## 1.0 INTRODUCTION

This test report is being submitted by BASF Corporation (BASF) for a hazardous waste incinerator located at BASF's Freeport, Texas, facility. This unit is designated as Incinerator IN-701. An emission test was performed for Incinerator IN-701 in response to United States Environmental Protection Agency's (USEPA's) Clean Air Act Section 114 Information Collection Request (ICR), dated January 31, 2024, for the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Hazardous Waste Combustors (HWCs) codified in Title 40 Code of Federal Regulations (CFR) Part 63 Subpart EEE.

This report describes the testing that was conducted for the purpose of collecting data on hazardous air pollutants (HAPs).

### 1.1 FACILITY OVERVIEW

The BASF Freeport facility produces organic chemicals for use in various commercial industries. The BASF Freeport facility is considered a major stationary source of HAPs as defined in Section 112(a) of the Clean Air Act as amended November 15, 1990.

The location and identification numbers of the BASF Freeport site are:

BASF Corporation  
602 Copper Road  
Freeport, Texas 77541  
Latitude: 29.00269, Longitude: -95.39355  
EPA ID No. TXD 008 081 697  
EPA Facility Registry Service (FRS) No. 110000463392  
Standard Industrial Classification (SIC) 2869  
North American Industry Classification System (NAICS) 325199

## 1.2 HAZARDOUS WASTE COMBUSTOR OVERVIEW

Incinerator IN-701 is a liquid injection incinerator. The incinerator is a horizontal, cylindrical, self-supporting unit designed for forced draft operation and has a design thermal capacity of 100 million British thermal units per hour (MMBtu/hr). The incinerator is equipped with heat recovery for steam production. There is no air pollution control equipment installed on the unit. Incinerator IN-701 is fired on a mixture of natural gas, process vent gas, liquid hazardous waste, and liquid non-hazardous waste. The liquid hazardous waste fired in Incinerator IN-701 is identified as acrylic acid water. The liquid non-hazardous waste is identified as AA-E2 residue. The Source Classification Code (SCC) for Incinerator IN-701 is 50300503 (waste disposal, solid waste disposal – industrial, incineration, hazardous waste incinerators: liquid injection). Figure 1-1 provides a general process schematic of Incinerator IN-701.

**FIGURE 1-1  
INCINERATOR IN-701 SCHEMATIC**

## 1.3 TEST OVERVIEW

This emission test was designed to provide the information requested in USEPA's ICR. One test condition was performed for the incinerator. The test condition consisted of seven replicate test runs. Incinerator IN-701 was operated in a normal and representative manner during the emission test (*i.e.*, in a manner consistent with the incinerator's current operating parameter limits (OPLs)).

The ICR required emission testing for the following pollutants:

- Polycyclic aromatic hydrocarbons (PAH);
- Polychlorinated biphenyls (PCB);
- Hydrocarbons (HC);
- Hydrogen fluoride (HF);

- 
- Hydrogen bromide (HBr); and
  - Hydrogen cyanide.

Feedstream (both hazardous and non-hazardous) analyses were also required for higher heating value and fluorine and bromine contents for each test run.

BASF submitted a request to USEPA to waive the emission testing requirements for HF and HBr. In addition, BASF requested to waive the feedstream analytical requirements for fluorine and bromine contents. These waivers were requested because BASF does not use any fluorinated or brominated compounds in any of the processes that generate the incinerator feedstreams. Therefore, the feedstreams should not contain any fluorine or bromine. In a response dated March 12, 2024, USEPA approved the waiver requests. Therefore, this emission test did not include stack gas sampling for HF and HBr and did not include feedstream analyses for fluorine and bromine contents.

The emission test was coordinated by BASF personnel, who provided oversight of the incinerator operations and the stack sampling activities during the test program. Coterie Environmental LLC (Coterie) was responsible for the test report development. Alliance Technical Group, LLC, (ATG) developed the test plan and performed the stack sampling for the test program. ATG was responsible for all stack gas and liquid waste samples collected during the test program, with oversight by BASF and Coterie. The stack gas and liquid waste samples were sent to Eurofins Knoxville (Eurofins) for analysis.

## 1.4 TEST REPORT ORGANIZATION

This report has been prepared following Enclosure 1 of USEPA's ICR. The remaining sections of the report provide the following information:

- Section 2.0 presents a description of the operating conditions;
- Section 3.0 presents a summary of the sampling procedures;
- Section 4.0 presents a summary of the analytical procedures;
- Section 5.0 presents a summary of the feedstream analyses;
- Section 6.0 presents a summary of the stack gas results;
- Appendix A contains the site-specific test plan;
- Appendix B contains the process monitoring data;
- Appendix C contains the liquid waste sampling report;
- Appendix D contains the ATG report entitled *Source Test Report, BASF Corporation, Incinerator IN-701* (Report Number AST-2024-2250);
- Appendix E contains the analytical data packages; and
- Appendix F provides the analytical data assessment forms.

## 2.0 OPERATING CONDITIONS

This emission test was designed to provide the information requested in USEPA's ICR. The program consisted of one test condition. The test condition consisted of seven replicate test runs. The test condition was designed to demonstrate operations of Incinerator IN-701 in a normal and representative manner. The target conditions were set near the 2022 comprehensive performance test (CPT) targets.

### 2.1 COMBUSTION CHAMBER TEMPERATURE

BASF continuously monitors the combustion chamber temperature to demonstrate compliance with the minimum combustion chamber temperature OPL. Combustion chamber temperature is monitored in degrees Celsius (°C).

### 2.2 STACK GAS FLOW RATE

BASF continuously monitors the stack gas flow rate to demonstrate compliance with the maximum stack gas flow rate OPL. The stack gas flow rate is monitored in thousand actual cubic feet per minute (kacfm).

### 2.3 TOTAL HAZARDOUS WASTE FEED RATE

BASF continuously monitors the total hazardous waste feed rate to demonstrate compliance with the maximum total hazardous waste feed rate OPL. The total hazardous waste feed rate is monitored in thousand pounds per hour (klb/hr). The acrylic acid water is the only liquid hazardous waste fired in Incinerator IN-701.

### 2.4 AA-E2 RESIDUE FEED RATE

Non-hazardous AA-E2 residue is also fed to the incinerator. The AA-E2 residue feed rate is monitored in pounds per hour (lb/hr).

### 2.5 NATURAL GAS FEED RATE

Pipeline quality natural gas is used as the main fuel for Incinerator IN-701. BASF continuously monitors the natural gas feed rate for plant operations. This monitoring is not required by the HWC NESHAP. The natural gas feed rate is monitored in thousand standard cubic feet per minute (kscfm).

### 2.6 PROCESS VENT GAS FEED RATE

Non-hazardous process vent gas is also fed to the incinerator. BASF continuously monitors the process vent gas feed rate for plant operations. This monitoring is not required by the HWC NESHAP. The process vent gas is monitored in standard cubic feet per minute (scfm).

---

## 2.7 ATOMIZING FLUID PRESSURE

BASF continuously monitors the atomizing fluid pressure to demonstrate compliance with the minimum atomizing fluid pressure OPL. The atomizing fluid pressure is monitored in pounds per square inch gauge (psig).

## 2.8 TEST LOG

The emission test was conducted during the weeks of May 13 and May 20, 2024. Short summaries of the daily test activities are provided below.

*Monday, May 13, 2024* – The test team arrived onsite to setup equipment for testing.

*Tuesday, May 14, 2024* – No testing was performed.

*Wednesday, May 15, 2024* – The incinerator was operating at target conditions at 7:00 a.m. Run 1 began at 9:13 a.m. and ended at 1:21 p.m. Run 2 began at 2:02 p.m. and ended at 6:07 p.m. There were no disruptions during the test runs.

*Thursday, May 16, 2024* – The incinerator was operating at target conditions at 7:00 a.m. Run 3 began at 7:06 a.m. and ended at 11:10 a.m. Run 4 began at 11:40 a.m. and ended at 3:45 p.m. There were no disruptions during the test runs.

*Friday, May 17, 2024* – The incinerator was operating at target conditions at 7:00 a.m. Run 5 began at 7:00 a.m. and ended at 11:25 a.m. Run 6 began at 11:38 a.m. and ended at 3:43 p.m. There were no disruptions during the test runs.

*Monday, May 20, 2024* – The incinerator was operating at target conditions at 7:00 a.m. Run 7 began at 10:55 a.m. and ended at 3:01 p.m. There were no disruptions during the test run. The test team broke down the equipment, packed all samples, and left the site. All testing for the ICR was completed.

## 2.9 OPERATING DATA SUMMARY

Table 2-1 summarizes the operating conditions. The table compares the actual values achieved during the test to the targets provided in the site-specific test plan. The site-specific test plan is provided in Appendix A. The one-minute data recorded for the operating parameters is provided in Appendix B. The table presents the minimum, maximum, and average values for each test run and the average of the test run averages.

**TABLE 2-1**  
**OPERATING CONDITIONS**

OPERATING PARAMETER	UNITS	TARGETS	STATISTICS	RUN 1	RUN 2	RUN 3	RUN 4	RUN 5	RUN 6	RUN 7	AVERAGE
Combustion chamber temperature	°C	880	Average	881	881	881	881	881	881	881	881
			Minimum	878	878	877	877	878	879	877	
			Maximum	884	884	884	884	884	884	884	
Stack gas flow rate	kacfm	85	Average	85.5	85.7	85.4	85.1	85.0	85.0	84.8	85.2

			Minimum	129	128	129	128	129	129	128	
			Maximum	130	130	130	130	131	131	130	

## 3.0 SAMPLING PROCEDURES

Sampling was performed during the emission test to satisfy the requirements of the ICR. This section provides descriptions of the liquid waste and stack gas sampling procedures that were performed during the test.

### 3.1 LIQUID WASTE SAMPLING

BASF fed hazardous and non-hazardous liquid wastes to Incinerator IN-701 during the test. The hazardous waste is identified as acrylic acid water, and the non-hazardous waste is identified as AA-E2 residue. Samples of each liquid waste were collected during each run. The sampling methods were standard methods; therefore, only brief descriptions are provided. More detailed descriptions on the sampling methods can be found in the indicated reference documents and in the site-specific test plan. The liquid waste sampling report is provided in Appendix C.

Samples were collected at the beginning, middle, and end of each test run. At each sampling event, approximately 150 milliliters (mL) of each liquid waste was collected into two separate bottles. At the end of the run, each bottle had approximately 450 mL of sample. For each liquid waste, one sample was sent to the laboratory for analysis, and one sample was sent to the laboratory as a backup.

### 3.2 PROCESS VENT GAS SAMPLING

The process vent gas was fed to Incinerator IN-701 during the test. The process vent gas was not sampled during the test. Process vent gas characterization information is provided in Section 5.2.

### 3.3 NATURAL GAS SAMPLING

Natural gas was fed to Incinerator IN-701 during the test. The natural gas was not sampled during the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 3.4 STACK GAS SAMPLING

Stack gas samples were collected during each run. The stack gas sampling followed the USEPA methods documented in 40 CFR Part 60 Appendix A. More detailed descriptions of the sampling methods can be found in the indicated reference documents and in the site-specific test plan.

The following monitoring and sampling methods were used:

- USEPA Methods 1, 2, 3A, and 4 for determination of stack sampling traverse points, gas flow rate, composition, and moisture content;
- USEPA Method 23 for measurement of PAH and PCB emissions;

- USEPA Method 25A, a portable continuous emissions monitoring systems (CEMS) operated by the stack sampling contractor, to monitor the concentrations of HC in the stack gas;
- USEPA Method 320 for measurement of hydrogen cyanide emissions; and
- The facility's CEMS to monitor the concentrations of carbon monoxide (CO) and oxygen in the stack gas.

Table 3-1 summarizes the stack gas sampling that was performed and the resulting samples that were collected. The complete field data and sampling procedures for the testing are described in the ATG report in Appendix D.

**TABLE 3-1**  
**STACK GAS SAMPLING**

SAMPLING METHOD <sup>1</sup>	SAMPLING DURATION	SAMPLES COLLECTED PER RUN
USEPA Method 1	Before test series	Not applicable
USEPA Method 2	With each sampling train	Not applicable
USEPA Method 3A	Duration of each test run	Not applicable
USEPA Method 4	With each sampling train	Impingers weighed onsite
USEPA Method 23	240 minutes	Filter
		Front-half and back-half acetone and toluene rinses
		XAD-2 resin
		Deionized water impingers contents
		Deionized water impingers acetone and toluene rinses
USEPA Method 25A (Portable CEMS)	Duration of each test run	Not applicable
USEPA Method 320	60 minutes	Not applicable
Facility CEMS (USEPA Performance Specification 4B)	Duration of each test run	Not applicable

<sup>1</sup> USEPA Method refers to New Source Performance Standards, Test Methods and Procedures, Appendix A, 40 CFR Part 60. USEPA Performance Specification refers to New Source Performance Standards, Performance Specifications, Appendix B, 40 CFR Part 60.

### 3.4.1 POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS

Seven samples for PAH and PCB were collected according to USEPA Methods 1, 2, 3A, 4, and 23. For each run, samples of 20-minute duration were taken isokinetically at each of the 12 traverse points for a total sampling time of 240 minutes. Data was recorded at five-minute intervals.

The USEPA Method 23 sampling train operated during this test program contained the following components:

- Glass nozzle;
- Heated glass probe maintained between 223 and 273 degrees Fahrenheit (°F);

- 
- Heated quartz filter and Teflon support maintained between 223 and 273°F;
  - One condenser coil;
  - XAD sorbent trap;
  - Impinger 1 – empty;
  - Impinger 2 – 100 mL water;
  - Impinger 3 – 100 mL water;
  - Impinger 4 – empty; and
  - Impinger 5 – 200 to 300 grams silica gel.

All glassware used in the sampling train was cleaned prior to use. Additionally, all glassware connections were sealed with Teflon gaskets.

At the conclusion of each run, the filter and sorbent trap modules were recovered by sealing the openings with ground glass caps and plugs. The impinger contents were recovered in accordance with the procedures specified in USEPA Method 23. The inside surfaces of the nozzle, probe, and connecting glassware prior to the filter and sorbent module were washed with acetone and toluene.

The samples collected using the USEPA Method 23 sampling train were analyzed for PAH and PCB by high-resolution gas chromatography and high resolution mass spectrometry according to the guidelines of USEPA Method 23.

### **3.4.2 HYDROCARBONS**

The procedures outlined in USEPA Method 25A were used to measure the concentration of HC (as propane) in the stack gas during the test. A continuous sample of stack gas was withdrawn via a sample probe. The sample gas was filtered for removal of particulates prior to being sent to the analyzer. All parts of the sampling system and the analyzer were heated to a temperature of at least 250°F. Sampling was concurrent with the USEPA Method 23 testing.

### **3.4.3 HYDROGEN CYANIDE**

The procedures outlined in USEPA Method 320 were used to measure the concentration of hydrogen cyanide in the stack gas during the test. The stack gas was extracted at a constant rate through a heated probe, heated filter, and heated sample line and analyzed with a Fourier transform infrared (FTIR) analyzer. All parts of the sampling system and the analyzer were heated to a temperature of approximately 300°F.

### **3.4.4 CARBON MONOXIDE AND OXYGEN**

The Incinerator IN-701 CEMS were operated during each test run to monitor the concentrations of CO and oxygen in the stack gas. A continuous sample of stack gas is withdrawn via a sample probe. The HWC NESHAP requires that the CO and oxygen CEMS comply with Performance Specification 4B in 40 CFR Part 60 Appendix B.

---

### **3.5 SAMPLING QUALITY ASSURANCE AND QUALITY CONTROL**

The site-specific test plan described the sampling activities required for the test program. All sampling was performed in accordance with the site-specific test plan and referenced methods. No sampling deviations occurred during this test program.

### **3.6 SAMPLING DATA SUMMARY**

Tables 3-2 through 3-4 provide summaries of the sampling data for the test runs. Table 3-2 summarizes the sampling data for the USEPA Method 23 sampling train. Table 3-3 summarizes the sampling data for USEPA Method 25A. Table 3-4 summarizes the sampling data for USEPA Method 320.

The tables include data for actual sample volume in cubic feet (ft<sup>3</sup>) and corrected sample volume in dry standard cubic feet (dscf). Stack gas temperature and pressure data are presented in °F and inches of mercury (in. Hg), respectively. Stack gas composition data is presented in percent volume (% vol) or percent volume on a dry basis (% vol dry). Stack gas velocity is presented in feet per second (fps), and stack gas flow rate is presented in actual cubic feet per minute (acfm), standard cubic feet per minute (scfm), and/or dry standard cubic feet per minute (dscfm).

## 4.0 ANALYTICAL PROCEDURES

The analyses followed ASTM International (ASTM) and USEPA methods. This section describes the analyses and discusses any deviations in analytical procedures from those described in the site-specific test plan. The analytical data packages are provided in Appendix E.

### 4.1 LIQUID WASTE ANALYSES

All liquid waste samples were sent to Eurofins for analysis. Samples of the liquid wastes were analyzed for higher heating value using ASTM Method D240. All holding times for these analyses were met, and all quality assurance (QA) and quality control (QC) criteria for these analyses were within acceptance limits.

### 4.2 PROCESS VENT GAS ANALYSES

The process vent gas was not analyzed for the test. Process knowledge is used to characterize the process vent gas. Process vent gas characterization information is provided in Section 5.2.

### 4.3 NATURAL GAS ANALYSES

The natural gas was not analyzed for the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 4.4 STACK GAS ANALYSES

The stack gas samples were analyzed for PAH and PCB by high-resolution gas chromatography and high resolution mass spectrometry according to the guidelines of USEPA Method 23. The USEPA Method 23 samples were sent to Eurofins for analysis. In addition, USEPA Method 25A was used to monitor the stack gas for HC concentrations, and USEPA Method 320 (FTIR) was used to monitor the stack gas for hydrogen cyanide concentrations. All holding times for the USEPA Method 23 analyses were met, and all QA/QC criteria for the methods were within acceptable limits, except as noted in Section 4.5.

### 4.5 ANALYTICAL QUALITY ASSURANCE AND QUALITY CONTROL

Prior to testing, BASF and the contract laboratory established QA/QC goals for each analysis that would be performed as part of the test program. QA/QC objectives included precision, accuracy, representativeness, comparability, and completeness. Typical parameters include laboratory control sample (LCS) and LCS duplicate (LCSD) samples, field and sample duplicates, surrogates, standards, and spikes. Precision is expressed in terms of the distribution, or scatter, of replicate measurement results, calculated as the relative standard deviation (RSD) or, for duplicates, as relative percent difference

(RPD). Accuracy is expressed in terms of percent recovery (*e.g.*, for surrogates, spikes, and reference material).

Tables 4-1 through 4-4 provide details on the QA/QC results. Detailed descriptions of the evaluations are included in the analytical data packages provided in Appendix E and the analytical data assessment forms provided in Appendix F.

**TABLE 4-1**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**LIQUID WASTE SAMPLES – HIGHER HEATING VALUE**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Precision	Field duplicate	One per test program	≤20% relative percent difference	None
	Laboratory control sample duplicate	One per analytical batch	≤2% relative percent difference	None
	Sample duplicate	One per analytical batch	≤10% relative percent difference	None
Accuracy	Laboratory control samples	Two per analytical batch	98-102% recovery	None
Calibration	Initial Calibration	Before analysis and as needed	≤1% relative standard deviation	None
	Calibration checks	As needed	±1% difference from initial calibration	None
Contamination effects	None	---	---	---
Handling and traceability	Holding time	Each sample	<180 days	None

**TABLE 4-2**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Precision	Laboratory control sample duplicate	One per analytical batch	≤50% relative percent difference	None
Accuracy	Laboratory control samples	Two per analytical batch	70-130% recovery	The recovery of 2,2',5-trichlorobiphenyl (PCB-18) in the laboratory control sample was outside of limits.
	Internal standards (isotope dilution)	Every sample	20-130% recovery for polycyclic aromatic hydrocarbons 20-145% recovery for polychlorinated biphenyls	Some recoveries for polycyclic aromatic hydrocarbons in the Run 7 sample were outside of limits.
	Surrogate standards	Every sample	70-130% recovery	Recoveries for polycyclic aromatic hydrocarbon surrogates in several run samples were outside of limits.  The Run 4 sample was diluted so that no recoveries could be reported for polycyclic aromatic hydrocarbon surrogates.
Calibration	Initial calibration (five solutions)	Prior to sample analysis	1. Mean relative response factor for unlabeled standards: <10% relative standard deviation 2. Mean relative response factor for labeled reference compounds: <20% relative standard deviation	None

**TABLE 4-2 (CONTINUED)**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration (continued)	Calibration verification (midlevel standard)	At least once per shift	1. Response factors within $\pm 25\%$ of the initial calibration mean relative response factor for unlabeled standards 2. Response factors within $\pm 25\%$ of the initial calibration mean relative response factor for pre-sampling adsorbent standard and pre-extraction filter recovery standard 3. Response factors within $\pm 30\%$ of the initial calibration mean relative response factor for pre-extraction standard and alternative recovery standard	The opening continuing calibration verifications (140-88812/1, 140-88831/1, and 140-88872/1) were slightly outside QC limits for one or more isotope dilution analyte recoveries.
	Retention time window verification and gas chromatograph column performance	At the beginning of each shift	Compliance with USEPA Method 23	None
Contamination effects	Method blank	One per analytical batch	<Reporting limit	Phenanthrene was reported in the method blank for Batch 88561 at a concentration above the reporting limit.
	Field proof blank	One per test program	<Reporting limit	Several polycyclic aromatic hydrocarbons were reported in the field proof blank at concentrations above the reporting limit.
Handling and traceability	Holding time	Each sample	1. <30 days to extraction 2. <40 days from extraction to analysis <sup>1</sup>	None

<sup>1</sup> Holding time from extraction may be up to one year if samples are stored below -10°C.

**TABLE 4-3**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – HYDROCARBONS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration error test	Checked using USEPA Protocol 1 calibration gases	Prior to the first test run and after any failed drift test	±5% of calibration gas value	None
Drift test	Checked using USEPA Protocol 1 calibration gases	After the last test run and hourly during the test period	±3% of span value	None

**TABLE 4-4**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – HYDROGEN CYANIDE**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration transfer standard direct	Verify stability, confirm optical path length	Pre-test	±5% of cert value	None
Calibration transfer standard responses	Verify system stability, recovery, and response time	Pre and post-test run	±5% of mean value	None
Analyte spike	Verify system ability to quantify the analyte of interest in the gas stream	Pre-test	±30% theoretical recovery	None

Table 4-5 summarizes the analytical deviations and provides discussions of the impact that the deviations had on the analytical results, if any.

**TABLE 4-5**  
**SUMMARY OF ANALYTICAL DEVIATIONS**

RUN	DEVIATION/EXCEPTION	SIGNIFICANCE
<b>Liquid waste analyses:</b>		
None	None	None
<b>Stack gas analyses:</b>		
All	The recovery of 2,2',5-trichlorobiphenyl (PCB-18) in the laboratory control sample was outside of limits. The recovery was 144 percent, which is above the upper limit of 130 percent.	The recovery was slightly above the limit indicating a potential high bias. However, recovery in the laboratory control sample duplicate was within limits, indicating that the analysis was in control. Results for the test samples for this congener were all less than the reporting limit. Therefore, this deviations had minimal impact on the results.
7	The recoveries for 13C6-indeno(1,2,3-cd)pyrene and 13C6-dibenz(a,h)anthracene in the Run 7 sample were outside of limits. The recoveries were 14 and 10 percent, respectively, which is below the lower limit of 20 percent.	Generally, data quality is not considered affected if the signal-to-noise ratio is greater than 10:1, which was achieved for all isotope dilution analytes in the sample.
1,2,3,6,7,8	The recoveries for 13C6-benzo(c)fluorene, 13C12-benzo(j)fluoranthene, and anthracene-d10 surrogates in several run samples were outside of limits. The recoveries were all below the lower limit of 70 percent.	Generally, data quality is not considered affected if the signal-to-noise ratio is greater than 10:1, which was achieved for all isotope dilution analytes in the sample.
4	The polycyclic aromatic hydrocarbons surrogate recoveries for the Run 4 sample could not be determined due to the high dilution required to bring analytes within the calibration range.	The Run 4 polycyclic aromatic hydrocarbons results are significantly higher than the other run results. The quality of this data cannot be assessed using surrogate recovery criteria.
1, 2, 3	The response factor for 13C6-indeno(1,2,3-cd)pyrene was outside of the limit in the continuing calibration verification (CCV) for Batch 88812.	Results for Runs 1, 2, and 3 for indeno(1,2,3-cd)pyrene were consistent with other runs. This deviation has minimal impact on the results.
3, 5	The response factors for 13C6-indeno(1,2,3-cd)pyrene and 13C6-dibenz(a,h)anthracene were outside of limits in the CCV for Batch 88831.	Results for Runs 3 and 5 for indeno(1,2,3-cd)pyrene and dibenz(a,h)anthracene were consistent with other runs. This deviation has minimal impact on the results.
All	The response factors for 13C6-indeno(1,2,3-cd)pyrene and 13C6-dibenz(a,h)anthracene were outside of limits in the CCV for Batch 88872. This batch included the field proof blank sample.	Results for the field proof blank for indeno(1,2,3-cd)pyrene and dibenz(a,h)anthracene were slightly above the reporting limit. This deviation indicates a potential high bias for these analytes.
All	Phenanthrene was reported in the method blank for Batch 88561 at a concentration above the reporting limit. The reported concentration was 20.04 nanograms per sample (ng/sample), and the reporting limit was 6.00 ng/sample.	The results for phenanthrene may exhibit a slight high bias. Sample results for phenanthrene were much higher than the amount found in the method blank. Therefore, this deviation has minimal impact on the results.

**TABLE 4-5 (CONTINUED)**  
**SUMMARY OF ANALYTICAL DEVIATIONS**

RUN	DEVIATION/EXCEPTION	SIGNIFICANCE	
All	Several polycyclic aromatic hydrocarbons were reported in the field proof blank at concentrations above the reporting limit.		The results for these polycyclic aromatic hydrocarbons may exhibit a high bias.
	<i>Analyte</i>	<i>Result ng/sample</i>	
		<i>Reporting Limit ng/sample</i>	
	Acenaphthene	1,380	
	Benzo[a]pyrene	71	
	Benzo[g,h,i]perylene	1,110	
	Benzo[k]fluoranthene	76	
	Chrysene	76	
	Dibenz[a,h]anthracene	121	
	Fluoranthene	320	
	Fluorene	774	
	Indeno[1,2,3-cd]pyrene	93	
	2-Methylnaphthalene	4,430	
	Naphthalene	6,750	
	Phenanthrene	1,140	
	Pyrene	280	

## 5.0 FEEDSTREAM RESULTS

Acrylic acid water, AA-E2 residue, process vent gas, and natural gas were fed to Incinerator IN-701 during each test run. This section of the report presents the results of feedstream analyses.

### 5.1 ACRYLIC ACID WATER

The liquid hazardous waste fired in Incinerator IN-701 is identified as acrylic acid water. The acrylic acid water was fed to the incinerator during the testing. Table 5-1 presents the higher heating value of the acrylic acid water for each test run. The higher heating value is provided in British thermal units per pound (Btu/lb).

**TABLE 5-1**  
**ACRYLIC ACID WATER**

RUN	HIGHER HEATING VALUE (BTU/LB)
1	<339
2	449
3	628
4	<342
5	398
6	351
7	1,300
Average	<696

### 5.2 AA-E2 RESIDUE

The liquid non-hazardous waste is identified as AA-E2 residue. The AA-E2 residue was fed to the incinerator during the testing. Table 5-2 presents the higher heating value of the AA-E2 residue for each test run. The higher heating value is provided in Btu/lb.

**TABLE 5-2  
AA-E2 RESIDUE**

RUN	HIGHER HEATING VALUE (BTU/LB)
1	11,900
2	11,800
3	11,800
4	11,700
5	11,700
6	11,600
7	11,100
Average	11,600

### 5.3 PROCESS VENT GAS

Non-hazardous process vent gas was fed to the incinerator during the testing. These process vent gases are identified as the AA-E2 off-gas, the vacuum vent off-gas, and the nitrogen vent off-gas. The process vent gas is predominantly nitrogen with some organic content. The process vent gas is not expected to contain any HWC NESHAP regulated metals or chlorine in greater than trace quantities. Table 5-3 presents typical compositions in percent by weight (% wt) for the process vent gas.

**TABLE 5-3  
PROCESS VENT GAS**

COMPONENT	UNITS	AA-E2 OFF-GAS	VACUUM VENT OFF-GAS	NITROGEN VENT OFF-GAS
Acetic acid	% wt	0.6	0.2	---
Acrolein	% wt	0.1	---	---
Acrylic acid	% wt	0.3	2.8	---
Biphenyl	% wt	0.01	---	7.6
Dimethyl phthalate	% wt	---	---	1.8
Formaldehyde	% wt	0.4	---	---
Propane	% wt	0.8	---	---
Propylene	% wt	0.3	---	---
Carbon dioxide	% wt	3.0	0.1	---
Carbon monoxide	% wt	0.9	---	---
Water	% wt	7.8	0.2	0.6
Oxygen	% wt	3.8	22.5	1.0
Nitrogen	% wt	82	74.2	89

---

## 5.4 NATURAL GAS

Natural gas was also fed during the testing. The natural gas is not expected to contain any HWC NESHA regulated constituents in greater than trace quantities. BASF has an agreement with the supplier that regulates the content of the natural gas. The following requirements are included in the agreement:

- The gas shall contain no CO, halogens, or unsaturated hydrocarbons and not more than four hundred parts per million of hydrogen.
- The gas shall be commercially free from gum, gum-forming constituents, or other objectionable liquid or solid matter which might become separated from the gas during transmission through pipelines.
- The gas shall be free of all corrosive materials that may, in Transporter's determination, be harmful to its facilities.

Any natural gas that meets these requirements will not contain any HWC NESHA regulated constituents.

## 6.0 STACK GAS RESULTS

The emission test was designed to provide the information requested in USEPA's ICR. One test condition was performed for the incinerator. The test condition consisted of seven replicate test runs. The ICR emission testing included the following pollutants:

- PAH;
- PCB;
- HC;
- Hydrogen cyanide; and
- CO

The stack gas emission results are discussed below and summarized in the tables in Section 6.5. The ATG stack sampling report is provided in Appendix D. All analytical data packages are included in Appendix E.

### 6.1 POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS EMISSION RESULTS

USEPA Method 23 was used to sample and analyze the stack gas for PAH and PCB concentrations. Analytes that were reported as non-detect in any sample fraction were calculated using the method detection limits (MDLs) and are reported with a "<" sign.

### 6.2 HYDROCARBONS EMISSION RESULTS

USEPA Method 25A was used to monitor the stack gas for HC concentrations. The results were calculated assuming all non-detects were present at the reporting limit (RL) and are reported with a "<" sign.

### 6.3 HYDROGEN CYANIDE EMISSION RESULTS

USEPA Method 320 was used to monitor the stack gas for hydrogen cyanide concentrations. The results were calculated assuming all non-detects were present at the MDL and are reported with a "<" sign.

### 6.4 CARBON MONOXIDE

The Incinerator IN-701 CEMS were operated during the emission test to monitor the concentrations of CO and oxygen in the stack gas. The data presented for CO is based on hourly rolling average (HRA) values; the data presented for oxygen is based on one-minute average readings. The one-minute data recorded is provided in Appendix B.

---

## 6.5 STACK GAS RESULTS SUMMARY

Tables 6-1 through 6-5 provide summaries of the stack gas results.

Table 6-1 summarizes the PAH results. Results are presented in nanograms (ng) for the total sample train catch. Emission results are presented in nanograms per dry standard cubic meter (ng/dscm) uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-2 summarizes the PCB results. Results are presented in ng for the total sample train catch. Emission results are presented in ng/dscm uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-3 summarizes the HC results. Emission results are reported as propane and are presented in parts per million by volume on a dry basis (ppmv dry) uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-4 summarizes the hydrogen cyanide results. Emission results are presented in ppmv dry uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-5 summarizes the CO and oxygen results. The CO emission results are presented in ppmv dry corrected to seven percent oxygen, and the oxygen results are presented in % vol dry.

## LIST OF APPENDICES

Appendix A	Copy of Subpart EEE Enclosure 1
------------	---------------------------------

## 1.0 Introduction

Alliance Technical Group, LLC (Alliance) was retained by BASF Corporation (BASF) to conduct CAA Section 114 ICR testing at the Freeport, Texas facility. Testing will be conducted to determine the emission concentrations of Polycyclic Aromatic Hydrocarbons (PAH), Polychlorinated Biphenyls (PCB), Total Hydrocarbons (THC) and Hydrogen Cyanide (HCN) at the exhaust of Incinerator IN-701 (EPN 4-1-1). These sources are regulated under 40 CFR 63, Subpart EEE which is subject to this ICR. Alliance also understands that waste feed sampling and analysis is also required.

This site-specific test plan (SSTP) has been prepared to outline the project scope and schedule. Enclosure 1 of the EPA ICR does not require the submission of this test plan; however, a copy must be submitted with the final test report.

## 1.1 Facility Description

The BASF Freeport Site produces organic chemicals for use in various commercial industries. At this time, the BASF Freeport Site is considered a major stationary source of hazardous air pollutants (HAPs) as defined in Part A, Section 112 of the Clean Air Act as amended November 15, 1990.

## 1.2 Source and Control System Descriptions

The Incinerator IN-701 is a liquid injection incinerator. The incinerator is a horizontal, cylindrical, self-supporting unit designed for forced draft operation. The incinerator is equipped with heat recovery for steam production. There is no air pollution control equipment installed on the unit. The unit is designed to process non-hazardous and hazardous liquid waste and vent gases up to a capacity of 100 million British thermal units per hour (MMBtu/hr).

## 1.3 Project Team

Personnel planned to be involved in this project are identified in the following table.

**Table 1-1: Project Team**

<b>BASF Personnel</b>	Justin Matthews
<b>Regulatory Agency</b>	EPA
<b>Alliance Personnel</b>	Steven Dryden other field personnel assigned at time of testing event

## 1.4 Safety Requirements

Testing personnel will undergo site-specific safety training for all applicable areas upon arrival at the site. Alliance personnel will have current OSHA or MSHA safety training and be equipped with hard hats, safety glasses with side shields, steel-toed safety shoes, hearing protection, fire resistant clothing, and fall protection (including shock corded lanyards and full-body harnesses). Alliance personnel will conduct themselves in a manner consistent with Client and Alliance's safety policies.

A Job Safety Analysis (JSA) will be completed daily by the Alliance Field Team Leader.

## **2.0 Summary of Test Program**

To satisfy the requirements of the Section 114 ICR, the facility will conduct an informational test program to determine the emission concentrations of selected pollutants at the exhaust of the Incinerator IN-701 (EPN 4-1-1).

### **2.1 General Description**

All testing will be performed in accordance with specifications stipulated in U.S. EPA Reference Test Methods 1, 2, 3A, 4, 23, 25A, 320 and ASTM D240. Table 2-1 presents an outline and tentative schedule for the emissions testing program. The following is a summary of the test objectives.

- Emissions testing will be conducted on the exhaust of Incinerator IN-701 (EPN 4-1-1).
- Performance testing will be conducted in a normal and representative manner.
- Seven (7) test runs will be performed.
- A minimum of 141 dscf (4 dscm) will be collected during each EPA Method 23 test run.
- Total Hydrocarbons will be measured concurrently with the EPA Method 23 sampling.
- Waste feed samples will be collected and analyzed for higher heating value using the methods listed in Table 1.5 of the EPA ICR Enclosure 1 (Appendix A).
- Incinerator IN-701 (EPN 4-1-1) has two (2) liquid waste feed streams.
- Waste feed samples will be collected at the beginning, middle and end of each run and a field duplicate sample will be collected for one of the test runs.
- BASF has received an exemption for testing required for HF and HBr and feed sample analysis for fluorine and bromine listed in table 1.5. This exemption was received by email communication from Rachel Smoak – Fuels and Incineration Group on March 12, 2024

### **2.2 Process/Control System Parameters to be Monitored and Recorded**

Plant personnel will collect operational and parametric data at least once every 15 minutes during the testing. The following list identifies the measurements, observations and records that will be collected during the testing program:

- The same process data required during a Subpart EEE Comprehensive Performance Test.
- THC and/or CO CEMs concentrations corrected to 7% O<sub>2</sub>.

### **2.3 Proposed Test Schedule**

Table 2-1 presents an outline and tentative schedule for the emissions testing program.

**Table 2-1: Program Outline and Tentative Test Schedule**

Testing Location	Parameter	US EPA Method	No. of Runs	Run Duration	Est. Onsite Time
DAY 1 – May 13, 2024					
Equipment Setup & Pretest QA/QC Checks					8 hr
DAY 2 – May 14, 2024					
Incinerator IN-701	VFR	1-2	2	Concurrent with each pollutant test	12 hr
	O <sub>2</sub> /CO <sub>2</sub>	3A			
	BWS	4			
	PAH & PCB	23		4 hrs	
	THC	25A		4 hrs (concurrent with PAH/PCB)	
	HCN	320		1 hr	
	Higher Heating Value	ASTM D240		Approximately 150 mL into two separate bottles at the beginning, middle and end of each test run	
DAY 3 – May 15, 2024					
Incinerator IN-701	VFR	1-2	2	Concurrent with each pollutant test	12 hr
	O <sub>2</sub> /CO <sub>2</sub>	3A			
	BWS	4			
	PAH & PCB	23		4 hrs	
	THC	25A		4 hrs (concurrent with PAH/PCB)	
	HCN	320		1 hrs	
	Higher Heating Value	ASTM D240		Approximately 150 mL into two separate bottles at the beginning, middle and end of each test run	

**Table 2-1: Program Outline and Tentative Test Schedule (Cont.)**

Testing Location	Parameter	US EPA Method	No. of Runs	Run Duration	Est. Onsite Time
DAY 4 – May 16, 2024					
Incinerator IN-701	VFR	1-2	2	Concurrent with each pollutant test	12 hr
	O <sub>2</sub> /CO <sub>2</sub>	3A			
	BWS	4			
	PAH & PCB	23		4 hrs	
	THC	25A		4 hrs (concurrent with PAH/PCB)	
	HCN	320		1 hr	
	Higher Heating Value	ASTM D240		Approximately 150 mL into two separate bottles at the beginning, middle and end of each test run	
DAY 5 – May 17, 2024					
Incinerator IN-701	VFR	1-2	1	Concurrent with each pollutant test	12 hr
	O <sub>2</sub> /CO <sub>2</sub>	3A			
	BWS	4			
	PAH & PCB	23		4 hrs	
	THC	25A		4 hrs (concurrent with PAH/PCB)	
	HCN	320		1 hrs	
	Higher Heating Value	ASTM D240		Approximately 150 mL into two separate bottles at the beginning, middle and end of each test run	

## 2.4 Emission Reporting Units

Emission reporting units for each pollutant are below.

**Table 2-2: Emission Reporting Units**

Pollutant	Reporting Units
PAH & PCB	ng/dscm, ng/dscm @7% O <sub>2</sub>
THC & HCN	ppmvd, ppmvd @7% O <sub>2</sub>
Gas Flow Rate	acfm, scfm, dscfm
O <sub>2</sub> , CO <sub>2</sub>	% volume, dry
Moisture	% volume

Note: Pollutants will be calculated in lb/hr as well and reported in the final test report appendices emission summaries. These lb/hr results will not be summarized in the front summary of the final test report.

## 2.5 Test Report

The final test report must be submitted by August 30, 2024 and will include the following information. In addition to the final test report, the test results must be entered into the U.S. EPA Electronic Reporting Tool (ERT) for submittal via CEDRI.

- *Introduction* – Brief discussion of project scope of work and activities.
- *Results and Discussion* – A summary of test results and process/control system operational data with comparison to regulatory requirements or vendor guarantees along with a description of process conditions and/or testing deviations that may have affected the testing results.
- *Methodology* – A description of the sampling and analytical methodologies.
- *Sample Calculations* – Example calculations for each target parameter.
- *Field Data* – Copies of actual handwritten or electronic field data sheets.
- *Laboratory Data* – Copies of laboratory report(s) and chain of custody(s).
- *Quality Control Data* – Copies of all instrument calibration data and/or calibration gas certificates.
- *Process Operating/Control System Data* – Process operating and control system data (as provided by BASF) to support the test results.

### 3.0 Testing Methodology

This section provides a description of the sampling and analytical procedures for each test method that will be employed during the test program. All equipment, procedures and quality assurance measures necessary for the completion of the test program meet or exceed the specifications of each relevant test method. The emission testing program will be conducted in accordance with the test methods listed in Table 3-1.

**Table 3-1: Source Testing Methodology**

Parameter	U.S. EPA Reference Test Methods	Notes/Remarks
Volumetric Flow Rate	1 & 2	Full Velocity Traverses
Oxygen/Carbon Dioxide	3A	Instrumental Analysis
Moisture Content	4	Gravimetric Analysis
PAH & PCB	23	Isokinetic Sampling
Total Hydrocarbons	25A	Instrumental Analysis
Hydrogen Cyanide	320	FTIR – Continuous Sampling

All stack diameters, depths, widths, upstream and downstream disturbance distances and nipple lengths will be measured on site with an EPA Method 1 verification measurement provided by the Field Team Leader. These measurements will be included in the test report.

#### 3.1 U.S. EPA Reference Test Methods 1 and 2 – Sampling/Traverse Points and Volumetric Flow Rate

The sampling location and number of traverse (sampling) points will be selected in accordance with U.S. EPA Reference Test Method 1. To determine the minimum number of traverse points, the upstream and downstream distances will be equated into equivalent diameters and compared to Figure 1-1 in U.S. EPA Reference Test Method 1.

Full velocity traverses will be conducted in accordance with U.S. EPA Reference Test Method 2 to determine the average stack gas velocity pressure, static pressure and temperature. The velocity and static pressure measurement system will consist of a pitot tube and inclined manometer. The stack gas temperature will be measured with a K-type thermocouple and pyrometer.

Stack gas velocity pressure and temperature readings will be recorded during each test run. The data collected will be utilized to calculate the volumetric flow rate in accordance with U.S. EPA Reference Test Method 2.

#### 3.2 U.S. EPA Reference Test Method 3A – Oxygen / Carbon Dioxide

The oxygen (O<sub>2</sub>) and carbon dioxide (CO<sub>2</sub>) testing will be conducted in accordance with U.S. EPA Reference Test Method 3A. Data will be collected online and reported in one-minute averages. The sampling system will consist of a stainless-steel probe, Teflon sample line(s), gas conditioning system and the identified gas analyzer. The gas conditioning system will be a non-contact condenser used to remove moisture from the stack gas. If an unheated Teflon sample line is used, then a portable non-contact condenser will be placed in the system directly after the probe. Otherwise, a heated Teflon sample line will be used. The quality control measures are described in Section 3.7.

### 3.3 U.S. EPA Reference Test Method 4 – Moisture Content

The stack gas moisture content will be determined in accordance with U.S. EPA Reference Test Method 4. The gas conditioning train will consist of a series of chilled impingers. Prior to testing, each impinger will be filled with a known quantity of water or silica gel. Each impinger will be analyzed gravimetrically before and after each test run on the same analytical balance to determine the amount of moisture condensed.

### 3.4 U.S. EPA Reference Test Method 23 – PAH & PCBs

The polycyclic aromatic hydrocarbons (PAH) and polychlorinated biphenyls (PCB) testing will be conducted in accordance with U.S. EPA Reference Test Method 23. The sampling system will consist of a glass nozzle, heated glass-lined probe, glass filter holder with pre-cleaned heated glass-fiber filter, condenser coil, XAD resin trap, gas conditioning train, pump and calibrated dry gas meter. The gas conditioning system will consist of five (5) chilled impingers. The first impinger will be empty. The next two (2) impingers each will contain 100 mL of water. The fourth impinger will be empty while the fifth impinger will be charged with 200-300 grams of silica gel. The probe liner and filter heating systems will be maintained at a temperature of  $120 \pm 14^{\circ}\text{C}$  ( $248 \pm 25^{\circ}\text{F}$ ), and the impinger temperature will be maintained below at  $20^{\circ}\text{C}$  ( $68^{\circ}\text{F}$ ) or less throughout testing.

Method 23 Section 6.1.7 requires the condenser to be oriented at an angle to cause moisture to flow down to the XAD adsorbent module to facilitate condensate drainage. Glassware with this configuration is not currently available from a national supplier utilizing a large enough condenser to meet the temperature specifications of the method. Alliance will continue to work with manufacturers, but until equipment is widely available, the horizontal or vertical condenser configuration from traditional Method 23 will be utilized.

All glassware leading to the XAD adsorbing resin trap will be cleaned and sealed before mobilizing to the site. The sampling train will be assembled in the sample recovery area. The pre-cleaned quartz filter will be placed in a glass filter holder with a Teflon filter support and connected to the condenser coil. All open ends of the sampling train will be sealed with Teflon tape prior to complete assembly at the sampling location.

Following the completion of each test run, the sampling train will be leak checked at vacuum pressure greater than or equal to the highest vacuum pressure observed during the run and the contents of the impingers will be measured for moisture gain. The filter will be removed from the filter holder and placed in sample container 1. The XAD sorbent module will be sealed on both ends and placed on ice. The nozzle, probe liner, filter holder, condenser and all connecting glassware will be triple-rinsed and brushed with acetone followed by toluene, and these rinses will be recovered in sample container 2. The impinger water condensate will be recovered into sample container 3a. All impingers will then be rinsed three times with acetone and then three times with toluene and collected in sample container 3b. All containers will be sealed, labeled and liquid levels marked for transport to the identified laboratory for analysis.

Method 23 Section 8.2.9 has the impinger water and solvent rinses collected in a single container (No. 3). Due to analytical method development constraints of the subcontracted laboratory, it is necessary to split this recovery between two containers: condensate (Container No. 3a) and solvent rinses (Container No. 3b).

A field blank will be collected prior to initiating testing. A complete sampling system will be placed at the sampling location and multiple leak checks will be performed on the system similar to an actual testing scenario. The sample train will be then moved to the mobile laboratory for recovery. A full set of reagent blanks including a filter and a trap will be also submitted to the laboratory.

Any analyte mass that is non-detect from the laboratory will be reported at the estimated detection limit (EDL) or the minimum detection limit (MDL) and flagged accordingly.

Target PAH and PCB analytes are detailed below:

PAH Analytes			
PAH Compound	CAS Number	PAH Compound	CAS Number
Naphthalene	91-20-3	Chrysene	218-01-9
2-Methylnaphthalene	91-57-6	Benzo[b]fluoranthene	205-99-2
Acenaphthylene	208-96-8	Benzo[k]fluoranthene	207-08-9
Acenaphthene	83-32-9	Perylene	198-55-8
Fluorene	86-73-7	Benzo[a]pyrene	50-32-8
Anthracene	120-12-7	Benzo[e]pyrene	192-97-2
Phenanthrene	85-01-8	Benzo[g,h,i]perylene	191-24-2
Fluoranthene	206-44-0	Indeno[1,2,3-cd]pyrene	193-39-5
Pyrene	129-00-0	Dibenz[a,h]anthracene	53-70-3
Benz[a]anthracene	56-55-3		
PCB Analytes			
PCB Congener	CAS Number	PCB Congener	CAS Number
2,4'-DiCB	34883-43-7	2,2',3,3',4,4'-HxCB	38380-07-3
2,2',5'-TrCB	37680-65-2	2,2',3,4,4',5'-HxCB	35065-28-2
2,4,4'-TrCB	7012-37-5	2,2',4,4',5,5'-HxCB	35065-27-1
2,2',3,5'-TeCB	41464-39-5	2,3,3',4,4',5-HxCB	38380-08-4
2,2',5,5'-TeCB	35693-99-3	2,3,3',4,4',5'-HxCB	69782-90-7
2,3',4,4'-TeCB	32598-10-0	2,3',4,4',5,5'-HxCB	52663-72-6
3,3',4,4'-TeCB	32598-13-3	3,3',4,4',5,5'-HxCB	32774-16-6
3,4,4',5'-TeCB	70362-50-4	2,2',3,3',4,4',5-HpCB	35065-30-6
2,2',4,5,5'-PeCB	37680-73-2	2,2',3,4,4',5,5'-HpCB	35065-29-3
2,3,3',4,4'-PeCB	32598-14-4	2,2',3,4',5,5',6-HpCB	52663-68-0
2,3,4,4',5-PeCB	74472-37-0	2,3,3',4,4',5,5'-HpCB	39635-31-9
2,3',4,4',5-PeCB	31508-00-6	2,2',3,3',4,4',5,6-OcCB	52663-78-2
2',3,4,4',5-PeCB	65510-44-3	2,2',3,3',4,4',5,5',6-NoCB	40186-72-9
3,3',4,4',5-PeCB	57465-28-8	2,2',3,3',4,4',5,5',6,6'-DeCB	2051-24-3

### 3.5 U.S. EPA Reference Test Method 25A – Total Hydrocarbons

The total hydrocarbons (THC) testing will be conducted in accordance with U.S. EPA Reference Test Method 25A. Data will be collected online and reported in one-minute averages. The sampling system will consist of a stainless-steel probe, heated Teflon sample line(s) and the identified gas analyzer. The quality control measures are described in Section 3.8.

### 3.6 U.S. EPA Reference Test Method 320 – Hydrogen Cyanide

The concentrations of hydrogen cyanide (HCN) will be determined in accordance with U.S. EPA Reference Test Method 320. Each source gas stream will be extracted at a constant rate through a heated probe, heated filter and heated sample line and analyzed with a MKS MultiGas 2030 FTIR operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured will be selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio will be measured and recorded to document analyzer performance. A leak check will be performed on the sample cell. The instrument path length will be verified using ethylene as the Calibration Transfer Standard. Dynamic spiking will be performed using a certified standard of the target compound in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information are recorded and stored with the calculated analytical results. Any data point below the detection limit will be flagged and the MDL will be reported. The quality control measures are described in Section 3.9.

### 3.7 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 3A

Cylinder calibration gases will meet EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates will be included in the Quality Assurance/Quality Control Appendix of the report.

Low Level gas will be introduced directly to the analyzer. After adjusting the analyzer to the Low-Level gas concentration and once the analyzer reading is stable, the analyzer value will be recorded. This process will be repeated for the High-Level gas. For the Calibration Error Test, Low, Mid, and High-Level calibration gases will be sequentially introduced directly to the analyzer. The Calibration Error for each gas must be within 2.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever is closer to the stack gas concentration) will be introduced at the probe and the time required for the analyzer reading to reach 95 percent or 0.5% (whichever was less restrictive) of the gas concentration will be recorded. The analyzer reading will be observed until it reaches a stable value, and this value will be recorded. Next, Low-Level gas will be introduced at the probe and the time required for the analyzer reading to decrease to a value within 5.0 percent or 0.5% (whichever was less restrictive) will be recorded. If the Low-Level gas is zero gas, the acceptable response must be 5.0 percent of the upscale gas concentration or 0.5% (whichever was less restrictive). The analyzer reading will be observed until it reaches a stable value, and this value will be recorded. The measurement system response time and initial system bias will be determined from these data. The System Bias for each gas must be within 5.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever is closer to the stack gas concentration) will be introduced at the probe. After the analyzer response is stable, the value will be recorded. Next, Low-Level gas will be introduced at the probe, and the analyzer value will be recorded once it reaches a stable response. The System Bias for each gas must be within 5.0 percent of the Calibration Span or 0.5% absolute difference or the data is invalidated, and the Calibration Error Test and System Bias must be repeated.

The Drift between pre- and post-run System Bias must be within 3 percent of the Calibration Span or 0.5% absolute difference or the Calibration Error Test and System Bias must be repeated.

To determine the number of sampling points, a gas stratification check will be conducted prior to initiating testing. The pollutant concentrations will be measured at twelve traverse points (as described in Method 1) or three points (16.7, 50.0 and 83.3 percent of the measurement line). Each traverse point will be sampled for a minimum of twice the system response time.

If the pollutant concentration at each traverse point do not differ more than 5% or 0.3% (whichever is less restrictive) of the average pollutant concentration, then single point sampling will be conducted during the test runs. If the pollutant concentration does not meet these specifications but differs less than 10% or 0.5% from the average concentration, then three (3) point sampling will be conducted (stacks less than 7.8 feet in diameter - 16.7, 50.0 and 83.3 percent of the measurement line; stacks greater than 7.8 feet in diameter – 0.4, 1.0, and 2.0 meters from the stack wall). If the pollutant concentration differs by more than 10% or 0.5% from the average concentration, then sampling will be conducted at a minimum of twelve (12) traverse points. Copies of stratification check data will be included in the Quality Assurance/Quality Control Appendix of the report.

A Data Acquisition System with battery backup will be used to record the instrument response in one (1) minute averages. The data will be continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data will also be saved to the Alliance server. All data will be reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data will be relinquished to the report coordinator and then a final review will be performed by the Project Manager.

### **3.8 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 25A**

Cylinder calibration gases will meet EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates will be included in the Quality Assurance/Quality Control Appendix of the report.

Within two (2) hours prior to testing, zero gas will be introduced through the sampling system to the analyzer. After adjusting the analyzer to the Zero gas concentration and once the analyzer reading is stable, the analyzer value will be recorded. This process will be repeated for the High-Level gas, and the time required for the analyzer reading to reach 95 percent of the gas concentration will be recorded to determine the response time. Next, Low and Mid-Level gases will be introduced through the sampling system to the analyzer, and the response will be recorded when it is stable. All values must be less than +/- 5 percent of the calibration gas concentrations.

Mid-Level gas will be introduced through the sampling system. After the analyzer response is stable, the value will be recorded. Next, Zero gas will be introduced through the sampling system, and the analyzer value recorded once it reaches a stable response. The Analyzer Drift must be less than +/- 3 percent of the span value. Calibration drift checks will be conducted hourly.

Based on correspondence and subsequent approval from the EPA, only the first and last calibration drift check will be reported in the ERT database for each Method 25A test run. All intermittent calibration drift checks will be presented in the full final test report.

A Data Acquisition System with battery backup will be used to record the instrument response in one (1) minute averages. The data will be continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data will also be saved to the Alliance server. All data will be reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data will be relinquished to the report coordinator and then a final review will be performed by the Project Manager.

### 3.9 Quality Assurance/Quality Control – U.S. EPA Reference Method 320

EPA Protocol 1 Calibration Gases – Cylinder calibration gases used will meet EPA Protocol 1 (+/- 2%) standards or will be certified standards.

After providing ample time for the FTIR to reach the desired temperature and to stabilize, zero gas (nitrogen) will be introduced directly to the instrument sample port. While flowing nitrogen the signal amplitude will be recorded, a background spectra will be taken, a linearity check will be performed and recorded, the peak to peak noise and the root mean square in the spectral region of interest will be measured and a screenshot will be recorded.

Following the zero gas checks, room air will be pulled through the sample chamber and the line width and resolution will be verified to be at 1879 cm<sup>-1</sup>, the peak position will be entered and the FWHH will be recorded (screenshot). Following these checks, another background spectra will be recorded and the calibration transfer standard (CTS) will be introduced directly to the instrument sample port. The CTS instrument recovery will be recorded and the instrument mechanical response time will be measured.

Next, stack gas will be introduced to the FTIR through the sampling system and several scans will be taken until a stable reading will be achieved. The native concentration of our surrogate or target spiking analyte will be recorded. Spike gas will be introduced to the sampling system at a constant flow rate  $\leq 10\%$  of the total sample flow rate and a corresponding dilution ratio will be calculated along with a system response time. Matrix spike recovery spectra will be recorded and will be within the  $\pm 30\%$  of the calculated value of the spike concentration that the method requires.

The matrix spike recovery will be conducted once at the beginning of the testing and the CTS recovery procedures will be repeated following each test run. The corresponding values will be recorded.

#### 4.0 Quality Assurance Program

Alliance follows the procedures outlined in the Quality Assurance/Quality Control Management Plan to ensure the continuous production of useful and valid data throughout the course of this test program. The QC checks and procedures described in this section represent an integral part of the overall sampling and analytical scheme. Adherence to prescribed procedures is quite often the most applicable QC check.

#### 4.1 Equipment

Field test equipment is assigned a unique, permanent identification number. Prior to mobilizing for the test program, equipment is inspected before being packed to detect equipment problems prior to arriving on site. This minimizes lost time on the job site due to equipment failure. Occasional equipment failure in the field is unavoidable despite the most rigorous inspection and maintenance procedures. Therefore, replacements for critical equipment or components are brought to the job site. Equipment returning from the field is inspected before it is returned to storage. During the course of these inspections, items are cleaned, repaired, reconditioned and recalibrated where necessary.

Calibrations are conducted in a manner, and at a frequency, which meets or exceeds U.S. EPA specifications. The calibration procedures outlined in the U.S. EPA Methods, and those recommended within the Quality Assurance Handbook for Air Pollution Measurement Systems: Volume III (EPA-600/R-94/038c, September 1994) are utilized. When these methods are inapplicable, methods such as those prescribed by the American Society for Testing and Materials (ASTM) or other nationally recognized agency may be used. Data obtained during calibrations is checked for completeness and accuracy. Copies of calibration forms are included in the report.

The following sections elaborate on the calibration procedures followed by Alliance for these items of equipment.

- Dry Gas Meter and Orifice. A full meter calibration using critical orifices as the calibration standard is conducted at least semi-annually, more frequently if required. The meter calibration procedure determines the meter correction factor (Y) and the meter's orifice pressure differential ( $\Delta H@$ ). Alliance uses approved Alternative Method 009 as a post-test calibration check to ensure that the correction factor has not changed more than 5% since the last full meter calibration. This check is performed after each test series.
- Pitot Tubes and Manometers. Type-S pitot tubes that meet the geometric criteria required by U.S. EPA Reference Test Method 2 are assigned a coefficient of 0.84 unless a specific coefficient has been determined from a wind tunnel calibration. If a specific coefficient from a wind tunnel calibration has been obtained that coefficient will be used in lieu of 0.84. Standard pitot tubes that meet the geometric criteria required by U.S. EPA Reference Test Method 2 are assigned a coefficient of 0.99. Any pitot tubes not meeting the appropriate geometric criteria are discarded and replaced. Manometers are verified to be level and zeroed prior to each test run and do not require further calibration.
- Temperature Measuring Devices. All thermocouple sensors mounted in Dry Gas Meter Consoles are calibrated semi-annually with a NIST-traceable thermocouple calibrator (temperature simulator) and verified during field use using a second NIST-traceable meter. NIST-traceable thermocouple calibrators are calibrated annually by an outside laboratory.
- Nozzles. Nozzles are measured three (3) times prior to initiating sampling with a caliper. The maximum difference between any two (2) dimensions is 0.004 in.
- Digital Calipers. Calipers are calibrated annually by Alliance by using gage blocks that are calibrated annually by an outside laboratory.

- Barometer. The barometric pressure is obtained from a nationally recognized agency or a calibrated barometer. Calibrated barometers are checked prior to each field trip against a mercury barometer. The barometer is acceptable if the values agree within  $\pm 2$  percent absolute. Barometers not meeting this requirement are adjusted or taken out of service.
- Balances and Weights. Balances are calibrated annually by an outside laboratory. A functional check is conducted on the balance each day it is use in the field using a calibration weight. Weights are re-certified every two (2) years by an outside laboratory or internally. If conducted internally, they are weighed on a NIST traceable balance. If the weight does not meet the expected criteria, they are replaced.
- Other Equipment. A mass flow controller calibration is conducted on each Environics system annually following the procedures in the Manufacturer's Operation manual. A methane/ethane penetration factor check is conducted on the total hydrocarbon analyzers equipped with non-methane cutters every six (6) months following the procedures in 40 CFR 60, Subpart JJJJ. Other equipment such as probes, umbilical lines, cold boxes, etc. are routinely maintained and inspected to ensure that they are in good working order. They are repaired or replaced as needed.

#### **4.2 Field Sampling**

Field sampling will be done in accordance with the Standard Operating Procedures (SOP) for the applicable test methods. General QC measures for the test program include:

- Cleaned glassware and sample train components will be sealed until assembly.
- Sample trains will be leak checked before and after each test run.
- Appropriate probe, filter and impinger temperatures will be maintained.
- The sampling port will be sealed to prevent air from leaking from the port.
- Dry gas meter,  $\Delta P$ ,  $\Delta H$ , temperature and pump vacuum data will be recorded during each sample point.
- An isokinetic sampling rate of 90-110% will be maintained, as applicable.
- All raw data will be maintained in organized manner.
- All raw data will be reviewed daily for completeness and acceptability.

#### **4.3 Analytical Laboratory**

Analytical laboratory selection for sample analyses is based on the capabilities, certifications and accreditations that the laboratory possesses. An approved analytical laboratory subcontractor list is maintained with a copy of the certificate and analyte list as evidence of compliance. Alliance assumes responsibility to the client for the subcontractor's work. Alliance maintains a verifiable copy of the results with chain of custody documentation.

## Appendix A

**ENCLOSURE 1**  
**Source Testing Request for Hazardous Waste Combustors:**  
**Test Procedures, Methods, and Reporting Requirements**

This document provides an overview of the required testing, approved sampling and analysis methods, target pollutants and units of measure, and reporting requirements for hazardous waste combustors (HWC) that are required to provide emission test data to the U.S. Environmental Protection Agency (EPA) under the Clean Air Act (CAA) section 114 (42 U.S.C. 7414). The purpose for this testing is to gather data on air pollutant emissions from HWC in this source category to inform the EPA's decision-making process for regulation of these sources. All recipients must complete and submit test results by August 30, 2024. Recipients are asked to submit answers to questions in Section 4.0 of this enclosure by March 1, 2024. The document is organized as follows:

- 1.0    Testing Procedures and Methods**
- 2.0    How to Report Data**
- 3.0    How to Submit Emissions Test Data**
- 4.0    Additional Questions**
- 5.0    Contact Information for Questions**

**1.0    Testing Procedures and Methods**

The EPA requires emissions test data for several pollutants, including specific hazardous air pollutants (HAP) and potential surrogate groups. The Section 114 letter includes a list of emissions sources selected for testing at your facility. For each HWC emissions source listed in your Section 114 letter, you must perform an emissions test for some combination of pollutants (i.e., simultaneous measurements per group) and diluents according to the test protocols presented in Section 1.1 of this document. You are also required to perform feedstream sampling and analysis, where applicable, according to the procedures specified in Section 1.2 of this document.

If your facility has process units that are required to be tested, but you are unable to respond to an item exactly as requested in this document, please explain why you cannot respond as requested and/or provide any information you believe may be related in a submission to EPA for consideration as a request for alternative testing requirements.<sup>1</sup> For example, if you have a similar process unit at a different facility that is more amenable to testing, you may choose to submit a request to the individual specified in Section 5.0 to have the alternative unit tested in place of the unit EPA requested that you test. If you have conducted any of the requested groups of emissions tests since 2019 (i.e., any complete set of tests to be conducted simultaneously as described in Tables 1.1 and 1.2 along with any required feedstream analysis according to Table 1.3), and the prior data remain representative of your operations, please discuss with EPA whether the prior testing may meet the goals of the testing requirements specified in this document (e.g., test method, sample volume). For the issues noted in this paragraph, or if you

---

<sup>1</sup>NOTE: The EPA reserves all its enforcement rights provided by CAA section 113, including the right to bring a claim in the U.S. District Court to enforce the CAA section 114 obligation to comply with all the requests described in this document.

would like to request an alternate test method, please contact the person(s) specified in Section 5.0 of this document within **30 days** of receipt of your Section 114 letter with your recommended solution for consideration and approval.

Please note that you do not have to submit a site-specific test plan to the EPA for approval prior to testing; however, we require that you prepare a site-specific test plan to ensure that you address all the testing and reporting requirements and submit it as an appendix with your test report. Please note that you must report your process and emissions testing data using the **EPA's Electronic Reporting Tool (ERT)**, where applicable. You are directed to the ERT website (<https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert>) for a more complete and interactive description of the ERT, list of emissions test methods currently supported by the ERT, and a link to download the ERT.

You must follow all the procedures as specified in the test methods, including the quality assurance and quality control measures, and document the results in the ERT and in any test report provided to the EPA. For this program, you do not need to obtain audit materials from your state or local agency or from the EPA. You may apply any third-party audit materials you have on hand and document the results, but you are not required to do so.

## ***1.1 Stack Test Methods***

You must follow the stack test method procedures described in this section for the emissions sources listed in your Section 114 letter.

The owner/operator of the HWC must certify that the unit tested was operating in a normal and representative manner during the emissions test (i.e., in a manner consistent with the operating parameter limits specified in the source's title V permit). The owner/operator must also certify that it operated the air pollution control device(s) (APCD), if any, on the unit tested in accordance with the site specific operating plans required by 40 CFR Part 60, Subpart EEE (e.g., Operation and Maintenance Plan) during the emissions testing.

### ***1.1.1 Sample Location***

When selecting sampling locations:

- If the unit has multiple atmospheric vents that are not ducted to a common stack, you will need to test all atmospheric vents used during normal operation.

You must use EPA Method 1 or 1A of Appendix A-1 to 40 CFR Part 60, as applicable, to select the locations and number of traverse points for sampling for the tests in this section. See <https://www.epa.gov/emc/method-1-sample-velocity-traverses> and <https://www.epa.gov/emc/method-1a-small-ducts> for copies of the methods and guidance information for sampling situations not meeting Method 1 criteria.

### ***1.1.2 Emissions Measurement Methods***

Tables 1.1 and 1.2 summarize the testing required to be performed for each type of process unit.

Gas flow rate, oxygen (O<sub>2</sub>)/carbon dioxide (CO<sub>2</sub>), and gas moisture are required to be measured simultaneously with all pollutant tests.

Where concurrent testing is required, it is indicated in the table. If the table does not indicate simultaneous sampling is required for multiple pollutants, you may still choose to do so.

The primary reason for concurrent testing is to obtain a clear understanding about the overall HAP emissions profile from each emission process point. A second reason is to gather information that will help us evaluate the correlations between emissions of one pollutant to another pollutant, to potentially establish surrogate relationships. For example, the organic HAP tests and THC tests from the stack are required to be done at the same time. ***Tests that are required to be concurrent under this test request that are not done in this manner may be considered invalid and may need to be repeated.***

Feedrates of polychlorinated biphenyls (PCBs), fluorinated organics, brominated organics, and metals should be between the average feedrate and the maximum typical feedrate. Actual hazardous waste feedstreams typically fed to the operating unit must be used, rather than a surrogate feedstream. Spiking may be used to elevate the fluorinated organics or brominated organics feedrates to the range requested. This testing does not meet the criteria for subsequent testing of § 63.1207(h); operating parameters and emission limits are not waived during this testing.

**Table 1.1: Summary of Required Emissions Testing – Incinerators, Cement Kilns, Lightweight Aggregate Kilns, Solid Fuel Boilers, Liquid Fuel Boilers**

Parameter	Test Method	Units of Measure <sup>1</sup>
Polycyclic Aromatic Hydrocarbons (PAH), and Polychlorinated Biphenyls (PCB) <sup>2</sup>	EPA Method 23. Collect a minimum sample volume of 141 dscf (4 dscm) per run. Use high resolution mass spectrometry for sample analysis.	ng/dscm ng/dscm @ 7% O <sub>2</sub>
Total Hydrocarbons (THC)	EPA Method 25A <sup>3</sup> . Concurrent with the EPA Method 23 testing.	ppmvd ppmvd @ 7% O <sub>2</sub>
Hydrogen Fluoride (HF) and Hydrogen Bromide (HBr)	EPA Method 320 <sup>4</sup> or EPA Method 26A. Minimum of 2 hour sample duration. For EPA Method 26A, collect a minimum of 60 dscf. For HF, both the acid and basic impingers must be analyzed and reported. Report HF as total F collected in the acid and basic impingers.	ppmvd ppmvd @ 7% O <sub>2</sub>
Hydrogen Cyanide	EPA Method 320 <sup>4</sup> ; where entrained moisture droplets are present, Other Test Method 29 (OTM-29) should be used instead. OTM-29 may not be used on cement kilns. For OTM-29, breakthrough must be determined according to section 9.2.1 and reported.	ppmvd ppmvd @ 7% O <sub>2</sub>
Gas flow rate <sup>5</sup>	EPA Method 2, 2A, 2B, 2C, 2D, 2F, or 2G, as appropriate, simultaneous with each pollutant test run.	acfm, scfm, and dscfm
Oxygen (O <sub>2</sub> ) and Carbon Dioxide (CO <sub>2</sub> ) <sup>5</sup>	EPA Method 3A, simultaneous with each pollutant test run.	percent volume, dry
Moisture <sup>5</sup>	EPA Method 4, simultaneous with each pollutant test run.	percent volume

<sup>1</sup> ppmvd = parts per million by volume, dry basis; dscf = dry standard cubic feet; dscm = dry standard cubic meters; acfm = actual cubic feet per minute; scfm = standard cubic feet per minute; dscfm = dry standard cubic feet per minute; ng/dscm – nanograms per dry standard cubic meter;

<sup>2</sup> The target analytes for PAH and PCB are presented in Tables 1.3 and 1.4 respectively.

<sup>3</sup> If the facility uses a THC CEM to demonstrate compliance, the facility CEM data may be substituted.

<sup>4</sup> For analyte spiking, you must use the analytes of interest; the use of surrogate compound(s) is prohibited for the purposes of this CAA section 114 request.

<sup>5</sup> Gas flow rate, O<sub>2</sub>/CO<sub>2</sub> and moisture are required for all tests.

**Table 1.2: Summary of Required Emissions Testing – Hydrochloric Acid Production Furnaces**

Parameter	Test Method	Units of Measure <sup>1</sup>
Polycyclic Aromatic Hydrocarbons (PAH), and Polychlorinated Biphenyls (PCB) <sup>2</sup>	EPA Method 23. Collect a minimum sample volume of 141 dscf (4 dscm) per run. Use high resolution mass spectrometry for sample analysis.	ng/dscm ng/dscm @ 7% O <sub>2</sub>
Total Hydrocarbons (THC)	EPA Method 25A <sup>3</sup> . Concurrent with the EPA Method 23 testing.	ppmvd ppmvd @ 7% O <sub>2</sub>
Hydrogen Cyanide	EPA Method 320 <sup>4</sup> ; where entrained moisture droplets are present, Other Test Method 29 (OTM-29) should be used. For OTM-29, breakthrough must be determined according to section 9.2.1 and reported.	ppmvd ppmvd @ 7% O <sub>2</sub>
Gas flow rate <sup>5</sup>	EPA Method 2, 2A, 2B, 2C, 2D, 2F, or 2G, as appropriate, simultaneous with each pollutant test run.	acfm, scfm, and dscfm
Oxygen (O <sub>2</sub> ) and Carbon Dioxide (CO <sub>2</sub> ) <sup>5</sup>	EPA Method 3A, simultaneous with each pollutant test run.	percent volume, dry
Moisture <sup>5</sup>	EPA Method 4, simultaneous with each pollutant test run.	percent volume

<sup>1</sup> ppmvd = parts per million by volume, dry basis; dscf = dry standard cubic feet; dscm = dry standard cubic meters; acfm = actual cubic feet per minute; scfm = standard cubic feet per minute; dscfm = dry standard cubic feet per minute; ng/dscm – nanograms per dry standard cubic meter;

<sup>2</sup> The target analytes for PAH and PCB are presented in Tables 1.3 and 1.4 respectively.

<sup>3</sup> If the facility uses a THC CEM to demonstrate compliance, the facility CEM data may be substituted.

<sup>4</sup> For analyte spiking, you must use the analytes of interest; the use of surrogate compound(s) is prohibited for the purposes of this CAA section 114 request.

<sup>5</sup> Gas flow rate, O<sub>2</sub>/CO<sub>2</sub> and moisture are required for all tests.

Tables 1.3 and 1.4 provide a listing of target analytes for the PAH and PCB EPA Method 23 analysis, respectively. For copies of the EPA reference test methods and additional information, please refer to the EPA's Emission Measurement Center (EMC) website, <https://www.epa.gov/emc>.

Report all pollutant emissions test data using the units of measure indicated in Tables 1.1 and 1.2. Report the results of your emissions tests according to the directions provided in Section 2.0 of this document.

Unless otherwise specified, each pollutant emissions test should consist of at least 7 test runs for the sampling duration and/or volume indicated for each specified unit. Cement kilns with in-line raw mills are required to conduct 4 test runs with the raw mill on and 3 test runs with the raw mill off for each pollutant emissions test. For outlet testing, you should collect emissions samples at a location representing the composition of the flue gases at the exit to the atmosphere. For processes where emissions are controlled with an APCD, this location must be downstream of the last APCD the flue gases pass through before exiting to the atmosphere.

**Table 1.3: Target Analytes for PAH Testing**

Compound	CAS <sup>1</sup> Number	Compound	CAS Number
Naphthalene	91-20-3	Chrysene	218-01-9
2-Methylnaphthalene	91-57-6	Benzo[ <i>b</i> ]fluoranthene	205-99-2
Acenaphthylene	208-96-8	Benzo[ <i>k</i> ]fluoranthene	207-08-9
Acenaphthene	83-32-9	Perylene	198-55-8
Fluorene	86-73-7	Benzo[ <i>a</i> ]pyrene	50-32-8
Anthracene	120-12-7	Benzo[ <i>e</i> ]pyrene	192-97-2
Phenanthrene	85-01-8	Benzo[ <i>g,h,i</i> ]perylene	191-24-2
Fluoranthene	206-44-0	Indeno[ <i>1,2,3-cd</i> ]pyrene	193-39-5
Pyrene	129-00-0	Dibenz[ <i>a,h</i> ]anthracene	53-70-3
Benz[ <i>a</i> ]anthracene	56-55-3		

<sup>1</sup> Chemical Abstract Service.**Table 1.4: Target Analytes for PCB Testing**

<sup>1</sup> BZ No.: Ballschmiter and Zell 1980, or International Union of Pure and Applied Chemistry (IUPAC) number<sup>2</sup> Chemical Abstract Service.

During testing, you should monitor, record, and report all the same process data required during a Comprehensive Performance Test for each test run. Provide the one-minute average of the corrected to 7% oxygen raw values in addition to hourly rolling average data for carbon monoxide or total hydrocarbons CEMS. Report the maximum, minimum, and the average of the one-minute averages of each parameter for each test run. If process units have combined emissions prior to the sampling location, describe each process unit contributing to the emissions. Submit all process data (including CEMs data) in a spreadsheet as an attachment to the ERT. For process data that you record during testing, make clear the correlation between emissions measurements and process data (e.g., identify Method 23, run 1 with the associated

process data on the process data details tab of the ERT or flag the data appropriately in the attached spreadsheet).

In addition to the typical operating parameters, the following must be determined and reported for each test run:

- Total bromine and total fluorine feedrate(s) as determined by the methods in Table 1.5.
- The PCB feedrate for each PCB fed as determined by process knowledge or existing waste stream analysis.

## ***1.2 Feedstream Analysis Procedures and Methods***

Please provide an analysis of each feedstream (both hazardous and non-hazardous) fed during each test run. A minimum of three subsamples must be collected during a test run and composited for analysis according to Table 1.5. Sections 1.2.1 through 1.2.3 provide directions for collecting, selecting, preparing, and analyzing feedstream samples.

### ***1.2.1 How to Collect a Feedstream Sample***

Each stream fed to the HWC during the test shall be sampled according to the procedures used during the most recent comprehensive performance test. For both liquid and solid materials, composite sampling shall be performed for the duration of each test run to produce a single composite sample of each feedstream which can be split for analysis. For gaseous streams such as natural gas and process vents, manufacturer specifications and process knowledge are sufficient; sampling is not required.

### ***1.2.2 Analyzing Feed Samples***

Analyze the feed samples according to the methods in Table 1.5.

**Table 1.5: List of Analytical Methods for Feed Sample Analysis**

<b>Analyte</b>	<b>Method</b>	<b>Target Reported Units of Measure</b>
Higher Heating Value	ASTM E711, ASTM D240; or equivalent <sup>a</sup>	Btu/lb
Fluorine and Bromine	EPA SW-846-5050; ASTM E776; EPA SW-846-9056; SW-846-9076; or equivalent <sup>a</sup>	mg/kg

<sup>a</sup> An equivalent method means a published Voluntary Consensus Standard (VCS) or EPA method for the same analyte (i.e., higher heating value, fluorine, or bromine).

### *1.3 Ensuring Data Quality of the Source Tests Performed*

While we are not specifying numerical minimum detection levels for the tests to be performed, we have specified the testing conditions and methods required, including test run sample volumes or times when appropriate, which we believe will provide data of a quality sufficient for decision making.

We remind source owners and testers of the CAA section 114(a)(1) requirement to provide information requested for the development of emissions standards using methods that provide data necessary for the decisions. That includes data of quality sufficient to support those decisions. For the most part, we can identify test methods and procedures that will satisfy those decision-making needs (e.g., minimum sampling times). In other cases, we recognize that the source owner's or tester's selection of test procedures or equipment could bear significantly on the quality of the data. See **Section 2.3** below for guidance for calculating and reporting values measured below method detection levels.

We believe that the CAA is clear in that it is the responsibility of the source and the tester to apply methods and procedures that result in data quality necessary for our decisions, including providing for the lowest possible detection limits considering practical and reasonable limitations. For example, source owners and testers should not automatically choose to use low or medium quality equipment for testing (e.g., for cost reasons) if high quality equipment is reasonably available. We will review test reports in light of this expectation and will be particularly mindful of whether the testing procedures applied are representative of the highest reasonably expected capabilities (e.g., comparing reported minimum measurement detection levels between tests and testers).

***If we believe that a source owner or tester has failed to meet the requirement of the CAA to provide data of sufficient quality or quantity for our decisions, we will request additional measurements that require the use of improved testing procedures.***

On completion of your required tests, please provide a complete stack test report, including appendices and results from feedstream analysis. A complete stack test report includes the following information, at a minimum:

- General identification information for the facility including a mailing address; the actual facility address; the owner or operator, responsible official, or an appropriate representative (where applicable) and an email address and telephone number for this person; and the appropriate Federal Registry System (FRS) number for the facility;
- For each process unit to be tested, type of hazardous waste combustor (e.g., incinerator, cement kiln, lightweight aggregate kiln, liquid fuel boiler, solid fuel boiler, hydrochloric acid production furnace);
- For each process unit to be tested, a complete unit description, including the sampling location(s), all feedstreams (including supplemental fuels) used during testing, the appropriate source classification code (SCC), and the latitude and longitude of the emission point being tested (decimal degrees to six decimal points);
- Emissions control measures in use during the test, including:
  - APCD description and APCD ID

- A description of any pollution prevention or other HAP emission reduction approaches being implemented during the test program;
- A description of the emission release point configuration, including the Release Point ID, particularly for process units with multiple emission release points and multiple process units sharing the same APCD;
- Sampling site description; description of sampling and analysis procedures and any modifications to standard procedures; quality assurance procedures;
- Description of any deviations from the test methods or other anomalies that occurred with the process or APCD operations during the test;
- Documentation of any samples reanalyzed to evaluate anomalies;
- Run-by-run emission data in units of concentration and lb/hr;
- Stack or exhaust gas flow rate (as determined using EPA Method 2 or alternatives) at the time of and during the emissions test, as appropriate;
- Any process data and APCD monitoring data required in this document;
- Sample calculations of all applicable stack gas parameters, emission rates and analytical results, as applicable. *Note: For each test method, provide a sample calculation of one test run in all reported units (lb/hr, ppmvd, etc.). For concentration calculations involving ppmv, make sure ppmv in every calculation step is noted as wet versus dry (i.e., ppmvw versus ppmvd). For THC concentrations, specify in each calculation step the basis (i.e., “as carbon”, “as propane”, “as methane”, etc.);*
- Raw data sheets for field sampling;
- Raw data sheets for field and laboratory analyses;
- Complete laboratory report, inclusive of chromatograms, etc.;
- Chain-of-custody documentation;
- Explanation of laboratory data qualifiers;
- Quality assurance and quality control activities performed;
- Identification information for the company conducting the emissions test including a contact person and his/her email address;
- Any other information required by the test method, a relevant standard, or the Administrator;
- The test plan; and
- For cement kilns, the percent of operating time with raw mill on and raw mill off while feeding hazardous waste for 2020, 2021, and 2022.

## 2.0 How to Report Data

The method for reporting the results of any testing and monitoring requests depends on the type of tests and the type of methods used to complete the test requirements. This section discusses the requirements for reporting the data.

## 2.1 *Reporting Using the EPA's Electronic Reporting Tool (ERT)*

You must report your data using the most recent version of the EPA's Electronic Reporting Tool (ERT). The ERT is a Microsoft Access® database application that must be downloaded onto your computer prior to data entry. If you are not a registered owner of Microsoft Access®, you can install the runtime version of the Microsoft Access.® The most recent ERT version is available at <https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert>. The ERT supports importing data using Microsoft® Excel® import spreadsheets (which can be accessed at the above webpage) to document the collection of the field sampling data.

For Question 7a. of the ERT, for each sampling location, provide the corresponding information from Columns "Process Unit ID(s)," "Process Type Description," and "Control System (APCD ID)".

After completing the ERT, you will also need to attach an electronic copy of the emission test report including any associated feedstream analysis (PDF format preferred) to the Attachments module of the ERT. Both the ERT Access® database file and the emission test report should be transmitted to the EPA as specified below in Section 3.

Rename the ERT test results file according to this naming convention prior to submitting the file: *HWC\_ERT\_Results\_[Company]\_[City-StateAbbrev].accdb*. If multiple ERT files are generated for different HWC at the facility, please succinctly indicate the unit tested at the end of the file name. Submissions will not be accepted if the ERT is not used.

## 2.3 *Instructions for Calculating and Reporting Measurements Less Than In-Stack Method Detection Levels for Emissions Data Submitted in Response to the HWC Testing Request*

The section provides instructions on how to report sample mass measured from isokinetic (manual) test methods (Section 2.3.1) and concentration data measured from instrumental methods (Section 2.3.2) in the ERT.<sup>2</sup>

### 2.3.1 *Instructions for Reporting Sample Mass*

Sample mass from isokinetic/manual methods must be reported in the ERT. When entering a sample mass in the ERT please describe the detection status of the mass in the adjacent *Flag* column using one of the following acronyms:

- **BDL** (below detection level) – the analytical value(s) used to calculate the sample mass is less than the laboratory's reported detection level(s);
- **DLL** (detection level limited)<sup>3</sup> – at least one but not all analytical values used to calculate the sample mass are less than the laboratory's reported detection level(s); or

---

<sup>2</sup> For ERT reporting, a facility enters in specific measurement data, which the ERT software uses to calculate emissions.

<sup>3</sup> The DLL description is for test results which have multiple reported fractions.

- **ADL** (above detection level) – the analytical value(s) used to calculate the sample mass is greater than the laboratory’s reported detection level(s).

**Note, if the detection status of the mass is “BDL”, then the sample mass entered should equal the full value of the analytical method detection limit (MDL).** You must use the method-specified approach for calculation and determination of the MDL. If the method does not specify the approach and calculation of the MDL, you must determine the MDL using the procedures specified in Section 15 of Method 301 (located in Appendix A of 40 CFR part 63).

For sample mass reported as BDL:

- Describe in the accompanying test report<sup>4</sup>, the procedures used to calculate the MDL including the measurements made, the standards used, and the statistical procedures applied. Note in the *Comments* column of the BDL value *where* in the test report this description is provided;
- For this request, calculate the corresponding emissions concentration and emissions rate using the full value of the MDL. Flag the calculated emissions concentration and emission rate with the same flag used to identify the sample mass, i.e., BDL, DLL, or ADL.

When entering a sample mass based on multiple reported fractions (for example, in the screen shot below):

- In the comment field, list each mass fraction in the order of the sample train with commas separating the individual values. If any fraction is below the detection limit, list it as a bracketed “less than” detection level value **equal to the MDL**;
- The sample mass should equal the sum of its fractional components including values reported at the MDL (i.e., bracketed less than values);
- If a sample mass is the sum of all BDL fractions, then the sample mass should be flagged as BDL (see chromium example below). If a sample mass consists of a combination of BDL and ADL fractions, then the sample mass should be flagged as “DLL” (see arsenic example below).

Compound	Mass	Units	Flag	Comments
Filterable Particulate	12.3	gm	ADL	
Arsenic	3.5	ug	DLL	[<1.00], 2.5
Cadmium	28.1	ug	ADL	26.8, 1.3
Chromium	2	mg	BDL	[<1.00], [<1.00]

<sup>4</sup> A test report must be submitted along with the HWC Testing Supplement and as part of a ERT submittal.

### 2.3.2 Instructions for Reporting Concentration Data

Instrumental test methods to be used in the HWC test request include EPA Methods 3A, 25A, and 320. For instrumental test methods, concentration rather than sample mass is reported for each test run. When reporting, flag “as measured” concentrations as BDL or ADL. For EPA Method 320, report BDL measurements at the minimum analyte concentration (or minimum analyte uncertainty, MAU), according to the method. Include in the accompanying test report relevant information relative to calibration gas values or other technical qualifiers for the measured data. For EPA Method 320, note in the *Comments* column of the emissions data *where* in the test report this information is provided.

## 3.0 How to Submit Emissions Test Data

Please review the materials gathered for your facility to respond to the test data request for the processes included in your section 114 letter according to this **Enclosure 1** to determine if you will claim any of the information as confidential business information (CBI). The **Enclosure 1** response for the testing conducted at each facility consists of the following (as applicable):

- ERT Access<sup>®</sup> database file(s) for the facility,
- Test report(s) including feedstream analysis for the facility (PDF format preferred), and
- Spreadsheet containing process data.

Each tested hazardous waste combustor must be in its own ERT database file.

If you claim CBI, you will need to separate your data into two portions (non-CBI and CBI) for submission to EPA using two different procedures. If you claim any CBI, create a non-CBI version of the **Enclosure 1** materials to be submitted with the CBI removed. Under CAA section 114(c), emissions data is not entitled to confidential treatment, and the EPA is required to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available. Please refer to **Enclosure 3** to aid you in determining what information can be claimed confidential. Submit the non-CBI version of the **Enclosure 1** materials following the procedure in Section 3.1. Submit the CBI version following the procedure in section 3.2.

### 3.1 Non-confidential Data

To submit your non-confidential data including test data files (ERT Access<sup>®</sup> files, PDF test reports, and the process data spreadsheet):

Attach an electronic copy of the emission test report including feedstream analysis and the process data spreadsheet within the attachment module of the ERT. Create a project data set submission file from the ERT. Upload the project data set zip file with your non-CBI materials

into the EPA's Compliance and Emissions Data Reporting Interface (CEDRI)<sup>5</sup> following the instructions in CEDRI for submitting an "ICR ERT Performance Report." (*Note: Do not upload CBI into CEDRI.*)

### 3.2 ***Confidential Data***

If the process data or other information you are providing is considered confidential, you will need to prepare files containing ***only*** the confidential portion of your data and submit it electronically. Please refer to **Enclosure 3** to aid you in determining what information can be claimed confidential.

Electronic submissions must be transmitted ***directly*** and ***only*** to the OAQPS CBI Office at the email address [oaqpscbi@epa.gov](mailto:oaqpscbi@epa.gov), and should include clear CBI markings and be flagged to the attention of the Hazardous Waste Combustor Sector Lead. Do not copy the sector lead but flag it to their attention in the subject line and text of the email. If assistance is needed with submitting large electronic files that exceed the file size limit for email attachments, and if you do not have your own file sharing service, please email [oaqpscbi@epa.gov](mailto:oaqpscbi@epa.gov) to request a file transfer link. Information submitted to this mailbox will be retrieved and securely maintained on a restricted site limited to personnel with active CBI authorization.

---

<sup>5</sup> Log in to CEDRI at <https://cdx.epa.gov/>. For more information on CEDRI visit <https://www.epa.gov/electronic-reporting-air-emissions/cedri>. Once logged in, select "Create a Report" and choose report type "Information Collection Request (ICR)." Use the green "Add" button to add the "Enclosure 1 Source Testing Request" report available for part 63 subpart EEE. Load the non-CBI zip file with your Enclosure 1 response, certify, and submit.

## 4.0 Additional Questions

For the questions in this section, please submit answers through CEDRI<sup>6</sup> as outlined in Section 3 by March 1, 2024.

1. Are you subject to 40 CFR part 63, subpart GGGGG, National Emission Standards for Hazardous Air Pollutants: Site Remediation?
2. Do you accept *remediation material* from a facility performing a remediation that is subject to 40 CFR part 63, subpart GGGGG, National Emission Standards for Hazardous Air Pollutants: Site Remediation?

The definition of *remediation material* found at 40 CFR part 63 subpart GGGGG, § 63.7957, reads as follows:

*Remediation material* means a material that contains one or more of the HAP listed in Table 1 of this subpart, and this material is one of the following:

- (1) A material found in naturally occurring media such as soil, groundwater, surface water, sediments, or a mixture of such materials with liquids, sludges, or solids which is inseparable by simple mechanical removal processes and is made up primarily of media. This material does not include debris as defined in 40 CFR 268.2.
- (2) A material found in intact or substantially intact containers, tanks, storage piles, or other storage units that requires clean up because this material poses a reasonable potential threat to contaminating media. Examples of these materials include, but are not limited to, solvents, oils, paints, and other volatile or semi-volatile organic liquids found in buried drums, cans, or other containers; gasoline, fuel oil, or other fuels in leaking underground storage tanks; and solid materials containing volatile or semi-volatile organics in unused or abandoned piles. Remediation material is not a waste or residue generated by routine equipment maintenance activities performed at a facility such as, but not limited to, tank bottoms and sludges removed during tank cleanouts; sludges and sediments removed from active wastewater treatment tanks, surface impoundments, or lagoons; spent catalyst removed from process equipment; residues removed from air pollution control equipment; and debris removed during heat exchanger and pipeline cleanouts.

---

<sup>6</sup> Log in to CEDRI at <https://cdx.epa.gov/>. For more information on CEDRI visit <https://www.epa.gov/electronic-reporting-air-emissions/cedri>. Once logged in, select “Create a Report” and choose report type “Information Collection Request (ICR).” Select the ICR Questionnaire report type for this part of the submission. Use the green “Add” button to add the “ICR Questionnaire” report available for part 63 subpart EEE. Upload the non-CBI file with your Additional Questions response, certify, and submit.

## 5.0 Contact Information for Questions

For questions on how to report data using the ERT, contact one of the following:

Theresa Lowe  
U.S. EPA  
(919) 541-4786

[lowe.theresa@epa.gov](mailto:lowe.theresa@epa.gov)

Kevin McGinn  
U.S. EPA  
(919) 541-3796

[mcginn.kevin@epa.gov](mailto:mcginn.kevin@epa.gov)

For questions on the test methods, contact one of the following:

Ned Shappley  
U.S. EPA  
(919) 541-7903

[shappley.ned@epa.gov](mailto:shappley.ned@epa.gov)

Kevin McGinn  
U.S. EPA  
(919) 541-3796

[mcginn.kevin@epa.gov](mailto:mcginn.kevin@epa.gov)

Walter Lin  
U.S. EPA  
(919) 541-1341

[lin.walter@epa.gov](mailto:lin.walter@epa.gov)

For general questions, including emissions sources selected for testing and reporting mechanisms other than the ERT, contact:

Rachel Smoak  
U.S. EPA  
(919) 541-0253

[smoak.rachel@epa.gov](mailto:smoak.rachel@epa.gov)

## Appendix C: LIQUID WASTE SAMPLING REPORT

---

## LIQUID WASTE SAMPLING REPORT

During each test run, each liquid waste was sampled and analyzed for higher heating value. BASF Corporation (BASF) personnel collected the liquid waste samples using a tap sampling procedure. The sampling taps were located in the waste feed lines. The sample taps were clearly identified and were inspected by the Emission Test Manager prior to testing.

Samples were collected at the beginning, middle, and end of each test run. At each sampling event, approximately 150 milliliters (mL) of each waste stream was collected into two separate bottles. At the conclusion of the run, each sample bottle had approximately 450 mL of sample.

The field duplicates were collected during Run 5.

All samples were properly logged on the waste sampling forms. These forms indicate sampler's initials, the run number, the date, and the time the sample was collected. The completed forms are included in this liquid waste sampling report.

Alliance Technical Group, LLC (Alliance) has completed the source testing as described in this report. Results apply only to the source tested and operating conditions for the specific test dates and times identified within this report. All results are intended to be considered in their entirety, and Alliance is not responsible for use of less than the complete test report without written consent. This report shall not be reproduced in full or in part without written approval from the customer.

To the best of my knowledge and abilities, all information, facts and test data are correct. Data presented in this report has been checked for completeness and is accurate, error-free and legible. Onsite testing was conducted in accordance with approved internal Standard Operating Procedures. Any deviations or problems are detailed in the relevant sections in the test report.

This report is only considered valid once an authorized representative of Alliance has signed in the space provided below; any other version is considered draft. This document was prepared in portable document format (.pdf) and contains pages as identified in the bottom footer of this document.

## Introduction

## 1.0 Introduction

Alliance Technical Group, LLC (Alliance) was retained by BASF Corporation (BASF) to conduct Clean Air Act (CAA) Section 114 information collection request (ICR) testing at the Freeport, Texas facility at the request of the United States Environmental Protection Agency (USEPA). Testing was conducted to determine the emission concentrations of polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), total hydrocarbons (THC) and hydrogen cyanide (HCN) at the exhaust of Incinerator IN-701 (EPN 4-1-1). This source is regulated under 40 CFR 63, Subpart EEE which is subject to this ICR.

## 1.1 Project Team

Personnel involved in this project are identified in the following table.

**Table 1-1: Project Team**

<b>BASF Personnel</b>	Brandon DeWitt Justin Matthews
<b>Alliance Personnel</b>	Seth Moore Andrew Christiansen Lane Dryden Jason Lovell Pandu Sattvika Ryan Simon

## 1.2 Test Program Notes

Calibration drift checks were performed on the Method 25A THC reference monitor hourly. Approximate 10-to-15-minute gaps in recorded THC data are noted due to these required QA checks. The EPA Method 320 HCN sampling was conducted using a shared heated sample line and therefore has corresponding data gaps during the THC QA drift checks.

## Summary of Results

## 2.0 Summary of Results

Alliance conducted CAA Section 114 ICR testing at the BASF facility in Freeport, Texas on May 15-17 and 20, 2024. Testing consisted of determining the emission rates of PAH, PCB, THC and HCN at the exhaust of Incinerator IN-701 (EPN 4-1-1).

Tables 2-1 through 2-6 provide summaries of the emission testing results. All results provided in these tables are on a concentration basis. Mass emission rates are provided in Appendix B. Any difference between the summary results listed in the following tables and the detailed results contained in appendices is due to rounding for presentation.

Result Tables Flag Definitions:

## Testing Methodology

### 3.0 Testing Methodology

The emission testing program was conducted in accordance with the test methods listed in Table 3-1. Method descriptions are provided below while quality assurance/quality control data is provided in Appendix D.

**Table 3-1: Source Testing Methodology**

Parameter	U.S. EPA Reference Test Methods	Notes/Remarks
Volumetric Flow Rate	1 & 2	Full Velocity Traverses
Oxygen/Carbon Dioxide	3A	Instrumental Analysis
Moisture Content	4	Gravimetric Analysis
PAH & PCB	23	Isokinetic Sampling
Total Hydrocarbons	25A	Instrumental Analysis
Hydrogen Cyanide	320	FTIR – Continuous Sampling
Gas Dilution System Certification	205	--

#### 3.1 U.S. EPA Reference Test Methods 1 and 2 – Sampling/Traverse Points and Volumetric Flow Rate

The sampling location and number of traverse (sampling) points were selected in accordance with U.S. EPA Reference Test Method 1. To determine the minimum number of traverse points, the upstream and downstream distances were equated into equivalent diameters and compared to Figure 1-1 (for isokinetic sampling) in U.S. EPA Reference Test Method 1.

Full velocity traverses were conducted in accordance with U.S. EPA Reference Test Method 2 to determine the average stack gas velocity pressure, static pressure and temperature. The velocity and static pressure measurement system consisted of a pitot tube and inclined manometer. The stack gas temperature was measured with a K-type thermocouple and pyrometer.

Stack gas velocity pressure and temperature readings were recorded during each test run. The data collected was utilized to calculate the volumetric flow rate in accordance with U.S. EPA Reference Test Method 2.

#### 3.2 U.S. EPA Reference Test Method 3A – Oxygen / Carbon Dioxide

The oxygen (O<sub>2</sub>) and carbon dioxide (CO<sub>2</sub>) testing was conducted in accordance with U.S. EPA Reference Test Method 3A. Data was collected online and reported in one-minute averages. The sampling system consisted of a stainless-steel probe, Teflon sample line(s), gas conditioning system and the identified gas analyzer. The gas conditioning system was a non-contact condenser used to remove moisture from the stack gas. A heated Teflon sample line was used. The quality control measures are described in Section 3.8.

#### 3.3 U.S. EPA Reference Test Method 4 – Moisture Content

The stack gas moisture content (BWS) was determined in accordance with U.S. EPA Reference Test Method 4. The gas conditioning train consisted of a series of chilled impingers. Prior to testing, each impinger was filled with a known quantity of water or silica gel. Each impinger was analyzed gravimetrically before and after each test run on the same balance to determine the amount of moisture condensed.

### 3.4 U.S. EPA Reference Test Method 23 – PAH and PCB

The PAH and PCB testing was conducted in accordance with U.S. EPA Reference Test Method 23. The sampling system consisted of a glass nozzle, heated glass-lined probe, glass filter holder with pre-cleaned heated glass-fiber filter, condenser coil, XAD sorbent module, gas conditioning train, pump and calibrated dry gas meter. The gas conditioning system consisted of five (5) chilled impingers. The first impinger was empty. The next two (2) impingers each contained 100 mL of water. The fourth impinger was empty while the fifth impinger was charged with 200-300 grams of silica gel. The probe liner and filter heating systems were maintained at a temperature of  $120 \pm 14^{\circ}\text{C}$  ( $248 \pm 25^{\circ}\text{F}$ ), and the impinger temperature was maintained at  $20^{\circ}\text{C}$  ( $68^{\circ}\text{F}$ ) or less throughout testing.

Method 23 Section 6.1.7 requires the condenser to be oriented at an angle to cause moisture to flow down to the XAD adsorbent module to facilitate condensate drainage. Glassware with this configuration is not currently available from a national supplier utilizing a large enough condenser to meet the temperature specifications of the method. Alliance will continue to work with manufacturers, but until equipment is widely available, the horizontal or vertical condenser configuration from traditional Method 23 was utilized.

All glassware leading to the XAD adsorbing resin trap was cleaned and sealed before mobilizing to the site. Glassware cleaning consisted of washing with warm soapy water and rinsing with distilled water and acetone. The sampling train was assembled in the sample recovery area. The glass-fiber filter was placed in a glass filter holder with a Teflon filter support and connected to the condenser coil. All open ends of the sampling train were sealed with Teflon tape prior to complete assembly at the sampling location.

Following the completion of each test run, the sampling train was leak checked at vacuum pressure greater than or equal to the highest vacuum pressure observed during the run and the contents of the impingers were measured for moisture gain. The XAD sorbent module was sealed on both ends and placed on ice. The filter was removed from the filter holder and placed in sample container 1. The nozzle, probe liner, filter holder, condenser and all connecting glassware were triple-rinsed and brushed with acetone and then toluene, and these rinses were recovered in sample container 2. The impinger water condensate was recovered into sample container 3a. All impingers were then rinsed three times with acetone and then three times with toluene and collected in sample container 3b. All containers were sealed, labeled and liquid levels marked for transport to the identified laboratory for analysis.

Method 23 Section 8.2.9 has the impinger water and solvent rinses collected in a single container (No. 3). Due to analytical method development constraints of the subcontracted laboratory, it was necessary to split this recovery between two containers: condensate (Container No. 3a) and solvent rinses (Container No. 3b).

A field train proof blank was collected. A complete sampling system was placed at the sampling location and multiple leak checks were performed on the system similar to an actual testing scenario. The sample train was then moved to the mobile laboratory for recovery. A full set of reagent blanks including a filter and a trap were also submitted to the laboratory.

Targeted PAH and PCB analytes are detailed below:

PAH Analytes			
PAH Compound	CAS Number	PAH Compound	CAS Number
Naphthalene	91-20-3	Chrysene	218-01-9
2-Methylnaphthalene	91-57-6	Benzo[b]fluoranthene	205-99-2
Acenaphthylene	208-96-8	Benzo[k]fluoranthene	207-08-9
Acenaphthene	83-32-9	Perylene	198-55-8
Fluorene	86-73-7	Benzo[a]pyrene	50-32-8

### 3.5 U.S. EPA Reference Test Method 25A – Total Hydrocarbons

The total hydrocarbons (THC) testing was conducted in accordance with U.S. EPA Reference Test Method 25A. Data was collected online and reported in one-minute averages. The sampling system consisted of a stainless-steel probe, heated Teflon sample line(s) and the identified gas analyzer. The quality control measures are described in Section 3.9.

### 3.6 U.S. EPA Reference Test Method 320 – Hydrogen Cyanide

The concentrations of hydrogen cyanide were determined in accordance with U.S. EPA Reference Test Method 320. Each source gas stream was extracted at a constant rate through a heated probe, heated filter and heated sample line and analyzed with a MKS MultiGas 2030 FTIR operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured were selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio were measured and recorded to document analyzer performance. A leak check was performed on the sample cell. The instrument path length was verified using ethylene as the Calibration Transfer Standard. Dynamic spiking was performed using a certified standard of the target compound in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information are recorded and stored with the calculated analytical results. The quality control measures are described in Section 3.10.

### 3.7 U.S. EPA Reference Test Method 205 – Gas Dilution System Certification

A calibration gas dilution system field check was conducted in accordance with U.S. EPA Reference Method 205. An initial three (3) point calibration was conducted, using individual Protocol 1 gases, on the analyzer used to complete the dilution system field check. Multiple dilution rates and total gas flow rates were utilized to force the dilution system to perform two dilutions on each mass flow controller. The diluted calibration gases was sent directly to the analyzer, and the analyzer response recorded in an electronic field data sheet. A mid-level supply gas, with a cylinder concentration within 10% of one of the gas divider settings described above, was introduced directly to the analyzer, and the analyzer response recorded in an electronic field data sheet. The cylinder concentration and the analyzer response agreed within 2%. These steps were repeated three (3) times. The average analyzer response agreed within 2% of the predicted gas concentration. No single injection differed more than 2% from the average instrument response for that dilution. Copies of the Method 205 data can be found in the Quality Assurance/Quality Control Appendix.

### 3.8 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 3A

Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

Low Level gas was introduced directly to the analyzer. After adjusting the analyzer to the Low-Level gas concentration and once the analyzer reading was stable, the analyzer value was recorded. This process was repeated for the High-Level gas. For the Calibration Error Test, Low, Mid, and High Level calibration gases were sequentially introduced directly to the analyzer. All values were within 2.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe and the time required for the analyzer reading to reach 95 percent or 0.5% (whichever was less restrictive) of the gas concentration was recorded. The analyzer reading was observed until it reached a stable value, and this value was recorded. Next, Low Level gas was introduced at the probe and the time required for the analyzer reading to decrease to a value within 5.0 percent or 0.5% (whichever was less restrictive) was recorded. If the Low-Level gas was zero gas, the response was 0.5% or 5.0 percent of the upscale gas concentration (whichever was less restrictive). The analyzer reading was observed until it reached a stable value and this value was recorded.

The measurement system response time and initial system bias were determined from these data. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe. After the analyzer response was stable, the value was recorded. Next, Low Level gas was introduced at the probe, and the analyzer value recorded once it reached a stable response. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference or the data was invalidated and the Calibration Error Test and System Bias were repeated.

Drift between pre- and post-run System Bias was within 3 percent of the Calibration Span or 0.5% absolute difference. If the drift exceeded 3 percent or 0.5%, the Calibration Error Test and System Bias were repeated.

To determine the number of sampling points, a gas stratification check was conducted prior to initiating testing. The pollutant concentrations were measured at three points (16.7, 50.0 and 83.3 percent of the measurement line). Each traverse point was sampled for a minimum of twice the system response time. The diluent concentration at each traverse point did not differ more than 5 percent of the average diluent concentration, and single point sampling was conducted during the test runs. Copies of stratification check data can be found in the Quality Assurance/Quality Control Appendix.

A Data Acquisition System with battery backup was used to record the instrument response in one (1) minute averages. The data was continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data was also saved to the Alliance server. All data was reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data was relinquished to the report coordinator and then a final review was performed by the Project Manager.

### **3.9 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 25A**

Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

Within two (2) hours prior to testing, zero gas was introduced through the sampling system to the analyzer. After adjusting the analyzer to the Zero gas concentration and once the analyzer reading was stable, the analyzer value was recorded. This process was repeated for the High-Level gas, and the time required for the analyzer reading to reach 95 percent of the gas concentration was recorded to determine the response time. Next, Low and Mid-Level gases were introduced through the sampling system to the analyzer, and the response was recorded when it was stable. All values were less than +/- 5 percent of the calibration gas concentrations.

Mid-Level gas was introduced through the sampling system. After the analyzer response was stable, the value was recorded. Next, Zero gas was introduced through the sampling system, and the analyzer value recorded once it reached a stable response. The Analyzer Drift was less than +/- 3 percent of the span value. Analyzer drift checks were conducted once hourly during testing.

A Data Acquisition System with battery backup was used to record the instrument response in one (1) minute averages. The data was continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data was also saved to the Alliance server. All data was reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data was relinquished to the report coordinator and then a final review was performed by the Project Manager.

### **3.10 Quality Assurance/Quality Control – U.S. EPA Reference Method 320**

EPA Protocol 1 Calibration Gases – Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

After providing ample time for the FTIR to reach the desired temperature and to stabilize, zero gas (nitrogen) was introduced directly to the instrument sample port. While flowing nitrogen the signal amplitude was recorded, a background spectra was taken, a linearity check was performed and recorded, the peak to peak noise and the root mean square in the spectral region of interest was measured and a screenshot was recorded.

Following the zero gas checks, room air was pulled through the sample chamber and the line width and resolution was verified to be at 1879 cm<sup>-1</sup>, the peak position was entered and the FWHH was recorded (screenshot). Following these checks, another background spectra was recorded and the calibration transfer standard (CTS) was introduced directly to the instrument sample port. The CTS instrument recovery was recorded and the instrument mechanical response time was measured.

Next, stack gas was introduced to the FTIR through the sampling system and several scans were taken until a stable reading was achieved. The native concentration of our target spiking analyte (HCN) was recorded. Spike gas was introduced to the sampling system at a constant flow rate  $\leq 10\%$  of the total sample flow rate and a corresponding dilution ratio was calculated along with a system response time. Matrix spike recovery spectra were recorded and were within the  $\pm 30\%$  of the calculated value of the spike concentration that the method requires.

The matrix spike recovery was conducted once at the beginning of the testing and the CTS recovery procedures were repeated following each test run. The corresponding values were recorded.

## EPA PROTOCOL GAS CERTIFICATE OF ANALYSIS

Cylinder Number:	EB0050312	Certification Date:	03/20/2023
Product ID Number:	125372	Expiration Date:	03/18/2031
Cylinder Pressure:	1900 PSIG	MFG Facility:	- Shreveport - LA
COA #	EB0050312.20230228-0	Lot Number:	EB0050312.20230228
Customer PO. NO.:		Tracking Number:	073560728
Customer:		Previous Certification Dates:	

This calibration standard has been certified per the May 2012 EPA Traceability Protocol, Document EPA-600/R-12/531, using procedure G2.

Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

### Certified Concentration(s)

Component	Concentration	Uncertainty	Analytical Principle	Assayed On
Carbon Dioxide	22.9 %	±0.13 %	FTIR	03/20/2023
Oxygen	23.0 %	±0.13 %	MPA	03/13/2023
Nitrogen	Balance			

Analytical Measurement Data Available Online.

### Reference Standard(s)

Serial Number	Lot	Expiration	Type	Balance	Component	Concentration	Uncertainty(%)	NIST Reference
CC237232	CC237232.20180504	07/21/2026	GMIS	N2	O2	24 %	0.497	071001

CO2	FTIR	MKS	MKS 2031DJG2EKVS13T	017146467	03/20/2023

### SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

Note: The mass flow controller's calibration values are used by the dilution system's operating software to improve accuracy. These calibrations are not necessarily indicative of the systems overall performance. Performance is verified by conducting a Method 205 prior to each field use.

## CERTIFIED GAS CERTIFICATE OF ANALYSIS

Cylinder Number:	EB0099721	Certification Date:	11/13/2023
Product ID Number:	124838	Expiration Date:	11/12/2025
Cylinder Pressure:	1900 PSIG	MFG Facility:	- Shreveport - LA
COA #	EB0099721.20231102-0	Lot Number:	EB0099721.20231102
Customer PO. NO.:		Tracking Number:	095703006
Customer:		Previous Certification Dates:	

This mixture is for laboratory use only, not for drug, household or other use.  
This mixture is certified in Mole % to be within  $\pm 2\%$  of the actual number reported with a confidence of 95%.  
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.  
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

### Certified Concentration(s)

Component	Concentration	Uncertainty	Analytical Principle
Ethylene	102 PPM	$\pm 2\%$ NIST	FTIR
Nitrogen	Balance		

Analytical Measurement Data Available Online.

### Analytical Instrumentation

Component	Principle	Make	Model	Serial	MPC Date
C2H4	FTIR	MKS	MKS 2031DJG2EKVS13T	017146467	

### SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of  $k=2$  to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Austin Abranovic  
Alliance Source Testing, LLC  
214 Central Circle SW  
Decatur AL 35603

Generated 6/30/2024 1:48 PM

## JOB DESCRIPTION

BASF Waste Feeds

## JOB NUMBER

140-36941-1

# Eurofins Knoxville

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

## Authorization

## Qualifiers

### General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

**Job Narrative**  
**140-36941-1**

**Receipt**

The samples were received on 5/30/2024 7:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6° C and 4.0° C.

**Receipt Exceptions**

The Field Sampler was not listed on the Chain of Custody.

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. Matrix not listed, logged per project requirements.

**General Chemistry**

Gross Calorific Value: The heat of combustion (gross calorific value) of the samples was determined using SOP number KNOX-WC-0010 (based on ASTM Method D5865 for solids and ASTM Method D240 for liquids). A waste feed sample is combusted in an oxygen bomb that has been placed in a bomb calorimeter. The energy released during this combustion process is captured in the calorimeter, and the temperature rise of a water bath surrounding the bomb is measured. The temperature rise is proportional to the heat liberated during the combustion in calories. The gross calorific value is calculated from the temperature rise, the sample weight, and the calibration coefficient of the calorimeter. Certain extraneous sources of heat are assessed, and the effect of these heat sources is accounted for in the calculation, as well as the effect of various accelerants that are added to enhance combustion of the sample. The gross heat of combustion is calculated in units of cal/g using the following equation:

$$Q \text{ (gross)} = [(\Delta tEE) - (e1+e2+e3+e4)] / m$$

Where:

Q (gross) = Gross calorific value at constant volume as determined, cal/g

EE = Heat capacity of the calorimeter, cal/°C

Δt = Corrected temperature rise as measured by the calorimeter, °C

e1 = Correction for heat of formation of nitric acid in calories, calculated by the calorimeter based on the energy released by the sample

e2 = Correction for sulfur, which is usually 0

e3 = Correction for fuse wire

e4 = Correction for spike addition that is calculated by the calorimeter using the spike weight benzoic acid equivalent (grams) times the benzoic acid heat of combustion (6318 cal/g)

m = Mass of the sample, g

The results are converted to Btu/lb, as necessary using the following conversion factor: 1 cal/g = 1.8 Btu/lb.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Eurofins TestAmerica Knoxville Heat of Combustion Data Review / Narrative Checklist

Methods: ASTM D5865, D240 by SOP KNOX-WC-0010, Rev. 8

Page 1 of 1

Batch Number:	88130	Job Number(s):	140-37073, 140-36919, 140-36928, 140-36941		
Analysis Date:	6/27/2024	Analyst Name:	TMB	Method Citation	<input type="checkbox"/> D5865 <input checked="" type="checkbox"/> D240

Review Items	N/A	Y	N	If No, why is data reportable?	2nd √
<b>Section 1. Calibration</b>					
1. Was a <b>weekly</b> calibration check performed for each bomb/bucket combination and %D $\leq$ 1%?		X			X
2. Is the %D for the weekly calibration check $\leq$ 1%?		X		If not $\leq$ 1.0%, discard data and repeat.	X
3. Was the final weekly calibration successful? (%D $\leq$ 1.0%)		X			X
4. Is the initial calibration complete, with at least ten calibration runs?		X			X
5. Are the previous ten calibration runs recorded on the calorimeter calibration worksheet?		X			X
6. Does the rolling average show a %RSD $\leq$ 1.0%?		X			X
<b>Section 2. Client Sample Analysis</b>					
1. Were all special project requirements met? (Review Project Notes, Project Documents, and Comments in Backlog)		X			X
2. Were sample IDs verified?		X			X
3. Were all weights entered directly into TALS?		X			X
4. Were all transcriptions checked? (Check transcription of data from calorimeter to TALS worksheet ( $\Delta t$ , Acid Correction))		X			X
5. Were any data collected by writing the values on paper?			N		X
6. Are all written entries neat, professional, and scanned into the documents section of the TALS batch?	N/A				X
7. Calculations checked for error? (Verify that the final instrument result = calculated result on spreadsheet (to 3 significant figures))		X			X
<b>Section 3. Preparation/Matrix QC</b>					
1. LCS/LCSD done per batch of up to twenty samples?		X			X
2. LCS/LCSD recoveries within laboratory established QC limits? (98-102%)		X			X
3. LCS/LCSD RPD within laboratory established QC limits? ( $\leq$ 2.0% RPD)		X			X
4. Was a duplicate sample analyzed per batch of up to 10 samples?		X			X
5. DUP RPD $\leq$ 10.0%? If no, list ID:		X		____ [F5] OS &/or DUP < 5xRL, absolute difference < RL ____ [Option] MS/MSD/DUP-%RPD.NCM: _____	X
<b>Section 4. TALS Reporting</b>					
1. If Batch Information Complete?		X			X
2. Batch QC linked correctly?		X			X
3. Is raw data from calorimeter and calibration summary attached as a default file?		X			X
4. Are all non-conformances documented (NCM Manager)?	N/A			NCM Number(s): _____	X
5. Was appropriate narrative NCM added (NCM Create/Edit)?		X		<input checked="" type="checkbox"/> [5853]	X
6. Final report acceptable? (Results, units, analysis dates are correct. Flags and/or errors were addressed.)		X			X

## Eurofins TestAmerica Knoxville Heat of Combustion Data Review / Narrative Checklist

Methods: ASTM D5865, D240 by SOP KNOX-WC-0010, Rev. 8

Page 1 of 1

Batch Number:	88175	Job Number(s):	140-36941, 140-36956		
Analysis Date:	6/28/2024	Analyst Name:	TMB	Method Citation	<input type="checkbox"/> D5865 <input checked="" type="checkbox"/> D240

Review Items	N/A	Y	N	If No, why is data reportable?	2nd √
<b>Section 1. Calibration</b>					
1. Was a <b>weekly</b> calibration check performed for each bomb/bucket combination and %D ≤ 1%?		X			X
2. Is the %D for the weekly calibration check ≤1%?		X		If not ≤1.0%, discard data and repeat.	X
3. Was the final weekly calibration successful? (%D ≤1.0%)		X			X
4. Is the initial calibration complete, with at least ten calibration runs?		X			X
5. Are the previous ten calibration runs recorded on the calorimeter calibration worksheet?		X			X
6. Does the rolling average show a %RSD ≤1.0%?		X			X
<b>Section 2. Client Sample Analysis</b>					
1. Were all special project requirements met? (Review Project Notes, Project Documents, and Comments in Backlog)		X			X
2. Were sample IDs verified?		X			X
3. Were all weights entered directly into TALS?		X			X
4. Were all transcriptions checked? (Check transcription of data from calorimeter to TALS worksheet (Δt, Acid Correction)		X			X
5. Were any data collected by writing the values on paper?			N		X
6. Are all written entries neat, professional, and scanned into the documents section of the TALS batch?	N/A				X
7. Calculations checked for error? (Verify that the final instrument result = calculated result on spreadsheet (to 3 significant figures))		X			X
<b>Section 3. Preparation/Matrix QC</b>					
1. LCS/LCSD done per batch of up to twenty samples?		X			X
2. LCS/LCSD recoveries within laboratory established QC limits? (98-102%)		X			X
3. LCS/LCSD RPD within laboratory established QC limits?(≤2.0% RPD)		X			X
4. Was a duplicate sample analyzed per batch of up to 10 samples?		X			X
5. DUP RPD ≤10.0%? If no, list ID:		X		____ [F5] OS &/or DUP < 5xRL, absolute difference <RL ____ [Option] MS/MSD/DUP-%RPD.NCM:_____	X
<b>Section 4. TALS Reporting</b>					
1. If Batch Information Complete?		X			X
2. Batch QC linked correctly?		X			X
3. Is raw data from calorimeter and calibration summary attached as a default file?		X			X
4. Are all non-conformances documented (NCM Manager)?	N/A			NCM Number(s): _____	X
5. Was appropriate narrative NCM added (NCM Create/Edit)?		X		<input checked="" type="checkbox"/> [5853]	X
6. Final report acceptable? (Results, units, analysis dates are correct. Flags and/or errors were addressed.)		X			X

## Qualifiers

### Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
C	The compound co-eluted with other compounds
C129	The compound co-eluted with PCB-129
C156	The compound co-eluted with PCB-156
C20	The compound co-eluted with PCB-20
C90	The compound co-eluted with PCB-90
G	The reported quantitation limit has been raised due to an exhibited elevated noise or matrix interference
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.
S	Ion suppression

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Method Summary

Client: Alliance Source Testing LLC  
Project/Site: BASF Freeport TX - ICR M23

Job ID: 140-36940-1

Method	Method Description	Protocol	Laboratory
23	Chlorinated Biphenyl Congeners (Stationary Source)	EPA	EET KNX
23	Polycyclic Aromatic Hydrocarbons (Stationary Source)	EPA	EET KNX
Combined Prep	Extraction, Source Air Samples (Combined)	None	EET KNX
Dilution	Dilution and Re-fortification of Standards	None	EET KNX
Split	Source Air Split	None	EET KNX

140-36940-14	A-2174,A-2175 M23 MEDIA CHECK XAD,FILTEF	Air	05/15/24 00:00	05/30/24 19:00

**Job Narrative**  
**140-36940-1**

**Revision**

The report being provided is a revision of the original report sent on 7/30/2024. The report (revision 1) is being revised due to: being revised to include a table with isotope dilution corrections for the field surrogates.

**Receipt**

The samples were received on 5/30/2024 7:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 3.8° C, 20.1° C and 20.1° C.

**Receipt Exceptions**

The Field Sampler was not listed on the Chain of Custody.

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. Sample matrix not listed.

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): M23 - EPN 4-1/IN-701-RUN 5-COMBINED (140-36940-5). Back half solvent rinse and water rinse labeled as run 6, matched by collection time.

The Chain of Custody was received without any analyses selected. No analysis listed on COC for filter fractions.

**High-Res**

The Pre-Sampling Adsorbent Standards and Pre-Extraction Filter Recovery Standard for the PAH analysis were not quantitated by isotope dilution technique, but rather by internal standards that were added after extraction & concentration. These standards were removed from the final report forms. The recoveries were recalculated by isotope dilution technique outside the LIMS system and are presented in a table in the narrative. The target analytes were quantitated by isotope dilution technique.

Sample #	13C6-Benzo(c)fluorene	13C12-Benzo(j)fluoranthene	Anthracene-d10
1	116	102	27
2	113	104	2
3	107	65	99
4	diluted out		
5	118	74	75
6	118	46	85
7	127	63	87
8	53	97	47

The EPA Method 23 states to quantitate the sample results against the continuing calibration verification. Knoxville's approach is to quantitate the sample results against the initial calibration, consistent with other Hi-Res methodology.

The reporting limit (RL) and method detection limit (MDL) for the PAH analytes have not been established. The MDL is set equal to the RL. The reporting limit is supported by the initial calibration.

The Pre-Extraction Filter Surrogate, PCB-159L, was not spiked onto the filter due to unavailability of the standard when the extraction started.

Method 23: One or more Isotope Dilution Analyte (IDA) recoveries associated with the following sample are below the method recommended limit: M23 - EPN 4-1/IN-701-RUN 7-COMBINED (140-36940-7). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample(s).

Method 23: The method blank for preparation batch 140-87620 and 140-87906 contained Phenanthrene above the reporting limit (RL). The entire sample was consumed during analysis or extraction, therefore, the data have been reported.

Method 23: The PAH field surrogate and filter surrogate are not reported due to the high dilution required to bring analytes within calibration range. These surrogates are diluted out M23 - EPN 4-1/IN-701-RUN 4-COMBINED (140-36940-4).

Method 23: Although the sample extraction time was met, EPA Method EPA\_23\_PAH samples, M23 - EPN 4-1/IN-701-RUN 4-COMBINED (140-36940-4) were analyzed outside the extraction holding time (40 days). The extracts were stored frozen, which extends the holding time to one year. There is no holding time violation and no impact on the data quality.

Method 23: The following samples exhibited elevated noise or matrix interferences for one or more analytes causing elevation of the detection limit (EDL): M23 - EPN 4-1/IN-701-FIELD BLANK-COMBINED (140-36940-8) . The reporting limit (RL) for the affected analytes has been raised to be equal to the EDL, and a "G" qualifier applied.

Method 23: Filter surrogate Anthracene-d10 or field surrogate 13C12-Benzo(j)fluoranthene was below QC limits, even after recalculating against its respective IDA for the following samples. See the recoveries in the table in the narrative.

M23 - EPN 4-1/IN-701-RUN 1-COMBINED (140-36940-1), M23 - EPN 4-1/IN-701-RUN 2-COMBINED (140-36940-2) and M23 - EPN 4-1/IN-701-RUN 3-COMBINED (140-36940-3)

Method 23: Field surrogate 13C12-Benzo(j)fluoranthene is below QC limits even after recalculating vs its respective IDA for the following samples. See the recoveries in the table in the narrative.

M23 - EPN 4-1/IN-701-RUN 7-COMBINED (140-36940-7)

Method 23: Field surrogate 13C12-Benzo(j)fluoranthene was below QC limits for the following sample, even after requantitating vs its respective IDA. The recoveries can be found in the table in the narrative.

M23 - EPN 4-1/IN-701-RUN 6-COMBINED (140-36940-6)

Method 23: Filter surrogate Anthracene-d10 and field surrogate 13C6-Benzo(c)fluorene was below QC limits even after requantitating against its respective IDA for the following sample. Surrogate recoveries can be found in a table in the narrative.

M23 - EPN 4-1/IN-701-FIELD BLANK-COMBINED (140-36940-8)

Method 23: The opening PAH Continuing Calibration Verification, (CCV 140-88872/1) was slightly outside QC limits for one or more Isotope Dilution Analyte (IDA) recoveries. All target analyte recoveries are in QC limits. After discussion with the project manager, it was decided to report the data with narration.

Method 23: The opening PAH Continuing Calibration Verification, (CCV 140-88812/1) was slightly outside QC limits for one or more Isotope Dilution Analyte (IDA) recoveries. All target analyte recoveries are in QC limits. After discussion with the project manager, it was decided to report the data with narration.

Method 23: The opening PAH Continuing Calibration Verification, (CCV 140-88831/1) was slightly outside QC limits for one or more Isotope Dilution Analyte (IDA) recoveries. All target analyte recoveries are in QC limits. After discussion with the project manager, it was decided to report the data with narration.

Method 23: One or more Isotope Dilution Analyte (IDA) recoveries associated with the following samples are below the method recommended limit: A-2174,A-2175 M23 MEDIA CHECK XAD,FILTER (140-36940-14). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample(s).

Method 23: One or more ion abundance ratios are outside criteria for a labeled surrogate associated with the following samples: M23 - EPN 4-1/IN-701-RUN 5-COMBINED (140-36940-5) and M23 - EPN 4-1/IN-701-RUN 6-COMBINED (140-36940-6).

Method 23: The required dilution factor for the following sample was higher than could be achieved by "in vial" dilution, as it would dilute out the Isotope Dilution Analytes (IDA): M23 - EPN 4-1/IN-701-RUN 4-COMBINED (140-36940-4). As such, the dilution was achieved by taking a subsample of the undiluted extract, adding sufficient solvent, and re-spiking the extract with IDA. This samples was analyzed undiluted and at a 20X dilution prior to the post dilution spike being required. These analyses produce no usable results due to extreme matrix interferences.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

### Organic Prep

PAH Filter Surrogate Anthracene-d10 was spiked 10 x lower than the method requirement. Recoveries were calculated based on the amount spiked.

Method Split: The following samples required a Gel-Permeation clean up, via EPA method 3640A, to reduce matrix interference: M23 - EPN 4-1/IN-701-RUN 1-COMBINED (140-36940-1), M23 - EPN 4-1/IN-701-RUN 2-COMBINED (140-36940-2), M23 - EPN 4-1/IN-701-RUN 3-COMBINED (140-36940-3), M23 - EPN 4-1/IN-701-RUN 4-COMBINED (140-36940-4), M23 - EPN 4-1/IN-701-RUN 5-COMBINED (140-36940-5), M23 - EPN 4-1/IN-701-RUN 6-COMBINED (140-36940-6), M23 - EPN 4-1/IN-701-RUN 7-COMBINED (140-36940-7), M23 - EPN 4-1/IN-701-FIELD BLANK-COMBINED (140-36940-8) and A-2174,A-2175 M23 MEDIA CHECK XAD,FILTER (140-36940-14).

Method Split: During final concentration, this sample turned yellow and developed strange characteristics. The sample concentrated normally until slightly less than 1 mL, including recovery standard. At this point, concentration on the N-Evap with only nitrogen slowed to a near halt. The N-Evap bath was used, at hexane temperature, to aid in concentration. After several cumulative hours of both nitrogen only and nitrogen with bath concentration, the sample fully stopped concentrating at slightly above 0.5 mL.

In the bath, the sample looked clear yellow, but upon sitting out of the bath for a few minutes the sample turned extremely cloudy. After sitting out even longer, the sample solidified and when inverted multiple times became a viscous liquid.

M23 - EPN 4-1/IN-701-RUN 4-COMBINED (140-36940-4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
