## 1.0 INTRODUCTION

This test report is being submitted by BASF Corporation (BASF) for a hazardous waste fired boiler located at BASF's Pasadena, Texas, facility. This unit is designated as the F-10 Boiler. An emission test was performed for the F-10 Boiler in response to United States Environmental Protection Agency's (USEPA's) Clean Air Act Section 114 Information Collection Request (ICR), dated January 31, 2024, for the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Hazardous Waste Combustors (HWCs) codified in Title 40 Code of Federal Regulations (CFR) Part 63 Subpart EEE.

This report describes the testing that was conducted for the purpose of collecting data on hazardous air pollutants (HAPs).

### 1.1 FACILITY OVERVIEW

BASF manufactures OxoAlcohol and plasticizers at the Pasadena facility. The BASF Pasadena facility is considered an area stationary source of HAPs as defined in Section 112(a) of the Clean Air Act as amended November 15, 1990.

The location and identification numbers of the BASF Pasadena facility are:

BASF Corporation  
Pasadena Plant  
4403 La Porte Highway 225  
Pasadena, Texas 77501  
Latitude: 29.72229, Longitude: -95.15094  
EPA ID No. TXD 980 808 778  
EPA Facility Registry Service (FRS) No. 110002081942  
Standard Industrial Classification (SIC) 2869  
North American Industry Classification System (NAICS) 325199

All correspondence should be directed to the following facility contact:

## 1.2 HAZARDOUS WASTE COMBUSTOR OVERVIEW

BASF operates the F-10 Boiler to provide energy recovery as steam while destroying hazardous waste streams generated in the production units. The F-10 Boiler is fired on a mixture of natural gas, process vent gas, and liquid hazardous waste. The liquid hazardous waste fired in the F-10 Boiler is identified as waste liquid fuel. The boiler is equipped with a superheater, an economizer, a selective catalytic reduction (SCR) system, a forced draft fan, and a stack. The Source Classification Code (SCC) for the F-10 Boiler is 10202002 (external combustion, industrial boiler, hazardous waste, liquid/gaseous fuel boiler). Figure 1-1 provides a general process schematic of the F-10 Boiler.

**FIGURE 1-1  
F-10 BOILER SCHEMATIC**

## 1.3 TEST OVERVIEW

This emission test was designed to provide the information requested in USEPA's ICR. One test condition was performed for the boiler. The test condition consisted of seven replicate test runs. The F-10 Boiler was operated in a normal and representative manner during the emission test (*i.e.*, in a manner consistent with the boiler's current operating parameter limits (OPLs)).

The ICR requires emission testing for the following pollutants:

- Polycyclic aromatic hydrocarbons (PAH);
- Polychlorinated biphenyls (PCB);
- Hydrocarbons (HC);

- 
- Hydrogen fluoride (HF);
  - Hydrogen bromide (HBr); and
  - Hydrogen cyanide.

Feedstream (both hazardous and non-hazardous) analyses were also required for higher heating value and fluorine and bromine contents for each test run.

BASF submitted a request to USEPA to waive the emission testing requirements for HF and HBr. In addition, BASF requested to waive the feedstream analytical requirements for fluorine and bromine contents. These waivers were requested because BASF does not use any fluorinated or brominated compounds in any of the processes that generate the boiler feedstreams. Therefore, the feedstreams should not contain any fluorine or bromine. In a response dated March 12, 2024, USEPA approved the waiver requests. Therefore, this emission test did not include stack gas sampling for HF and HBr and did not include feedstream analyses for fluorine and bromine contents.

The emission test was coordinated by BASF personnel, who provided oversight of the boiler operations and the stack sampling activities during the test program. Coterie Environmental LLC (Coterie) was responsible for the test plan and report development. Alliance Technical Group, LLC, (ATG) performed the stack sampling for the test program. ATG was responsible for all stack gas and waste liquid fuel samples collected during the test program, with oversight by BASF and Coterie. The stack gas and waste liquid fuel samples were sent to Eurofins Knoxville (Eurofins) for analysis.

## 1.4 TEST REPORT ORGANIZATION

This report has been prepared following Enclosure 1 of USEPA's ICR. The remaining sections of the report provide the following information:

- Section 2.0 presents a description of the operating conditions;
- Section 3.0 presents a summary of the sampling procedures;
- Section 4.0 presents a summary of the analytical procedures;
- Section 5.0 presents a summary of the feedstream analyses;
- Section 6.0 presents a summary of the stack gas results;
- Appendix A contains the site-specific test plan, including quality assurance project plan (QAPP);
- Appendix B contains the process monitoring data;
- Appendix C contains the waste liquid fuel sampling report;
- Appendix D contains the ATG report entitled *Source Test Report, BASF Corporation, F-10 Boiler* (Report Number AST-2024-2352);
- Appendix E contains the analytical data packages; and
- Appendix F provides the analytical data assessment forms.

## 2.0 OPERATING CONDITIONS

This emission test was designed to provide the information requested in USEPA's ICR. The program consisted of one test condition. The test condition consisted of seven replicate test runs. The test condition was designed to demonstrate operations of the F-10 Boiler in a normal and representative manner. To establish the operating conditions for the test, operating data from April 2023 through March 2024 was reviewed. The target conditions were set within the averages and the maximum or minimum OPL, as appropriate.

### 2.1 COMBUSTION CHAMBER TEMPERATURE

BASF continuously monitors the combustion chamber temperature to demonstrate compliance with the minimum combustion chamber temperature OPL. Combustion chamber temperature is monitored in degrees Fahrenheit (°F).

### 2.2 COMBUSTION AIR FLOW RATE

BASF continuously monitors the combustion air flow rate to demonstrate compliance with the maximum combustion air flow rate OPL. The combustion air flow rate is monitored in thousand pounds per hour (klb/hr).

### 2.3 STEAM PRODUCTION RATE

BASF continuously monitored the steam production rate for plant operations. This monitoring is not required by the HWC NESHAP but is required under the Boiler and Industrial Furnace (BIF) performance standards to demonstrate compliance with the maximum steam production rate OPL. The steam production rate is monitored in klb/hr.

### 2.4 TOTAL HAZARDOUS WASTE FEED RATE

BASF continuously monitors the total hazardous waste feed rate to demonstrate compliance with the maximum total hazardous waste feed rate OPL. The total hazardous waste feed rate is monitored in gallons per minute (gpm).

### 2.5 NATURAL GAS FEED RATE

Pipeline quality natural gas is used as the main fuel for the F-10 Boiler. BASF continuously monitors the natural gas feed rate for plant operations. This monitoring is not required by the HWC NESHAP. The natural gas feed rate is monitored in thousand standard cubic feet per hour (kscfh).

---

## 2.6 PROCESS VENT GAS FEED RATE

Non-hazardous process vent gas is also fed to the boiler. BASF continuously monitors the process vent gas feed rate for plant operations. This monitoring is not required by the HWC NESHAP. The process vent gas feed rate is monitored in pounds per hour (lb/hr).

## 2.7 ATOMIZING FLUID DIFFERENTIAL PRESSURE

BASF continuously monitors the atomizing fluid differential pressure to demonstrate compliance with the minimum atomizing fluid differential pressure OPL. The atomizing fluid differential pressure is monitored in pounds per square inch gauge (psig).

## 2.8 TEST LOG

The emission test was conducted during the weeks of June 3 and June 10, 2024. Short summaries of the daily test activities are provided below.

*Monday, June 3, 2024* – The test team arrived onsite to setup equipment for testing.

*Tuesday, June 4, 2024* – The boiler was operating at target conditions at 9:30 a.m. Run 1 began at 10:12 a.m. Testing was paused at 10:32 a.m. because a reactor tank had to be re-filled. Testing resumed at 1:02 p.m. Testing was delayed at 3:26 p.m. due to a pressure loss in the waste feed line. Run 1 could not be completed due to the waste feed line issue and was voided.

*Wednesday, June 5, 2024* – The boiler was operating at target conditions at 9:00 a.m. Run 2 began at 9:32 a.m. Testing was paused at 9:42 a.m. due to severe weather. Testing resumed at 12:33 p.m. and was paused again at 12:58 p.m. due to severe weather. Run 2 resumed at 2:04 p.m. and ended at 5:56 p.m.

*Thursday, June 6, 2024* – The boiler was operating at target conditions at 6:30 a.m. Run 3 began at 7:20 a.m. and ended at 11:33 a.m. Run 4 began at 12:11 p.m. and ended at 4:26 p.m. There were no disruptions during the test runs.

*Friday, June 7, 2024* – The boiler was operating at target conditions at 5:00 a.m. Run 5 began at 5:40 a.m. and ended at 9:53 a.m. There were no disruptions during the test run.

*Tuesday, June 11, 2024* – The boiler was operating at target conditions at 12:45 p.m. Run 6 began at 1:17 p.m. and ended at 5:33 p.m. There were no disruptions during the test run.

*Wednesday, June 12, 2024* – The boiler was operating at target conditions at 6:30 a.m. Run 7 began at 7:30 a.m. and ended at 11:39 a.m. Run 8 began at 12:16 p.m. and ended at 4:26 p.m. There were no disruptions during the test runs. The test team broke down the equipment, packed all samples, and left the site. All testing for the ICR was completed.

---

## 2.9 OPERATING DATA SUMMARY

Table 2-1 summarizes the operating conditions. The table compares the actual values achieved during the test to the targets provided in the site-specific test plan. The site-specific test plan is provided in Appendix A. The one-minute data recorded for the operating parameters is provided in Appendix B. The table presents the minimum, maximum, and average values for each test run and the average of the test run averages.

**TABLE 2-1**  
**OPERATING CONDITIONS**

OPERATING PARAMETER	UNITS	TARGETS	STATISTICS	RUN 2	RUN 3	RUN 4	RUN 5	RUN 6	RUN 7	RUN 8	AVERAGE
Combustion chamber temperature	°F	1,700	Average	1,755	1,775	1,743	1,718	1,750	1,780	1,751	1,753
			Minimum	1,702	1,742	1,676	1,706	1,714	1,726	1,734	
			Maximum	1,794	1,795	1,796	1,757	1,794	1,801	1,789

			Minimum	12.0	12.0	12.0	12.0	12.0	12.0	12.0	
			Maximum	12.0	12.0	12.0	12.0	12.0	12.0	12.0	

## 3.0 SAMPLING PROCEDURES

Sampling was performed during the emission test to satisfy the requirements of the ICR. This section provides descriptions of the waste liquid fuel and stack gas sampling procedures that were performed during the test.

### 3.1 WASTE LIQUID FUEL SAMPLING

The waste liquid fuel was fed to the F-10 Boiler during the emission test. Samples of the waste liquid fuel were collected during each run. The sampling methods were standard methods; therefore, only brief descriptions are provided. More detailed descriptions on the sampling methods can be found in the indicated reference documents and in the QAPP. The QAPP is provided in Appendix A. The waste liquid fuel sampling report is provided in Appendix C.

Samples were collected at the beginning, middle, and end of each test run. At each sampling event, approximately 150 milliliters (mL) of the waste stream was collected into two separate bottles. At the end of the run, each bottle had approximately 450 mL of sample. One sample was sent to the laboratory for analysis, and one sample was sent to the laboratory as a backup.

### 3.2 PROCESS VENT GAS SAMPLING

The process vent gas was fed to the F-10 Boiler during the test. The process vent gas was not sampled during the test. Process vent gas characterization information is provided in Section 2.2 of the site-specific test plan.

### 3.3 NATURAL GAS SAMPLING

Natural gas was fed to the F-10 Boiler during the test. The natural gas was not sampled during the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 3.4 STACK GAS SAMPLING

Stack gas samples were collected during each run. The stack gas sampling followed the USEPA methods documented in 40 CFR Part 60 Appendix A. More detailed descriptions of the sampling methods can be found in the indicated reference documents and in the QAPP.

The following monitoring and sampling methods were used:

- USEPA Methods 1, 2, 3A, and 4 for determination of stack sampling traverse points, gas flow rate, composition, and moisture content;
- USEPA Method 23 for measurement of PAH and PCB emissions;

- USEPA Method 25A, a portable continuous emissions monitoring systems (CEMS) operated by the stack sampling contractor, to monitor the concentrations of HC in the stack gas;
- USEPA Method 320 for measurement of hydrogen cyanide emissions; and
- The facility's CEMS to monitor the concentrations of carbon monoxide (CO) and oxygen in the stack gas.

Table 3-1 summarizes the stack gas sampling that was performed and the resulting samples that were collected. The complete field data and sampling procedures for the testing are described in the ATG report in Appendix D.

**TABLE 3-1**  
**STACK GAS SAMPLING**

SAMPLING METHOD <sup>1</sup>	SAMPLING DURATION	SAMPLES COLLECTED PER RUN
USEPA Method 1	Before test series	Not applicable
USEPA Method 2	With each sampling train	Not applicable
USEPA Method 3A	Duration of each test run	Not applicable
USEPA Method 4	With each sampling train	Impingers weighed onsite
USEPA Method 23	240 minutes	Filter
		Front-half and back-half acetone and toluene rinses
		XAD-2 resin
		Deionized water impingers contents
		Deionized water impingers acetone and toluene rinses
USEPA Method 25A (Portable CEMS)	Duration of each test run	Not applicable
USEPA Method 320	60 minutes	Not applicable
Facility CEMS (USEPA Performance Specification 4B)	Duration of each test run	Not applicable

<sup>1</sup> USEPA Method refers to New Source Performance Standards, Test Methods and Procedures, Appendix A, 40 CFR Part 60. USEPA Performance Specification refers to New Source Performance Standards, Performance Specifications, Appendix B, 40 CFR Part 60.

### 3.4.1 POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS

Seven samples for PAH and PCB were collected according to USEPA Methods 1, 2, 3A, 4, and 23. For each run, samples of 20-minute duration were taken isokinetically at each of the 12 traverse points for a total sampling time of 240 minutes. Data was recorded at five-minute intervals.

The USEPA Method 23 sampling train operated during this test program contained the following components:

- Glass nozzle;
- Heated glass probe maintained between 223 and 273°F;

- 
- Heated quartz filter and Teflon support maintained between 223 and 273°F;
  - One condenser coil;
  - XAD sorbent trap;
  - Impinger 1 – empty;
  - Impinger 2 – 100 mL water;
  - Impinger 3 – 100 mL water;
  - Impinger 4 – empty; and
  - Impinger 5 – 200 to 300 grams silica gel.

All glassware used in the sampling train was cleaned prior to use. Additionally, all glassware connections were sealed with Teflon gaskets.

At the conclusion of each run, the filter and sorbent trap modules were recovered by sealing the openings with ground glass caps and plugs. The impinger contents were recovered in accordance with the procedures specified in USEPA Method 23. The inside surfaces of the nozzle, probe, and connecting glassware prior to the filter and sorbent module were washed with acetone and toluene.

The samples collected using the USEPA Method 23 sampling train were analyzed for PAH and PCB by high-resolution gas chromatography and high resolution mass spectrometry according to the guidelines of USEPA Method 23.

### **3.4.2 HYDROCARBONS**

The procedures outlined in USEPA Method 25A were used to measure the concentration of HC (as propane) in the stack gas during the test. A continuous sample of stack gas was withdrawn via a sample probe. The sample gas was filtered for removal of particulates prior to being sent to the analyzer. All parts of the sampling system and the analyzer were heated to a temperature of at least 250°F. Sampling was concurrent with the USEPA Method 23 testing.

### **3.4.3 HYDROGEN CYANIDE**

The procedures outlined in USEPA Method 320 were used to measure the concentration of hydrogen cyanide in the stack gas during the test. The stack gas was extracted at a constant rate through a heated probe, heated filter, and heated sample line and analyzed with a Fourier transform infrared (FTIR) analyzer. All parts of the sampling system and the analyzer were heated to a temperature of approximately 300°F.

### **3.4.4 CARBON MONOXIDE AND OXYGEN**

The F-10 Boiler CEMS were operated during each test run to monitor the concentrations of CO and oxygen in the stack gas. A continuous sample of stack gas is withdrawn via a sample probe. The HWC NESHAP requires that the CO and oxygen CEMS comply with Performance Specification 4B in 40 CFR Part 60 Appendix B.

---

### **3.5 SAMPLING QUALITY ASSURANCE AND QUALITY CONTROL**

The site-specific test plan and QAPP described the sampling activities required for the test program. All sampling was performed in accordance with the site-specific test plan, QAPP, and referenced methods.

Run 1 of the test was voided due to operational issues with the boiler. The run was initially paused for the operational issues. After the run was paused due to a pressure loss in the waste feed line, BASF decided to stop the sampling and void the run. Seven runs were performed for the test (Runs 2 through 8). This deviation has no impact on the test results.

No other sampling deviations occurred during this test program.

### **3.6 SAMPLING DATA SUMMARY**

Tables 3-2 through 3-4 provide summaries of the sampling data for the test runs. Table 3-2 summarizes the sampling data for the USEPA Method 23 sampling train. Table 3-3 summarizes the sampling data for USEPA Method 25A. Table 3-4 summarizes the sampling data for USEPA Method 320.

The tables include data for actual sample volume in cubic feet (ft<sup>3</sup>) and corrected sample volume in dry standard cubic feet (dscf). Stack gas temperature and pressure data are presented in °F and inches of mercury (in. Hg), respectively. Stack gas composition data is presented in percent volume (% vol) or percent volume on a dry basis (% vol dry). Stack gas velocity is presented in feet per second (fps), and stack gas flow rate is presented in actual cubic feet per minute (acfm), standard cubic feet per minute (scfm), and/or dry standard cubic feet per minute (dscfm).

## 4.0 ANALYTICAL PROCEDURES

The analyses followed ASTM International (ASTM) and USEPA methods. This section describes the analyses and discusses any deviations in analytical procedures from those described in the site-specific test plan and QAPP. The QAPP was distributed to the laboratory for review prior to the test. The analytical data packages are provided in Appendix E.

### 4.1 WASTE LIQUID FUEL ANALYSES

All waste liquid fuel samples were sent to Eurofins for analysis. Samples of the waste liquid fuel were analyzed for density using ASTM Method D1475 and higher heating value using ASTM Method D240. All holding times for these analyses were met, and all quality assurance (QA) and quality control (QC) criteria for these analyses were within acceptance limits.

### 4.2 PROCESS VENT GAS ANALYSES

The process vent gas was not analyzed during the test. Process knowledge is used to characterize the process vent gas. Process vent gas characterization information is provided in Section 2.2 of the site-specific test plan.

### 4.3 NATURAL GAS ANALYSES

The natural gas was not analyzed for the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 4.4 STACK GAS ANALYSES

The stack gas samples were analyzed for PAH and PCB by high-resolution gas chromatography and high resolution mass spectrometry according to the guidelines of USEPA Method 23. The USEPA Method 23 samples were sent to Eurofins for analysis. In addition, USEPA Method 25A was used to monitor the stack gas for HC concentrations, and USEPA Method 320 (FTIR) was used to monitor the stack gas for hydrogen cyanide concentrations. All holding times for the USEPA Method 23 analyses were met, and all QA/QC criteria for the methods were within acceptable limits, except as noted in Section 4.5.

### 4.5 ANALYTICAL QUALITY ASSURANCE AND QUALITY CONTROL

Prior to testing, BASF and the contract laboratory established QA/QC goals for each analysis that would be performed as part of the test program. QA/QC objectives included precision, accuracy, representativeness, comparability, and completeness. Typical parameters include laboratory control sample (LCS) and LCS duplicate (LCSD) samples, field and sample duplicates, surrogates, standards, and spikes. Precision is expressed in terms of the distribution, or scatter, of replicate measurement results,

calculated as the relative standard deviation (RSD) or, for duplicates, as relative percent difference (RPD). Accuracy is expressed in terms of percent recovery (e.g., for surrogates, spikes, and reference material).

Tables 4-1 through 4-5 provide details on the QA/QC results. Detailed descriptions of the evaluations are included in the analytical data packages provided in Appendix E and the analytical data assessment forms provided in Appendix F.

**TABLE 4-1**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**LIQUID WASTE SAMPLES – DENSITY**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Precision	Field duplicate	One per test program	≤20% relative percent difference	None
	Sample duplicate	One per analytical batch	≤10% relative percent difference	None
Accuracy	Laboratory control samples	Two per analytical batch	99-101% recovery	None
Calibration	Calibration	Before analysis and as needed	≤0.5% relative standard deviation	None
Contamination effects	None	---	---	---
Handling and traceability	Holding time	Each sample	<180 days	None

**TABLE 4-2**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**LIQUID WASTE SAMPLES – HIGHER HEATING VALUE**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Precision	Field duplicate	One per test program	≤20% relative percent difference	None
	Laboratory control sample duplicate	One per analytical batch	≤2% relative percent difference	None
	Sample duplicate	One per analytical batch	≤10% relative percent difference	None
Accuracy	Laboratory control samples	Two per analytical batch	98-102% recovery	None

**TABLE 4-2 (CONTINUED)**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**LIQUID WASTE SAMPLES – HIGHER HEATING VALUE**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration	Initial Calibration	Before analysis and as needed	≤1% relative standard deviation	None
	Calibration checks	As needed	±1% difference from initial calibration	None
Contamination effects	None	---	---	---
Handling and traceability	Holding time	Each sample	<180 days	None

**TABLE 4-3**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Precision	Laboratory control sample duplicate	One per analytical batch	≤50% relative percent difference	None
Accuracy	Laboratory control samples	Two per analytical batch	70-130% recovery	Recoveries of naphthalene in the laboratory control samples were outside of limits.
	Internal standards (isotope dilution)	Every sample	20-130% recovery for polycyclic aromatic hydrocarbons 20-145% recovery for polychlorinated biphenyls	None
	Surrogate standards	Every sample	70-130% recovery	Recoveries for 13C6-benzo(c)fluorene surrogate in Run 2 and Run 3 samples were outside of limits. The Run 6 sample was not spiked with field surrogates.

**TABLE 4-3 (CONTINUED)**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration	Initial calibration (five solutions)	Prior to sample analysis	1. Mean relative response factor for unlabeled standards: <10% relative standard deviation 2. Mean relative response factor for labeled reference compounds: <20% relative standard deviation	None
	Calibration verification (midlevel standard)	At least once per shift	1. Response factors within $\pm 25\%$ of the initial calibration mean relative response factor for unlabeled standards 2. Response factors within $\pm 25\%$ of the initial calibration mean relative response factor for pre-sampling adsorbent standard and pre-extraction filter recovery standard 3. Response factors within $\pm 30\%$ of the initial calibration mean relative response factor for pre-extraction standard and alternative recovery standard	Some response factors were outside of limits.
	Retention time window verification and gas chromatograph column performance	At the beginning of each shift	Compliance with USEPA Method 23	None

**TABLE 4-3 (CONTINUED)**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Contamination effects	Method blank	One per analytical batch	<Reporting limit	Naphthalene, phenanthrene, fluoranthene, and pyrene were reported in the method blank for Batch 88945 at concentrations above the reporting limits.
	Field proof blank	One per test program	<Reporting limit	2,4'-Dichlorobiphenyl (PCB-8), 2,2',3,5'-tetrachlorobiphenyl (PCB-44), and phenanthrene were reported in the field proof blank at concentrations above the reporting limits.
Handling and traceability	Holding time	Each sample	1. <30 days to extraction 2. <40 days from extraction to analysis <sup>1</sup>	None

<sup>1</sup> Holding time from extraction may be up to one year if samples are stored below -10°C.

**TABLE 4-4**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – HYDROCARBONS**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration error test	Checked using USEPA Protocol 1 calibration gases	Prior to the first test run and after any failed drift test	±5% of calibration gas value	None
Drift test	Checked using USEPA Protocol 1 calibration gases	After the last test run and hourly during the test period	±3% of span value	None

**TABLE 4-5**  
**SUMMARY OF QUALITY ASSURANCE/QUALITY CONTROL**  
**STACK GAS – HYDROGEN CYANIDE**

QUALITY CONTROL CHECK		FREQUENCY	ACCEPTANCE CRITERIA	NOTED DEVIATIONS
Calibration transfer standard direct	Verify stability, confirm optical path length	Pre-test	±5% of cert value	None
Calibration transfer standard responses	Verify system stability, recovery, and response time	Pre and post-test run	±5% of mean value	None
Analyte spike	Verify system ability to quantify the analyte of interest in the gas stream	Pre-test	±30% theoretical recovery	None

Table 4-6 summarizes the analytical deviations and provides discussions of the impact that the deviations had on the analytical results, if any.

**TABLE 4-6**  
**SUMMARY OF ANALYTICAL DEVIATIONS**

RUN	DEVIATION/EXCEPTION	SIGNIFICANCE
<b>Waste liquid fuel analyses:</b>		
None	None	None
<b>Stack gas analyses:</b>		
All	Recoveries of naphthalene in the laboratory control samples were outside of limits. The recoveries were 816 percent and 691 percent, which is above the upper limit of 140 percent.	The recoveries were above the limit indicating a potential high bias. This congener was reported at levels above the reporting limit in all samples. These results may be biased high.
2, 3	Recoveries for 13C6-benzo(c)fluorene surrogate in Run 2 and Run 3 samples were outside of limits. Both recoveries were 131 percent, which is just above the upper limit of 130 percent.	Generally, data quality is not considered affected if the signal-to-noise ratio is greater than 10:1, which was achieved for all analytes in the sample.
6	The Run 6 sample was not spiked with field surrogates.	This was a laboratory oversight. The recoveries for these surrogates were within limits for all other samples. This deviation has minimal impact on the results.
2, 3	The response factors for 13C6-indeno(1,2,3-cd)pyrene and 13C6-dibenz(a,h)anthracene were outside of limits in the continuing calibration verification (CCV) for Batch 88999.	Results for Runs 2 and 3 for indeno(1,2,3-cd)pyrene and dibenz(a,h)anthracene were consistent with other runs. This deviation has minimal impact on the results.

**TABLE 4-6 (CONTINUED)**  
**SUMMARY OF ANALYTICAL DEVIATIONS**

RUN	DEVIATION/EXCEPTION			SIGNIFICANCE
7	The response factor for 13C6-indeno(1,2,3-cd)pyrene was outside of limits in the CCV for Batch 89076.			Result for Run 7 for indeno(1,2,3-cd)pyrene was consistent with other runs. This deviation has minimal impact on the results.
4	The response factor for the labeled standard 2,2',3,3',4,4',5,5',6,6'-decachlorobiphenyl (PCB-209L) was outside of limits in the CCV for Batch 88871.			The 2,2',3,3',4,4',5,5',6,6'-decachlorobiphenyl result for Run 4 was reported as an estimated value below the reporting limit. All other run results were nondetect. This deviation has minimal impact on the results.
All	Several polycyclic aromatic hydrocarbons were reported in the method blank for Batch 88945 at concentrations above the reporting limits.			The results for these analytes may exhibit a high bias.
	<i>Analyte</i>	<i>Result ng/sample</i>	<i>Reporting Limit ng/sample</i>	
	Fluoranthene	15.46	6.00	
	Naphthalene	1,119	75.0	
	Phenanthrene	18.18	6.00	
	Pyrene	55.75	6.00	
All	2,4'-Dichlorobiphenyl (PCB-8), 2,2',3,5'-tetrachlorobiphenyl (PCB-44), and phenanthrene were reported in the field proof blank at concentrations above the reporting limits.			The results for these analytes may exhibit a high bias.
	<i>Analyte</i>	<i>Result ng/sample</i>	<i>Reporting Limit ng/sample</i>	
	Phenanthrene	412	60.0	
	2,4'-Dichlorobiphenyl (PCB-8)	0.659	0.600	
	2,2',3,5'-tetrachlorobiphenyl (PCB-44)	1.02	0.900	

## 5.0 FEEDSTREAM RESULTS

Waste liquid fuel, process vent gas, and natural gas were fed to the F-10 Boiler during each test run. This section of the report presents the results of feedstream analyses.

### 5.1 WASTE LIQUID FUEL

The liquid hazardous waste fired in the F-10 Boiler is identified as waste liquid fuel. The waste liquid fuel was fed to the boiler during the testing. Table 5-1 presents the higher heating value and density of the waste liquid fuel for each test run. The higher heating value is provided in British thermal units per pound (Btu/lb), and the density is provided in grams per cubic centimeter (g/cm<sup>3</sup>).

**TABLE 5-1**  
**WASTE LIQUID FUEL**

RUN	HIGHER HEATING VALUE (BTU/LB)	DENSITY (G/CM <sup>3</sup> )
2	15,300	0.831
3	15,200	0.830
4	15,200	0.830
5	15,200	0.830
6	15,100	0.830
7	14,800	0.829
8	14,800	0.829
Average	15,100	0.830

### 5.2 PROCESS VENT GAS

The process vent gas was fed to the boiler. Process knowledge is used to characterize the process vent gas. Process vent gas characterization information is provided in Section 2.2 of the site-specific test plan.

### 5.3 NATURAL GAS

Pipeline quality natural gas was fed to the boiler as the main fuel for combustion. The natural gas is not expected to contain any HWC NESHAP regulated constituents in greater than trace quantities.

## 6.0 STACK GAS RESULTS

The emission test was designed to provide the information requested in USEPA's ICR. One test condition was performed for the boiler. The test condition consisted of seven replicate test runs. The ICR emission testing included the following pollutants:

- PAH;
- PCB;
- HC;
- Hydrogen cyanide; and
- CO

The stack gas emission results are discussed below and summarized in the tables in Section 6.5. The ATG stack sampling report is provided in Appendix D. All analytical data packages are included in Appendix E.

### 6.1 POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS EMISSION RESULTS

USEPA Method 23 was used to sample and analyze the stack gas for PAH and PCB concentrations. Analytes that were reported as non-detect in any sample fraction were calculated using the method detection limits (MDLs) and are reported with a "<" sign.

### 6.2 HYDROCARBONS EMISSION RESULTS

USEPA Method 25A was used to monitor the stack gas for HC concentrations. The results were calculated assuming all non-detects were present at the reporting limit (RL) and are reported with a "<" sign.

### 6.3 HYDROGEN CYANIDE EMISSION RESULTS

USEPA Method 320 was used to monitor the stack gas for hydrogen cyanide concentrations. The results were calculated assuming all non-detects were present at the MDL and are reported with a "<" sign.

### 6.4 CARBON MONOXIDE

The F-10 Boiler CEMS were operated during the emission test to monitor the concentrations of CO and oxygen in the stack gas. The data presented for CO is based on hourly rolling average (HRA) values; the data presented for oxygen is based on one-minute average readings. The one-minute data recorded is provided in Appendix B.

---

## 6.5 STACK GAS RESULTS SUMMARY

Tables 6-1 through 6-5 provide summaries of the stack gas results.

Table 6-1 summarizes the PAH results. Results are presented in nanograms (ng) for the total sample train catch. Emission results are presented in nanograms per dry standard cubic meter (ng/dscm) uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-2 summarizes the PCB results. Results are presented in ng for the total sample train catch. Emission results are presented in ng/dscm uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-3 summarizes the HC results. Emission results are reported as propane and are presented in parts per million by volume on a dry basis (ppmv dry) uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-4 summarizes the hydrogen cyanide results. Emission results are presented in ppmv dry uncorrected and corrected to seven percent oxygen and lb/hr.

Table 6-5 summarizes the CO and oxygen results. The CO emission results are presented in ppmv dry corrected to seven percent oxygen, and the oxygen results are presented in % vol dry.

## 1.0 INTRODUCTION

This site-specific test plan is being submitted by BASF Corporation (BASF) for a hazardous waste fired boiler located at BASF's Pasadena, Texas, facility. This unit is designated as the F-10 Boiler. An emission test will be performed for the F-10 Boiler in response to United States Environmental Protection Agency's (USEPA's) Clean Air Act Section 114 Information Collection Request (ICR), dated January 31, 2024, for the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Hazardous Waste Combustors (HWCs) codified in Title 40 Code of Federal Regulations (CFR) Part 63 Subpart EEE.

This plan describes the testing to be conducted for the F-10 Boiler for the purpose of collecting data on hazardous air pollutants (HAPs). In accordance with the ICR, this test plan will not be submitted for approval prior to the testing. It will be submitted as an appendix of the emission test report.

### 1.1 FACILITY OVERVIEW

BASF manufactures OxoAlcohol and plasticizers at the Pasadena facility. The BASF facility is considered an area stationary source of HAPs as defined in Section 112(a) of the Clean Air Act as amended November 15, 1990.

The location and identification numbers of the BASF Pasadena facility are:

BASF Corporation  
Pasadena Plant  
4403 La Porte Highway 225  
Pasadena, Texas 77501  
Waste Permit No. 50385  
Industrial Solid Waste Registration No. 33849  
EPA ID No. TXD980808778

All correspondence should be directed to the following facility contact:

John T. Igoe, P.E., CSP  
Sr. EHS Specialist

## 1.2 HAZARDOUS WASTE COMBUSTOR OVERVIEW

BASF operates the F-10 Boiler to provide energy recovery as steam while destroying hazardous waste streams generated in the production units. The F-10 Boiler is fired on a mixture of natural gas, process vent gas, and liquid hazardous waste. The liquid hazardous waste fired in the F-10 Boiler is identified as waste liquid fuel. The boiler is equipped with a superheater, an economizer, a selective catalytic reduction (SCR) system, a forced draft fan, and a stack.

## 1.3 TEST OVERVIEW

This emission test is designed to provide the information requested in USEPA's ICR. One test condition will be performed for the boiler. The F-10 Boiler will be operated in a normal and representative manner during the emission test (*i.e.*, in a manner consistent with the boiler's current operating parameter limits (OPLs)).

The ICR requires emission testing for the following pollutants:

- Polycyclic aromatic hydrocarbons (PAH);
- Polychlorinated biphenyls (PCB);
- Hydrocarbons (HC);
- Hydrogen fluoride (HF);
- Hydrogen bromide (HBr); and
- Hydrogen cyanide.

Feedstream (both hazardous and non-hazardous) analyses are also required for higher heating value and fluorine and bromine contents for each test run.

BASF submitted a request to USEPA to waive the emission testing requirement for HF and HBr. In addition, BASF requested to waive the feedstream analytical requirement for fluorine and bromine contents. These waivers were requested because BASF does not use any fluorinated or brominated compounds in any of the processes that generate the boiler feedstreams. Therefore, the feedstreams should not contain any fluorine or bromine. In a response dated March 12, 2024, USEPA approved the waiver requests. Therefore, this emission test will not include stack gas sampling for HF and HBr and will not include feedstream analyses for fluorine and bromine contents.

This emission test is being coordinated by BASF personnel, who will provide oversight of the boiler operations and the stack sampling activities during the test program. Coterie Environmental LLC (Coterie) is responsible for the test plan and report development. Alliance Technical Group, LLC, (ATG) will perform the stack sampling for the test program. ATG will be responsible for all stack gas and waste liquid fuel samples collected during the test program, with oversight by BASF and Coterie. The stack gas and waste liquid fuel samples will be sent to Eurofins Knoxville (Eurofins) for analysis. Additional

---

information on the project team roles and responsibilities is provided in the quality assurance project plan (QAPP) in Appendix A.

The emission test will be conducted during the week of June 3, 2024. The test will consist of seven replicate test runs. The testing is expected to take four days. The test report will be submitted by August 30, 2024.

## **1.4 TEST PLAN ORGANIZATION**

This plan has been prepared in accordance with the ICR. The remaining sections of the plan provide the following information:

- Section 2.0 presents information on the boiler's feedstreams;
- Section 3.0 presents a detailed engineering description of the F-10 Boiler;
- Section 4.0 presents a description of the test operations;
- Section 5.0 presents a summary of the test sampling and analysis procedures; and
- Appendix A includes the QAPP.

## 2.0 FEEDSTREAM CHARACTERIZATION

The F-10 Boiler is fired on a mixture of natural gas, process vent gas, and liquid hazardous waste. The liquid hazardous waste is identified as waste liquid fuel.

### 2.1 WASTE LIQUID FUEL

Waste liquid fuel is generated in the OxoAlcohol process and the plasticizer process. Waste liquid fuel is characteristically hazardous and carries the 40 CFR Part 261 hazardous waste codes of D001 (ignitability) and D018 (benzene). The waste liquid fuel is stored in Tank D-74 at ambient temperature. The waste is generally low in ash, chlorine, and metals contents. Table 2-1 presents the typical characteristics of the waste liquid fuel. The higher heating value is provided in British thermal units per pound (Btu/lb), and the metals, chlorine, ash, and organic HAP contents are provided in milligrams per kilogram (mg/kg). The waste liquid fuel does not contain any PCBs based on process knowledge.

**TABLE 2-1**  
**WASTE LIQUID FUEL**

PARAMETER	UNITS	TYPICAL
Higher heating value	Btu/lb	16,000 – 18,000
Ash	mg/kg	< 1,000
Chlorine	mg/kg	< 50
Metals:		
Antimony	mg/kg	< 5.0
Arsenic	mg/kg	< 2.0
Barium	mg/kg	< 1.0
Beryllium	mg/kg	< 1.0
Cadmium	mg/kg	< 0.5
Chromium	mg/kg	< 1.5
Lead	mg/kg	< 1.5
Mercury	mg/kg	< 0.015
Silver	mg/kg	< 3.0
Thallium	mg/kg	< 3.5
Organic hazardous air pollutants:		
Benzene	mg/kg	0 – 100

### 2.2 PROCESS VENT GAS

Non-hazardous process vent gas is fed to the boiler. This stream consists of various organic compounds as well as carbon monoxide (CO), nitrogen, and hydrogen from the production process. Composition of the gas varies depending on process conditions. The gas is collected in the waste gas header for the unit and is hard piped to the boiler. Table 2-2 provides information on the process vent gas characteristics.

---

The higher heating value is provided in British thermal units per standard cubic foot (Btu/scf), and the metals, chlorine, ash, and organic HAP contents are provided in mg/kg.

**TABLE 2-2**  
**PROCESS VENT GAS**

PARAMETER	UNITS	TYPICAL
Higher heating value	Btu/scf	1,850
Regulated metals	mg/kg	Trace
Chlorine	mg/kg	Trace
Ash	mg/kg	Trace
Organic hazardous air pollutants	mg/kg	None

## **2.3 NATURAL GAS**

Natural gas is also fed to the boiler as the main fuel for combustion. The natural gas is not expected to contain any HWC NESHAP regulated constituents in greater than trace quantities.

## **2.4 WASTE CHOSEN FOR THE TEST**

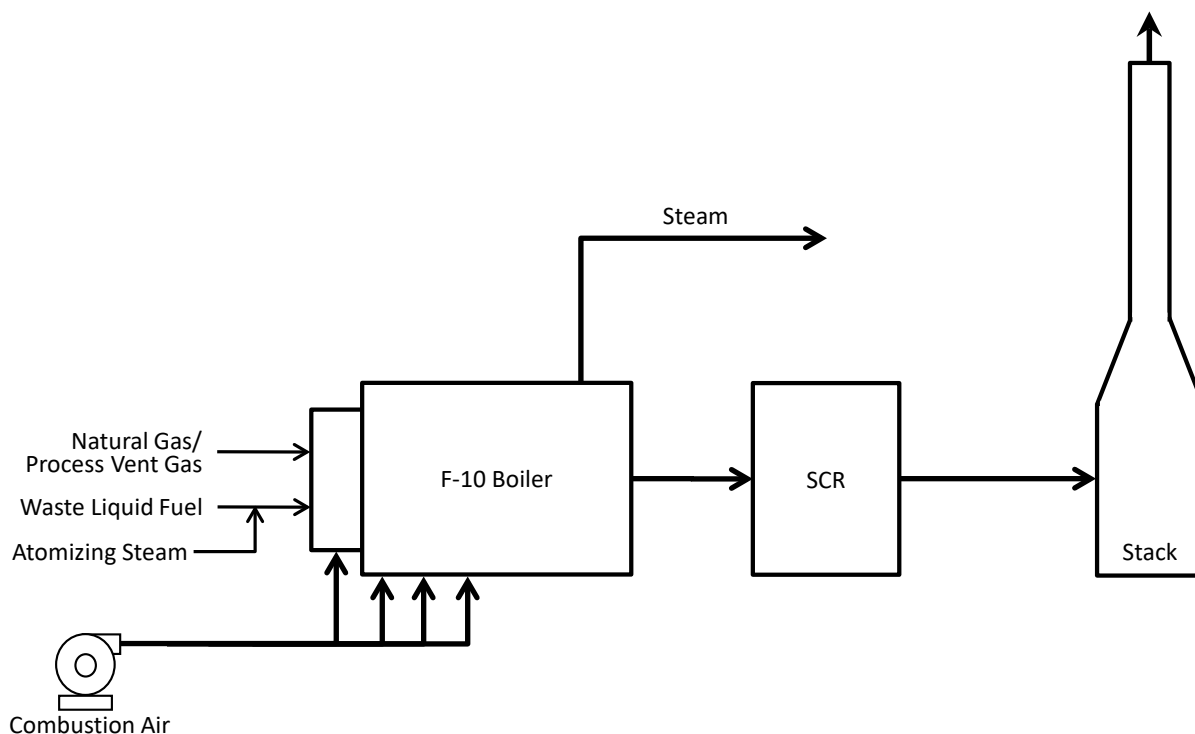

The F-10 Boiler only combusts one liquid hazardous waste stream identified as the waste liquid fuel. This stream will be fed to the boiler during the testing.

### 3.0 ENGINEERING DESCRIPTION

The F-10 Boiler is used to provide energy recovery as steam, while destroying liquid hazardous wastes generated by onsite production units. The F-10 Boiler is designed for a nominal heat input of 180 million British thermal units per hour (MMBtu/hr) and is fired on a mixture of waste liquid fuel, process vent gas, and natural gas. Natural gas and process vent gas are the primary fuels for the boiler.

The main components of the boiler are a firebox, a superheater, an economizer, an SCR system, a forced draft fan, and a stack. The F-10 Boiler uses a low-nitrogen oxides (NO<sub>x</sub>) burner and the SCR system for control of NO<sub>x</sub> emissions. No other air pollution control equipment is installed on the unit. The F-10 Boiler is a forced draft unit, and the primary motive force to move the combustion gases through the system is provided by the combustion air fan. Figure 3-1 provides a process schematic of the F-10 Boiler.

**FIGURE 3-1**  
**F-10 BOILER PROCESS SCHEMATIC**

---

### **3.1 WASTE STORAGE SYSTEM**

The waste liquid fuel is hard piped from the production processes to a 20,000-gallon accumulation tank (Tank D-74). The waste liquid fuel is accumulated in Tank D-74 at ambient temperature. The vent gases from Tank D-74 are sent to a flare for processing.

### **3.2 WASTE AND FUEL DELIVERY SYSTEMS**

Waste liquid fuel, process vent gas, and natural gas are fed to the F-10 Boiler. The following sections provide detail on each delivery system.

#### **3.2.1 LIQUID WASTE DELIVERY SYSTEM**

The waste liquid fuel is fed in batch fashion from Tank D-74 to the F-10 Boiler once a certain level is achieved in the accumulation tank. The waste liquid fuel is pumped through a carbon steel feed line and flow meter to a single waste gun located in the center of the burner air register. The waste liquid fuel is atomized with steam prior to combustion. The feed line from Tank D-74 is equipped with a control valve for flow control and two automated ball valves for isolation to ensure proper control and shutdown of the liquid feed.

#### **3.2.2 PROCESS VENT GAS AND NATURAL GAS DELIVERY SYSTEM**

Process vent gas from facility production activities and several other locations is utilized in combination with natural gas as the primary fuel in the F-10 Boiler. Both the natural gas and process vent gas feed lines are equipped with a flow meter, control valve loop, and a double block and bleed station for proper control and shutdown of the feed.

### **3.3 BOILER**

The F-10 Boiler is a Cleaver Brooks D-type water-tube boiler, Model Number NB-601D. The boiler is equipped with one NATCOM low-NO<sub>x</sub> burner, Model Number P-174-SLSGG-32-1623. The burner is factory-mounted in the windbox.

Combustion air is supplied to the boiler through a Chicago Blower Corporation forced draft fan, Model Number 5800 SW. The fan has a capacity of 37,250 actual cubic feet per minute (acfm) of air. The forced draft fan provides the primary motive force for the flue gas through the system.

The heat from the combustion of the feed materials is transferred to the boiler tubes to facilitate the production of steam from incoming feed water. Heat transfer occurs in two sections of the boiler: the superheater and the economizer. The combustion gas passes through the superheater section of the boiler prior to entering the economizer. Steam is generated in the boiler, and the economizer section of the boiler is used to remove any additional heat from the combustion gas to preheat the incoming boiler feed water.

---

### **3.4 AIR POLLUTION CONTROL**

The boiler is equipped with a low-NO<sub>x</sub> burner and an anhydrous ammonia SCR system to control NO<sub>x</sub> emissions. The SCR system includes a catalyst and an ammonia distribution system. The boiler is not equipped with any other air pollution control devices.

### **3.5 EXHAUST STACK**

Combustion gas vents to the atmosphere through a stack. The stack discharge is approximately 75 feet above ground level. The stack has a diameter of 4.5 feet and is equipped with isokinetic sampling ports.

## 4.0 TEST OPERATIONS

BASF intends to perform one test condition to collect the data requested in the ICR. This section of the plan establishes the boiler operations that will be demonstrated during the testing. In addition, the amount of waste needed for testing, the monitoring data to be collected during testing, and a schedule for the testing are presented here.

### 4.1 NORMAL OPERATING CONDITIONS

The ICR requested that the F-10 Boiler be operated in a normal and representative manner during the emission test. To establish the operating conditions for the test, operating data from April 2023 through March 2024 was reviewed. Data for the following operating parameters was reviewed:

- Combustion chamber temperature;
- Combustion air flow rate; and
- Total hazardous waste feed rate.

Table 4-1 presents the average value and the OPL for each parameter. The combustion chamber temperature is monitored in degrees Fahrenheit (°F), the combustion air flow rate is monitored in thousand pounds per hour (klb/hr), and the total hazardous waste feed rate is monitored in gallons per minute (gpm).

**TABLE 4-1**  
**AVERAGE VALUES FOR OPERATING PARAMETERS**

PARAMETER	UNITS	AVERAGE VALUE <sup>1</sup>	OPERATING PARAMETER LIMIT	LIMIT TYPE
Combustion chamber temperature	°F	1,702	1,399	Minimum
Combustion air flow rate	klb/hr	86	113	Maximum
Total hazardous waste feed rate	gpm	1.4	5.6	Maximum

<sup>1</sup> Values represent the averages of hazardous waste operating data collected for April 2023 through March 2024.

### 4.2 TEST CONDITION

The test condition is designed to demonstrate operations of the F-10 Boiler at normal and representative conditions. The target conditions were set within the averages presented in Table 4-1 and the maximum or minimum OPL, as appropriate. The process vent gas feed rate and the natural gas feed rate, which are monitored in lb/hr and thousand standard cubic feet per hour (kscfh), respectively, will be allowed to vary as needed to achieve the other target conditions. All operating conditions

presented in this plan are calculated values; the actual conditions observed during the test may vary slightly from these values.

A summary of the target operating conditions is provided in Table 4-2.

**TABLE 4-2**  
**TARGET TEST CONDITION**

OPERATING PARAMETER	UNITS	TARGETS	OPERATING PARAMETER LIMIT
Combustion chamber temperature	°F	1,700	1,399
Combustion air flow rate	klb/hr	100	113
Total hazardous waste feed rate	gpm	2.0	5.6
Process vent gas feed rate	lb/hr	Variable	- - -
Natural gas feed rate	kscfh	Variable	- - -

#### 4.3 TEST MATERIALS AND QUANTITIES

Table 4-3 summarizes the quantity of materials required to conduct the testing. Seven runs will be carried out for the test condition. Each test run will require approximately 4.5 hours. A maximum of two runs will be performed per day. An additional 30 minutes of run time will be required for each day of testing to establish the steady state conditions before the start of the test runs, and approximately 60 minutes will be required between consecutive test runs. Therefore, for the purpose of calculating test quantities, a total of 36.5 hours has been used. We have also added approximately 40 percent to each total to allow for unforeseen delays.

**TABLE 4-3**  
**TEST MATERIAL QUANTITIES**

MATERIAL	UNITS	QUANTITY
Waste liquid fuel	gallons	6,200

#### 4.4 TEST MONITORING

Operating data will be reported for each test run. Table 4-4 presents the operating data that will be reported for the testing. All one-minute average values will be reported for each parameter for each run. Run averages, minimums, and maximums will be determined.

**TABLE 4-4**  
**MONITORED AND REPORTED OPERATING PARAMETERS**

INSTRUMENT TAG NUMBER	DESCRIPTION
TI-7428A-G	Combustion chamber temperature
FT-7420	Combustion air flow rate
FT-7417	Steam production rate
FT-7493	Total hazardous waste feed rate
FC-7478	Process vent gas feed rate
FC-7464	Natural gas feed rate
P-7602	Atomizing fluid differential pressure

In addition to the operating parameters listed in Table 4-4, BASF will also report one-minute average and hourly rolling average data for the oxygen-corrected CO emission concentration from the boiler's continuous emissions monitoring systems (CEMS).

#### 4.5 TEST SCHEDULE

The sampling effort will require one day for setup and four days for testing. During setup, sampling equipment and instruments will be prepared and calibrated, supplies will be brought onsite, and sampling locations will be prepared. The seven test runs will be performed over the four testing days. Although the onsite activities will dictate the actual timing, a preliminary schedule is presented in Table 4-5.

**TABLE 4-5**  
**TEST SCHEDULE**

DAY	START	STOP	ACTIVITY
1	---	---	Setup of sampling equipment and pre-test meetings
2	08:00	08:30	Begin feeding designated materials at target rates and establish steady-state operating conditions
	08:30	09:30	Perform cyclonic flow check and preliminary flow traverse
	09:30	14:00	Run 1
	14:00	15:00	Set-up of sampling equipment for Run 2
	15:00	19:30	Run 2
3	08:00	08:30	Begin feeding designated materials at target rates, establish steady-state operating conditions, and setup sampling equipment for Run 3
	08:30	13:00	Run 3
	13:00	14:00	Set-up of sampling equipment for Run 4
	14:00	18:30	Run 4

**TABLE 4-5 (CONTINUED)**  
**TEST SCHEDULE**

DAY	START	STOP	ACTIVITY
4	08:00	08:30	Begin feeding designated materials at target rates, establish steady-state operating conditions, and setup sampling equipment for Run 5
	08:30	13:00	Run 5
	13:00	14:00	Set-up of sampling equipment for Run 6
	14:00	18:30	Run 6
5	08:00	08:30	Begin feeding designated materials at target rates, establish steady-state operating conditions, and setup sampling equipment for Run 7
	08:30	13:00	Run 7
	13:00	- - -	Break down sampling equipment

## 5.0 SAMPLING AND ANALYSIS

The test condition will consist of seven replicate test runs. For each run, samples will be collected using procedures described in the QAPP found in Appendix A. Since most of the proposed methods are standard reference methods, only brief descriptions are presented. Sample holding times will be consistent with the analytical requirements for the methods used.

### 5.1 WASTE LIQUID FUEL SAMPLING AND ANALYSIS

Waste liquid fuel samples will be collected during each run. The waste sampling location will be clearly labeled during the test. Table 5-1 summarizes the waste liquid fuel sampling and analysis procedures.

**TABLE 5-1**  
**WASTE LIQUID FUEL SAMPLING AND ANALYSIS**

WASTE	SAMPLING METHOD	SAMPLING AMOUNT/ FREQUENCY	ANALYTICAL PARAMETER	ANALYTICAL METHOD <sup>1</sup>
Waste liquid fuel	Tap sampling	Approximately 150 mL into two separate bottles at beginning, middle, and end of each test run	Density	ASTM Method D1475
			Higher heating value	ASTM Method D240

<sup>1</sup> ASTM refers to ASTM International.

BASF personnel will collect the waste liquid fuel samples from a tap located on the feed line. The tap will be flushed initially (allowed to flow briefly) before the samples are collected. Samples will be collected at the beginning, middle, and end of each test run. At each sampling event, approximately 150 milliliters (mL) of the waste stream will be collected into two separate bottles. At the end of the run, each sample bottle will have approximately 450 mL of sample. One sample will be sent to the laboratory for analysis, and one sample will be sent to the laboratory as a backup.

The waste liquid fuel samples will be analyzed to characterize the waste stream. Density and higher heating value of the waste liquid fuel will be determined for each test run.

### 5.2 PROCESS VENT GAS SAMPLING AND ANALYSIS

The process vent gas will not be sampled and analyzed during the test. Process knowledge is used to characterize the process vent gas. Process vent gas characterization information is provided in Section 2.2.

### 5.3 NATURAL GAS SAMPLING AND ANALYSIS

The natural gas will not be sampled and analyzed during the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 5.4 STACK GAS SAMPLING AND ANALYSIS

The stack gas will be monitored for HC emissions and sampled for PAH, PCB, and hydrogen cyanide emissions during the test. In addition, the facility's CEMS continuously monitor the stack gas CO concentration. The following monitoring/sampling methods will be used:

- USEPA Methods 1, 2, 3A, and 4 for determination of stack sampling traverse points, gas flow rate, composition, and moisture content;
- USEPA Method 25A, a portable CEMS operated by the stack sampling contractor, to monitor the concentrations of HC in the stack gas;
- USEPA Method 23 for measurement of PAH and PCB emissions;
- USEPA Method 320 for measurement of hydrogen cyanide emissions; and
- The facility's CEMS to monitor the concentrations of CO and oxygen in the stack gas.

Table 5-2 summarizes the stack gas samples to be taken, the parameters to be measured, and the frequency of measurement.

**TABLE 5-2**  
**STACK GAS SAMPLING AND ANALYSIS**

SAMPLING METHOD <sup>1</sup>	SAMPLING DURATION	ANALYTICAL PARAMETER	ANALYTICAL METHOD <sup>1</sup>
USEPA Methods 1, 2, 3A, and 4	Not applicable	Traverse points, stack flow, composition, and moisture	Not applicable
USEPA Method 25A (Portable CEMS)	Continuous	Hydrocarbons	USEPA Method 25A (Portable CEMS)
USEPA Method 23	240 minutes (minimum)	Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	USEPA Method 23
USEPA Method 320	60 minutes (minimum)	Hydrogen cyanide	USEPA Method 320
Facility CEMS (USEPA Performance Specification 4B)	Continuous	Carbon monoxide and oxygen	Facility CEMS (USEPA Performance Specification 4B)

<sup>1</sup> USEPA Method refers to New Source Performance Standards, Test Methods and Procedures, Appendix A, 40 CFR Part 60. USEPA Performance Specification refers to New Source Performance Standards, Performance Specifications, Appendix B, 40 CFR Part 60.

## 1.0 INTRODUCTION

This quality assurance project plan (QAPP) is being submitted by BASF Corporation (BASF) for the hazardous waste fired boiler located at BASF's Pasadena, Texas, facility. This unit is designated as the F-10 Boiler. An emission test will be performed for the F-10 Boiler in response to United States Environmental Protection Agency's (USEPA's) Clean Air Act Section 114 Information Collection Request (ICR), dated January 31, 2024, for the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Hazardous Waste Combustors (HWCs) codified in Title 40 Code of Federal Regulations (CFR) Part 63 Subpart EEE. This QAPP describes the quality assurance (QA) and quality control (QC) program associated with the ICR testing to be conducted for the F-10 Boiler. In accordance with the ICR, this QAPP will not be submitted for approval prior to the testing. It will be submitted as an appendix of the emission test report

### 1.1 FACILITY OVERVIEW

BASF manufactures OxoAlcohol and plasticizers at the Pasadena facility. The BASF facility is considered an area stationary source of HAPs as defined in Section 112(a) of the Clean Air Act as amended November 15, 1990.

The street address and identification numbers of the BASF Pasadena facility are:

BASF Corporation  
Pasadena Plant  
4403 La Porte Highway 225  
Pasadena, Texas 77501  
Waste Permit No. 50385  
Industrial Solid Waste Registration No. 33849  
EPA ID No. TXD980808778

All correspondence should be directed to the following facility contact:

John T. Igoe, P.E., CSP  
Sr. EHS Specialist  
BASF Corporation  
P.O. Box 600

## 1.2 HAZARDOUS WASTE COMBUSTOR OVERVIEW

BASF operates the F-10 Boiler to provide energy recovery as steam while destroying hazardous waste streams generated in the production units. The F-10 Boiler is fired on a mixture of natural gas, process vent gas, and liquid hazardous waste. The liquid hazardous waste fired in the F-10 Boiler is identified as waste liquid fuel. The boiler is equipped with a superheater, an economizer, a selective catalytic reduction (SCR) system, a forced draft fan, and a stack. More information regarding the design and operation of the F-10 Boiler can be found in Section 3.0 of the site-specific test plan.

## 1.3 TEST OVERVIEW

The emission test is designed to provide the information requested in USEPA's ICR. One test condition will be performed for the boiler. The F-10 Boiler will be operated in a normal and representative manner during the emission test (*i.e.*, in a manner consistent with the boiler's current operating parameter limits (OPLs)).

The ICR emission testing will include the following pollutants:

- Polycyclic aromatic hydrocarbons (PAH);
- Polychlorinated biphenyls (PCB);
- Hydrocarbons (HC); and
- Hydrogen cyanide.

The waste liquid fuel will also be analyzed for higher heating value and density for each test run.

This emission test is being coordinated by BASF personnel, who will provide oversight of the boiler operations and the stack sampling activities during the test program. Coterie Environmental LLC (Coterie) is responsible for the test plan and report development. Alliance Technical Group, LLC, (ATG) will perform the stack sampling for the test program. ATG will be responsible for all stack gas and waste liquid fuel samples collected during the test program, with oversight by BASF and Coterie. The stack gas and waste liquid fuel samples will be sent to Eurofins Knoxville (Eurofins) for analysis.

## 1.4 QUALITY ASSURANCE PROJECT PLAN ORGANIZATION

This QAPP has been prepared following the USEPA document entitled *Preparation Aids for the Development of Category I Quality Assurance Project Plan*. The QAPP will serve as an essential guidance by which the emission test will be performed. The QAPP defines all aspects of QA/QC procedures and establishes sampling and analytical quality indicators that will demonstrate achievement of the test objectives. Additionally, this QAPP defines precision and accuracy criteria for the required measurements that will be used to demonstrate that all associated test data is of sufficient quality to satisfy the requirements of the USEPA's ICR. The remaining sections of the QAPP provide the following information:

- Section 2.0 presents information on the emission test project team;

- 
- Section 3.0 describes the emission test sampling procedures;
  - Section 4.0 presents sample handling and documentation information;
  - Section 5.0 discusses the emission test analytical procedures;
  - Section 6.0 presents the emission test data quality objectives;
  - Section 7.0 discusses calibration procedures and preventative maintenance;
  - Section 8.0 discusses data reduction, validation, and reporting procedures;
  - Section 9.0 discusses QA reports;
  - Section 10.0 includes a list of reference documents for the QAPP; and
  - Attachment A provides a list of analytes for the testing.

## 2.0 ORGANIZATION OF PERSONNEL, RESPONSIBILITIES, AND QUALIFICATIONS

BASF and their contractors will have specific and unique duties in the implementation of the ICR emission test project. The project team duties are summarized below. A project organization flow chart is provided in Figure 2-1. The contractors selected for this project have established training programs that identify, ensure, and document that the personnel assigned to their tasks have appropriate knowledge, skills, training, and certifications to perform their duties. Any key personnel that become unavailable will be replaced by equally qualified personnel prior to test mobilization. This QAPP will be distributed to key project personnel for review prior to the emission test.

BASF, through the Emission Test Manager and operations crew, will:

- Procure and prepare waste feeds;
- Operate F-10 Boiler at the designated conditions;
- Collect waste samples; and
- Report all feed rates and F-10 Boiler process parameters.

Coterie, through the Offsite Project Coordinator, will:

- Prepare the sit-specific test plan and QAPP;
- Provide oversight for the project;
- Perform a detailed QA review of all analytical results; and
- Prepare the final report.

ATG, through the Stack Testing Director and stack sampling field team, will:

- Perform stack gas sampling;
- Implement the QA program for the stack sampling and analysis;
- Provide custody of all samples generated by the test efforts;
- Transport the samples to the laboratories for analysis; and
- Prepare the stack sampling report and supporting documentation.

The laboratory will:

- Perform sample analyses;
- Perform method and QAPP specified QA/QC; and
- Provide a complete laboratory report with a detailed case narrative.

---

## **2.1 EMISSION TEST MANAGER**

John Igoe will serve as the BASF Emission Test Manager. Mr. Igoe will be responsible for directing BASF personnel in the operations of the F-10 Boiler during the testing. He will also ensure that all necessary unit operating data is collected during the test.

## **2.2 OFFSITE PROJECT COORDINATOR**

Heather McHale of Coterie will provide offsite coordination of the test program. Ms. McHale will ensure that all test team members communicate throughout the test program and that the objectives of the test plan are met. As the Offsite Project Coordinator, Ms. McHale will also ensure that all analytical data is validated and that all deviations are adequately addressed in the appropriate sections of the test report.

## **2.3 STACK TESTING DIRECTOR**

Dan Loubiere of ATG will serve as the Stack Testing Director for the emission test. Mr. Loubiere will be responsible for technical supervision of the project, data interpretation, overall report preparation, and coordination with all laboratories and outside service providers. Mr. Loubiere or a project manager who reports to Mr. Loubiere will oversee the field crew during the testing, will be responsible for all aspects of sample collection, and will report any deviations immediately to the Emission Test Manager and Offsite Project Coordinator. The Stack Testing Director may or may not be onsite during the emission test.

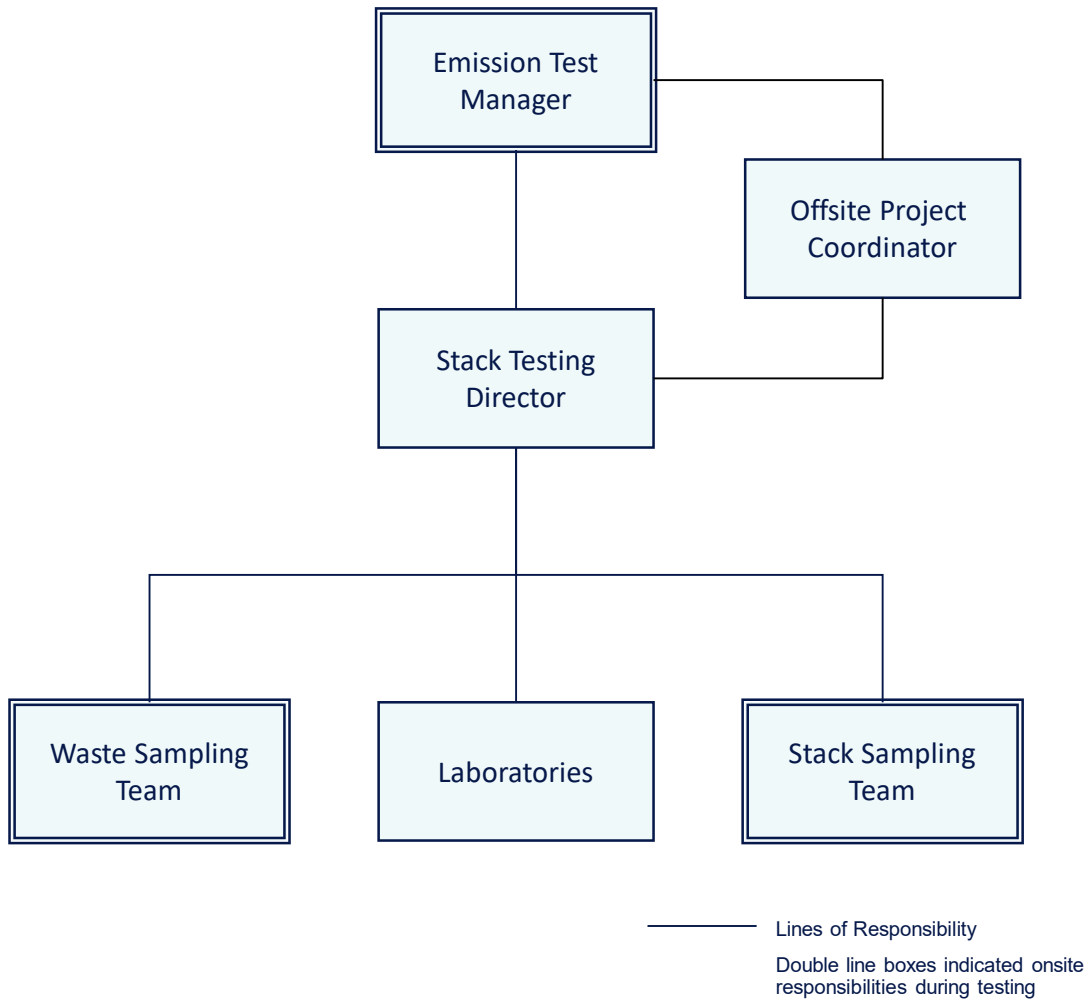

## **2.4 FIELD TEAM**

The field team will be made up of BASF and contractor personnel. BASF operators will be responsible for collecting all waste samples. The stack sampling field team will collect all stack gas samples and will take custody of the waste samples from the operators at the conclusion of the testing.

## **2.5 LABORATORY**

Eurofins will be the subcontracted laboratory. The point of contact for the laboratory is Courtney Adkins. The laboratory is well experienced in conducting analyses per the methods described in this QAPP. Prior to test execution, the QAPP will be submitted to the laboratory for review and understanding of their project responsibilities. The laboratory representative will sign the appropriate QAPP signature page. The laboratory representative will be responsible for ensuring that the laboratory follows all analytical methods specified in the QAPP in accordance with their standard operating procedure (SOPs), that a detailed case narrative is prepared addressing all analytical deviations, and that a complete laboratory report is provided.

**FIGURE 2-1**  
**PROJECT ORGANIZATION**

## 3.0 SAMPLING PROCEDURES

This section provides descriptions of the waste and stack gas sampling procedures to be performed during the test.

### 3.1 WASTE LIQUID FUEL SAMPLING

Waste liquid fuel samples will be collected during each run. The waste sampling locations will be clearly labeled during the test. Table 3-1 summarizes the waste liquid fuel sampling procedures.

**TABLE 3-1**  
**WASTE LIQUID FUEL SAMPLING**

WASTE	SAMPLING METHOD	SAMPLING AMOUNT/ FREQUENCY
Waste liquid fuel	Tap sampling	Approximately 150 mL into two separate bottles at beginning, middle, and end of each test run

BASF personnel will collect the waste liquid fuel samples from a tap located on the feed line. The tap will be flushed initially (allowed to flow briefly) before the samples are collected. At each sampling event, approximately 150 milliliters (mL) of the waste stream will be collected into two separate bottles. At the end of the run, each sample bottle will have approximately 450 mL of sample. One sample will be sent to the laboratory for analysis, and one sample will be sent to the laboratory as a backup.

### 3.2 PROCESS VENT GAS SAMPLING

The process vent gas will not be sampled and analyzed during the test. Process knowledge is used to characterize the process vent gas.

### 3.3 NATURAL GAS SAMPLING

The natural gas will not be sampled and analyzed during the test. The natural gas is not expected to contain any regulated constituents in greater than trace quantities.

### 3.4 STACK GAS SAMPLING

The stack gas sampling will follow the methods documented in 40 CFR Part 60 Appendix A (USEPA Methods). Brief descriptions of these methods are provided in this section. Any modifications to prescribed USEPA methods are outlined in the sampling procedure descriptions below. Table 3-2 summarizes the sampling procedures to be used during the test for collection of stack gas samples.

**TABLE 3-2  
STACK GAS SAMPLING**

PARAMETER	SAMPLING METHOD <sup>1</sup>	SAMPLE FRACTION(S)
Traverse points, gas flow rate, composition, and moisture content	USEPA Methods 1, 2, 3A, and 4	Not applicable
Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	USEPA Method 23	Filter
		Front-half and back-half acetone and toluene rinses
		XAD-2 resin
		Deionized water impingers contents
		Deionized water impingers acetone and toluene rinses
Hydrocarbons	USEPA Method 25A	Not applicable
Hydrogen cyanide	USEPA Method 320	Not applicable
Carbon monoxide and oxygen	Facility CEMS (USEPA Performance Specification 4B)	Not applicable

<sup>1</sup> USEPA Method refers to New Source Performance Standards, Test Methods and Procedures, Appendix A, 40 CFR Part 60. USEPA Performance Specification refers to New Source Performance Standards, Performance Specifications, Appendix B, 40 CFR Part 60.

Adequate sampling ports are available to support the sampling. The gas flow rate, composition, and moisture content data will be collected concurrent with the isokinetic sampling train.

### **3.4.1 SAMPLING POINT DETERMINATION – USEPA METHOD 1**

The number and location of the stack gas sampling points will be determined according to the procedures outlined in USEPA Method 1. Verification of absence of cyclonic flow will be conducted prior to testing by following the procedure described in USEPA Method 1. The cyclonic flow check will be performed once for the test.

### **3.4.2 FLUE GAS VELOCITY AND VOLUMETRIC FLOW RATE – USEPA METHOD 2**

The flue gas velocity and volumetric flow rate will be determined according to the procedures outlined in USEPA Method 2. Velocity measurements will be made using Type S pitot tubes conforming to the geometric specifications outlined in USEPA Method 2. Differential pressures will be measured with fluid manometers. Effluent gas temperatures will be measured with thermocouples equipped with digital readouts.

### **3.4.3 FLUE GAS COMPOSITION AND MOLECULAR WEIGHT – USEPA METHOD 3A**

The composition of the bulk gas and the gas molecular weight at the stack (concentrations of carbon dioxide and oxygen) will be determined by USEPA Method 3A. The stack sampling contractor will supply oxygen and carbon dioxide analyzers and all other associated equipment. The analyzers will be calibrated according to the procedures outlined in the method. A continuous sample of stack gas will be

---

withdrawn via a sample probe. The gas will be filtered and passed through a conditioning system for removal of particulates and moisture prior to being sent to the analyzer.

The calculated molecular weight will be used for all isokinetic calculations. The measured oxygen concentration will also be used to correct emission concentrations to seven percent oxygen.

#### **3.4.4 FLUE GAS MOISTURE CONTENT – USEPA METHOD 4**

The flue gas moisture content will be determined in conjunction with each isokinetic train according to the sampling and analytical procedures outlined in USEPA Method 4. The impingers will be connected in series and will contain reagents as described for each sampling method. The impingers will be housed in an ice bath to ensure condensation of the moisture from the flue gas stream. Any moisture that is not condensed in the impingers is captured in the silica gel. Moisture content is determined by weighing the various sample fractions.

#### **3.4.5 POLYCYCLIC AROMATIC HYDROCARBONS AND POLYCHLORINATED BIPHENYLS – USEPA METHOD 23**

The sampling procedures outlined in USEPA Method 23 will be used to determine the PAH and PCB concentrations in the stack gas during the emission test. The specific list of analytes is provided in Attachment A. The sampling train will consist of a glass fiber filter and coil condenser followed by a XAD-2 resin trap and a series of impingers. A total of four impingers will be used in the sampling train. The first of these impingers will be empty and will be followed by two impingers each containing 100 mL of reagent water. These impingers will be followed by an impinger containing approximately 200 to 300 grams of silica gel. A recirculating pump will also be connected to the sampling train to continuously circulate cold water to the condenser and resin trap to maintain the resin trap temperature below 68 degrees Fahrenheit (°F). A diagram of the sampling train is presented in Figure 3-1.

In preparation for the sampling event, several labeled sampling standards will be introduced inside the resin to monitor sampling efficiencies as well as to provide insights to the sample preservation and storage conditions. Upon preparation of the spiked resin traps, a separate fraction of resin from the same batch will be spiked the same day using the same solutions used in the field sampling modules and will be refrigerated in the laboratory until the return of the field samples. At such time, the control resin will become the laboratory method blank.

All sampling train components will be constructed of materials specified in the methods and will be cleaned and prepared per method specifications prior to testing. The probe and filter temperatures will be maintained between 223 and 273°F. The sampling runs will be performed within  $\pm 10$  percent of isokinetic conditions. A minimum of 141 dry standard cubic feet (dscf) of sample gas will be collected over a minimum of 240 minutes.

USEPA Method 23 Section 6.1.7 requires that the condenser to be oriented at an angle to cause moisture to flow down to the XAD adsorbent module to facilitate condensate drainage. Glassware with

this configuration is not currently available from a national supplier utilizing a large enough condenser to meet the temperature specifications of the method. Until equipment is widely available, the horizontal or vertical condenser configuration from traditional USEPA Method 23 will be utilized.

The recovery of the sampling train will result in the sample fractions listed in Table 3-2. The sampling train will be recovered according to the procedures specified in the method with one exception. USEPA Method 23 Section 8.2.9 specifies that the impinger condensate and solvent rinses are to be collected in a single container (No. 3). Due to analytical method development constraints of the subcontracted laboratory, it will be necessary to recover the sample fractions separately: impinger condensate (Container No. 3A) and solvent rinses (Container No. 3B). The filter will be shipped in a Petri dish, and all rinses will be collected in amber glass jars. The XAD-2 resin will be wrapped and shipped in the glass trap.

All sample fractions will be combined during extraction. The sample will be spiked with extraction standards. The sample will be analyzed for PAH and PCB by USEPA Method 23 (high resolution gas chromatograph/high resolution mass spectroscopy).

**FIGURE 3-1**  
**USEPA METHOD 23 SAMPLING TRAIN**

### 3.4.6 HYDROCARBONS – USEPA METHOD 25A

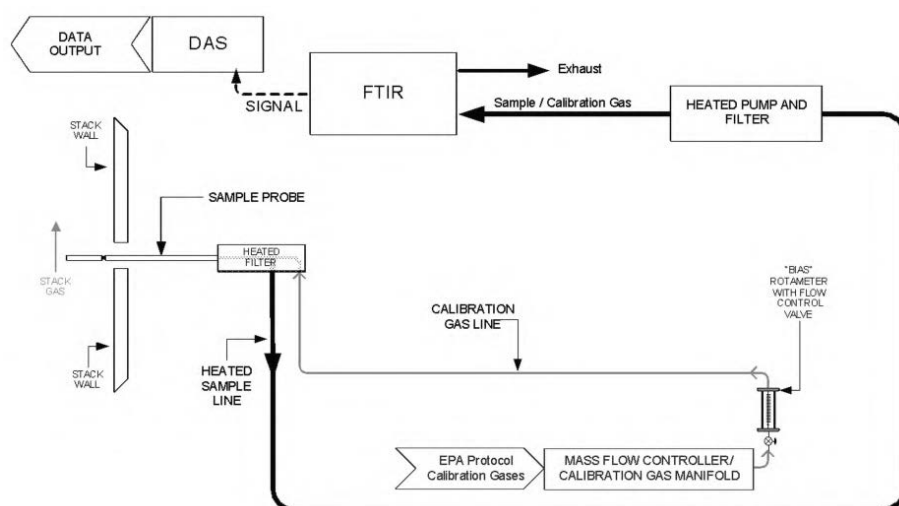

The procedures outlined in USEPA Method 25A will be used to measure the concentration of HC in the stack gas during the test. The stack sampling contractor will supply an HC analyzer with a span calibrated to match the anticipated HC concentration of the stack gas. Sampling will be concurrent with the USEPA Method 23 testing.

A continuous sample of stack gas will be withdrawn via a sample probe. The sampled gas will be filtered for removal of particulates prior to being sent to the analyzer. All parts of the sampling system and the analyzer will be heated to a temperature of at least 250°F. The wet-basis HC concentration will be reported in parts per million by volume (ppmv), as propane.

### 3.4.7 HYDROGEN CYANIDE – USEPA METHOD 320

The procedures outlined in USEPA Method 320 will be used to measure the concentration of hydrogen cyanide in the stack gas during the test. The stack gas will be extracted at a constant rate through a heated probe, heated filter, and heated sample line and analyzed with a Fourier transform infrared (FTIR) analyzer operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured will be selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio will be measured and recorded to document analyzer performance. A leak check will be performed on the sample cell. The instrument path length will be verified using ethylene as the Calibration Transfer Standard. Dynamic spiking will be performed using a certified standard of the target compound in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information will be recorded and stored with the calculated analytical results. A diagram of the sampling system is presented in Figure 3-2.

**FIGURE 3-2  
USEPA METHOD 320 SAMPLING SYSTEM**

A continuous sample of stack gas will be withdrawn via a sample probe. The sampled gas will be filtered for removal of particulates prior to being sent to the analyzer. All parts of the sampling system and the analyzer will be heated to a temperature of approximately 300°F. The wet-basis hydrogen cyanide concentration will be reported in ppmv.

### 3.4.8 CARBON MONOXIDE AND OXYGEN – USEPA PERFORMANCE SPECIFICATION 4B

The facility's continuous emissions monitoring systems (CEMS) will be used to measure the concentration of carbon monoxide (CO) and oxygen in the stack gas during the test.

A continuous sample of stack gas will be withdrawn via a sample probe. The sampled gas will be filtered and will be passed through a conditioning system for removal of particulates and moisture prior to being sent to the analyzer. The CO concentration will be reported in parts per million by volume dry basis (ppmv dry) corrected to seven percent oxygen.

## 3.5 SAMPLING LOCATION

All sampling will be conducted on the F-10 Boiler stack. Figure 3-3 provides a diagram of the sampling location.

**FIGURE 3-3**  
**SAMPLING LOCATION**

F-10 Boiler Stack (EPN 84) Stack

---

### **3.6 SAMPLING QUALITY CONTROL PROCEDURES**

Specific sampling QC procedures will be followed to ensure the production of useful and valid data throughout the course of this test program.

Prior to the start of testing, all sampling equipment will be thoroughly checked to ensure clean and operable components and to ensure no damage occurred during shipping. Once the equipment has been set up, the manometer used to measure pressure across the pitot tube will be leveled and zeroed, and the number and location of all sampling traverse points will be checked.

At the start of each test day and throughout the testing, all sample train components will be checked to ensure they remain in good condition and continue to operate properly. Electrical components will be checked for damaged wiring or bad connections. All glassware will be inspected to make sure no cracks or chips are present.

All sampling trains will be assembled and recovered in a mobile laboratory to ensure a clean environment, free of uncontrolled dust. To ensure the sampling trains are free of contamination, all glassware will remain sealed until assembly of the sampling train.

Pre-test and post-test leak checks will be performed for each sampling train, as required by the respective test methods. Care will be taken to make sure all sampling trains are being operated within the specifications of their respective method.

At the end of testing each day, all sampling equipment will be sealed and covered to protect from possible contamination and weather damage.

## 4.0 SAMPLE HANDLING AND DOCUMENTATION

Sample custody procedures for this program are based on procedures from *Handbook: QA/QC Procedures for Hazardous Waste Incineration* (QA/QC Handbook) and Chapter One of *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (SW-846). The procedures that will be used are discussed below.

### 4.1 FIELD SAMPLING OPERATIONS

The stack sampling contractor will be responsible for ensuring custody and sample tracking documentation procedures are followed for the field sampling and field analytical efforts. Documentation of all sample collection activities will be recorded on pre-printed data collection forms. Table 4-1 provides a summary of sample custody documentation requirements.

**TABLE 4-1**  
**SAMPLE CUSTODY DOCUMENTATION REQUIREMENTS**

CUSTODY DOCUMENT	REQUIRED INFORMATION
Sample data forms	Sampler's name or initials
	Date and time of sample collection
	Sampling technique
	Compositing technique (waste samples)
	Sample identifier
	Sampling location
Chain of custody	Unique identifier for each sample shipped
	Date and time of sample collection
	Sample preservation requirements
	Analysis and preparation procedures requested
	Signature of individual relinquishing sample custody

Samples will be collected, transported, and stored in clean containers constructed of materials inert to the analytical matrix, such as glass jars. Only containers allowing airtight seals will be used. Amber glass will be employed when specified by the method. All waste feed samples will be packed by the stack sampling contractor for transfer or shipment to the appropriate laboratories. Sample tracking and custody forms, which include sample identification and analysis requests, will be enclosed in the sample shipment container.

Upon receipt by the laboratory, information pertaining to the samples will be recorded on the sample tracking and custody form or an attachment to the form. The laboratory will note the overall condition

---

of the samples, including the temperature of the samples upon receipt. The laboratory will also note any discrepancy in the sample identification between the sample labels and the custody forms. The signature of the person receiving the samples will be provided on the chain of custody (COC).

If the laboratory notes discrepancies in sample identification labels and forms or suspects issues concerning sample integrity, the laboratory will contact the Stack Testing Director, who will then contact the Offsite Project Coordinator, as appropriate. In many instances, questions concerning sample labeling can be rectified through discussions between the Stack Testing Director and the laboratory. Some sample integrity concerns can be rectified using archived samples. If archive samples are not available, the sample integrity issues are discussed with the Stack Testing Director and/or the Offsite Project Coordinator, and appropriate actions are taken, as warranted by the specific issue.

Every record pertaining to sample collection activities, including, but not limited to, stack sampling data sheets, process sample data sheets, sample tracking forms, sampling equipment calibration forms, balance calibration forms, and reagent preparation information will be submitted with the report to provide evidence that the samples were handled properly, taken at the correct time and in the correct manner, assigned a unique identifier, received intact by the laboratory, and preserved as appropriate. Adherence to the holding times indicated in Section 5.0, Tables 5-1 and 5-2, will be noted in the laboratory analytical results.

## **4.2 FIELD LABORATORY OPERATIONS**

The stack sampling contractor will provide an onsite laboratory trailer for sample train assembly and recovery and documentation and recordkeeping activities. Sample tracking documentation, shipping records, reagent and standards traceability, and all sampling activity records will be maintained in the laboratory trailer.

Documentation of onsite analytical activities, such as calibration, standards traceability, sample preparation steps, and raw measurement results will also be maintained onsite.

## 5.0 ANALYTICAL PROCEDURES

The analyses will follow ASTM International (ASTM) Methods and USEPA Methods. Table 5-1 presents the analytical methods for waste liquid fuel samples. Table 5-2 presents the analytical methods for stack gas samples. These tables present the referenced analytical method, the laboratory performing the analysis, the extraction and analysis holding time, and if required, the sample preservation and sample preparation method. Collection of these samples was described in Section 3.0. Note that the tables in Section 3.0 specify which samples are to be collected using which methods; the tables included in this section specify the preparation and analytical methods to be used to evaluate each sample.

**TABLE 5-1**  
**PREPARATION AND ANALYSIS PROCEDURES FOR WASTE LIQUID FUEL SAMPLES**

PARAMETER	ANALYTICAL METHOD <sup>1</sup>	LAB	PRESERVATIVE REQUIRED	EXTRACTION HOLDING TIME	ANALYSIS HOLDING TIME	PREPARATION METHOD <sup>1</sup>
Density	ASTM Method D1475	Eurofins	Not applicable	Not applicable	180 days	Not applicable
Higher heating value	ASTM Method D240	Eurofins	Not applicable	Not applicable	180 days	Not applicable

<sup>1</sup> ASTM refers to ASTM International.

**TABLE 5-2**  
**PREPARATION AND ANALYSIS PROCEDURES FOR STACK GAS SAMPLES**

PARAMETER	ANALYTICAL METHOD <sup>1</sup>	LAB	PRESERVATIVE REQUIRED	EXTRACTION HOLDING TIME	ANALYSIS HOLDING TIME	PREPARATION METHOD <sup>1</sup>
Molecular weight	USEPA Method 3A	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable
Moisture	USEPA Method 4	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable
Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	USEPA Method 23	Eurofins	≤6°C in the dark	30 days	40 days <sup>2</sup>	USEPA Method 23
Hydrocarbons	USEPA Method 25A	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable

**TABLE 5-2 (CONTINUED)**  
**PREPARATION AND ANALYSIS PROCEDURES FOR STACK GAS SAMPLES**

PARAMETER	ANALYTICAL METHOD <sup>1</sup>	LAB	PRESERVATIVE REQUIRED	EXTRACTION HOLDING TIME	ANALYSIS HOLDING TIME	PREPARATION METHOD <sup>1</sup>
Hydrogen cyanide	USEPA Method 320	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable
Carbon monoxide and oxygen	USEPA Performance Specification 4B	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable

<sup>1</sup> USEPA Method refers to New Source Performance Standards, Test Methods and Procedures, Appendix A, 40 CFR Part 60. USEPA Performance Specification refers to New Source Performance Standards, Performance Specifications, Appendix B, 40 CFR Part 60.

<sup>2</sup> Holding time from extraction may be up to one year if samples are stored below -10°C.

## 6.0 DATA QUALITY OBJECTIVES

The purpose of this test program is to provide the information requested in USEPA's ICR. BASF is committed to ensuring data generated during this project are scientifically valid, defensible, complete, and of known precision and accuracy. These objectives can be best achieved by applying the requirements of USEPA accepted methodology as well as the more specific recommendations and guidelines for test burns. To ensure consistency and adequacy of plans and reports and overall data quality, guidance from Chapter One of SW-846 and the QA/QC Handbook has been integrated into the approaches and philosophies of this QAPP.

Key measures of performance include the objectives for precision, accuracy, representativeness, completeness, and comparability (commonly referred to as PARCC parameters). This section presents project-specific data quality objectives for this test. These objectives represent the level of data quality considered acceptable for valid decision making, as measured in a manner that best reflects performance in the actual project matrices. These objectives will be communicated to the entire project team, including onsite sampling personnel and offsite contract laboratories.

### 6.1 QUALITY CONTROL PARAMETERS

QC objectives include precision, accuracy, representativeness, comparability, and completeness. Typical parameters include matrix spike (MS) and MS duplicate (MSD) samples, laboratory control sample (LCS) and LCS duplicate (LCSD) samples, post digestion spike (PDS) and post digestion spike duplicate (PDSD) samples, field and sample duplicates, surrogates, standards, and spikes. Tables 6-1 and 6-2 provide the project specific QC procedures for assessing accuracy and precision for critical measurement parameters. Critical parameters are those that directly relate to the ICR requirements. These tables list the parameter of analysis, the QC parameter, the QC procedure, the frequency at which accuracy and precision are determined, and the objective.

Table 6-3 provides information on the number of samples that will be collected for the emission test.

**TABLE 6-1**  
**QUALITY CONTROL OBJECTIVES FOR WASTE LIQUID FUEL SAMPLES**

ANALYTICAL PARAMETER	QC PARAMETER	QC PROCEDURE	FREQUENCY <sup>1</sup>	OBJECTIVE <sup>1</sup>
Density	Precision	Field duplicate	One per test program	<20% relative percent difference <sup>2</sup>
	Accuracy	Laboratory control sample	One per analytical batch	99-101% recovery
Higher heating value	Precision	Field duplicate	One per test program	<20% relative percent difference <sup>2</sup>
		Laboratory control sample duplicate	One per analytical batch	≤2% relative percent difference <sup>2</sup>
		Sample duplicate	One per analytical batch	≤10% relative percent difference <sup>2</sup>
	Accuracy	Laboratory control samples	Two per analytical batch	98-102% recovery

<sup>1</sup> Unless specified otherwise, the frequency and objective provided for each parameter are based on specifications in the analytical method.

<sup>2</sup> If the concentrations are less than five times the reporting limit, the laboratory will be unable to control these limits.

**TABLE 6-2**  
**QUALITY CONTROL OBJECTIVES FOR STACK GAS SAMPLES**

ANALYTICAL PARAMETERS	QC PARAMETER	QC PROCEDURE	FREQUENCY <sup>1</sup>	OBJECTIVE <sup>1</sup>
Polycyclic aromatic hydrocarbons	Precision	Laboratory control sample duplicate	One per analytical batch	≤25% relative percent difference
	Accuracy	Laboratory control samples	Two per analytical batch	60-140% recovery
		Internal standards (isotope dilution)	Every sample	20-130% recovery
		Surrogate standards	Every sample	70-130% recovery
Polychlorinated biphenyls	Precision	Laboratory control sample duplicate	One per analytical batch	≤50% relative percent difference
	Accuracy	Laboratory control samples	Two per analytical batch	60-135% recovery
		Internal standards (isotope dilution)	Every sample	20-145% recovery
		Surrogate standards	Every sample	20-130% recovery <sup>2</sup> 70-130% recovery <sup>3</sup>

<sup>1</sup> Unless specified otherwise, the frequency and objective provided for each parameter are based on specifications in the analytical method.

<sup>2</sup> These recoveries are required for surrogates PCB-28L, PCB-111L, and PCB-178L.

<sup>3</sup> These recoveries are required for surrogates PCB-8L, PCB-79L, PCB-95L, and PCB-153L.

**TABLE 6-3  
NUMBER OF SAMPLES**

SAMPLE MATRIX	SAMPLE DESCRIPTION	SAMPLES COLLECTED PER RUN	SAMPLES COLLECTED FOR QUALITY CONTROL	TOTAL SAMPLES COLLECTED	SAMPLES ANALYZED	SAMPLES ARCHIVED
Waste liquid fuel	Bulk liquid	2	2	16	8	8
Stack gas – polycyclic aromatic hydrocarbons and polychlorinated biphenyls	Filter	1	2	9	8	1
	Front-half and back-half acetone and toluene rinses	1	1	8	8	0
	XAD-2 resin	1	2	9	8	1
	Deionized water impingers contents	1	1	8	8	0
	Deionized water impingers acetone and toluene rinses	1	1	8	8	0
	Deionized water	0	1	1	0	1
	Acetone	0	1	1	0	1
	Toluene	0	1	1	0	1

### 6.1.1 PRECISION

Precision is a measure of the reproducibility of results under a given set of conditions. It is expressed in terms of the distribution, or scatter, of replicate measurement results, calculated as the relative standard deviation (RSD) or, for duplicates, as relative percent difference (RPD). RPD and RSD values are calculated using the following equations:

$$RPD = \left( \frac{|X_1 - X_2|}{\text{avg } X} \right) \times 100$$

$$RSD = \left( \frac{\text{STDEV}}{\text{avg } X} \right) \times 100$$

Where  $X_1$  and  $X_2$  represent each of the duplicate results.

---

### 6.1.2 ACCURACY

Accuracy is a measure of the difference between an analysis result and the “true” value. Accuracy is expressed in terms of percent recovery (e.g., for surrogates, spikes, and reference material). Percent recovery for spiked samples, such as MS samples, is calculated using the following equation:

$$\% \text{Recovery} = \left( \frac{\text{SSR} - \text{SR}}{\text{SA}} \right) \times 100$$

Where:

SSR = Spiked sample result

SR = Sample result

SA = Spike added

Percent recovery for other QC parameters, such as LCS, surrogates, and standards, is calculated using the following equation:

$$\% \text{Recovery} = \left( \frac{\text{Measured Value}}{\text{True Value}} \right) \times 100$$

### 6.1.3 REPRESENTATIVENESS

Representativeness is defined as the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition. An appropriate sampling strategy that addresses collection of representative samples in time and space is crucial to subsequent decision-making and defensibility of the data. There are no numerical objectives for representativeness. The selection of suitable locations and sampling strategies, as described in this QAPP, and adherence to sample collection protocols are the bases for ensuring representativeness.

### 6.1.4 COMPARABILITY

Comparability is defined as expressing the confidence with which one data set can be compared to another. There are no numerical objectives for comparability. A representative sample whose results are comparable to other data sets is ensured primarily using standard reference sampling and analytical methods. Reported in common units, the results generated should thus be comparable to those obtained from other emissions tests and allow for consistent decision-making.

### 6.1.5 COMPLETENESS

Completeness is defined as “a measure of the amount of valid data collected compared to the amount planned.” Completeness can be defined quantitatively using the following equation:

$$\% \text{Completeness} = \left( \frac{\text{No. of Valid Data}}{\text{No. of Data Planned}} \right) \times 100$$

---

In the overall project context, the target is 100 percent completeness, which for a valid test condition is defined as consisting of three valid test runs. A valid test run is one in which sufficient valid data are presented to make any demonstrations required by the ICR.

A run can be valid even though the completeness objective of 100 percent for the data package is not achieved. Given the possibility of human error (and other unpredictable problems) and the inability of collecting additional samples after a test is completed, the impact of achieving less than 100 percent completeness must be assessed in the specific situation, rather than arbitrarily rejecting all the useable scientific information for the run without such consideration. For example, satisfying the completeness objective for a single piece of analytical data includes providing documentation that proves the following:

- An acceptable number of sub-samples were collected and composited;
- Compositing procedures were followed;
- The sample collection log was completed;
- Shipping documents and laboratory instructions were prepared and followed;
- The correct analytical procedures were followed;
- Any necessary modifications to methodology were documented and justified;
- Approved laboratory records were completed;
- Proper data reduction procedures were followed; and
- Analytical instrument printouts were included.

Clearly, the failure of a sampler to note the time a sub-sample was taken (where the previous and following sample times are noted) has less impact on the validity and acceptability of a data package than a failure by the laboratory to demonstrate that the analytical instrument was properly calibrated.

Any errors or omissions in a data package will be identified and accompanied by a discussion of the potential impact on the validity of the data package and the conclusions of the report for the consideration and approval of the USEPA.

## **6.2 EVALUATION OF CONTAMINATION EFFECTS**

Blanks will be collected throughout the test program to evaluate the effects of contamination on results. Blank samples of all reagents used in the stack sampling program will be collected. Field blanks will be collected during the test program if required by the respective method. Method blanks will be prepared and analyzed by the respective laboratories to evaluate the cleanliness of sample handling and preparation and overall laboratory practices. Since reagent blanks cannot be collected for waste samples, the laboratory method blank will be used to determine the effects of contamination for waste analyses.

Table 6-4 provides the type and acceptance criteria for each stack gas blank to be analyzed. These blanks, as well as the laboratory method blanks for the waste samples, provide critical information on the potential contamination that may occur in test program samples. The results of blank analyses can prove very useful when attempting to understand anomalies in data or generally higher than expected test results.

**TABLE 6-4**  
**BLANK ANALYSIS OBJECTIVES FOR STACK GAS SAMPLES**

ANALYTICAL PARAMETERS	BLANK TYPE	FREQUENCY	OBJECTIVE
Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	Field train proof blank	One per test program	<Reporting limit
	Method blank	One per analytical batch	<Reporting limit
	Reagent blanks	One set per test program	Archived <sup>1</sup>

<sup>1</sup> The specified reagent blanks will initially be archived. These blanks will only be analyzed if sample contamination is suspected based on other analytical results.

### 6.3 PERFORMANCE AUDITS

On September 13, 2010, the USEPA issued a final rule to restructure the stationary source audit program. The program requires that audit samples be analyzed along with the samples collected while testing for regulatory compliance. This analysis helps the regulatory agency determine the validity of compliance test results. The rule requires sources to obtain and use audit samples from accredited providers. The USEPA has approved the National Environmental Laboratory Accreditation Conference (NELAC) Institute (TNI) Stationary Source Audit Program to provide accredited audit samples.

The USEPA suspended the audit program on May 28, 2019, due to a lack of sample providers, and this emission test is not being performed to demonstrate compliance. Therefore, BASF will not obtain any audit samples for the test.

### 6.4 CORRECTIVE ACTION

During any testing project, simple or complex, there is potential that deviations from data quality objectives may occur. This section gives corrective action procedures to be used to mitigate such problems.

#### 6.4.1 EQUIPMENT FAILURE

Any equipment found to be out of calibration or operating improperly will be repaired or replaced before additional measurements are made. If equipment repair is done onsite, calibrations will be performed in accordance with the applicable methods prior to use. It may be necessary to transport equipment offsite for calibration. If calibrations cannot be performed, the equipment will not be used. If measurements are made with equipment subsequently found to be out of calibration or operating

---

improperly, a detailed explanation of the cause of the malfunction will be provided. The effect of the malfunction on the data will be assessed, and the data will be qualified.

#### **6.4.2 ANALYTICAL DEVIATIONS**

For analyses where a method QC check sample, such as a method blank, does not meet method specifications, the problem will be investigated to determine the cause as well as any corrective action that should be taken. Once the corrective action has been taken, the analysis will be re-examined to verify the problem has been eliminated.

In instances of out of specification spikes or calibrations, the samples involved will be re-extracted or reanalyzed if possible. In those instances where reanalyzing the sample is not possible, corrective measures will be taken to improve method performance prior to analysis of the next batch of samples.

Results for samples where matrix interferences preclude meeting objectives for recoveries of surrogates or spikes will be evaluated for potential bias to calculated emission results.

#### **6.4.3 CONTAMINATION**

The handling procedures for samples taken during this test, from blank testing to sample collection and analysis, are designed to eliminate contamination by limiting their exposure to contaminants in the ambient air and other outside sources. If levels of contamination are present above the reporting limits in the analyzed blanks, the archived blank samples will be analyzed. Corrective action will be taken if the results of the field blanks are significantly different from those of the reagent blanks or trip blanks. This comparison will indicate whether high levels in the field blank are due to contamination from exposure to outside sources, contamination of reagent materials or, in the case of sorbent traps, from degradation of the traps.

#### **6.4.4 PROCEDURAL DEVIATIONS**

SOPs for the methods being performed will be available onsite during all testing. BASF and the project team will determine an appropriate action in all cases where standard procedures cannot resolve the problem.

## 7.0 CALIBRATION PROCEDURES AND PREVENTATIVE MAINTENANCE

This section presents a brief discussion of calibration and routine maintenance procedures to be used for sampling and analytical equipment. Criteria for analytical calibrations are also included. Calibration procedures for each analytical method are discussed in detail within the methods.

### 7.1 SAMPLING EQUIPMENT

All sampling equipment will be provided by the stack sampling contractor. The equipment will be calibrated prior to arrival onsite and after all testing has been completed. The sampling equipment calibration requirements and acceptance limits are listed in Table 7-1.

The equipment will be calibrated according to the criteria specified in the reference method being employed. In addition, the stack sampling contractor will follow the guidelines set forth in the *Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods*. When these methods are inapplicable, methods such as those prescribed by ASTM will be used. Dry gas meters, orifices, nozzles, and pitot tubes are calibrated in accordance with these documents. The range of the calibration is specified for all environmental measurements to encompass the range of probable experimental values. This approach ensures that all results are based upon interpolative analyses rather than extrapolative analyses. Calibrations are designed to include, where practical, at least three measurement points evenly spaced over the range. This practice minimizes the probability that false assumptions of calibration linearity will be made. In addition, it is common practice to select, when practical, at least one calibration value that approximates the levels anticipated in the actual measurement.

Data obtained during calibrations are recorded on standardized forms, which are checked for completeness and accuracy. Data reduction and subsequent calculations are performed using computer software. Calculations are checked at least twice for accuracy. Copies of calibration forms will be included in the test or project reports.

**TABLE 7-1**  
**SAMPLING EQUIPMENT CALIBRATION REQUIREMENTS**

STACK GAS PARAMETER	QUALITY PARAMETER	METHOD OF DETERMINATION	FREQUENCY	CRITERIA
Gas flow	Pitot tube angle and dimensions	Calibrated in a wind tunnel or measurements with a vernier micrometer and angle indicator	Pre-test and post-test	To specifications in USEPA Method 2
	Barometer	Measurements with a NIST traceable barometer or calibrated vs. National Weather Service station	Not applicable	Not applicable
	Stack gas thermocouple	Calibrated vs. ASTM mercury-in-glass thermometer or NIST standards	Pre-test and post-test	Within 1.5% as °R
Isokinetic sampling train	Dry gas meter and orifice	Calibrated against reference orifices or against a reference dry gas meter	Pre-test and post-test	1. Y within 0.05 of pre-test Y 2. H <sub>@</sub> within 0.15 of pre-test
	Probe nozzle	Measurements with a vernier micrometer to 0.001 inches	Pre-test and post-test <sup>1</sup>	Maximum difference in any two dimensions within 0.004 inches
	Dry gas meter thermocouples	Calibrated vs. ASTM mercury-in-glass thermometer or NIST standards	Pre-test and post-test	Within 1.5% as °R
	Trip balance	Calibrated vs. standard weights	Pre-test	Within 0.5 grams
Carbon dioxide and oxygen analyzers	Analyzer calibration error test	Checked using USEPA Protocol 1 calibration gases	Before the test run and after any failed system bias or drift check	±2% of calibration span
	System bias test	Checked using USEPA Protocol 1 calibration gases	Before and after each test run	±5% of calibration span
	System drift check	Checked using USEPA Protocol 1 calibration gases	After the post-test system bias test	±3% of calibration span
Hydrocarbon analyzer	Calibration error test	Checked using USEPA Protocol 1 calibration gases	Prior to the first test run and after any failed drift test	±5% of calibration gas value
	Drift test	Checked using USEPA Protocol 1 calibration gases	After the last test run and hourly during the test period	±3% of span value
Hydrogen cyanide Fourier transform infrared analyzer	Calibration transfer standard direct	Verify stability, confirm optical path length	Pre-test	±5% of cert value
	Calibration transfer standard responses	Verify system stability, recovery, and response time	Prior to the first test run and after each test run	±5% of mean value
	Analyte spike	Verify system ability to quantify the analyte of interest in the gas stream	Pre-test	±30% theoretical recovery

**TABLE 7-1 (CONTINUED)**  
**SAMPLING EQUIPMENT CALIBRATION REQUIREMENTS**

STACK GAS PARAMETER	QUALITY PARAMETER	METHOD OF DETERMINATION	FREQUENCY	CRITERIA
Carbon monoxide analyzer (Facility CEMS)	Calibration drift check	Checked using calibration gases	Daily	±3% of calibration span
Oxygen analyzer (Facility CEMS)	Calibration drift check	Checked using calibration gases	Daily	±0.5% volume

<sup>1</sup> If glass or quartz nozzles are used, only a pre-test calibration will be performed, as the calibration cannot change.

### **7.1.1 PITOT TUBES**

Each pitot tube is inspected in accordance with the geometry standards contained in USEPA Method 2 or calibrated in a wind tunnel. A calibration coefficient is calculated for each pitot tube.

### **7.1.2 DIFFERENTIAL PRESSURE GAUGES**

Fluid manometers do not require calibration other than leak checks. Manometers are leak-checked in the field prior to each test series and again upon completion of testing.

### **7.1.3 DIGITAL TEMPERATURE INDICATOR**

One digital temperature indicator is used to determine the flue gas temperature, probe temperature, oven temperature, impinger outlet temperature, and dry gas meter temperature. The digital temperature indicator is calibrated with a reference thermocouple and potentiometer system that is calibrated against National Institute of Standards and Technology (NIST) standards or calibrated versus an ASTM mercury in-glass thermometer. The calibration is acceptable if the agreement is within ±1.5 percent in degrees Rankine (°R) in the temperature range of 460 to 1,600°R (0 to 1,140°F).

### **7.1.4 DRY GAS METER AND ORIFICE**

A set of calibrated orifices is used to calibrate the dry gas meter and orifice. For the meter orifice, an orifice calibration factor is calculated using three different sized calibrated orifices. Each calibrated orifice is measured twice for a total of six measurements. Alternatively, a reference dry gas meter is used to calibrate the field dry gas meter over a range of five different meter pressures. For the dry gas meter, the full calibration provides the calibration factor of the dry gas meter.

### **7.1.5 BAROMETER**

The stack sampling contractor will use a purchased, factory-calibrated, NIST traceable barometer. The barometer calibrations are good for one year, and the barometer is disposed of when the calibration expires. Alternatively, the stack sampling contractor personnel will calibrate a barometer prior to arrival onsite against a National Weather Service station.

---

### **7.1.6 NOZZLE**

Nozzles will be calibrated onsite using a micrometer. At least three readings will be taken at quarter turns. The arithmetic average of the values obtained during the calibration is used.

### **7.1.7 CONTINUOUS EMISSIONS MONITORS**

The stack sampling contractor will supply CEMS to measure the concentrations of carbon dioxide, oxygen, and HC in the stack gas. The monitors will be calibrated according to the procedures outlined in the respective test methods.

The facility's CEMS will be used to measure the concentrations of CO and oxygen in the stack gas. A calibration drift check is performed daily as required by the Appendix to HWC NESHAP.

### **7.1.8 FOURIER TRANSFORM INFRARED ANALYZERS**

The FTIR analyzer will be calibrated according to the procedures outlined in the test method. After providing ample time for the analyzer to reach the desired temperature and to stabilize, zero gas (nitrogen) will be introduced directly to the instrument sample port. While flowing nitrogen, the signal amplitude will be recorded, a background spectra will be taken, a linearity check will be performed and recorded, the peak to peak noise and the root mean square in the spectral region of interest will be measured, and a screenshot will be recorded.

Following the zero gas checks, ambient air will be pulled through the sample chamber, and the line width and resolution will be verified to be at 1,879 reciprocal centimeters ( $\text{cm}^{-1}$ ). The peak position will be entered, and the full-width at half height will be recorded (screenshot). Following these checks, another background spectra will be recorded, and the calibration transfer standard (CTS) will be introduced directly to the instrument sample port. The CTS instrument recovery will be recorded, and the instrument mechanical response time will be measured.

The stack gas will be introduced to the analyzer through the sampling system, and several scans will be taken until a stable reading is achieved. The native concentration of the spiking analyte will be recorded. Spike gas will be introduced to the sampling system at a constant flow rate less than or equal to ten percent of the total sample flow rate, and a corresponding dilution ratio will be calculated along with a system response time. Matrix spike recovery spectra will be recorded to compare to against method requirements.

The matrix spike recovery will be conducted once at the beginning of the testing, and the CTS recovery procedures will be repeated following each test run. The corresponding values will be recorded.

## **7.2 ANALYTICAL EQUIPMENT**

Analytical equipment calibration and QC procedures and internal QC checks are included to ensure accuracy of the measurements made by laboratory equipment. Table 7-2 provides a summary of the calibration and QC checks included for each analytical method for this test program.

**TABLE 7-2**  
**ANALYTICAL EQUIPMENT CALIBRATION AND QUALITY CONTROL CHECKS**

PARAMETER	QUALITY CONTROL CHECK	METHOD OF DETERMINATION	FREQUENCY	ACCEPTANCE CRITERIA
Density	Initial calibration	Average of at least three determinations	Before analysis and as needed	≤0.5% relative standard deviation
Higher heating value	Initial calibration	Running average of 10 daily calibration standards	Initially and as needed	≤1% relative standard deviation
	Calibration check	Instrument calibration verification	Daily	±1% difference
Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	Initial calibration	Five high resolution concentration calibration solutions	Prior to sample analysis	1. Mean relative response factor for unlabeled standards: <10% relative standard deviation 2. Mean relative response factor for labeled reference compounds: <20% relative standard deviation
	Calibration verification	Midlevel standard	At least once per shift	1. Response factors within ±25% of the initial calibration mean relative response factor for unlabeled standards 2. Response factors within ±25% of the initial calibration mean relative response factor for pre-sampling adsorbent standard and pre-extraction filter recovery standard 3. Response factors within ±30% of the initial calibration mean relative response factor for pre-extraction standard and alternative recovery standard
	Retention time window verification and gas chromatograph column performance	Monitor retention times, verify gas chromatograph column performance	At the beginning of each shift	Compliance with USEPA Method 23

## 7.3 PREVENTATIVE MAINTENANCE

To ensure the quality and reliability of the data obtained, preventative maintenance is performed on the sampling and analytical equipment. The following sections outline those procedures.

### 7.3.1 SAMPLING EQUIPMENT

An in-house equipment maintenance program is part of routine operations. The maintenance program's strengths include:

- Availability of personnel experienced in the details of equipment maintenance and fabrication;
- Maintenance of an adequate spare parts inventory; and
- Availability of tools and specialized equipment.

For field equipment, preventive maintenance schedules are developed from historical data. Table 7-3 gives specific maintenance procedures for field equipment. Maintenance schedules for major analytical instruments (*e.g.*, balances, gas chromatographs) are based on manufacturer's recommendations.

**TABLE 7-3**  
**MAINTENANCE ACTIVITIES FOR FIELD SAMPLING EQUIPMENT**

EQUIPMENT	MAINTENANCE ACTIVITIES	SPARE PARTS
Vacuum system	Before and after field program: 1) Check oil and oiler jar 2) Leak check 3) Verify vacuum gauge is functional  Yearly or as needed: 1) Replace valves in pump	Spare fluid
Inclined manometer	Before and after each field program: 1) Leak check 2) Check fluid for discoloration or visible matter  Yearly or as needed: 1) Disassemble and clean 2) Replace fluid	Spare fluid, O-rings
Dry gas meter	Before and after each field program: 1) Check meter dial for erratic rotation  Every 3 months: 1) Remove panels and check for excessive oil or corrosion 2) Disassemble and clean	None
Nozzles	Before and after each test: 1) Verify no dents, corrosion, or other damage 2) Glass or quartz nozzles, check for chips and cracks	Spare nozzles
Diaphragm pump	Before and after each test: 1) Leak check, change diaphragm if needed	None
Miscellaneous	Check for availability of spare parts	Fuses, fittings, thermocouples, thermocouple wire, variable transformers.

### 7.3.2 ANALYTICAL EQUIPMENT

In addition to including QC checks in the analysis of test program samples, the laboratories also perform regular inspection and maintenance of the laboratory equipment. Table 7-4 lists some of the routine maintenance procedures associated with the analytical equipment to be used in this test program.

**TABLE 7-4**  
**MAINTENANCE ACTIVITIES FOR ANALYTICAL EQUIPMENT**

PARAMETER	EQUIPMENT	MAINTENANCE PROCEDURES
Polycyclic aromatic hydrocarbons and polychlorinated biphenyls	High resolution gas chromatograph/high resolution mass spectroscopy	<ol style="list-style-type: none"> <li>1. Change rotary pump oil</li> <li>2. Clean beam center/focus stack and outer source</li> <li>3. Clean ion volume</li> <li>4. Change source slit</li> </ol>

## 8.0 DATA REDUCTION, VALIDATION, AND REPORTING

This section presents the approaches to be used to reduce, validate, and report measurement data. With respect to the test, a quality team of companies and laboratories will be working together to ensure the success of this project. The team will make certain that:

- All raw data packages are paginated and assigned a unique project number. Each project number will reflect the type of analyses performed (*i.e.*, organic, inorganic, waste feed, air emissions).
- Each data package contains a case narrative, sample description information, sample receipt information, COC documentation, and summary report. All associated QA/QC results, run/batch data, instrument calibration data, sample extraction/preparation logs, and chromatograms, *etc.* will be included in each final laboratory report. Each report will also contain a list of validation qualifiers.
- These data are assigned to a specific appendix in the test report for easy reference and data review.

### 8.1 DATA REDUCTION

The methods referenced in this QAPP for field measurements and lab analyses are standard methods and are routinely used for such measurements and analyses. Data reduction procedures will follow the specific calculations presented in the reference methods.

Extreme care will be exercised to ensure hand-recorded data are written accurately and legibly. Additionally, prepared and formatted data recording forms will be required for all data collection. This is an important aid to verify all necessary data items are recorded. The collected field and laboratory data will be reviewed for correctness and completeness.

The stack sampling contractor will reduce and validate the sampling and field measurement data. The sampling data will include flow measurements, calibrations, *etc.* Each laboratory will reduce all analytical results prior to submission. The analytical data will be used to determine concentrations and emission rates of the compounds of interest. The way the derived quantities will be reported is discussed in Section 8.3.

### 8.2 DATA VALIDATION

Validation demonstrates that a process, item, data set, or service satisfies the requirements defined by the user. For this program, review and evaluation of documents and records will be performed to assess the validity of samples collected, methodologies used, and data reported. This review comprises three parts: review of field documentation, review of laboratory data reports, and evaluation of data quality. The Offsite Project Coordinator will have overall responsibility for data validation.

---

The sampling and analytical methods for this program have been selected because of their accepted validity for these types of applications. Adherence to the accepted methods, as described in this QAPP, is the first criterion for validation. The effectiveness of the analytical methods as applied to this study will be evaluated based on project-specific quality indicators, such as audit samples, replicate samples, and matrix and surrogate spikes.

### **8.2.1 REVIEW OF FIELD DOCUMENTATION**

Sample validation is intended to ensure samples collected are representative of the population under study. Criteria for acceptance include positive identification, documentation of sample shipment, preservation and storage, and documentation demonstrating adherence to sample collection protocols and QC checks. As part of the review of field documentation, field data sheets will be checked for completeness, correctness, and consistency.

### **8.2.2 LABORATORY REVIEW OF DATA**

The representative from each laboratory will approve all data results. The representative's signature will be included in the report. This signature will indicate that all QA/QC expectations were met. If expectations were not met, the discrepancies will be explained in the laboratory case narrative. The laboratory representative will discuss the QA/QC issues and include the impact of these issues on the data results in the case narrative.

Laboratory raw data packages will include the following information:

- A table of contents for the raw data; and
- Numbered pages, correlating to the table of contents.

### **8.2.3 EVALUATION OF DATA QUALITY**

Under the direction of the Offsite Project Coordinator, the project team will review and evaluate the reported data. Data quality will be assessed. Review of the laboratory reports will result in an evaluation of the following parameters:

- Holding time for samples from date of collection to date of preparation and/or analysis;
- Sample storage conditions during the holding period prior to analysis;
- Tuning and calibration of instruments;
- PARCC parameter results and acceptance criteria;
- Blank sample analysis results; and
- Performance evaluation (audit) sample results, if applicable.

## **8.3 DATA REPORTING**

The test report will be submitted to USEPA by August 30, 2024, or an extension will be requested.

---

All data will be reported in the appropriate units as applicable to the sample stream and the method of analysis. Waste analytical results will be reported as concentrations by weight. Stack gas results will be reported on a concentration basis and mass emission rates.

Specific procedures will be followed when reporting test results. This section describes the conventions for detection limits, blank correction, and the use of significant figures.

### **8.3.1 MANAGEMENT OF NON-DETECTS**

There are several specific situations that will arise in which calculations will need to be performed, but the analytical results are non-detects (at some level). Contracted laboratories are requested to achieve the lowest detection limits possible for each of the methods included in this QAPP. All detection limits shall be defined in the laboratory reports. No data results shall be reported as “ND” without a defined numerical value provided as the detection limit.

The procedures for handling non-detects will be communicated to each laboratory and the stack sampling contractor. When dealing with detection limits and non-detect data, the following guidelines will be used:

- Method detection limits (MDLs) will be used to report waste analytical data;
- MDLs, reliable detection limits (RDLs), or estimated detection limits (EDLs) will be used to report stack gas analytical data, as appropriate; and
- Any results that use non-detects will be reported as maxima (*i.e.*, with a less-than sign – “<”).

### **8.3.2 BACKGROUND/BLANK CORRECTION**

No methods used in this test program allow background or blank correction. Every effort will be made to use reagents and sampling media of the highest quality to ensure that no contamination is indicated in any of the blank samples. Any background contamination found will be documented.

### **8.3.3 ROUNDING AND SIGNIFICANT FIGURES**

Observational results will be made with as many significant figures as possible. Rounding will be deferred until all resultant calculations have been made. The following rules will be applied in rounding data:

- When the digit after the one to be rounded is less than five, the one to be rounded is left unchanged; and
- When the digit after the one to be rounded is greater than or equal to five, the one to be rounded is increased by one.

Intermediate results will be presented in the final report at an appropriate level of significance (*i.e.*, rounded), although the derived, or resultant, calculations will be based on unrounded intermediate data. Consequently, it may not be possible to precisely reconstruct the resultant calculations on any table from the rounded intermediate results due to rounding errors.

## 9.0 QUALITY ASSURANCE REPORTS

Activities affecting data quality will be reviewed by the project team daily in the field, and as appropriate during non-field efforts. This will allow assessment of the overall effectiveness of the QAPP. These reviews will include the following:

- Summary of key QA activities, stressing measures that are being taken to ensure adherence to the QAPP;
- Description of problems observed that may impact data quality and corrective actions taken;
- Status of sample shipment and integrity at time of receipt and progress of sample analysis;
- Assessment of the QC data gathered over that time period;
- Any changes in QA organizational activities and personnel; and
- Results of internal or external assessments and the plan for correcting identified deficiencies, if any.

The testing program will have multiple tiers of QA/QC reviews. The specific laboratory performing the analysis will review the data for which they are responsible, and the laboratory project manager will sign the analytical data reports. Any QA/QC anomalies will be discussed in the case narrative. The Offsite Project Coordinator will also review the laboratory data package to discuss how the QA/QC anomalies may impact the emissions calculations. Any data determined to be invalid will be stated in the final report, and the impact of the invalid data on the test program will be assessed. Through this multiple tier process, all stages of the testing program will be tracked, monitored, reviewed, and documented.

## **Appendix C:**

### **WASTE LIQUID FUEL SAMPLING REPORT**

---

## WASTE LIQUID FUEL SAMPLING REPORT

During each test run, waste liquid fuel was sampled and analyzed for higher heating value and density. BASF Corporation (BASF) personnel collected the waste liquid fuel samples using a tap sampling procedure. The sampling tap was located in the waste liquid fuel feed line. The sample tap was clearly identified and was inspected by the Emission Test Manager prior to testing.

Samples were collected at the beginning, middle, and end of each test run. At each sampling event, approximately 150 milliliters (mL) of the waste stream was collected into two separate bottles. At the conclusion of the run, each bottle had approximately 450 mL of sample.

The field duplicate samples were collected as described in the quality assurance project plan (QAPP). The field duplicates were collected during Run 3.

All samples were properly logged on the waste sampling forms. These forms indicate sampler's initials, the run number, the date, and the time the sample was collected. The completed forms are included in this waste liquid fuel sampling report.

Alliance Technical Group, LLC (Alliance) has completed the source testing as described in this report. Results apply only to the source tested and operating conditions for the specific test dates and times identified within this report. All results are intended to be considered in their entirety, and Alliance is not responsible for use of less than the complete test report without written consent. This report shall not be reproduced in full or in part without written approval from the customer.

To the best of my knowledge and abilities, all information, facts and test data are correct. Data presented in this report has been checked for completeness and is accurate, error-free and legible. Onsite testing was conducted in accordance with approved internal Standard Operating Procedures. Any deviations or problems are detailed in the relevant sections in the test report.

This report is only considered valid once an authorized representative of Alliance has signed in the space provided below; any other version is considered draft. This document was prepared in portable document format (.pdf) and contains pages as identified in the bottom footer of this document.

## Introduction

## 1.0 Introduction

Alliance Technical Group, LLC (Alliance) was retained by BASF Corporation (BASF) to conduct Clean Air Act (CAA) Section 114 information collection request (ICR) testing at the Pasadena, Texas facility at the request of the United States Environmental Protection Agency (USEPA). Testing was conducted to determine the emission concentrations of polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), total hydrocarbons (THC) and hydrogen cyanide (HCN) at the exhaust of the F-10 Boiler (EPN 84). This source is regulated under 40 CFR 63, Subpart EEE which is subject to this ICR.

## 1.1 Project Team

Personnel involved in this project are identified in the following table.

**Table 1-1: Project Team**

<b>BASF Personnel</b>	John Igoe
<b>Coterie Personnel</b>	Trevor Romans
<b>Alliance Personnel</b>	Jason Lovell Matthew Brumley Andrew Christiansen Andrew Christiansen-Gomez

## 1.2 Test Program Notes

Run 1 was voided due to waste feed issues.

Run 2 was paused at 9:37 due to inclement weather and was resumed at 12:32. Run 2 was paused again at 12:47, due to inclement weather, and was resumed at 14:04.

Calibration drift checks were performed on the Method 25A THC reference monitor hourly. Approximate 10-to-15-minute gaps in recorded THC data are noted due to these required QA checks. The EPA Method 320 HCN sampling was conducted using a shared heated sample line and therefore has corresponding data gaps during the THC QA drift checks.

## Summary of Results

## 2.0 Summary of Results

Alliance conducted CAA Section 114 ICR testing at the BASF facility in Pasadena, Texas on June 5-7, 11 and 12, 2024. Testing consisted of determining the emission rates of PAH, PCB, THC and HCN at the exhaust of the F-10 Boiler (EPN 84).

Tables 2-1 through 2-6 provide summaries of the emission testing results. All results provided in these tables are on a concentration basis. Mass emission rates are provided in Appendix B. Any difference between the summary results listed in the following tables and the detailed results contained in appendices is due to rounding for presentation.

Result Tables Flag Definitions:

**BDL** - Below Detection Level

**DLL** - Detection Level Limited

**ADL** - Above Detection Level

## Testing Methodology

### 3.0 Testing Methodology

The emission testing program was conducted in accordance with the test methods listed in Table 3-1. Method descriptions are provided below while quality assurance/quality control data is provided in Appendix D.

**Table 3-1: Source Testing Methodology**

Parameter	U.S. EPA Reference Test Methods	Notes/Remarks
Volumetric Flow Rate	1 & 2	Full Velocity Traverses
Oxygen/Carbon Dioxide	3A	Instrumental Analysis
Moisture Content	4	Gravimetric Analysis
PAH & PCB	23	Isokinetic Sampling
Total Hydrocarbons	25A	Instrumental Analysis
Hydrogen Cyanide	320	FTIR – Continuous Sampling
Gas Dilution System Certification	205	--

#### 3.1 U.S. EPA Reference Test Methods 1 and 2 – Sampling/Traverse Points and Volumetric Flow Rate

The sampling location and number of traverse (sampling) points were selected in accordance with U.S. EPA Reference Test Method 1. To determine the minimum number of traverse points, the upstream and downstream distances were equated into equivalent diameters and compared to Figure 1-1 (for isokinetic sampling) in U.S. EPA Reference Test Method 1.

Full velocity traverses were conducted in accordance with U.S. EPA Reference Test Method 2 to determine the average stack gas velocity pressure, static pressure and temperature. The velocity and static pressure measurement system consisted of a pitot tube and inclined manometer. The stack gas temperature was measured with a K-type thermocouple and pyrometer.

Stack gas velocity pressure and temperature readings were recorded during each test run. The data collected was utilized to calculate the volumetric flow rate in accordance with U.S. EPA Reference Test Method 2.

#### 3.2 U.S. EPA Reference Test Method 3A – Oxygen / Carbon Dioxide

The oxygen (O<sub>2</sub>) and carbon dioxide (CO<sub>2</sub>) testing was conducted in accordance with U.S. EPA Reference Test Method 3A. Data was collected online and reported in one-minute averages. The sampling system consisted of a stainless-steel probe, Teflon sample line(s), gas conditioning system and the identified gas analyzer. The gas conditioning system was a non-contact condenser used to remove moisture from the stack gas. A heated Teflon sample line was used. The quality control measures are described in Section 3.8.

#### 3.3 U.S. EPA Reference Test Method 4 – Moisture Content

The stack gas moisture content (BWS) was determined in accordance with U.S. EPA Reference Test Method 4. The gas conditioning train consisted of a series of chilled impingers. Prior to testing, each impinger was filled with a known quantity of water or silica gel. Each impinger was analyzed gravimetrically before and after each test run on the same balance to determine the amount of moisture condensed.

### 3.4 U.S. EPA Reference Test Method 23 – PAH and PCB

The PAH and PCB testing was conducted in accordance with U.S. EPA Reference Test Method 23. The sampling system consisted of a glass nozzle, heated glass-lined probe, glass filter holder with pre-cleaned heated glass-fiber filter, condenser coil, XAD sorbent module, gas conditioning train, pump and calibrated dry gas meter. The gas conditioning system consisted of five (5) chilled impingers. The first impinger was empty. The next two (2) impingers each contained 100 mL of water. The fourth impinger was empty while the fifth impinger was charged with 200-300 grams of silica gel. The probe liner and filter heating systems were maintained at a temperature of  $120 \pm 14^{\circ}\text{C}$  ( $248 \pm 25^{\circ}\text{F}$ ), and the impinger temperature was maintained at  $20^{\circ}\text{C}$  ( $68^{\circ}\text{F}$ ) or less throughout testing.

Method 23 Section 6.1.7 requires the condenser to be oriented at an angle to cause moisture to flow down to the XAD adsorbent module to facilitate condensate drainage. Glassware with this configuration is not currently available from a national supplier utilizing a large enough condenser to meet the temperature specifications of the method. Alliance will continue to work with manufacturers, but until equipment is widely available, the horizontal or vertical condenser configuration from traditional Method 23 was utilized.

All glassware leading to the XAD adsorbing resin trap was cleaned and sealed before mobilizing to the site. Glassware cleaning consisted of washing with warm soapy water and rinsing with distilled water and acetone. The sampling train was assembled in the sample recovery area. The glass-fiber filter was placed in a glass filter holder with a Teflon filter support and connected to the condenser coil. All open ends of the sampling train were sealed with Teflon tape prior to complete assembly at the sampling location.

Following the completion of each test run, the sampling train was leak checked at vacuum pressure greater than or equal to the highest vacuum pressure observed during the run and the contents of the impingers were measured for moisture gain. The XAD sorbent module was sealed on both ends and placed on ice. The filter was removed from the filter holder and placed in sample container 1. The nozzle, probe liner, filter holder, condenser and all connecting glassware were triple-rinsed and brushed with acetone and then toluene, and these rinses were recovered in sample container 2. The impinger water condensate was recovered into sample container 3a. All impingers were then rinsed three times with acetone and then three times with toluene and collected in sample container 3b. All containers were sealed, labeled and liquid levels marked for transport to the identified laboratory for analysis.

Method 23 Section 8.2.9 has the impinger water and solvent rinses collected in a single container (No. 3). Due to analytical method development constraints of the subcontracted laboratory, it was necessary to split this recovery between two containers: condensate (Container No. 3a) and solvent rinses (Container No. 3b).

A field train proof blank was collected. A complete sampling system was placed at the sampling location and multiple leak checks were performed on the system similar to an actual testing scenario. The sample train was then moved to the mobile laboratory for recovery. A full set of reagent blanks including a filter and a trap were also submitted to the laboratory.

Targeted PAH and PCB analytes are detailed below:

PAH Analytes			
PAH Compound	CAS Number	PAH Compound	CAS Number
Naphthalene	91-20-3	Chrysene	218-01-9
2-Methylnaphthalene	91-57-6	Benzo[b]fluoranthene	205-99-2
Acenaphthylene	208-96-8	Benzo[k]fluoranthene	207-08-9
Acenaphthene	83-32-9	Perylene	198-55-8
Fluorene	86-73-7	Benzo[a]pyrene	50-32-8
Anthracene	120-12-7	Benzo[e]pyrene	192-97-2
Phenanthrene	85-01-8	Benzo[g,h,i]perylene	191-24-2
Fluoranthene	206-44-0	Indeno[1,2,3-cd]pyrene	193-39-5
Pyrene	129-00-0	Dibenz[a,h]anthracene	53-70-3
Benz[a]anthracene	56-55-3		
PCB Analytes			
PCB Congener	CAS Number	PCB Congener	CAS Number

### 3.5 U.S. EPA Reference Test Method 25A – Total Hydrocarbons

The total hydrocarbons (THC) testing was conducted in accordance with U.S. EPA Reference Test Method 25A. Data was collected online and reported in one-minute averages. The sampling system consisted of a stainless-steel probe, heated Teflon sample line(s) and the identified gas analyzer. The quality control measures are described in Section 3.9.

### 3.6 U.S. EPA Reference Test Method 320 – Hydrogen Cyanide

The concentration of hydrogen cyanide (HCN) was determined in accordance with U.S. EPA Reference Test Method 320. Each source gas stream was extracted at a constant rate through a heated probe, heated filter and heated sample line and analyzed with a MKS MultiGas 2030 FTIR operated by a portable computer. The computer has FTIR spectra of calibration gases stored on the hard drive. These single component calibration spectra are used to analyze the measured sample spectra. The gas components to be measured were selected from the spectra library and incorporated into the analytical method. The signal amplitude, linearity, and signal to noise ratio were measured and recorded to document analyzer performance. A leak check was performed on the sample cell. The instrument path length was verified using ethylene as the Calibration Transfer Standard. Dynamic spiking was performed using a certified standard of the target compound in nitrogen with sulfur hexafluoride blended as a tracer to calculate the dilution factor. All test spectra, interferograms, and analytical method information are recorded and stored with the calculated analytical results. The quality control measures are described in Section 3.10.

### 3.7 U.S. EPA Reference Test Method 205 – Gas Dilution System Certification

A calibration gas dilution system field check was conducted in accordance with U.S. EPA Reference Method 205. An initial three (3) point calibration was conducted, using individual Protocol 1 gases, on the analyzer used to complete the dilution system field check. Multiple dilution rates and total gas flow rates were utilized to force the dilution system to perform two dilutions on each mass flow controller. The diluted calibration gases was sent directly to the analyzer, and the analyzer response recorded in an electronic field data sheet. A mid-level supply gas, with a cylinder concentration within 10% of one of the gas divider settings described above, was introduced directly to the analyzer, and the analyzer response recorded in an electronic field data sheet. The cylinder concentration and the analyzer response agreed within 2%. These steps were repeated three (3) times. The average analyzer response agreed within 2% of the predicted gas concentration. No single injection differed more than 2% from the average instrument response for that dilution. Copies of the Method 205 data can be found in the Quality Assurance/Quality Control Appendix.

### 3.8 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 3A

Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

Low Level gas was introduced directly to the analyzer. After adjusting the analyzer to the Low-Level gas concentration and once the analyzer reading was stable, the analyzer value was recorded. This process was repeated for the High-Level gas. For the Calibration Error Test, Low, Mid, and High Level calibration gases were sequentially introduced directly to the analyzer. All values were within 2.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe and the time required for the analyzer reading to reach 95 percent or 0.5% (whichever was less restrictive) of the gas concentration was recorded. The analyzer reading was observed until it reached a stable value, and this value was recorded. Next, Low Level gas was introduced at the probe and the time required for the analyzer reading to decrease to a value within 5.0 percent or 0.5% (whichever was less restrictive) was recorded. If the Low-Level gas was zero gas, the response was 0.5% or 5.0 percent of the upscale gas concentration (whichever was less restrictive). The analyzer reading was observed until it reached a stable value and this value was recorded.

The measurement system response time and initial system bias were determined from these data. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference.

High or Mid-Level gas (whichever was closer to the stack gas concentration) was introduced at the probe. After the analyzer response was stable, the value was recorded. Next, Low Level gas was introduced at the probe, and the analyzer value recorded once it reached a stable response. The System Bias was within 5.0 percent of the Calibration Span or 0.5% absolute difference or the data was invalidated and the Calibration Error Test and System Bias were repeated.

Drift between pre- and post-run System Bias was within 3 percent of the Calibration Span or 0.5% absolute difference. If the drift exceeded 3 percent or 0.5%, the Calibration Error Test and System Bias were repeated.

To determine the number of sampling points, a gas stratification check was conducted prior to initiating testing. The diluent concentrations were measured at three points (16.7, 50.0 and 83.3 percent of the measurement line). Each traverse point was sampled for a minimum of twice the system response time. The diluent concentration at each traverse point did not differ more than 5 percent of the average diluent concentration, and single point sampling was conducted during the test runs. Copies of stratification check data can be found in the Field Data Appendix.

A Data Acquisition System with battery backup was used to record the instrument response in one (1) minute averages. The data was continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data was also saved to the Alliance server. All data was reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data was relinquished to the report coordinator and then a final review was performed by the Project Manager.

### **3.9 Quality Assurance/Quality Control – U.S. EPA Reference Test Method 25A**

Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

Within two (2) hours prior to testing, zero gas was introduced through the sampling system to the analyzer. After adjusting the analyzer to the Zero gas concentration and once the analyzer reading was stable, the analyzer value was recorded. This process was repeated for the High-Level gas, and the time required for the analyzer reading to reach 95 percent of the gas concentration was recorded to determine the response time. Next, Low and Mid-Level gases were introduced through the sampling system to the analyzer, and the response was recorded when it was stable. All values were less than +/- 5 percent of the calibration gas concentrations.

Mid-Level gas was introduced through the sampling system. After the analyzer response was stable, the value was recorded. Next, Zero gas was introduced through the sampling system, and the analyzer value recorded once it reached a stable response. The Analyzer Drift was less than +/- 3 percent of the span value. Analyzer drift checks were conducted once hourly during testing.

A Data Acquisition System with battery backup was used to record the instrument response in one (1) minute averages. The data was continuously stored as a \*.CSV file in Excel format on the hard drive of a computer. At the completion of testing, the data was also saved to the Alliance server. All data was reviewed by the Field Team Leader before leaving the facility. Once arriving at Alliance's office, all written and electronic data was relinquished to the report coordinator and then a final review was performed by the Project Manager.

### **3.10 Quality Assurance/Quality Control – U.S. EPA Reference Method 320**

EPA Protocol 1 Calibration Gases – Cylinder calibration gases used met EPA Protocol 1 (+/- 2%) standards. Copies of all calibration gas certificates can be found in the Quality Assurance/Quality Control Appendix.

After providing ample time for the FTIR to reach the desired temperature and to stabilize, zero gas (nitrogen) was introduced directly to the instrument sample port. While flowing nitrogen the signal amplitude was recorded, a background spectra was taken, a linearity check was performed and recorded, the peak to peak noise and the root mean square in the spectral region of interest was measured and a screenshot was recorded.

Following the zero gas checks, room air was pulled through the sample chamber and the line width and resolution was verified to be at 1879 cm<sup>-1</sup>, the peak position was entered and the FWHH was recorded (screenshot). Following these checks, another background spectra was recorded and the calibration transfer standard (CTS) was introduced directly to the instrument sample port. The CTS instrument recovery was recorded and the instrument mechanical response time was measured.

Next, stack gas was introduced to the FTIR through the sampling system and several scans were taken until a stable reading was achieved. The native concentration of our target spiking analyte (HCN) was recorded. Spike gas was introduced to the sampling system at a constant flow rate  $\leq 10\%$  of the total sample flow rate and a corresponding dilution ratio was calculated along with a system response time. Matrix spike recovery spectra were recorded and were within the  $\pm 30\%$  of the calculated value of the spike concentration that the method requires.

The matrix spike recovery was conducted once at the beginning of the testing and the CTS recovery procedures were repeated following each test run. The corresponding values were recorded.

### Stack Parameters

Duct Orientation: Vertical  
Duct Design: Circular  
Distance from Far Wall to Outside of Port: 59.25 in  
Nipple Length: 6.50 in  
Depth of Duct: 52.75 in  
Cross Sectional Area of Duct: 15.18 ft<sup>2</sup>  
No. of Test Ports: 2  
Distance A: 25.0 ft  
Distance A Duct Diameters: 5.7 (must be  $\geq 0.5$ )  
Distance B: 50.0 ft  
Distance B Duct Diameters: 11.4 (must be  $\geq 2$ )  
Minimum Number of Traverse Points: 12  
Actual Number of Traverse Points: 12  
Number of Readings per Point: 4  
Measurer (Initial and Date): ACG 6/3/24  
Reviewer (Initial and Date): MBB 6/3/24

### SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of k=2 to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

## CERTIFIED GAS CERTIFICATE OF ANALYSIS

Cylinder Number:	EB0087432	Certification Date:	04/24/2023
Product ID Number:	124838	Expiration Date:	04/23/2025
Cylinder Pressure:	1900 PSIG	MFG Facility:	- Shreveport - LA
COA #	EB0087432.20230423-0	Lot Number:	EB0087432.20230423
Customer PO. NO.:		Tracking Number:	083082405
Customer:		Previous Certification Dates:	

This mixture is for laboratory use only, not for drug, household or other use.  
This mixture is certified in Mole % to be within  $\pm 2\%$  of the actual number reported with a confidence of 95%.  
This mixture was manufactured by scale; weights traceable to N.I.S.T. Certificate #822/266926-02.  
Do Not Use This Cylinder Below 100 psig (0.7 Megapascal).

### Certified Concentration(s)

Component	Concentration	Uncertainty	Analytical Principle
Ethylene	99.7 PPM	$\pm 2\%$ NIST	FTIR
Nitrogen	Balance		

Analytical Measurement Data Available Online.

### Reference Standard(s)

Serial Number	Lot	Expiration	Type	Balance	Component	Concentration	Uncertainty(%)	NIST Reference
CC518673	CC518673	07/27/2023	PS	N2	C2H4	99.8 PPM	2	4011772

### Analytical Instrumentation

Component	Principle	Make	Model	Serial	MPC Date
C2H4	FTIR	MKS	MKS 2031DJG2EKVS13T	017146467	

### SMART-CERT

This is to certify the gases referenced have been calibrated/tested, and verified to meet the defined specifications. This calibration/test was performed using Gases or Scales that are traceable through National Institute of Standards and Technology (NIST) to the International System of Units (SI). The basis of compliance stated is a comparison of the measurement parameters to the specified or required calibration/testing process. The expanded uncertainties use a coverage factor of  $k=2$  to approximate the 95% confidence level of the measurement, unless otherwise noted. This calibration certificate applies only to the item described and shall not be reproduced other than in full, without written approval from Red Ball Technical Gas Services. If not included, the uncertainty of calibrations are available upon request and were taken into account when determining pass or fail.

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Austin Abranovic  
Alliance Source Testing, LLC  
214 Central Circle SW  
Decatur AL 35603

Generated 7/17/2024 10:06 AM

## JOB DESCRIPTION

BASF Pasadena TX Waste Feed

## JOB NUMBER

140-37217-1

# Eurofins Knoxville

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

## Authorization

Job ID: 140-37217-1

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▣	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Sample Summary

# Method Summary

Client: Alliance Source Testing, LLC  
Project/Site: BASF Pasadena TX Waste Feed

Job ID: 140-37217-1

Method	Method Description	Protocol	Laboratory
D1475	Density	ASTM	EET KNX
D240	Heat of Combustion	ASTM	EET KNX

**Protocol References:**

ASTM = ASTM International

**Laboratory References:**

EET KNX = Eurofins Knoxville, 5815 Middlebrook Pike, Knoxville, TN 37921, TEL (865)291-3000

**Job Narrative**  
**140-37217-1**

**Receipt**

The samples were received on 6/19/2024 9:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 20.1° C.

**Receipt Exceptions**

The Field Sampler was not listed on the Chain of Custody.

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. Matrix not listed, logged per project requirements.

The following samples were submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): WASTE FEED-COMPOSITE-RUN 3A DUP (140-37217-15) and WASTE FEED-COMPOSITE-RUN 3B DUP (140-37217-16)

**General Chemistry**

Gross Calorific Value: The heat of combustion (gross calorific value) of the samples was determined using SOP number KNOX-WC-0010 (based on ASTM Method D5865 for solids and ASTM Method D240 for liquids). A waste feed sample is combusted in an oxygen bomb that has been placed in a bomb calorimeter. The energy released during this combustion process is captured in the calorimeter, and the temperature rise of a water bath surrounding the bomb is measured. The temperature rise is proportional to the heat liberated during the combustion in calories. The gross calorific value is calculated from the temperature rise, the sample weight, and the calibration coefficient of the calorimeter. Certain extraneous sources of heat are assessed, and the effect of these heat sources is accounted for in the calculation, as well as the effect of various accelerants that are added to enhance combustion of the sample. The gross heat of combustion is calculated in units of cal/g using the following equation:

$$Q \text{ (gross)} = [(\Delta tEE) - (e1+e2+e3+e4)] / m$$

Where:

Q (gross) = Gross calorific value at constant volume as determined, cal/g

EE = Heat capacity of the calorimeter, cal/°C

Δt = Corrected temperature rise as measured by the calorimeter, °C

e1 = Correction for heat of formation of nitric acid in calories, calculated by the calorimeter based on the energy released by the sample

e2 = Correction for sulfur, which is usually 0

e3 = Correction for fuse wire

e4 = Correction for spike addition that is calculated by the calorimeter using the spike weight benzoic acid equivalent (grams) times the benzoic acid heat of combustion (6318 cal/g)

m = Mass of the sample, g

The results are converted to Btu/lb, as necessary using the following conversion factor: 1 cal/g = 1.8 Btu/lb.

Method D1475: Density: The density (or specific gravity) of the samples was determined using SOP number KNOX-WC-0015, based on ASTM Methods D1475 (replaced D1963) and D854. A Hubbard-Carmick type pycnometer is tared on a four-place analytical balance. The pycnometer filled with water is weighed to calibrate the volume at the desired temperature. The pycnometer filled with sample is weighed to determine the weight of the sample at the calibrated volume. The standard temperature for this procedure is 25.0°C. The density and specific gravity of the material are calculated using the following equations:

$$d(\text{SAMP}) = [C(T) - A] / V(T)$$

Where:

d(SAMP) = Density of the liquid sample at temperature T, g/cm<sup>3</sup>

C(T) = Weight of pycnometer filled with sample at temperature T, g

A = Weight of pycnometer, g

V(T) = Volume of pycnometer at temperature T, cm<sup>3</sup>

$$d(\text{SAMP}) = [C(T) - A] / [V(T) - [(D(T) - C(T)) / dH_2O(T)]]$$

Where:

d(SAMP) = Density of the solid sample at temperature T, g/cm<sup>3</sup>  
D(T) = Weight of pycnometer filled with water and an aliquot of the sample at temperature T, g  
C(T) = Weight of pycnometer partially filled with an aliquot of the sample at temperature T, g  
A = Weight of pycnometer, g  
dH<sub>2</sub>O(T) = Density of pure water at temperature T, g/cm<sup>3</sup>  
V(T) = Volume of pycnometer at temperature T, cm<sup>3</sup>

$$S(T) = d(\text{SAMP}) / d\text{H}_2\text{O}(T)$$

Where:

S(T) = Specific gravity of the sample at temperature T, unitless

d(SAMP) = Density of the sample at temperature T, g/cm<sup>3</sup>

dH<sub>2</sub>O(T) = Density of pure water at temperature T, g/cm<sup>3</sup>

T = Temperature of analysis

Conversion factors:

1 lb/gal = 0.1198 g/cm<sup>3</sup>

1 Kg/cu. m = 0.001 g/cm<sup>3</sup>

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Eurofins TestAmerica Knoxville Heat of Combustion Data Review / Narrative Checklist

Methods: ASTM D5865, D240 by SOP KNOX-WC-0010, Rev. 8

Page 1 of 1

Batch Number:	88720	Job Number(s):	140-37090, 400-257786, 140-37217		
Analysis Date:	07-16-2024	Analyst Name:	TMB/TGR	Method Citation	<input type="checkbox"/> D5865 <input checked="" type="checkbox"/> D240

Review Items	N/A	Y	N	If No, why is data reportable?	2nd √
<b>Section 1. Calibration</b>					
1. Was a <b>weekly</b> calibration check performed for each bomb/bucket combination and %D $\leq$ 1%?		X			X
2. Is the %D for the weekly calibration check $\leq$ 1%?		X		If not $\leq$ 1.0%, discard data and repeat.	X
3. Was the final weekly calibration successful? (%D $\leq$ 1.0%)		X			X
4. Is the initial calibration complete, with at least ten calibration runs?		X			X
5. Are the previous ten calibration runs recorded on the calorimeter calibration worksheet?		X			X
6. Does the rolling average show a %RSD $\leq$ 1.0%?		X			X
<b>Section 2. Client Sample Analysis</b>					
1. Were all special project requirements met? (Review Project Notes, Project Documents, and Comments in Backlog)		X			X
2. Were sample IDs verified?		X			X
3. Were all weights entered directly into TALS?		X			X
4. Were all transcriptions checked? (Check transcription of data from calorimeter to TALS worksheet ( $\Delta t$ , Acid Correction))		X			X
5. Were any data collected by writing the values on paper?			X		X
6. Are all written entries neat, professional, and scanned into the documents section of the TALS batch?	n/a				X
7. Calculations checked for error? (Verify that the final instrument result = calculated result on spreadsheet (to 3 significant figures))		X			X
<b>Section 3. Preparation/Matrix QC</b>					
1. LCS/LCSD done per batch of up to twenty samples?		X			X
2. LCS/LCSD recoveries within laboratory established QC limits? (98-102%)		X			X
3. LCS/LCSD RPD within laboratory established QC limits? ( $\leq$ 2.0% RPD)		X			X
4. Was a duplicate sample analyzed per batch of up to 10 samples?			X	Duplicate sample analyzed per batch of up to 20 samples per SOP.	X
5. DUP RPD $\leq$ 10.0%? If no, list ID:		X		____ [F5] OS &/or DUP < 5xRL, absolute difference < RL ____ [Option] MS/MSD/DUP-%RPD.NCM: _____	X
<b>Section 4. TALS Reporting</b>					
1. If Batch Information Complete?		X			X
2. Batch QC linked correctly?		X			X
3. Is raw data from calorimeter and calibration summary attached as a default file?		X			X
4. Are all non-conformances documented (NCM Manager)?	n/a			NCM Number(s): _____	X
5. Was appropriate narrative NCM added (NCM Create/Edit)?		X		<input checked="" type="checkbox"/> [5853]	X
6. Final report acceptable? (Results, units, analysis dates are correct. Flags and/or errors were addressed.)		X			X

## EUROFINS KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST Log In Number:

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Are the shipping containers intact?	✓			<input type="checkbox"/> Containers, Broken	NO Custody Seal
2. Were ambient air containers received intact?			✓	<input type="checkbox"/> Checked in lab	Received ambient for 20.01.20.14
3. The coolers/containers custody seal if present, is it intact?			✓	<input type="checkbox"/> Yes <input type="checkbox"/> NA	LAB 6-19-24 Hand delivered
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID: 5076 Correction factor: +0.1°C			✓	<input type="checkbox"/> Cooler Out of Temp, Client Contacted, Proceed/Cancel <input type="checkbox"/> Cooler Out of Temp, Same Day Receipt	6) 3A Dup 3B Dup
5. Were all of the sample containers received intact?	✓			<input type="checkbox"/> Containers, Broken	10
6. Were samples received in appropriate containers?	✓			<input type="checkbox"/> Containers, Improper; Client Contacted; Proceed/Cancel	13
7. Do sample container labels match COC? (IDs, Dates, Times)	✓			<input type="checkbox"/> COC & Samples Do Not Match <input type="checkbox"/> COC Incorrect/Incomplete <input type="checkbox"/> COC Not Received	
8. Were all of the samples listed on the COC received?	✓	✓		<input checked="" type="checkbox"/> Sample Received, Not on COC <input type="checkbox"/> Sample on COC, Not Received	
9. Is the date/time of sample collection noted?	✓			<input type="checkbox"/> COC; No Date/Time; Client Contacted	Labeling Verified by: _____ Date: _____
10. Was the sampler identified on the COC?		✓		<input checked="" type="checkbox"/> Sampler Not Listed on COC	pH test strip lot number: _____
11. Is the client and project name/# identified?	✓			<input type="checkbox"/> COC Incorrect/Incomplete	
12. Are tests/parameters listed for each sample?	✓			<input type="checkbox"/> COC No tests on COC	
13. Is the matrix of the samples noted?	✓	✓		<input checked="" type="checkbox"/> COC Incorrect/Incomplete	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			<input type="checkbox"/> COC Incorrect/Incomplete	Box 16A: pH Preservation Box 18A: Residual Chlorine
15. Were samples received within holding time?	✓			<input type="checkbox"/> Holding Time - Receipt	Preservative: _____
16. Were samples received with correct chemical preservative (excluding Encore)?			✓	<input type="checkbox"/> pH Adjusted, pH Included (See box 16A) <input type="checkbox"/> Incorrect Preservative	Lot Number: _____
17. Were VOA samples received without headspace?			✓	<input type="checkbox"/> Headspace (VOA only)	Exp Date: _____
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number: _____			✓	<input type="checkbox"/> Residual Chlorine	Analyst: _____
19. For 1613B water samples is pH<9?			✓	<input type="checkbox"/> If no, notify lab to adjust	Date: _____
20. For rad samples was sample activity info. Provided?			✓	<input type="checkbox"/> Project missing info	Time: _____
Project #: 14007031 PM Instructions: _____					

Sample Receiving Associate: Ch Dema Date: 6-19-24

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Austin Abranovic  
Alliance Source Testing LLC  
214 Central Circle SW  
Decatur AL 35603

Generated 9/6/2024 4:19 PM Revision 1

## JOB DESCRIPTION

BASF Pasadena TX M23

## JOB NUMBER

140-37234-1

# Eurofins Knoxville

## Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

## Authorization

## Qualifiers

### Dioxin

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
C	The compound co-eluted with other compounds
C129	The compound co-eluted with PCB-129
C156	The compound co-eluted with PCB-156
C20	The compound co-eluted with PCB-20
C90	The compound co-eluted with PCB-90
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.
S	Ion suppression
S1-	Surrogate recovery exceeds control limits, low biased.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▣	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Method Summary

Client: Alliance Source Testing LLC  
Project/Site: BASF Pasadena TX M23

Job ID: 140-37234-1

Method	Method Description	Protocol	Laboratory
23	Chlorinated Biphenyl Congeners (Stationary Source)	EPA	EET KNX
23	Polycyclic Aromatic Hydrocarbons (Stationary Source)	EPA	EET KNX
Combined Prep	Extraction, Source Air Samples (Combined)	None	EET KNX
Split	Source Air Split	None	EET KNX

### Protocol References:

EPA = US Environmental Protection Agency

None = None

### Laboratory References:

140-37234-7	M23 F-10 BOILER RUN 8 COMBINED	Air	06/12/24 16:26	06/19/24 09:00
140-37234-8	M23 F-10 BOILER BT COMBINED	Air	06/03/24 17:00	06/19/24 09:00
140-37234-14	M23 MEDIA CHECK A-2229 FILTER, A-2228 XAI COMBINED	Air	06/03/24 00:00	06/19/24 09:00

**Job Narrative**  
**140-37234-1**

**Revision**

The report being provided is a revision of the original report sent on 7/26/2024. The report (revision 1) is being revised due to: Revising report to update various M23 data issues, IDAs, FS, MDLs.

**Receipt**

The samples were received on 6/19/2024 9:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 0.2° C.

**Receipt Exceptions**

The Field Sampler was not listed on the Chain of Custody.

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. Matrix not listed, logged per project requirements.

The Chain of Custody was received without any analyses selected. Logged per project requirements.

**High-Res**

The Pre-Sampling Adsorbent Standards and Pre-Extraction Filter Recovery Standard for the PAH analysis were not quantitated by isotope dilution technique, but rather by internal standards that were added after extraction & concentration. These standards were removed from the final report forms. The recoveries were recalculated by isotope dilution technique outside the LIMS system and are presented in a table in the narrative. The target analytes were quantitated by isotope dilution technique.

Sample #	13C6-Benzo(c)fluorene	13C12-Benzo(j)fluoranthene	Anthracene-d10
1	131	103	70
2	131	107	77
3	114	103	73
4	118	104	87
5	122	114	75
6	116	113	74
7	116	104	83
8	119	105	110

The EPA Method 23 states to quantitate the sample results against the continuing calibration verification. Knoxville's approach is to quantitate the sample results against the initial calibration, consistent with other Hi-Res methodology.

The reporting limit (RL) and method detection limit (MDL) for the PAH analytes have not been established. The MDL is set equal to the RL. The reporting limit is supported by the initial calibration.

The Pre-Extraction Filter Surrogate, PCB-159L, was not spiked onto the filter due to unavailability of the standard when the extraction started.

Method 23: The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 140-88192 and 140-88337 and analytical batch 140-88920 recovered outside acceptance limits for Naphthalene. The entire sample was consumed during analysis or extraction therefore, the data have been reported.

Method 23: The method blank for preparation batch 140-88192 and 140-88337 contained multiple analytes above the reporting limit (RL). The entire sample was consumed during analysis or extraction, therefore, the data have been reported.

Method 23: Field surrogate 13C6-Benzo(c)fluorene was slightly above QC limits for the following samples after recalculating the recoveries against its respective IDA. See the table of recoveries in the narrative.

M23 F-10 BOILER RUN 2 COMBINED (140-37234-1) and M23 F-10 BOILER RUN 3 COMBINED (140-37234-2)

Method 23: The opening PAH Continuing Calibration Verification, (CCV 140-88999/1) was slightly outside QC limits for one or more Isotope Dilution Analyte (IDA) recoveries. All target analyte recoveries are in QC limits. After discussion with the project manager, it was decided to report the data with narration.

Method 23: The opening PAH Continuing Calibration Verification, (CCV 140-89076/1) was slightly outside QC limits for one or more Isotope Dilution Analyte (IDA) recoveries. All target analyte recoveries are in QC limits. After discussion with the project manager, it was decided to report the data with narration.

Method 23: Sample M23 F-10 BOILER RUN 6 COMBINED (140-37234-5) was not spiked with PCB field surrogates.

Method 23: The continuing calibration standard, (WDMCCV 140-88871/1), was outside method control criteria of 30%D for PCB-209L. The unlabeled native analyte PCB-209 recovered within limits. At client's request, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### **Organic Prep**

PAH Filter Surrogate Anthracene-d10 was spiked 10 x lower than the method requirement. Recoveries were calculated based on the amount spiked.

Method Split: The following samples required a Gel-Permeation clean up, via EPA method 3640A, to reduce matrix interference: M23 F-10 BOILER RUN 2 COMBINED (140-37234-1), M23 F-10 BOILER RUN 3 COMBINED (140-37234-2), M23 F-10 BOILER RUN 4 COMBINED (140-37234-3), M23 F-10 BOILER RUN 5 COMBINED (140-37234-4), M23 F-10 BOILER RUN 6 COMBINED (140-37234-5), M23 F-10 BOILER RUN 7 COMBINED (140-37234-6), M23 F-10 BOILER RUN 8 COMBINED (140-37234-7), M23 F-10 BOILER BT COMBINED (140-37234-8) and M23 MEDIA CHECK A-2229 FILTER, A-2228 XAD COMBINED (140-37234-14).

Method Split: A deviation from the Standard Operating Procedure (SOP) occurred. Details are as follows: During column cleanup, the 2:3 methylene chloride and hexane mixture was not added to the column after the 35 mL hexane elution step. all samples were affected.

Method Split: original samples were pulled from archive and continued through SIM PAH column clean ups.

M23 F-10 BOILER RUN 2 COMBINED (140-37234-1), M23 F-10 BOILER RUN 3 COMBINED (140-37234-2), M23 F-10 BOILER RUN 4 COMBINED (140-37234-3), M23 F-10 BOILER RUN 5 COMBINED (140-37234-4), M23 F-10 BOILER RUN 6 COMBINED (140-37234-5), M23 F-10 BOILER RUN 7 COMBINED (140-37234-6), M23 F-10 BOILER RUN 8 COMBINED (140-37234-7), M23 F-10 BOILER BT COMBINED (140-37234-8) and M23 MEDIA CHECK A-2229 FILTER, A-2228 XAD COMBINED (140-37234-14)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Resolution Check Report ( DFS SN: 3439 )

Date: 18 Jul 2024 21:24  
MID Experiment: ResCheck\_HRPAH  
Target Resolution: 10000  
Resolution Warning : 10000  
Resolution Error : 10000  
Reference: FC43\_HRPAH.lua  
Status: RESOLUTION PASSED

## Segment 1

Lock mass 149.9899 [m/z] Resolution: 11529 [5%height]

Cali. mass 180.9883 [m/z] Resolution: 12813 [5%height]

Ref. mass 168.9883 [m/z] Resolution: 12431 [5%height]

## Segment 2

Lock mass 213.9897 [m/z] Resolution: 11728 [5%height]

Cali. mass 263.9866 [m/z] Resolution: 12648 [5%height]

Ref. mass 225.9898 [m/z] Resolution: 11535 [5%height]

d3240718r3

### Segment 3

Lock mass 313.9834 [m/z] Resolution: 11546 [5%height]

Cali. mass 463.9738 [m/z] Resolution: 12703 [5%height]

Ref. mass 413.9770 [m/z] Resolution: 12390 [5%height]

## Reports
