each year (GW)	0.38	0.67	1.07	1.39	1.69	2.02	2.38

#### Policy scenario

In the policy scenario, both small scale PV capacity and community solar capacity in Georgia grow at a faster rate than they would without policy intervention, which in this case would be the implementation of a measure to incentivize small scale PV generate and community solar PV generation. The generating capacity of solar PVs in end-use sectors in the AEO 2023 Low Zero- Carbon Technology Cost case from 2025 to 2050 was used as a reference point for the policy scenario and is shown in the table below. This case was selected because incentivizing community solar projects would most likely take the form an investment tax credit or production tax credit, ultimately decreasing the cost of solar PVs. It is assumed the amount of generating capacity in Georgia of small-scale solar PVs in the policy scenario will grow at the same rate as the amount of generating capacity of solar PVs by end-use sectors in the US projected by the AEO 2023 Low Zero- Carbon Technology Cost case.<sup>26</sup> The AEO 2023 Low Zero- Carbon Technology Cost case projects the amount of generating capacity of solar PVs by end-use sectors grows at an average annual rate of 7.6% from 2025 to 2030, 5.9% from 2030 to 2035, 6.0% from 2035 to 2040, 6.8% from 2040 to 2045 and 5.9% from 2045 to 2050. These average annual rates of growth are applied to Georgia's small-scale PV generating capacity to project generating capacity in the policy scenario from 2022 to 2050 in the table shown below.

<sup>24</sup> U.S. Energy Information Administration, [Annual Energy Outlook 2023, Narrative](#). March 16, 2023. The reference case represents EIA's best guess under nominal conditions, which presumes no new policy or laws over the modeled time horizon.

<sup>25</sup> U.S. Energy Information Administration, [Annual Energy Outlook. Table 16. Renewable Energy Generating Capacity and Generation](#). Retrieved February 23, 2024

<sup>26</sup> U.S. Energy Information Administration, [Annual Energy Outlook](#). Retrieved February 23, 2024. The AEO 2023 Low Zero- Carbon Technology Cost case assumes technology costs of power generation technologies that produce zero emissions are lower than the Reference case. Specifically, it is assumed that overnight capital costs and fixed operating and maintenance costs decline more rapidly than in the Reference case.

In addition, it is assumed the amount of generating capacity of community solar PV in Georgia in the policy scenario will grow at the same rate as the amount of generating capacity of solar PVs in the electric power sector in the US projected by the AEO 2023 Low Zero- Carbon Technology Cost case. The AEO 2023 Low Zero- Carbon Technology Cost case projects the amount of generating capacity of solar PVs in the electric power sector grows at an average annual rate of 21.8% from 2025 to 2030, 8.6% from 2030 to 2035, 4.2% from 2035 to 2040, 4.7% from 2040 to 2045 and 4.2% from 2045 to 2050. These average annual rates of growth are applied to Georgia's community solar PV generating capacity to project generating capacity in the policy scenario from 2022 to 2050 in the table shown below.

Table 6. Policy projection for Annual Generating Capacities

Item	2022	2025	2030	2035	2040	2045	2050
End-use sector solar PV generating capacity each year (GW)	48.63	67.48	93.27	120.92	156.93	210.17	272.29
Small-scale PV generating capacity in Georgia each year (GW)	0.24	0.34	0.47	0.60	0.78	1.05	1.36
Electric power sector PV solar generating capacity each year (GW)	74.98	182.28	380.85	544.95	658.66	813.14	982.65
Community solar PV generating capacity each year (GW)	0.14	0.33	0.69	0.99	1.19	1.47	1.78
Total solar PV generating capacity each year (GW)	0.38	0.67	1.15	1.59	1.98	2.52	3.14

Ernst & Young, LLP (EY) prepared the attached Report only for Georgia Environmental Protection Division (GA EPD) pursuant to an agreement solely between EY and GA EPD. EY did not perform its services on behalf of or to serve the needs of any other person or entity, and this methodology may not be appropriate to use by other entities. Accordingly, EY expressly disclaims any duties or obligations to any other person or entity based on its use of the attached Report. Any other person or entity must perform its own due diligence inquiries and procedures for all purposes. GA EPD alone is responsible for any decision to implement actions identified in our Report or other actions from the provision of our services and for compliance with applicable regulatory requirements. Client is solely responsible for the preparation of its Climate Pollution Reduction Grant submissions and applications, including making all of the judgements inherent in preparing them.

EY did not perform an audit, review, examination or other form of attestation in accordance with any generally accepted auditing, review or other assurance standards of GA EPD. Accordingly, EY did not express any form of assurance on EPD. The observations relating to CPRG decision and opportunities that EY provided to GA EPD were: 1) based on the facts and circumstances present to EY; 2) designed to assist GA EPD in reaching its own conclusions; and 3) do not constitute our concurrence with or support of GA EPD partners and jurisdictions.

#### Increase Use of Wastewater Gas to Energy

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Increase Use of Wastewater Gas to Energy	34,182	262,065

Prepared by: City of Atlanta/Stantec

Tool Used: MS Excel

**Datasets:** Organic waste values are derived from City of Atlanta and Fulton County. Food waste is assumed to be diverted from the airport and COA Public Works

**Methods used to estimate and quantify GHG emissions for the biogas to energy estimates:**

GHG Reduction Through 2030

Parameter	Unit	Wastewater Residuals	Food Waste	FOG	Total
Mass*	dry tons/day	59	25	1	84
Volatile Solids/Total Solids*	Mass/Mass	80%	85%	95%	81%
Volatile Solids Reduction*	dry tons/day	55%	75%	90%	61%
Biogas Production	cubic feet/day	778,800	478,125	25,650	1,256,925
Total Energy Production	MMBtu/h	17.85	10.96	0.59	28.80
Power Production	MW	1.99	1.22	0.07	3.21
Power Production	MWh/year	17,412	10,690	573	28,102
GHG Reduction*	MT CO2e/year	7,060	4,334	233	11,394
Number of Years in Operation*	years	3	3	3	3
<b>GHG Reduction Through 2030</b>	MT CO2e	21,180	13,003	698	<b>34,182</b>

**Notes:**

1. GHG Reduction includes only power offsets
2. SRSO (SERC South) eGRID region emits 891.9 lbs CO2e/MWh
3. Parasitic loads are not included in the analysis
4. Renewable heat generation is not included in the analysis
5. Wastewater residuals include COA Utoy Creek and Fulton County
6. FOG = Fats, Oils, and Grease
7. Food waste quantity from COA airport and COA Public Works
8. Power conversion efficiency assumption
9. Specific biogas yield = 15 cf/lb volatile solids reduced

\* All other assumptions include an asterisk

GHG Reduction Through 2050

**Increase Diversion of Waste from Landfills**

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO2e)	
	2025 - 2030	2030 - 2050
Increase Use of Wastewater Gas to Energy	Low: 700,000 High: 7,700,000	Low: 8,700,000 High: 103,500,000

**Prepared by:** Greenlink Analytics

Brief Description of Intervention: Divert waste from landfills. In Atlanta, divert 50% by 2030 and 75% by 2050. In other parts of the 29-county area, divert 40% by 2030 and 75% by 2050.

**Notes on Intervention Implementation and Methodology:**

- GHG reduction ranges shown reflect the potential in Atlanta only, up to the potential in the entire 29-county area. Estimated life-cycle emissions reductions are calculated based on EPA's WARM model and expected growth in waste. Population growth and per-capita waste is assumed to be equivalent across 29 counties. Landfill alternatives were modeled in WARM based on baseline waste collection by material types for City of Atlanta.
- Does not account for potential interactions between different interventions.

**Policy Options:**

EPA's WARM model was utilized to estimate GHG emission reductions resulting from the diversion of waste from landfills. EPA's WARM model estimates life-cycle emissions impacts, which would occur over time. GHG reductions per ton of waste diverted were estimated based on waste-collection data for the City of Atlanta from Atlanta Recycles. Because recycling and other diversion measures avoid significant levels of emissions by reducing the use of new raw materials future production, Atlanta's recent baseline life-cycle GHG emissions – inclusive of existing recycling levels – are negative. The waste diversion goals are applied as percentages of the total waste that would otherwise go to landfills each year. The Waste Diversion file can be easily modified with different assumptions to calculate reductions based on different goals or baseline waste levels for the 29 counties.

The proportional distribution of waste by categories of materials was determined based on City of Atlanta data, and is assumed to be the same for the 29 counties. Baseline waste collection in future years is forecasted to grow based on expected population growth and estimated growth in per-capita waste generation for high-income countries. The estimated percentage growth in population and waste per-capita are assumed to be the same across the 29 counties.

Scaling baseline Atlanta waste collection by population for the 29 counties results in an input assumption that 92% of the waste is non-Atlanta. This adds a lot of tonnage to the baseline from Atlanta Recycles and has a large impact on the emissions reduction estimates for the 29 counties. One question that is not clear is whether this split is appropriate or potentially overstates the waste for the non-Atlanta areas due to failing to capture the effects of any non-Atlanta waste being deposited in Atlanta landfills, or differences in per-capita waste. However, it appears that extant research has not found a significant difference in average per-capita waste between urban and rural communities in developed countries. The 92% assumption can be modified easily in the Waste Diversion file as needed.

Regardless of the goals or estimated baseline across the 29 counties, the estimated GHG reduction for a given amount of waste diversion stays constant. The WARM model estimates that 1 million short tons of waste diverted from Atlanta-area landfills would result in life-cycle GHG reductions equivalent to about 350,000 metric tons of CO<sub>2</sub>. The default goals are shown below.

Landfill Diversion (% of weight)		
	2030	2050
Non-Atlanta Goal:	40%	75%
Atlanta Goal:	50%	75%

Non-Atlanta Baseline Waste Collection (% of ARC):	92%
---	-----

Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs

PCAP Priority Measure	Cumulative GHG Emissions Reductions (MT CO <sub>2</sub> e)	
	2025 - 2030	2030 - 2050
Increase Local Government Adoption of Climate Mitigating Policies, Ordinances, and Programs	4,500,000	48,100,000

Prepared by: Greenlink Analytics

**Brief Description of Intervention:** Through technical assistance and related efforts, facilitate and incentivize local emissions-mitigating policies across the 29-county area, such as participation in ARC's Green Communities program.

**Notes on Intervention Implementation and Methodology:**

- This intervention includes a wide range of potential local measures. These could focus around providing technical assistance to get more local communities to participate in ARC's Green Communities initiative, and for participating communities to adopt more of the available measures. This analysis incorporates impacts on corporate emissions from local climate plans and policies, transportation mode shifting away from passenger vehicles, and agricultural and forestry measures. Emissions reductions were estimated based on a literature review, data from RMI's Energy Policy Simulator, and other sources.
- Does not account for potential interactions between different interventions.

**Policy Options:**

This intervention includes a wide range of potential local measures. These could focus around providing technical assistance and related efforts to get more local communities to participate in ARC's Green Communities initiative, and for participating communities to adopt more of the available measures. This analysis incorporates impacts on corporate emissions from local climate plans and policies, transportation mode shifting away from passenger vehicles (26% mode shift by 2050), and agricultural and forestry measures. Emissions reductions were estimated based on a literature review on corporate emissions, data from RMI's Energy Policy Simulator, and other supporting sources.

Impacts on self-reported corporate emissions were estimated based on academic research that indicates predicts a roughly 7% decrease for facilities owned by the 16% of emitters that report emissions. No impacts are included for corporations that do not report emissions because they are less likely to adopt new mitigation measures in response to CAPs, and their lack of reporting would make verification impractical. Annual emissions reductions relative to baseline levels are ramped up gradually starting in 2026, until reaching 7% in 2035.

The emissions impacts of the other measures were estimated utilizing RMI's Energy Policy Simulator for Georgia. The results were scaled down to the 29-county level based on population for transportation mode shifting and based on land area for agricultural and forestry measures. RMI's Energy Policy Simulator results do not include comprehensive impacts from land use. Significant increases in the preservation of green spaces, for example, could result in higher impacts than those reflected in the agricultural and forestry measures.

## Appendix D: LIDAC Analysis Technical Support Document

The table on the following pages identifies low-income disadvantaged communities (LIDAC) within the 29-county Atlanta MSA. It leverages two resources to identify these communities:

1. **Climate and Economic Justice Screening Tool (CEJST):** Any Census tract designated as disadvantaged within CEJST for the Atlanta MSA is directly included in the table.
2. **EJScreen's Supplemental Indexes:** Census block groups within the Atlanta MSA are analyzed based on their percentile ranking across any of the EJScreen's Supplemental Indexes where only block groups falling at or above the 90<sup>th</sup> percentile compared to the nation are included.

Additionally, the table includes percentile classes that appear in both screening tools, highlighting cells in which the communities are at or above the 90<sup>th</sup> percentile.
